IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches. Program costs will be shared with WE&T. CEI implementation shall integrate with Workforce Education and Training efforts by providing CEI process, lessons learned and case study input to energy engineering curriculum designers for Community Colleges and Universities. This activity will be coordinated through the Statewide Workforce Education and Training program team and will ultimately be integrated into the web portal that is being developed by that team.

iv. **Program-specific marketing and outreach efforts**

As with other information and education sub-programs, CEI will be primarily delivered by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing, and outreach efforts. Other channels of delivery may be developed. Marketing and outreach plans include training of the IOU in-house staff and customer groups. Collateral materials such as fact sheets, how-to documents, and PowerPoint slides will be produced and distributed during sales calls, public events or trade shows.

Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program

Formatted: Normal, Indent: Left: 0", Hanging: 0.38", Don't keep with next

Formatted: Indent: Left: 0.88"

~~participation. CEI will be integral to the Integrated Resource Management initiative for food processors.~~

CEI will be marketed through utility account executives, as well as through educational outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, Demand Response Program outreach, phone and e-mail support will be provided.

Formatted: Indent: Left: 0.5"

In ~~2010-2012~~2013-2014, marketing campaigns will provide a wide range of action-oriented solutions targeted to “personas” identified through segmentation research. In addition, marketing efforts will be “bundled.” That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment the IOUs will be better able to communicate with and serve customers.

Marketing efforts will incorporate a variety of marketing tactics and activities to promote the CEI sub-program. Education, awareness and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to help the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy-related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach ~~coordination~~ will be coordinated among the IOUs utilizing the statewide coordination process described above.

#### ~~v.~~ Non-energy activities of program

Formatted: Font: Bold

Formatted: Indent: Left: 0.56"

CEI implementation ~~shall will~~ include non-energy activities such as recognition awards, local area or sector competitions, awareness campaigns, education about non-energy related LEED points and definitions, and use of computerized financial analysis tools and cost estimating and forecasting tools. ~~In addition, the CEI sub-program will help customers learn about and access the many certification programs available, such as ENERGY STAR, LEED, and ISO.~~

Formatted: Indent: Left: 0.43", Hanging: 0.13", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Start at: 1 + Alignment: Right + Aligned at: 0.63" + Tab after: 0.75" + Indent at: 0.75", Tab stops: 0.56", List tab + Not at 0.75"

Formatted: Indent: Left: 0.56"

**vi. Non-IOU Programs**

CEI implementation shall include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies to support integrated efforts. The utility managers will partner with programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to develop co-branded program information and marketing collateral target to commercial-sector customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. Closer alignment with these other programs will be achieved in order to deliver the customer a more comprehensive solution. With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Commercial Calculated sub-program incentives for energy efficient equipment that may also reduce air emissions.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.5", Tab stops: 0.56", Left

**vii. CEC work on PIER with EPIC Collaboration**

CEI implementation shall continually seek to promote the adoption of new technologies developed through the PIER-EPIC CEC research process and to expose customers to demonstration, research and/or pilot projects. The continuous improvement process envisioned by CEI will provide new equipment/processes, and methods that will enable customers to achieve energy efficiency "stretch" goals in a cost-effective manner.

**Formatted:** Indent: Left: 0.88"  
**Formatted:** Font: Bold  
**Formatted:** Indent: Left: 0.5", Hanging: 0.13", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.63" + Tab after: 0.75" + Indentat: 0.75", Tab stops: 0.63", Left + 1", List tab + Notat 0.75"  
**Formatted:** Indent: Left: 0.5"

**viii. CEC work on codes and standards**

The program will not be implemented with a direct linkage to codes and standards efforts. However, see Section 6.b.ii., above. See Section 6.b.ii.

**Formatted:** Indent: Left: 0.88"  
**Formatted:** Font: Bold  
**Formatted:** Indent: Left: 0.5", Hanging: 0.13", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.63" + Tab after: 0.75" + Indentat: 0.75", Tab stops: 0.63", Left + 1", List tab + Notat 0.75"

**ix. Non-utility market initiatives**

CEI will support Energy Management certification efforts (ANSI, ISO), engaging at the material level. Non-utility market initiatives such as education about federal tax incentives for energy efficiency investments is an example of a non-utility information and guidance that CEI sub program will provide customers. CEI will support Energy Management certification efforts (ANSI, ISO), engaging at the material level. Non-utility market initiatives such as education about federal tax incentives for energy efficiency investments is an example of a non-utility information and guidance that CEI sub program will provide customers.

**Formatted:** Indent: Left: 0.5"  
**Formatted:** Font: Bold  
**Formatted:** Indent: Left: 0.5", Firstline: 0", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.63" + Tab after: 0.75" + Indentat: 0.75", Tab stops: 0.63", List tab + Notat 0.75"

**c) Best Practices**

CEI's approach applies the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the commercial market sector. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation,

**Formatted:** Indent: Left: 0.5", Tab stops: 0.5", Left  
**Formatted:** Font: Bold  
**Formatted:** Indent: Left: 0.88"  
**Formatted:** Indent: Left: 0.13"

and (6) Modification. This approach can now be successfully implemented given the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

CEI moves customer engagement from “project to project” to market transformation. The CEI approach applies the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management: Commit, Assess, Plan, Implement, Evaluate, and Modify. This approach can now be successfully implemented given the three-year program cycle allowing longer-term and deeper project development engagements with customers.

One means of delivering significant energy efficiency is to place or pay for a full-time energy manager at a customer site. This manager provides advice on, and management of, energy management improvements. The CEI program will consider implementing such a strategy in situations where there is strong potential for cost-effective delivery of energy savings. In so doing, the IOUs will share best practices of ongoing similar programs, such as PG&E’s More Than a Million program, which places energy managers at customer sites and requires the managers to “pay for themselves” in energy savings within six months. M&V from other utilities engaged in such strategies, such as at BC Hydro, are being evaluated.

As general best practice, programs will incorporate lessons learned from past EM&V activities, as available, to improve results, as well as other utility programs.

**d) Innovation**

Formatted: Font: Bold

CEI is a new way of packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Formatted: Indent: Left: 0.13"

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management. CEI is a new way of packaging energy efficiency, demand response and self-generation products and services aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Formatted: Indent: Left: 0.38"

**e) Integrated/coordinated Demand Side Management**

Formatted: Font: Bold

CEI includes project analysis and implementation support of recommendations of Statewide Integrated Energy Audits which provide customers with an inventory of facility end-use breakdown and energy efficiency, demand response and self-generation investment opportunities. Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat

participation in the same program. Additionally, this successful participation makes these customers likely candidates for other similarly related ~~types of programs~~, but because of siloing – thinking of programs as separate, unrelated efforts – this has proved difficult. ~~While a successful program experience leads to repeat participation, there has been difficulty in cross pollinating similarly related types of programs with these candidates due to program specific silos.~~ To overcome the historic ~~this, siloing of DSM~~, the CEI sub-program will leverage ~~lesson's~~ lessons learned from ~~the~~ DSM efforts by offering comprehensive, coordinated marketing and program delivery.

~~A primary issue when integrating energy efficiency and demand response programs is that the two programs are at financial odds with one another, as both programs often reduce the potential for each other's financial incentives. For example, energy efficiency may reduce the overall baseline by which the demand response program's incentives are based upon. Since benefits from long term energy savings derived from technological measures outweigh the temporary demand reduction benefits derived from behavioral actions, the CEI sub-program will offer additional incentives support and services for energy efficiency measures that enable demand response when customers enroll, or are already enrolled, in demand response programs. In so doing, the program seeks to maximize the potential for both types of programs.~~

~~A secondary issue when integrating energy efficiency and demand response programs is that communications of both types of DSM program are often non-coordinated, since energy efficiency is typically technology technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer "event season" and wane throughout the remainder of the year. To overcome these differences, the Program will offer integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable, which will give customers the opportunity to enroll in demand response programs as well as energy efficiency programs.~~

~~Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response programs in addition to energy efficiency programs.~~

To support the integration of energy efficiency and demand response programs, the sub-program will focus on several tactics:

- ~~○ Promotion and incentivizing of demand response enabling energy efficiency measures to ensure that energy efficiency is completed first to maximize potentials~~
- ~~○ Integrated and coordinated year round marketing (e.g., Applications, collateral, web sites, and events)~~
- ~~○ Linking of program eligibility requirements (e.g., Customer size)~~
- ~~○ Provide unified technical assistance through enhanced EE/DR Audits through the TA Program to allow for cross-harvesting opportunities~~
- ~~○ Integrated presence on utility websites~~

**Formatted:** Indent: Left: 0.63", Bulleted+  
Level: 1 + Aligned at: 0.75" + Tab after: 1" +  
Indent at: 1"

- ~~○ Regular coordination meetings between energy efficiency and demand response program management~~

~~CEI is recognized as an integrated element by supporting the statewide IDSM program's goals and objectives, and the IOUs will increase IDSM messaging and coordination within CEI. During the 2010-2012 program cycle, funding for energy efficiency and demand response cannot be commingled; therefore payments will be split between the two programs as appropriate.~~

Formatted: Indent: Left: 0.38"

**f) Integration Across Resource Types**

Formatted: Font: Bold

CEI implementation shall include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies to support integrated efforts. IOU CEI sub-program managers will partner as appropriate with CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information, marketing collateral and financial incentive analysis with customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will ~~inform customer~~ provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote CEI, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, utility program managers will partner with the local water districts to produce co-branded marketing collateral, attend trade shows, and co-~~release notices~~ release brochures, for programs with interactive water and energy effects.

**g) Pilots**

Formatted: Font: Bold

N/A

~~Based on Energy Division feedback, a potential initiative that will be explored in the 2010-2012 program cycle is that of a "Resource Energy Manager" (REM). REMs are essentially energy managers who are placed at the customer's facility to be a project champion and shepherd energy efficiency projects through to completion. Their salary is typically paid for through the energy savings they generate. REMs have been successfully used by IOUs in the government sector (typically military bases) in past program cycles and a similar program has been available for commercial customers in the Pacific Northwest. The concept of using REMs in the commercial segment will be explored to determine the viability and cost effectiveness of such an approach. An appropriate EM&V plan will also be required prior to launching an REM activity such that the affects of the project on achieving higher levels of energy efficiency can easily be determined.~~

**h) EM&V**

Formatted: Font: Bold

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This may include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

Once results of the 2010-2012 evaluations are ready, recommendations will be reviewed for modifying the CEI PIP accordingly. The IOUs plan to work together and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.

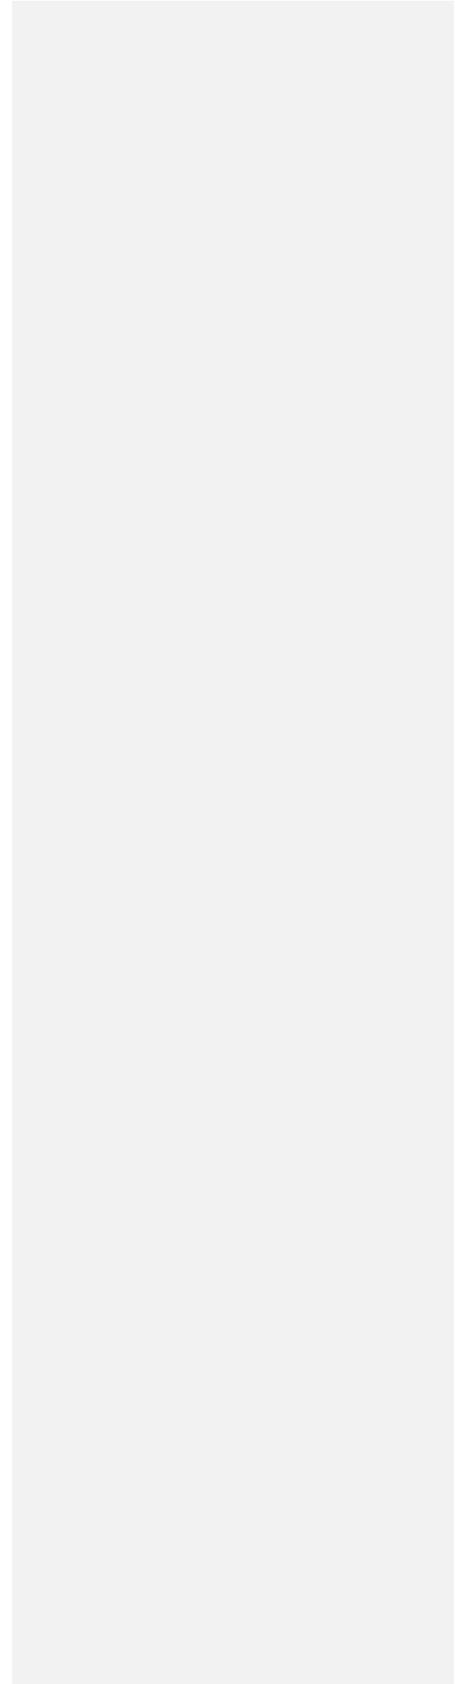

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions.

**Formatted:** Indent: Left: 0.13"

**41. ~~2f~~ Program Name: Commercial Direct Install Nonresidential HVAC, core sub-program**

**Program ID: SCG3712**

**Program Type: Statewide Core Program**

**1. ~~2~~ Projected Program Budget Table**

**Table 1 – reference the overarching program for budget details**

**2. ~~3~~ Projected Program Gross Impacts Table – by calendar year**

**Table 2 – reference the overarching program for savings gross impact details**

**44. Program Description**

**a) Describe program**

The Nonresidential HVAC Sub-program is a statewide program that will continue the transformation process of California’s HVAC market to ensure that:

- ~~a.~~
- ~~b.~~ HVAC technology, equipment, installation, and maintenance are of the highest quality;
- ~~c.~~ Quality installation and maintenance practices are easily recognized and requested by customers;
- ~~d.~~ The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- HVAC market business models for installing and maintaining heating and cooling systems change from commodity-based to value-added service business.

The IOUs are building towards this vision for HVAC by implementing a comprehensive set of strategies that builds on existing program, education, and marketing efforts and leverages relationships within the HVAC industry to transform the market towards a sustainable, quality driven market. Through this state-wide HVAC Sub-program and the Western HVAC Performance Alliance group of industry stakeholders, we will continue to gain a better understanding of the market response to our programs as well as the behavioral implications of the various market participants, and then actively revise/update strategies and programs accordingly, as guided by the California Long Term Energy Efficiency Strategic Plan (Strategic Plan).

Market transformation and direct energy savings and demand reductions will be achieved through a series of Sub-program elements that are summarized below:

**Upstream HVAC Equipment Distributor Incentive**

This sub-program element offers incentives to upstream market actors who sell qualifying high efficiency HVAC equipment. The logic that underscores this sub-program’s design is

**Formatted:** Numbered+ Level:1 + NumberingStyle:1, 2, 3, ... + Startat: 1 + Alignment:Left + A lignedat: 0.38" + Indentat: 0.63"

**Formatted:** Numbered+ Level:1 + NumberingStyle:1, 2, 3, ... + Startat: 1 + Alignment:Left + A lignedat: 0.38" + Indentat: 0.63"

**Formatted:** Indent:Left: 0"

**Formatted:** Font:Bold

**Formatted:** Indent: Firstline: 0", Tab stops: 0.38",Left

**Formatted:** Font:Bold

**Formatted:** Indent: Left: 0.13",SpaceA fter: 0 pt, Numbered+ Level:1 + NumberingStyle: a, b, c, ... + Startat: 1 + Alignment:Left + A lignedat: 0.25" + Indentat: 0.5"

**Formatted:** Indent: Left: 0.38",SpaceA fter: 0 pt, No bullets or numbering

**Formatted:** Indent: Left: 0.38",SpaceA fter: 0 pt, Bulleted+ Level:2 + A lignedat: 0.75" + Indentat: 1"

**Formatted:** Indent: Left: 0.38",Bulleted+ Level:2 + A lignedat: 0.75" + Indentat: 1"

**Formatted:** Indent:Left: 0.38"

**Formatted:** Indent:Left: 0.38"

**Formatted:** Indent:Left: 0.38"

that a small number of upstream market actors are in a position to impact hundreds of thousands of customers and influence their choice of equipment by increasing the stocking and promotion of high efficiency HVAC equipment. The upstream model cost-effectively leverages this market structure and existing relationships. The sub-program element also provides an online rebate application system to facilitate program participant sales and invoice tracking, which further reduces administrative costs as compared with paper application processing.

Formatted: Indent: Left: 0.38"

The upstream sub-program element is designed to adapt to market changes, and therefore the IOUs will continue working with relevant industry players to continually enhance the program to include new beyond-code upstream incentives.

#### **Nonresidential Quality Installation**

This sub-program element is applicable to installations of packaged HVAC systems, with a rated capacity up to 760,000 BTU/H. This sub-program element is based on the assumption that energy and demand savings are achievable through the application of QI in accordance with appropriate industry standards (e.g., ACCA, SMACNA and ASHRAE) applied to new commercial HVAC equipment.

Formatted: Indent: Left: 0.38"

This sub-program element intends to:

- Collaborate with EM&V efforts to quantify potential savings;
- Develop and implement a sub-program element focused on comprehensive, continuously improving installation activities that capture those savings and provide a high return on investment (ROI) to the end-user, thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan.

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.38", Bulleted+ Level: 1 + Aligned at: 0.75" + Indent at: 1", Tab stops: 0.63", Left

Formatted: Indent: Left: 0.38", Tab stops: 0.63", Left

#### **Nonresidential Quality Maintenance**

**—This sub-program element may represent one of the more creative aspects of the HVAC “Big Bold Energy Efficiency Strategy.” It is based on the assumption that there are energy and demand savings achievable through the regular application of quality maintenance (QM) procedures applied to existing nonresidential HVAC equipment. This sub-program element intends to implement a commercial maintenance program focused on comprehensive, continuously improving O&M activities that capture those savings and provide a high return on investment (ROI) to the end-user, thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan.**

Formatted: Font: Not Bold

Equipment efficiencies are improved by applying diagnostic methods and the detailed HVAC inspection and maintenance tasks of American National Standards Institute (ANSI)/American Society of Heating, Refrigerating and Air Conditioning (ASHRAE)/Air Conditioning Contractors of America (ACCA) Standard 180.

Formatted: Indent: Left: 0.38"

The QM sub-program element is driven by Service Agreements between customers and contractors. The program incorporates training, marketing and incentives to help contractors understand and communicate the value of HVAC quality maintenance and energy efficiency. The program is also supported by commercial customer referrals from utility Sales and Service Representatives.

Formatted: Indent: Left: 0.38", Tab stops: 0.44", Left

The 2013-14 HVAC QM efforts will focus on continuous improvement, design enhancements, implementation barriers and collecting program data to help improve savings estimates.

**i.b) List of Measures**

To achieve energy savings and the market transformation desired by the Strategic Plan, a variety of appropriate incentives is required to influence specific market actions. Incentives will be targeted to all levels of the HVAC value chain and will be available for equipment (Upstream) and services (Quality Installation and Quality Maintenance).

Additionally, in coordination with the Emerging Technologies Program, the Nonresidential HVAC QM program will continue to consider higher initial incentives for any HVAC emerging technologies that may be newly introduced to the marketplace via this sub-program. Once the new products have taken hold in the market place, any such incentives would be adjusted to reflect market conditions.

**Upstream HVAC Equipment Incentive**

Eligible measures may include packaged and split system air conditioners and heat pumps and other commercial HVAC equipment. Packaged units less than 65,000 Btu/hour are rated according to seasonal energy-efficiency rating (SEER) and steady state energy efficiency rating (EER). Units greater than 65,000 Btu/hour are rated according to EER and integrated part-load value (IEER). See the tables available on the program website [www.cainstantrebates.com](http://www.cainstantrebates.com) for current minimum qualifying efficiency ratings for each size category and corresponding incentive values.

<u>Measure Category</u>	<u>Incentive Level (Not to Exceed)</u>
<u>Air-Cooled Packaged and Split Systems &lt; 5.4 Tons of Cooling Capacity</u>	<u><del>\$4075</del> - \$450/ton</u>
<u>Air-Cooled Packaged and Split Systems &gt;= 5.4 Tons of Cooling Capacity</u>	<u>\$20 - \$150/ton</u>
<u>Water- or Evaporative-Cooled Systems &gt;= 5.4 Tons of Cooling Capacity</u>	<u><del>\$407100</del> - \$300/ton</u>
<u>Air-Cooled Chiller Equipment</u>	<u>\$25 - \$90/ton</u>
<u>Water-Cooled Chiller Equipment</u>	<u><del>\$407100</del> - \$300/ton</u>
<u>Variable Refrigerant (VRF/VRV) Equipment</u>	<u><del>\$630100</del> - \$1,530/ton</u>

Additional gas savings measures may be included in the program upon further evaluation of their viability and cost-effectiveness. New offering development evaluations will occur through ongoing IOU product development efforts and such continuous national efforts as the Consortium for Energy Efficiency's Commercial HVAC efforts.

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0", Line spacing: single

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.38"

**Nonresidential Quality Installation**

At this point, providing a list of measures and incentive levels is premature, as a valid Quality Installation based Sub-program must be more fully planned and vetted through the Western HVAC Performance Alliance (WHPA), and since EM&V research under discussion through the HVAC EM&V Project Coordination Group (PCG) is needed to clarify a market-realistic baseline for the level of quality of HVAC installation services. This Sub-program will continue to be designed during 2012-in 2013 for the 2013-2014 program cycle and therefore will not be providing incentives, at least not initially.

**Nonresidential Quality Maintenance**

<u>Measure</u>	<u>Purpose</u>	<u>Incentive Level</u>
<b><u>Customer Service Agreement Incentive</u></b>	Decrease customer's additional cost to upgrade to a QM Service Agreement. Keep the Service Agreement in place and units maintained by Contractor for 3 years	Up to \$3,836 per HVAC unit covered by agreement
<b><u>Contractor Service Agreement Incentive</u></b>	Compensate Contractors' for overhead costs related to Service Agreement sale and unit inventory.	\$75
<b><u>Contractor QM Tasks Incentive</u></b>	Reduce some of the additional costs of minor repairs that are required but don't receive incentives.	\$50
<b><u>Contractor EE Tasks Incentive</u></b>	Compensate Contractors' for completion of a specific set of tasks (see 4.1) required to bring the unit to minimum performance level (within 6 months of Service Agreement approval).  <b><u>EE Tasks Eligible for Incentives</u></b> <u>Coil cleaning</u> <u>Fan Maintenance</u> <u>Refrigerant system test</u> <u>Refrigerant system service</u> <u>Economizer functional test</u> <u>Integrate economizer wiring</u> <u>Replace damper motor</u> <u>Replace controller/sensor</u> <u>Renovate linkage &amp; other components</u> <u>Decommission economizer</u> <u>Replace thermostat</u> <u>Adjust thermostat schedule</u>	Up to \$2,425 per HVAC unit

**c) List of Non-incentive Commercial Customer Services Energy Advisor Services**

The Nonresidential HVAC sub-program will include a variety of non-incentive program services intended to support customers and contractors in achieving greater energy efficiency from HVAC upgrades and quality installations and quality maintenance. The list of such service includes:

- Education of the market on the value of selecting high-efficiency systems.

Formatted: Indent: Left: 0.5", Firstline: 0"

- ii. Reports for customers of estimated energy savings, cost savings and carbon reductions for their HVAC systems treated under the program.
- iii. Training for contractors on HVAC industry standards, sales and marketing of the value of those standards, and their implementation in the field.
- iv. Education for customers on how HVAC industry standards can help them compare bids of contractor services and select those with high-road skills.
- v. Customer education about the benefits of establishing a long-term trust relationship with a qualified contractor, which can lead to future energy and cost savings, such as from better planning for future HVAC system replacements and the quality installation of those systems when replaced.
- vi. Participating contractors can receive new business sales leads from utility company customer representatives.
- Improved comfort and indoor air quality for customers.

**5.) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

The Nonresidential HVAC subprogram is a market transformation oriented program.

See Section 7. below for, and so the following, market transformation information about the subprogram for 2013-2014 that replaces and enhances sections 5.a., 5.b. and 5.c. of the HVAC Program plan from 2010-2012, which had covered quantitative baseline and market transformation information, as well as program design to overcome barriers.

**Formatted:** Indent: Left: 0"

**b) Market Transformation Information**

Summary of the market transformation objectives of the program:

The Nonresidential HVAC Sub program will continue the transformation process of California's HVAC market to ensure that:

**Formatted:** Indent: Left: 0.5", Hanging: 0.13", Numbered+ Level: 2 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + A linedat: 1" + Tab after: 1.25" + Indentat: 1.25", Tab stops: 0.75", List tab + Notat 1.25"

HVAC technology, equipment, installation, and maintenance are of the highest quality;

**Formatted:** Indent: Left: 0.75"

Quality installation and maintenance practices are easily recognized and requested by customers;

**Formatted:** Indent: Left: 0.88", Bulleted+ Level: 1 + A linedat: 0.5" + Tab after: 0.75" + Indentat: 0.75", Tab stops: 1.25", List tab + Notat 0.75"

The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and

HVAC market business models for installing and maintaining heating and cooling systems change from commodity based to value added service business.

See Section 7. below.

**Formatted:** Indent: Left: 0.13"

Description of the market, including identification of the relevant market actors and the relationships among them:

The three central functions of heating, ventilating, and air conditioning (HVAC) are interrelated, especially with the need to provide thermal comfort and acceptable indoor air quality within reasonable installation, operation, and maintenance costs. In modern buildings the design, installation, and control systems of these functions are integrated into one or more HVAC systems.

The HVAC industry is a worldwide enterprise, with roles including operation and maintenance, system design and construction, equipment manufacturing and sales, and in education and research. The HVAC industry was historically regulated by the manufacturers of HVAC equipment, but regulating and standards organizations such as HARDI, ASHRAE, SMACNA, ACCA, Uniform Mechanical Code, and International Mechanical Code have been established to support the industry and encourage high standards and achievement.

For very small buildings, contractors normally "size" and select HVAC systems and equipment on behalf of end-use customers. For larger buildings, building services designers and engineers, such as mechanical, architectural, or building services engineers analyze, design, and specify the HVAC systems, and specialty mechanical contractors build and commission them. Distributors stock equipment from manufacturers in local regions and sell HVAC systems to contractors or building services companies. Building permits and code compliance inspections of the installations are normally required for all sizes of buildings (Reference: Wikipedia, HVAC Industry).

Market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies:

Successful market transformation programs first and foremost need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>46</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>47</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful market transformation programs have involved multiple organizations, providing overlapping

<sup>47</sup> CPUC (2008) Strategic Plan, p. 5.

~~market interventions<sup>48</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities will continue to work with the CPUC and all stakeholders to help achieve market transformation while meeting the immediate energy, demand, and environmental needs.~~

~~Provided that HVAC is allotted sufficient EM&V funds, the statewide team will build on the growing body of HVAC research in California to ensure the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies have been studied to inform future program decision-making.~~

~~Key Barriers:~~

- ~~— Lack of awareness: Customers do not appreciate the energy efficiency benefits of QI/QM, and suffer from a lack of information, time, and resources to assess their own energy efficiency opportunities;~~
- ~~— Performance uncertainties: Previous research has been conducted on the energy savings achievable through HVAC system maintenance measures such as RCA and Duct Sealing, but despite all this research many performance uncertainties still exist, and furthermore, this research has not been able to effectively demonstrate the full energy savings benefits of QI/QM;~~
- ~~— Bounded rationality: It is logical to assume that the HVAC industry would want to take the necessary training required to deliver high quality service; however, market dynamics have not supported such logic as the industry has largely become commoditized and low price/low quality typically wins out. Equipment stocking patterns have followed this same dynamic, such that customers who may seek high efficiency systems have had to wait for systems to be shipped from outside of California.~~
- ~~— Hidden costs: End-use customers do not clearly recognize the loss of energy efficiency performance benefits of a HVAC system if it is not properly installed and maintained, and do not recognize without assistance the value over time of purchasing a high efficiency system versus a standard efficiency one.~~
- ~~— Organizational customs: The HVAC industry has largely become commoditized into an industry driven by low costs and quality where quality is assumed but not understood or valued by the customer. This is a result, in part, of contractors having minimal success in communicating the value of QI/QM to consumers and consumers not understanding the linkages between comfort and energy use.~~

~~— Description of the proposed intervention(s) and its/their intended results, including which barriers the intervention is intended to address:~~

~~Historically, the nonresidential retrofit programs directed toward customers and contractors have had very low uptake rates on high efficiency HVAC systems, plus~~

**Formatted:** Indent: Left: 0.75"

<sup>48</sup> Nadel, Thorne, Saches, Prindle & Elliot (2003).

there is very little understanding in the market of the value of quality maintenance and installation services. Consequently, the critical foundation required for achieving HVAC market transformation consists of two main strategies:

- Continue to leverage the high level of participation in the Upstream sub-program element to ensure availability in the market and drive sales of high-efficiency equipment, and
- Build customer and contractor participation in the HVAC Quality Maintenance program element, since it is designed to provide an evergreen foundation across a broad customer base of existing HVAC users for achieving deep energy savings across HVAC and other programs.
  - The QM program element incorporates training, marketing and incentives to help contractors understand and communicate the value of HVAC quality maintenance and energy efficiency.
  - This program element is driven by Service Agreements between customers and contractors, establishing an on-going relationship of trust that also then enables better decisions to be made about replacement of equipment with high-efficiency systems and the proper quality installation of those systems.
  - The resulting increase in market share of high-efficiency equipment and quality installation and maintenance services then allows increased levels of customer, installer, and distributor/manufacturer knowledge and interest in these systems, which should then make it easier to achieve further increases in the market share of these energy saving practices.

### c) Program Intervention Design to Overcome Barriers

See Section 7. below.

- Lack of awareness: By quantifying the energy efficiency benefits of QI/QM, the benefits of QI/QM (as well as those “premium” HVAC services that prove to exceed the ANSI QI/QM standards) will be better understood by program participants. It is our goal to discover the evidence, and expected return on investment (ROI), that customers will require to authorize payment for these measures when subsidies are removed. Via the Upstream sub-program element, the delivery process of information about high-efficiency units is streamlined. Delivery from distributors and manufacturers through contractors will provide consistent information on the benefits of energy efficiency and reduces the need for end user analysis, thus allowing more customers to see the benefits of implementing energy efficiency projects/measures.

**Formatted:** Indent: Left: 0.88", Bulleted+ Level: 1 + A linedat: 1" + Tab after: 1.25" + Indentat: 1.25"

**Formatted:** Indent: Left: 1.38", Bulleted+ Level: 3 + A linedat: 1.5" + Tab after: 1.75" + Indentat: 1.75"

**Formatted:** Indent: Left: 1.13"

**Formatted:** Indent: Left: 1.38", Bulleted+ Level: 3 + A linedat: 1.5" + Tab after: 1.75" + Indentat: 1.75"

**Formatted:** Indent: Left: 0.38"

**Formatted:** Indent: Left: 1.38", Bulleted+ Level: 3 + A linedat: 1.5" + Tab after: 1.75" + Indentat: 1.75"

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.38", Tab stops: 0.63", List tab + Not at 0.5"

**Formatted:** Indent: Left: 0.38"

**Formatted:** Indent: Left: 0.13"

**Formatted:** Indent: Left: 0.38"

**Formatted:** Indent: Left: 0.63", Bulleted+ Level: 1 + A linedat: 0.5" + Tab after: 0.75" + Indentat: 0.75", Don't adjust space between Latin and A siantext, Don't adjust space between A siantext and numbers, Tab stops: 1", List tab + Not at 0.75" + 1.25"

~~— Performance uncertainties: The innovative diagnostic methods and technologies used by the QM pThe innovative diagnostic methods and technologies used by the QM program element set it apart from tune-ups and other HVAC maintenance efforts. Program measures include a thorough site assessment and repairs well above and beyond routine HVAC unit maintenance. The methods provided allow contractors enrolled in the program to precisely evaluate commercial customers' HVAC units and subsequently improve unit efficiency and realize energy savings.~~

~~— Bounded rationality: The sub-program incentives and promotion of qualified participating contractors encourage the HVAC industry to want to take the necessary training required to deliver high quality service. Upstream incentives ensure product availability to influence the decision-maker at the time of purchase or service.~~

**Formatted:** Indent: Left: 0.63", Bulleted+ Level: 1 + A linedat: 1" + Tabafter: 1.25" + Indentat: 1.25"

~~— Hidden costs: By encouraging contractors to promote the concepts and value of quality maintenance at the time of system installation, customers will be more likely to regularly maintain the system and be assured that the energy efficiency performance benefits of their new system will continue throughout the life of their system. The Upstream incentive channel controls incentive availability for high efficiency systems to the most relevant segments and can support smaller per unit incentives than if they were customer rebates, thereby maintaining cost effectiveness.~~

~~— Organizational customs: The program effort is designed to help demonstrate the value proposition of a high quality contracting business and educating consumers on the energy benefits of QI/QM. Additionally, incentives to upstream market actors encourage the development and promotion of new energy efficiency technologies and tiered incentive structure to build towards meeting future codes and standards changes.~~

**Formatted:** Indent: Left: 0.88", Bulleted+ Level: 1 + A linedat: 1" + Tabafter: 1.25" + Indentat: 1.25"

~~Additionally, several other issues could potentially influence sub-program design for Quality Installation, including:~~

**Formatted:** Indent: Left: 0.88"

~~— Other organizations have established processes and procedures for QI. These processes should be evaluated to determine how well they perform in comparison to minimum QI standards.~~

**Formatted:** Indent: Left: 0.88", Bulleted+ Level: 1 + A linedat: 0.25" + Indentat: 0.5", Tabstops: Not at 1.25"

~~— Lack of industry consensus on QI standards and technical protocols~~

~~— Overcoming market barriers to exceeding Title 24 Standards~~

~~— Cost-effective constraints arising from limited savings for QI measures exceeding Title 24.~~

~~— Forging sustainable HVAC industry and market actor support.~~

~~— Addressing challenges in standard applicability across a range of commercial building types and HVAC systems.~~

~~— True energy savings measurement procedures.~~

~~— The WHPA "Road Map" noted that while of both the Title 24 and ACCA standards mandate distribution system evaluation and specify limits for allowable leakage, the Nonresidential QI committee concluded that:~~

~~“To date, no satisfactory method for performing these examinations has been found for a wide range of non-residential installations.” (WHPA Non-Residential Quality Installation Road Map, 2010, p. 2)~~

	<u>2010 information.</u>	
<b>Commercial Quality Installation</b>	1. Percentage of HVAC contracting companies that are participating in statewide commercial OI program as a share of the targeted market <sup>49</sup>  <sup>50</sup> * "Target market" defined as C20 licensed HVAC contracting companies in CA.	2a

Market Transformation metrics should neither be used for short term analyses nor for specific program analyses; rather, should focus on broad market segments. Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as "Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly funded intervention is no longer appropriate in that specific market."<sup>49</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>50</sup>.

Markets are social institutions<sup>51</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>52</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>53</sup>. According to York<sup>54</sup>, "Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are three ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy."

Resolution E-4385 identified a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms, and these MTIs were presented at a public workshop to allow for public comments and discussion before being finalized. Consistent with the outcome of that public workshop, MTIs for this subprogram are below:

<b><u>Nonresidential Quality Maintenance</u></b>		
<u>Commercial HVAC Systems Serviced</u>	<u>TBD</u>	<u>TBD</u>
<u>QM-Standard Service Agreements Signed</u>	<u>TBD</u>	<u>TBD</u>
<u>Participating Contractors that Sign at Least One QM-Standard Service Agreement</u>	<u>TBD</u>	<u>TBD</u>

**e) Advancing Strategic Plan Goals and Objectives**

**Upstream HVAC Equipment Incentive**

- Support for Strategic Plan, HVAC Goal 1 to improve code compliance (and related SB454, which is now codified at Public Utilities Code Section 399.4)

Most HVAC distributors and manufacturers have not actively engaged in the areas of quality installations and increasing related permit compliance, mainly because they are not directly involved in the relevant code compliance market processes. However, they are supplying and helping with training contractors who are in the best position to ensure that quality installations occur, and who are often in a central

Formatted: Indent: Left: 0.13"

Formatted: Indent: Left: 0.13"  
Formatted: Indent: Left: 0.5"

Formatted: Font: Bold  
Formatted: Indent: Left: 0.13"  
Formatted: Indent: Left: 0.31", Hanging: 0.19", Bulleted + Level: 1 + Aligned at: 0.63" + Indent at: 0.88"  
Formatted: Indent: Left: 0.38"  
Formatted: Indent: Left: 0.88"

role regarding permit compliance. The program will continue to engage these market actors for ideas and possible program modifications to enhance support of quality installations and permit compliance.

- Support for Strategic Plan, HVAC Goal 4 to improve market penetration of new climate-appropriate HVAC technologies

The Upstream HVAC sub-program element can serve as an incubator program for increasing the market penetration of promising HVAC technologies, in coordination with HVAC elements of the Emerging Technologies program.

The sub-program element will support improvement to HVAC equipment by providing incentives for various high-efficiency HVAC equipment categories. The eligible equipment categories are based primarily on the Consortium for Energy Efficiency HVAC specifications, which have multiple tiers designed to increase the market share of high-efficiency equipment. Furthermore, by leveraging the geographic area of the Upstream HVAC sub-program throughout California and other parts of the West, the result will be increased participation, which will lead to increased market share of high-efficiency equipment sufficient to argue for standards changes.

Both SMUD and NV Energy currently offer a similar Upstream HVAC program. The California Upstream HVAC Program will look to leverage these existing relationships in addition to engaging the DOE, Southwest Energy Efficiency Project (SWEET), Western Cooling Efficiency Center (WCEC), Western HVAC Performance Alliance (WHPA) and manufacturers to create a regional strategy to develop and increase the commercialization of new climate-appropriate HVAC technologies.

#### Nonresidential Quality Installation

The program will help to achieve the following near-term strategic goals as identified in Chapter 6 of the Strategic Plan:

- 2-3: Provide expanded QI/QM training – In order to participate in the program, contractors will be required to attend specific training sessions that introduce them to the appropriate industry standards.
- 2-4: Implement contractor accreditation program – Additional support will be made available through the sub-program to reinforce the WE&T Program's efforts toward increasing the level of technician certification.

#### Nonresidential Quality Maintenance

The program will help to achieve the following near-term strategic goals, as identified in Chapter 6 of the Strategic Plan:

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.38", Hanging: 0.13", Bulleted + Level: 1 + Aligned at: 0.63" + Indent at: 0.88"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.88"

Formatted: Indent: Left: 0.63"

Formatted: Indent: Left: 0.63"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 0.75" + Indent at: 1"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 0.75" + Indent at: 1"

Formatted: Indent: Left: 0.38"

- 2-1: Create a Statewide QI/QM Brand – QM will support the Energy Upgrade California branding as applicable.
- 2-2: Launch Statewide Brand – QM will support the Energy Upgrade California branding as applicable.
- 2-3: Provide expanded QI/QM training –HVAC service technicians will continue to be fully trained on the delivery of the measures promoted by the Program. Furthermore, feedback mechanisms will be utilized to continually evaluate technician performance to ensure that they are applying the information they are being taught in the QI/QM training. Nearly all economists and government leaders agree that negative impacts of the current worldwide financial crisis are likely to linger for years. Thus, the IOUs will work closely with the industry to reduce (and wherever possible eliminate) the direct costs of this transformative training to technicians and contractors who are willing and able to apply their skills and new tools to the task at hand.
- 2-4: Implement contractor accreditation program – Efforts will be made to promote NATE certification.
- 2-5: Develop standards for on-board diagnostic functionality – Evaluating the use of hand-held and other types of diagnostic systems in the field will help determine viable protocols for commercial applications.
- 2-6: Prioritize in-field diagnostic approaches – Conducting the appropriate level of research into existing diagnostic and verification approaches will provide the IOUs and the HVAC industry with the information necessary to target future efforts based on quantifiable energy efficiency benefits.

**Formatted:** Indent: Left: 0.69", Hanging: 0.19", Space After: 0 pt, Bulleted+ Level: 1 + Aligned at: 0.88" + Indent at: 1.13", Tab stops: 0.88", Left

## 6.) Program Implementation

### a) Statewide IOU Coordination

The IOUs will jointly participate in California’s nonresidential HVAC efforts to achieve real market transformation. In order to accomplish this task, the IOUs will use the principles of adaptive management and follow a structured process to continuously update and enhance the program throughout the two-year implementation cycle. The process will be as follows:

- Designate an IOU Program Lead – The process for adaptive management will begin with each IOU designating an HVAC Program Lead. The lead will be the conduit through which information between IOUs will flow and will investigate new innovations, special accomplishments and challenges faced by sub-program managers and the managers of cross cutting statewide programs within their own IOU. Where such innovations or challenges intersect HVAC and show potential for improving the HVAC program, the Program Lead will present such information to a quarterly HVAC Program Management Team meeting.
- Hold HVAC Program Management Team Meetings – Meetings will be held at least quarterly, individual innovations and accomplishments experienced in one IOU will be transmitted to all IOUs. The HVAC Program Management Team will evaluate the innovations and accomplishments of the individual IOUs, hear ideas for course corrections and overcoming challenges, measure the HVAC program’s progress against statewide metrics and goals and prepare summations for presentation to the Western HVAC Performance Alliance.
- Adopt Program Enhancements – Once the HVAC Program Management Team agrees that a particular idea or innovation has merit on a statewide-level, each IOU program lead will distribute the information to their sub-program element managers for adoption and integration as appropriate. In some cases, it may be necessary to invite the sub-program element managers to the HVAC Program Management Team to get their feedback and ensure they receive the same message.
- Evaluate Program Enhancements Against Statewide Targets – To complete the adaptive management loop, the HVAC Program Management Team will track the program’s accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results<sup>55</sup>. The HVAC Program Management Team will determine whether future course corrections are needed, and if so, “activate” a fresh start of the adaptive management cycle to generate the improvements necessary to stay on track.

Additional areas of program coordination include:

— **Program name:** Nonresidential HVAC Sub-program

i.  
Nonresidential HVAC Sub-program

Formatted: Indent: Left: 0", First line: 0"

**ii. Program delivery mechanisms**

The Nonresidential HVAC Sub-program is the umbrella activity that encompasses the three sub-program elements summarized above in Section 4.a. The IOUs will deliver the Sub-program through a combination of third-party vendors and internal administrative staff. The Sub-program will be delivered in collaboration with existing industry infrastructures in order to increase its overall effectiveness. Program guidance will be provided to the CPUC/IOUs through the Western HVAC Performance Alliance as described below. The program will be targeted to consumers, contractors and distributors to create a push/pull dynamic that influences sustained market changes.

**iii. Incentive levels**

See Section 4.b above for more information on sub-program measures.

**iv. Marketing and outreach plans**

Specific outreach efforts will be made to the industry to keep them engaged with IOU programs and in the Strategic Plan process. On a macro level, this outreach will occur through the Western HVAC Performance Alliance. On a micro level, each sub-program element has specific tactics in place to engage the industry in its own particular demand reduction, energy savings and market transformation objectives

The Upstream sub-program element will explore outreach activities to upstream market actors in other geographic areas that ship into and across service territories and will continue communication with the industry to see where additional collaboration can occur to maximize marketing and outreach resources.

The IOUs will continue to develop common outreach materials, with feedback from market actors to enhance their effectiveness. These marketing materials will only be available to participating contractors, and will leverage IOU and other statewide branding efforts.

**v. IOU program interactions**

The IOUs are engaged in ongoing collaboration with the CEC and other agencies via the Codes and Standards process and will be able to coordinate and communicate voluntary programs and incentives with mandatory codes that become enacted for the future. Increasing the communication regarding the Strategic Plan will allow all entities to move and plan towards the same objectives.

In order to support the need for increased code compliance, the sub-program will continue to cooperate with CEC training and other compliance support activities targeted at local building departments. Such activities will also be used to promote

Formatted: Indent: Left: 0.75"

the economic and performance benefits of QI/QM. The sub-program will also continue to coordinate its activities with IOU local government partnerships, third-party programs and Codes and Standards activities to ensure that code compliance becomes fully integrated into these programs.

**vi. Similar IOU and POU programs**

As mentioned in Section 5.e. above, the three IOUs and SMUD implement the same or very similar Upstream HVAC Equipment Incentive Program.

As a result of increased federal equipment efficiency standards, many utilities across the country have begun to offer service-based programs that independently offer measures such as RCA and Duct Sealing. It is expected that the HVAC QM Program could stimulate a paradigm shift by delivering a comprehensive suite of maintenance services that comply with ASHRAE/ACCA/ANSI Standard 180, designed to address the full range of efficiency measures available for commercial HVAC systems.

POUs manage many different types of HVAC programs. However, none of them seek to accomplish the aggressive market transformation goals being proposed by the IOUs. Via the Western HVAC Performance Alliance, the IOUs will continue seek to increase their interactions with the POUs to better align IOU and POU HVAC programs. This may involve increasing awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.

**b) Program Delivery and Coordination**

The program will be coordinated with the following activities:

**i. Emerging Technologies program**

The program is expected to interact extensively with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment and the advancement of energy efficient climate-appropriate HVAC technologies.

**ii. Codes and Standards program**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This ensures that the code-based solutions are consistent with that program's other activities. The Codes and Standards PIP describes the specific actions that the Program will employ to address HVAC.

As technologies advance and market penetration increases to an acceptable level, the minimum threshold for eligibility in California can increase to lock in the higher efficiency levels and continue an upward level of efficiency for HVAC equipment.

Formatted: Indent: Left: 0.63"  
Formatted: Indent: Left: 0.75"

Coordination of HVAC, Codes and Standards and Emerging Technologies activities will be realized through regular interactions of statewide program teams to discuss program integration and implementation issues.

### iii. WE&T efforts

The workforce education and training needs for the HVAC industry will be managed through the Statewide IOU Workforce Training and Education (WE&T) Program umbrella. However, the WE&T activity will be coordinated with the statewide HVAC Sub-program activity to ensure that the individual efforts are complementary.

Participating contractors in the HVAC sub-program will be required to attend program-specific QM training in order to participate in the programs.

The IOUs will leverage relationships with upstream market actors established through this sub-program to extend the delivery of training modules developed through the HVAC elements of the statewide WE&T Program.

### iv. Program-specific marketing and outreach efforts

The primary outreach vehicle between the Upstream sub-program element and program participants is via the website: [www.cainstantrebates.com](http://www.cainstantrebates.com) and other electronic communication (e.g., e-mail and newsletters). The cost of operating this website is shared between the participating IOUs and POUs. Additional marketing and outreach activities exist through personal contact between the program staff and program participants. Targeted QI/QM marketing materials can be distributed to contractors via these established upstream channels.

Marketing support will be available for participating HVAC service contractors in order to promote the Statewide QI/QM efforts. Such support may include exclusive promotion on IOU websites, brochures and other leave-behind materials that contractors can use to promote QI/QM and their involvement with the sub-program.

The Nonresidential HVAC sub-program will coordinate marketing activities with other offerings within the Commercial program to create a seamless customer experience.

### v. Non-energy activities of program

The direct energy benefits of the program result from promotion of high efficiency HVAC systems and the quality installation and maintenance of new and existing systems. Other activities will be required to support these energy savings goals. These activities include significant efforts in program design enhancements and coordination, technology evaluation and integration, contractor training and consumer marketing.

**Formatted:** Indent: Left: 0.88"

The program will continue to be active in a number of non-resource and market transformation activities that are required to ensure that the HVAC industry is fully involved in the development and implementation of the many tactics required to address the short and long term goals of the Strategic Plan. One such activity is the Westem HVAC Performance Alliance (WHPA). The WHPA is necessary to keep the industry engaged in the Strategic Plan process and to provide guidance and support for the implementation of the various tactics required to transform the industry. Mindful that HVAC industry organizations are not traditionally structured, staffed or allocate resources to contribute the level of involvement envisioned by the Strategic Plan, the HVAC Convener’s Report concluded that: “The agencies and utilities should work together to ensure the working group is adequately funded to meet its responsibilities”

The WHPA involves high-level HVAC industry stakeholders—such as manufacturers, distributors, contractors, associations, organized labor and influential end user/customers—to coordinate industry sponsorship of and participation in HVAC strategies. Membership also includes and is targeted at other key players, such as the CPUC, California Energy Commission, utilities, building owners/managers, university researchers, consumers, and the Federal Government.

As a communication and coordination entity for HVAC energy-saving collaboration among IOUs, ED, other state and local government entities, and a broad set of HVAC industry and market stakeholders, the WHPA is chartered 1) to champion (coordinate, guide, prioritize, track and facilitate the implementation and evolution of) the HVAC Action Plan in support of the Strategic Plan and 2) to provide thoughtful input into IOU HVAC Energy Efficiency (EE) Program efforts.

**vi. Non-IOU Programs**

The Upstream sub-program element, in collaboration with the ET Program, will leverage its involvement with the U.C. Davis Westem Cooling Efficiency Center and other industry and academic efforts to continually evaluate and include new equipment technologies as they become more commercially viable.

The IOUs will take an active role in Consortium for Energy Efficiency (CEE) activities to ensure that California’s quality needs are appropriately reflected in the ongoing CEE specification-setting efforts.

The program will interact with the HVAC industry to develop and introduce increasingly stronger QM standards that ensure systems are operating in their most efficient state.

The Program will remain engaged with CEC, CARB, DOE and other government agencies responsible for regulating various aspects of HVAC equipment, services and training.

**Formatted:** Indent: Left: 0.88"

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.75", Numbered+ Level: 1 + NumberingStyle: i, ii, iii, ... + Start at: 1 + Alignment: Right + Aligned at: 1.63" + Tab after: 1.75" + Indent at: 1.75", Tab stops: 0.88", List tab + Not at 1.75"

**Formatted:** Indent: Left: 0.75"

**Formatted:** Indent: Left: 0.94", Tab stops: 1", Left

**vii. CEC work on PIEREPIC**

The Program will interact extensively with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment and climate-appropriate HVAC technology advancement and market adoption.

**viii. CEC work on codes and standards**

See Section 6.b.ii. above.

**ix. Non-utility market initiatives**

The tenets of QI and QM are being actively pursued by leaders in the HVAC industry itself. Air Conditioning Contractors of America (ACCA) has taken the lead in this national effort by developing various ANSI-recognized QI and QM standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR, Utilities). Other organizations have also developed processes designed to improve the operating efficiency of HVAC systems (e.g., SMACNA, NCI). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards that drive increased energy savings for customers.

**c) Best Practices**

The Statewide HVAC Program demonstrates several examples of programmatic best practices. First, the Program involves the HVAC industry in all aspects of the program including public policy, program design and implementation – both formally through the Western HVAC Performance Alliance and informally through various ad-hoc working groups. Industry involvement is a crucial step in achieving the desired market transformation goals. Second, the Program uses an adaptive management process, as described in Section 6.a, to ensure that the Program is responsive to the changing market environment. Included under this process are inter-utility coordination meetings between HVAC, Emerging Technologies and Codes and Standards program managers to ensure these three programs are well coordinated and implemented consistent with the goals of the Strategic Plan. The Program includes the appropriate level of focus on technology issues through the close involvement with the Emerging Technologies program to advance the various technological and policy issues required to meet the deep energy savings and demand reduction goals desired by the Strategic Plan.

The use of industry-accepted design, construction and maintenance standards represents a quality-oriented best practice in air conditioning system installations and maintenance. Industry standards have been developed and vetted by national committees of industry experts and represent the best available information to use for program design. Additionally, networking through organizations such as CEE and the WHPA will provide

- Formatted: Indent: Left: 0.75"
- Formatted: Font: Bold
- Formatted: Indent: Left: 0.75", First line: 0", Numbered+ Level: 1 + NumberingStyle: i, ii, iii, ... + Start at: 1 + Alignment: Right + Aligned at: 1.63" + Tab after: 1.75" + Indent at: 1.75", Tab stops: 0.88", List tab + Not at 1.75"

- Formatted: Indent: Left: 0.88"
- Formatted: Not Superscript/Subscript, Not Highlight
- Formatted: Font: Bold
- Formatted: Indent: Left: 0.75", Numbered+ Level: 1 + NumberingStyle: i, ii, iii, ... + Start at: 1 + Alignment: Right + Aligned at: 1.63" + Tab after: 1.75" + Indent at: 1.75", Tab stops: 0.88", Left + Not at 1.75"
- Formatted: Indent: Left: 0.88"
- Formatted: Font: Bold
- Formatted: Indent: Left: 0.13"

opportunities for frequent feedback on QI and QM efforts being implemented within California and across the country.

In the Fall of 2007, ACEEE awarded the “Exemplary” Award to this Upstream sub-program element design. This essentially designated this Upstream program model as the highest performing program to promote HVAC equipment as compared to all programs across the United States.

#### **d) Innovation**

**Formatted: Font: Bold**

The Statewide Nonresidential HVAC Sub-program takes an innovative approach to program design through its implementation of a multi-faceted effort to engage all levels of the HVAC value chain. Each sub-program element under the umbrella and in those within the Residential HVAC Sub-program is designed to influence specific market changes. Within the sub-program elements, innovative techniques such as co-branded marketing and workforce training through existing industry channels will be employed to increase the program’s effectiveness. In addition, technical innovation is achieved specifically through the HVAC sub-program’s coordination with a dedicated advocacy effort to advance the state-of-the-art in vapor compression cooling and fault detection and diagnostics within the Emerging Technologies program.

A critical component of the Upstream sub-program element is its use of a web-based application and participation tool that provides transparency to both the program participants as well as the host IOU to be able to see what is occurring for applications that involve them. That this system allows participants to know the status in aggregate or down to a customer application level makes participation easy and efficient. For program participants, a paperless system is critical for ease of participation and for utilities there is reduction in cost per kWh saved from administrative costs over a paper review process.

Designing and delivering the QI sub-program program element through active partnership with the industry will increase the likelihood of its success, as will the use of industry-accepted standards for QI as the foundation for activities.

The innovation of the QM sub-program element exists through the adoption of a comprehensive maintenance approach based on industry-accepted standards. A more comprehensive maintenance effort that delivers well-documented energy savings sets the standard for HVAC efficiency programs. Furthermore, delivering this program through active partnership with the industry will increase the likelihood of its success. Finally, innovation results through a continuous improvement process that will be employed to evaluate the viability of offering additional incentives for installations that exceed established program standards.

**e) Integrated/coordinated Demand Side Management**

As with most HVAC oriented programs, the primary source of integration exists between energy efficiency and demand response activities. At a minimum, all marketing materials developed to support QI and QM sub-program elements will cross promote DR to educate customers on the availability of IOU DR programs. Required contractor training will be designed to include a discussion on DR programs and participating contractors will be required to deliver DR information as part of their customer sales efforts. The IOUs will also explore combined EE and DR opportunities within various HVAC distribution channels.

**f) Integration Across Resource Types**

The program can be designed to support CARB's efforts to regulate GHGs by providing consumer information on the phase-out of existing refrigerants and the move to zero ozone depletion potential (ODP) refrigerants with the customers maintenance invoice. Such information will seek to influence the customer's adoption of newer equipment by explaining the likelihood of increased maintenance costs as existing refrigerants become less available.

**g) Pilots**

No pilot programs are planned as part of this sub-program effort, though activities associated with improving QI and/or QM may be piloted before full implementation to ensure more coherent market adoption on roll-out.

**h) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. To support the continuous improvement envisioned by the adaptive management process and to fully address the intricacies of the program design, appropriate EM&V activities will be

Formatted: Font: Bold

Formatted: Font: Bold

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

Formatted: Font: Bold

Formatted: Not Superscript/ Subscript, Not Highlight

conducted as coordinated by the HVAC EM&V Project Coordination Group (PCG) and overseen by the CPUC.

Routine evaluation: the Upstream sub-program element will utilize the online incentive application system to track the sale of high-efficiency equipment from year to year. Reports can then be created to show the percent of equipment incentivized in tons based on SEER or EER. These reports will be prepared every year and compared to the previous accomplishments, and will determine whether the program is achieving goals.

## **7. 7) Market Transformation Information**

**The Nonresidential HVAC subprogram is a market transformation oriented program. The following information replaces and enhances Sections 5.a, 5.b, and 5.c. above of the HVAC Program plan from 2010-2012, which had covered quantitative baseline and market transformation information, as well as program design to overcome barriers.**

### **a) Summary of the market transformation objectives of the program:**

The Nonresidential HVAC Sub-program will continue the transformation process of California's HVAC market to ensure that:

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- HVAC market business models for installing and maintaining heating and cooling systems change from commodity-based to value-added service business.

### **b) Description of the market, including identification of the relevant market actors and the relationships among them:**

- The three central functions of heating, ventilating, and air-conditioning (HVAC) are interrelated, especially with the need to provide thermal comfort and acceptable indoor air quality within reasonable installation, operation, and maintenance costs. In modern buildings the design, installation, and control systems of these functions are integrated into one or more HVAC systems.
- The HVAC industry is a worldwide enterprise, with roles including operation and maintenance, system design and construction, equipment manufacturing and sales, and in education and research. The HVAC industry was historically regulated by the manufacturers of HVAC equipment, but regulating and standards organizations such as HARDI, ASHRAE, SMACNA, ACCA, Uniform Mechanical Code, and International

**Formatted:** Font: Bold

**Formatted:** Bullets and Numbering

**Formatted:** Indent: Left: 0.5"

**Formatted:** Indent: Left: 0.38", Bulleted+ Level: 1 + A linedat: 0.75" + Indentat: 1", Tab stops: 0.63", Left + 1.25", Left

**Formatted:** Bullets and Numbering

Mechanical Code have been established to support the industry and encourage high standards and achievement.

- For very small buildings, contractors normally "size" and select HVAC systems and equipment on behalf of end-use customers. For larger buildings, building services designers and engineers, such as mechanical, architectural, or building services engineers analyze, design, and specify the HVAC systems, and specialty mechanical contractors build and commission them. Distributors stock equipment from manufacturers in local regions and sell HVAC systems to contractors or building services companies. Building permits and code-compliance inspections of the installations are normally required for all sizes of buildings.

**c) Market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies:**

Successful market transformation programs first and foremost need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>56</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>57</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful market transformation programs have involved multiple organizations, providing overlapping market interventions<sup>58</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities will continue to work with the CPUC and all stakeholders to help achieve market transformation while meeting the immediate energy, demand, and environmental needs.

Provided that HVAC is allotted sufficient EM&V funds, the statewide team will build on the growing body of HVAC research in California to ensure the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies have been studied to inform future program decision-making.

Key Barriers:

Lack of value proposition awareness

<sup>56</sup> Peters, J.S., Mast, B., Igelzi, P., Megdal, L.M. (1998). *Market Effects Summary Study Final Report: Volume 1.* Available at <http://calmac.org/publications/19981215CAD0001ME.PDF>.

<sup>57</sup> CPUC (2008) Strategic Plan, p. 5.

<sup>58</sup> Nadel, Thorne, Saches, Prindle & Eliot (2003).

● Performance uncertainties: Previous research has been conducted on the energy savings achievable through HVAC system maintenance measures such as RCA and Duct Sealing, but despite all this research many performance uncertainties still exist, and furthermore, this research has not been able to effectively demonstrate the full energy savings benefits of QI/QM;

● End-use customers do not clearly recognize the loss of energy efficiency performance benefits of a HVAC system if it is not properly installed and maintained, and do not recognize without assistance the value over time of purchasing a high-efficiency system versus a standard-efficiency one.

**Formatted:** Bulleted+ Level:1 + Alignedat: 0.5" + Indentat: 0.75"

Availability of higher-efficiency equipment

**Formatted:** Indent:Left: 0.5"

● Stocking patterns of equipment follow demand, and since customers do not yet well appreciate the value of energy efficiency, HVAC equipment stocking in local distribution centers tends toward lower price, standard-efficiency systems. Without program intervention until market transformation occurs, customers who want to purchase higher-efficiency systems suffer delays from waiting for systems to be shipped from other locations, or just select standard-efficiency systems to avoid delay.

Search costs for qualified QM and/or QI contractors

● Customers do not appreciate the energy efficiency benefits of QI and QM, and suffer from a lack of information, time, and resources to assess their own energy efficiency opportunities.

**Formatted:** Indent:Left: 0.5", No bullets or numbering

**Formatted:** Bulleted+ Level:1 + Alignedat: 0.5" + Indentat: 0.75", Don't adjust space between Latin and A sian text, Don't adjust space between A sian text and numbers

Commoditized business model practices

● Bounded rationality: It is logical to assume that the HVAC industry would want to take the necessary training required to deliver high quality service; however, market dynamics have not supported such logic as the industry has largely become commoditized and low price/low quality typically wins out. Equipment stocking patterns have followed this same dynamic, such that customers who may seek high-efficiency systems have had to wait for systems to be shipped from outside of California;

**Formatted:** Indent:Left: 0.5", No bullets or numbering

⊖ Organizational customs:

● The HVAC industry has largely become commoditized into an industry driven by low costs and quality where quality is assumed but not understood or valued by the customer. This is a result, in part, of contractors having minimal success in communicating the value of QI/QM to consumers and consumers not understanding the linkages between comfort and energy use.

**Formatted:** Indent:Left: 0.56", No bullets or numbering

d) Description of the proposed intervention(s) and its/their intended results, including which barriers the intervention is intended to address:

**Formatted:** Numbered+ Level:1 + NumberingStyle:a, b, c, ... + Startat: 1 + Alignment:Right + Alignedat: 0.13" + Tab after: 0.38" + Indentat: 0.38"

Historically, the nonresidential retrofit programs directed toward customers and contractors have had very low uptake rates on high-efficiency HVAC systems, plus there is very little understanding in the market of the value of quality maintenance and

**Formatted:** Bulletsand Numbering

**Formatted:** Indent:Left: 0.5"

installation services. Consequently, the critical foundation required for achieving HVAC market transformation consists of two main strategies:

- Continue to leverage the high level of participation in the Upstream sub-program element to ensure availability in the market and drive sales of high-efficiency equipment, and
- Build customer and contractor participation in the HVAC Quality Maintenance program element, since it is designed to provide an evergreen foundation across a broad customer base of existing HVAC users for achieving deep energy savings across HVAC and other programs.
- The QM program element incorporates training, marketing and incentives to help contractors understand and communicate the value of HVAC quality maintenance and energy efficiency.
- This program element is driven by Service Agreements between customers and contractors, establishing an on-going relationship of trust that also then enables better decisions to be made about replacement of equipment with high-efficiency systems and the proper quality installation of those systems.
- The resulting increase in market share of high-efficiency equipment and quality installation and maintenance services then allows increased levels of customer, installer, and distributor/manufacturer knowledge and interest in these systems, which should then make it easier to achieve further increases in the market share of these energy saving practices.

Program Intervention to Overcome Barriers

Lack of value proposition awareness

- By quantifying the energy efficiency benefits of QI/QM, the benefits of QI/QM (as well as those “premium” HVAC services that prove to exceed the ANSI QI/QM standards) will be better understood by program participants. It is our goal to discover the evidence, and expected return on investment (ROI), that customers will require to authorize payment for these measures when subsidies are removed. Via the Upstream sub-program element, the delivery process of information about high-efficiency units is streamlined. Delivery from distributors and manufacturers through contractors will provide consistent information on the benefits of energy efficiency and reduces the need for end user analysis, thus allowing more customers to see the benefits of implementing energy efficiency projects/measures;

Performance uncertainties:

- The innovative diagnostic methods and technologies used by the QM program element set it apart from tune-ups and other HVAC maintenance efforts. Program

Formatted: Bulleted+ Level:1 + Alignedat: 0.5" + Indentat: 0.75"

Formatted: Indent:Left: 0.38"

Formatted: Bulleted+ Level:1 + Alignedat: 0.5" + Indentat: 0.75"

Formatted: Indent:Left: 0.88"

Formatted: Bulleted+ Level:1 + Alignedat: 0.5" + Indentat: 0.75"

Formatted: Indent:Left: 0.13"

Formatted: Bulleted+ Level:1 + Alignedat: 0.5" + Indentat: 0.75"

Formatted: Indent:Left: 0.5", No bullets or numbering

measures include a thorough site assessment and repairs well above and beyond routine HVAC unit maintenance. The methods provided allow contractors enrolled in the program to precisely evaluate commercial customers' HVAC units and subsequently improve unit efficiency and realize energy savings.

Availability of higher-efficiency equipment

- The Upstream incentives ensure product availability to influence the decision maker at the time of purchase or service.

Search costs for qualified QM and/or QI contractors

- By encouraging contractors to promote the concepts and value of quality maintenance at the time of system installation, customers will be more likely to regularly maintain the system and be assured that the energy efficiency performance benefits of their new system will continue throughout the life of their system.

Commoditized business model practices

- Bounded rationality: The sub-program incentives and promotion of qualified participating contractors encourage the HVAC industry to want to take the necessary training required to deliver high quality service;

⊖ Organizational customs:

- The program effort is designed to help demonstrate the value proposition of a high quality contracting business and educating consumers on the energy benefits of QI/QM. Additionally, incentives to upstream market actors encourage the development and promotion of new energy-efficiency technologies and tiered incentive structure to build towards meeting future codes and standards changes.

⊖ Additionally, several other issues could potentially influence sub-program design for Quality Installation, including:

- Other organizations have established processes and procedures for QI. These processes should be evaluated to determine how well they perform in comparison to minimum QI standards.
- Lack of industry consensus on QI standards and technical protocols
- Overcoming market barriers to exceeding Title 24 Standards
- Cost-effective constraints arising from limited savings for QI measures exceeding Title 24.
- Forging sustainable HVAC industry and market actor support.
- Addressing challenges in standard applicability across a range of commercial building types and HVAC systems.
- True energy savings measurement procedures.
- The WHPA “Road Map” noted that while of both the Title 24 and ACCA standards mandate distribution system evaluation and specify limits for allowable leakage, the Nonresidential QI committee concluded that:

**f) Evaluation plans and corresponding Market Transformation Indicators and Program Performance Metrics based on the program logic model:**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the three elements of the Nonresidential HVAC Sub-program (Resolution E-4385, Appendix A, pp 35-36):

Formatted: Indent: Left: 0.75"

Formatted: Numbered+ Level: 1 + NumberingStyle: a, b, c, ... + Startat: 1 + Alignment: Right + A linedat: 0.13" + Tab after: 0.38" + Indentat: 0.38"

**Table 3 – Program Performance Metrics**

Formatted: Indent: Left: 0.5"

Program	Metric	Metric Type
<i>Upstream HVAC</i>	1. (a) kW/ton incentivized in the program. (Note: Decrease in metric indicates positive progress), combined with (b) the number of units that are incentivized in the program vs. (c) number of units over 5.4 tons shipped to California as tracked through AHRI shipment data. (Assuming the availability of AHRI data.) <sup>1</sup>  <sup>1</sup> As indicated within this PPM, the availability of item (c) in this PPM is not yet confirmed, since it is closely-held, proprietary third-party information. The IOU team is in discussions with AHRI about obtaining this data and to ascertain the statistical validity of what data would be provided; the IOU team will communicate with the ED about any issues regarding this data element before the first reporting period in Q1 2011 for 2010 information.	2a
	2. The distributor stocking percentage of units eligible for program. (Note: Assumes availability of individual distributor data and/or aggregated data from HARDI.) <sup>1</sup>  <sup>1</sup> The availability of this data is not yet confirmed, since it is closely-held, proprietary third-party information. The IOU team is in discussions with AHRI about obtaining this data and to ascertain the statistical validity of what data would be provided; the IOU team will communicate with the ED about any issues regarding this data element before the first reporting period in Q1 2011 for 2010 information.	2b
<i>Commercial Quality Installation</i>	1. Percentage of HVAC contracting companies that are participating in statewide commercial QI program as a share of the targeted market*  * "Target market" defined as C20 licensed HVAC contracting companies in CA.	2a

Formatted: Indent: Left: 0.13"

Formatted: Indent: Left: 0.88"

Formatted: Indent: Left: 0.38"

Market Transformation metrics should neither be used for short-term analyses nor for specific program analyses; rather, should focus on broad market segments. Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>59</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>60</sup>.

Markets are social institutions<sup>61</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to

<sup>59</sup> California Public Utilities Commission Decision, D.98-04-063, Appendix A.

<sup>60</sup> California Public Utilities Commission (2008) *California Long Term Energy Efficiency Strategic Plan*, p. 5. Available at <http://www.californiaenergyefficiency.com/docs/EEStrategicPlan.pdf>

<sup>61</sup> Blumstein, C., Goldstone, S., & Lutzenhiser, L. (2001) “From technology transfer to market transformation”. Proceedings of the European Council for an Energy Efficient Economy Summer Study. Available at [http://www.eceee.org/conference\\_proceedings/eceee/2001/Panel\\_2/p2\\_7/Paper/](http://www.eceee.org/conference_proceedings/eceee/2001/Panel_2/p2_7/Paper/)

intermediary steps such as changing behavior, attitudes, and market supply chains<sup>62</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>63</sup>. According to York<sup>64</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are three ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

Resolution E-4385 identified a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms, and these MTIs were presented at a public workshop to allow for public comments and discussion before being finalized. Consistent with the outcome of that public workshop, MTIs for this subprogram are below.

**Table 4 – Market Transformation Indicators**

<u>HVAC-1</u>	<u>Market share of energy efficient climate appropriate HVAC equipment.</u>
<u>HVAC-3</u>	<u>Percentage of all California Commercial HVAC installation contractors using Quality Installation guidelines (weighted by size).</u>
<u>HVAC-4-Commercial</u>	<u>Percentage of Commercial HVAC units (systems) serviced in IOU service territory under a QM Service Agreement.</u>

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. To support the continuous improvement envisioned by the adaptive management process and to fully address the intricacies of the program design, appropriate EM&V activities will be conducted as coordinated by the HVAC EM&V Project Coordination Group (PCG) and overseen by the CPUC.

~~4f1.2g)~~ **Program Name: Commercial Direct Install, ~~core sub-program~~**  
**Program ID:**  
**Program Type: Statewide Core Program**

2) **Projected Program Budget Table**

~~Noted: The Projected Program Budget Table is not included since~~ PG&E's and SCG's &E Direct Install efforts are or may be delivered by third party bidders whose efforts are included in ~~th~~ the ~~their~~ 3<sup>rd</sup> Party Program implementation plans.

3) **Projected Program Gross Impacts Table**

~~Projected Program Gross Impacts Table not included since~~ Note: PG&E's Direct Install efforts are delivered by third party bidders whose efforts are included in the 3<sup>rd</sup> Party Program implementation plans.

4) **Program Description**

a) Describe Program

The Direct Install sub-program delivers free and low cost energy efficiency hardware retrofits through installation contractors to reduce peak demand and energy savings ~~to~~ for small commercial customers ~~with monthly demand typically less than 100 kW~~. The program targets ~~very small and~~ small businesses in a staged delivery approach that provides program services in specific geographic areas at different times allowing for a more concentrated, directed, and yet comprehensive program.

Note: PG&E's and SCG's Direct Installed (DI) sub-program is delivered through LGP and Third Party Channels. Specific descriptions and details of its DI program and offerings can be found in its respective LGP and Third Party PIPs.

**Formatted:** Font: 12 pt, Fontcolor: A uto

**Formatted:** Font: 12 pt, Fontcolor: A uto

**Formatted:** Font: 12 pt, Fontcolor: A uto

b) List of Measures

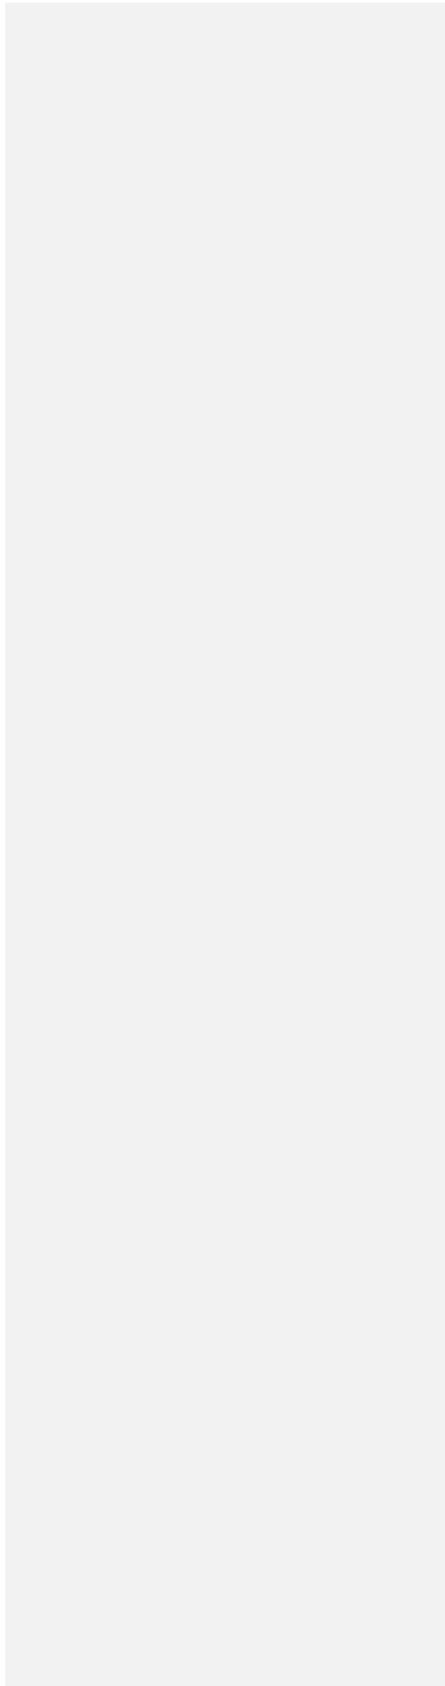

Direct Install will implement selected measures at reduced or no or low cost to the customer. Low cost measure opportunities will be targeted to small commercial customers. Eligible measure types include but are not limited to:

- ~~Lighting~~
- Gas Measures
- HVAC
- Air conditioning equipment
- Refrigeration ~~Gaskets, auto closers, and strip closers~~
- LED Exit Signs

**Formatted:** Indent: Left: 0.5", No bullets or numbering

c) List Non-incentive ~~Commercial Customer Services~~ Energy Advisor

The sub-program provides a complete turnkey solution for the customer, including equipment purchasing, installation, clean-up and disposal. In addition, information about the installed measures is provided to the customer that explains the energy efficiency benefits they received and proper operation and maintenance practices to ensure sustained performance.

## 5) Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Indicators (MTIs)

Formatted: Font: Bold

Formatted: Indent: Left: 0.5", Tab stops: 0.88", List tab + Notat 0.5"

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude "draft" metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

### b) Market Transformation Indicators (MTIs)

Formatted: Font: Bold

See Section 1a.5.a.

### c) Program Design to Overcome Barriers

Formatted: Font: Bold

Small businesses are a significant source of untapped energy-efficiency potential. The primary barriers to participation include limited capital resources, lack of expertise and understanding of the benefits of energy efficiency, a suspicion of the "free offer" and its legitimacy, and language and cultural barriers. ~~generally higher interest rates for smaller customers.~~

In addition, the majority of these customers occupy short-term leased facilities. Consequently, there is also a split incentive barrier to adoption of energy efficiency improvements. Split incentives occur when the customer and owner do not own the same equipment they pay bills for (e.g., the landlord owns the HVAC equipment and the customer pays utility bills for it, or vice versa). The program makes every effort to address this situation with both the owner/property management company and the tenant to communicate the benefits and gain approval for program services. The no cost offering makes this acceptance of the retrofit easier for the tenant.

While these small customers may be eligible for other elements such as the itemized retrofit incentive, the primary barriers beyond some cost reduction to participation by very small and small commercial customers are not addressed by that program. The No-Cost/Low Cost Installation element addresses these barriers by providing all equipment and installation services at no or very little charge to the customer.

The program utilizes a collaborative team of internal and external stakeholders to conduct strategic program outreach and marketing. Working with our External Affairs Outreach group the Direct Install program has worked actively with a number of Business Improvement Districts and local governments during the current cycle to increase local community involvement and raise the program's profile among BID businesses. This effort will continue during the 2013-2014 cycle with a concerted effort to partner with Local Government Programs and multiple BIDs to increase the number of BID customers involved in the Direct Install program.

Additionally, the Program-program has team members fluent in the languages spoken and familiar with the cultures in its territory to pro-actively working to bridge cultural and language barriers to understanding the benefits of energy efficiency, overcoming the suspicion of the "free offer" and its legitimacy.

**d) Quantitative Program Targets**

The Commercial Direct Installation Program has program targets defined within each direct install vendor contract.

**e) Advancing Strategic Plan goals and objectives**

In accordance with the Strategic Plan, this sub-program advances comprehensive energy efficiency, including:

- Integrating marketing and outreach to the commercial customer sector
- Integrating the approach to better maximize savings and minimize lost opportunities
- Identifying the most promising technologies that can play a role of providing multiple solutions, for energy efficiency.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: Bold

Formatted: Font: Bold

Formatted: Indent: Left: 0.75", Bulleted + Level: 1 + A linedat: 0.5" + Tab after: 0.75" + Indentat: 0.75", Tabstops: 1", List tab + Notat 0.75"

- Cross-promoting other energy efficiency (e.g., Workforce, Education & Training) and demand response programs.

6) **Program Implementation**

a) **Statewide IOU Coordination**

All California IOUs offer The Direct Install efforts. Specific areas of coordination include:

a) **Program name:**

- i. Commercial Direct Install

b) **ii. Program delivery mechanisms**

Third-party contractors will be used to perform program services such as customer outreach, survey existing equipment, explain and promote retrofits, and perform retrofit installations for customers and coordinates services performed by the ~~community~~ Community-Based Organizations (CBOs).

c) **iii. Incentive levels**

The sub-program does not pay a rebate or incentive to the direct install customer. Payments are made to the direct install vendor who employs said incentives to reduce the cost of delivering energy efficiency services. The products and installation of products are at reduced cost or free to the customer.

d) **iv. Marketing and outreach plans**

The sub-program is designed to increase the adoption of energy-efficient measures by small and hard-to-reach commercial customers through offering energy efficiency assessments, energy efficient equipment and installation to small business customers at no or low cost. ~~The target commercial customers are those under 100 kW of monthly demand.~~ Marketing efforts undertaken will be targeted based on customer size and demographics. Program interactions include working closely with Faith Based and Community Based Organizations as job development partners, creating and providing jobs in addition to the contract deliverables. This provides a partnership in the community that otherwise would not have engaged.

Additionally, the Program utilizes a collaborative team of internal and external stakeholders to conduct strategic program outreach and marketing. Working with our External Affairs Outreach group the Direct Install program has worked actively with a number of Business Improvement Districts and local governments during the current cycle to increase local community involvement and raise the program's profile among BID businesses. This effort will continue during the 2013-2014 cycle with a concerted effort to partner with Local Government Programs and multiple BIDs to increase the number of BID customers involved in the Direct Install program.

Direct Install contractors are selected using a competitive bid process to ensure cost-effective delivery of services. All customer outreach, existing equipment surveys, explanation and promotion of retrofits and installation of retrofits for customers will be delivered by the contractors.

**Formatted:** Indent:Left: 0.88",Numbered+ Level:1 + NumberingStyle:i, ii, iii, ... + Startat: 1 + Alignment:Right + Alignedat: 0.25" + Tabafter: 0.38" + Indentat: 0.38",Tab stops: 1", List tab + Notat 0.38"

**Formatted:** Font:Bold

The IOU Program Management staff provides a customer contact list to the Direct Install contractors. Using this list the contractors will contact the customer to set up an appointment to assess and install the recommended measures at no cost to the customer. In cases where a customer name is not shown on the list (for example, a new business that opened after the list was generated), the contractor confirms their eligibility before performing a survey. Contractors have the main responsibility for contacting eligible customers, but also work with appropriate CBO/FBO and local government partnerships to reach customers.

After completing the energy survey, the contractors must discuss the recommendations with the customer and explain which fixtures and/or lamps measures are recommended for upgrade and/or replacement. The contractor must then ask the customer whether to proceed with the retrofit:

- a. ~~If the customer needs time to consider the offer, the contractor must leave a copy of a "Customer Authorization Form" and a contact telephone number.~~
- b. ~~If the customer declines or decides not to proceed, the contractor must write the customer's reasons on the authorization.~~
- c. ~~If the customer accepts or decides to proceed with the retrofit/installation, the contractor must have him/her sign the authorization. The contractor uses the Customer Authorization Form to obtain the customer's written permission to proceed with the work. The Customer Authorization Form includes language defining an agreement between the customer and the contractor, and holds the contractor solely responsible, even if the contractor assigns a subcontractor to perform the actual work.~~

**Formatted:** Indent:Left: 0.75", Bulleted+ Level:1 + Alignedat: 0.5" + Tabafter: 0.75" + Indentat: 0.75",Tabstops: 1", List tab + Notat 0.75"

The contractor typically installs the equipment within a few days of obtaining permission to proceed. ~~The customer must complete the installation no more than 30 days after the~~

~~customer signs the Customer Authorization Form.~~ After completing the installation, the contractor must do ~~three-two~~ things:

- ~~—~~ Perform an on-site post-verification of the installation. The test must ensure that all retrofit work is completed and in compliance with all applicable statutes, acts, ordinances, regulations, codes and standards of the federal, state and local governmental agencies having regulatory jurisdiction.
- ~~e1.~~ ~~Have the customer complete and sign a Customer Questionnaire.~~
- ~~e2.~~ If a customer has any complaint about work done through the Program, the Contractor is ultimately responsible for handling it.

Any advertising or marketing material that the contractor uses must be approved by the Program manager in advance. All customer communications must be presented in the customer's primary language whenever possible and appropriate categories).

**~~a.i.~~ Emerging Technologies program**

Not applicable; this program does not seek to influence emerging technologies.

**~~b.ii.~~ Codes and Standards program**

Not applicable; this program is not directly involved with the Codes and Standards, but is indirectly involved insofar as Title 20/24 requirements dictate minimum efficiency standards.

**~~e.iii.~~ WE&T efforts**

Direct Install contractors will be required to provide customers with informational materials on statewide and local WE&T opportunities. In addition, the Direct Install program (through its contractor delivery network) offers an opportunity for achieving one of the primary goals of Workforce Education & Training – providing energy efficiency jobs for low income and disadvantaged workers. The linkage between Direct Install and the Statewide WE&T efforts will be made stronger as the WE&T program coalesces.

**~~e.iv.~~ Program-specific marketing and outreach efforts**

Program outreach occurs by working closely with local governments, Faith Based and Community Based Organizations. Marketing and outreach efforts focus on the energy efficiency benefits of the equipment installed, proper operation and maintenance and cross-promotion of DR activities. (Specific IOU budget information for this marketing activity is provided in Table 1.)

**~~e.v.~~ Non-energy activities of program**

As a turnkey program, Direct Install contractors are responsible for outreach efforts, equipment specification, equipment procurement, equipment installation, job-site clean-up, equipment disposal and post-installation inspection.

**ix. Non-utility market initiatives**

Not applicable

**c) Best Practices**

Direct Install Programs were successfully offered during the ~~2006-2008~~2010-2012 program cycle. Best practices were derived from these programs and include:

- Keep messaging and participation simple for the customer.
- Understand the key motivators that drive an industry and use that information to market the program.
- Make the program visible to targeted customers.
- Contact targeted customers through identified organizations and associations,
- Maintain a high level of customer service by providing customers with assistance with vendor management and other no cost, low cost recommendations.
- Identify qualifying products simply and effectively.

**d) Innovation**

As the market matures with information regarding energy efficiency, many small businesses are expressing an interest in the adoption of ~~advanced-emerging~~ technologies, such as solid state lighting, ~~T-8 to T-8 retrofits~~ and demand response enabling technologies. The IOU Direct Install Program Management team will continually evaluate these technologies and incorporating them into the program delivery model including potential customer co-pay into the program.

IOUs will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper savings.

**e) Integrated/coordinated Demand Side Management**

The Direct Install model provides a great opportunity to market other DSM (i.e., DR and CSI) to traditionally hard-to-reach customers. The program will make every effort to do so; however, it is acknowledged that these small business customers likely do not have the resources (both financial and personnel) to actively pursue participation in such programs (especially CSI). To help bridge this resource gap, DSM promotional materials will describe all known non-IOU programs that offer tax credits/rebates/financing for solar PV systems. Information on DR programs and rate alternatives/changes appropriate to the small-business (~~less than 100 kW~~) customer class will also be provided.

**f) Integration across resource types**

Formatted: Font: Bold

Promotional materials described in Section 6.e will also include information on water energy savings. In addition, such water savings measures (e.g., low flow faucets) may be evaluated for inclusion in the program delivery.

**g) Pilots**

Formatted: Font: Bold

Not applicable

**h) EM&V**

Formatted: Font: Bold

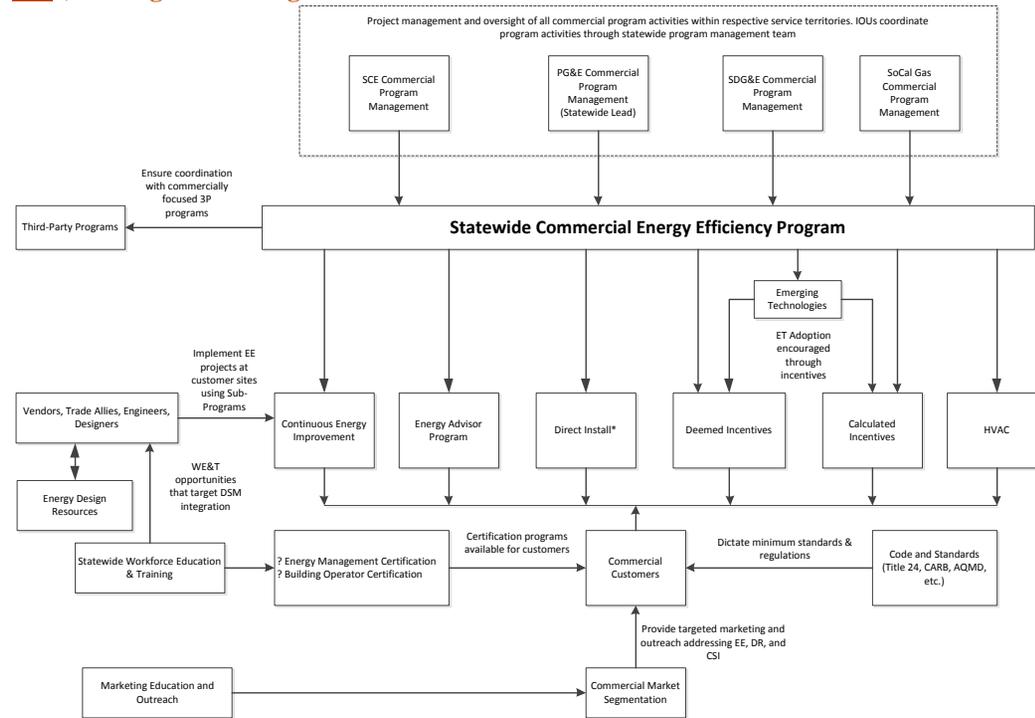

~~The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. The utilities plan to work together and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues. This plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.~~

~~Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions.~~ However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics,
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

## 2013-2014 PIP Addendum

<b>Program Name</b>	Statewide Industrial Energy Efficiency Program	<b>Date Submitted</b>	July 2, 2012
<b>Subprogram Name</b>	Statewide Industrial Energy Advisor Statewide Industrial CEI Statewide Industrial Calculated Incentives Statewide Industrial Deemed Incentives	<b>Utility Name</b>	SoCalGas
<b>Program ID</b>	SCG3713 SCG3714 SCG3715 SCG3716	<b>IOU Program Contact</b>	Andrew Ytuarte
		<b>Program Cycle</b>	2013-2014

This form is to be used to document any required changes to the Program Implementation Plans (PIPs). The following are triggers that will require a PIP change:

1. Changes to eligibiity rules
2. Changes affecting incentive levels (indicate advice letter approval below if required)
3. Fund shifts (indicate advice letter approval below if required)
4. Portfolio Budget and Other Commission-Directed Changes
5. Changes to Program Theory/Logic Models
6. Addition or elimination of programs and/or sub-programs (indicate advice letter approval below)
7. Changes in program targets
8. Change in sub-program approach - unless the IOUs submit logic models for the sub-programs (to be defined) with IOUs
9. Changes in incented measures
10. Changes in adopted PPMs/MTIs (indicate advice letter approval below if required)

### Identify Specific Trigger (above) requiring the PIP change

4. Portfolio Budget and Other Commission-Directed Changes

### Driver of Change:

Aim to reduce the complexity in IOUs' portfolios while increasing customer participation.

### Description of Change (if advice letter approval required, indicate Commission resolution or approval and provide hyperlink to advice letter):

The 2010-2012 Industrial Energy Efficiency Program program implementation plan (PIP) reflects the following sub-programs:

1. Nonresidential Audits Program
2. Calculated Incentives Program
3. Deemed Incentives Program
4. Continuous Energy Improvement

The new 2013-2014 Commercial Energy Efficiency Program will be simplified and consist of the following sub-programs:

1. Energy Advisor Program
2. Commercial Calculated Incentives Program
3. Commercial Deemed Incentives Program
4. Continuous Energy Improvement (CEI)

Revision Date: 05/11/2012

**PIP Section and/or Wording to be Changed or replaced:**

Changes are throughout the 2013-2014 Statewide Industrial Energy Efficiency Program.

**Replacement Language or Information**

Refer to Description of Program of 2013-2014 Statewide Industrial Energy Efficiency Program PIP for details on changes .

**Revised Energy Savings (If Any):**

Refer to 2013-2014 Statewide Industrial Energy Efficiency Program PIP for details.

**Other PIP Changes Required:**

Refer to 2013-2014 Statewide Industrial Energy Efficiency Program PIP for details of other changes.

## 4. Program Description

### a) Describe program

The purpose of the Statewide Industrial Energy Efficiency Program is to provide services to improve the energy efficiency of industrial facilities in California. The primary services provided to industrial customers include:

- Energy audits covering energy efficiency and demand management opportunities;
- Technical assistance in measures specification, procurement, and project management;
- Post-installation inspection and analysis to verify performance;
- Continuous energy improvement consultation; and
- Financial incentives and project financing for installed measures

Financial incentives will be based on:

- Deemed energy savings by per unit of equipment; and
- Calculated energy savings by per unit of energy

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

The significance of the industrial sector in energy use in California is evident by recognizing that it is responsible for a third of energy consumption in the state, as shown in the table below, taken from the California Long-Term Energy Efficiency Strategic Plan.

Contribution of the Industrial Sector	(% of total in CA)
Electricity use	16
Natural gas use	33
Energy use	22
End-use CO <sub>2</sub>	20

There are several factors unique to the industrial sector, as compared to the residential and commercial sectors, that present challenges to achieving energy efficiency and greenhouse gas (GHG) goals for the state. As taken from the Strategic Plan, these factors include:

- Industry uses a large quantity of energy and other resources via complex proprietary processes to create and bring products to market. Products, to varying degrees, have embedded energy that traditionally cannot be “zeroed out.”
- Industrial facilities are increasingly managed by corporations that reside outside of the state or the country, and that view these facilities as mobile assets in a competitive global marketplace.
- Industry is highly diverse in type, size, and operation. Customer types include the full range of industries from assembly plants, beverage manufacturing, and chemical production to water and wastewater treatment. Thus, uniform programs often will not match corporate or facility needs.
- Industries are subject to multiple policies and rules in resource areas (e.g. air quality, water quality, energy efficiency, GHG reductions, solid waste management), where compliance can raise competing objectives and outcomes.

To address these factors and challenges, the Statewide Industrial Energy Efficiency Program offers California’s industrial segment a statewide-consistent suite of products and services designed to:

- meet customer needs;
- overcome market barriers to energy management;
- enhance adoption of integrated demand-side management (IDSMS) practices; and
- advance the industry toward achieving the goals of the California Long Term Energy Efficiency Strategic Plan.

The program overcomes barriers through policies that:

- provide integrated solutions for the customer;
- create heightened awareness through education and outreach;
- foster continuous energy improvement (CEI);
- promote the use of commonly accepted standards; and

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

- support training to create a highly skilled energy efficiency workforce that is accessible to industry.

The Statewide Industrial Energy Efficiency Program includes four statewide sub-program elements that together comprise the core product and service offerings. Each of the four investor-owned utilities in the state also offers local programs that complement and enhance the core offerings in their region. The local portfolio mix of SoCalGas is specifically designed to enhance energy efficiency and DSM opportunities for industrial customers, including financial solutions.

Together, these offerings are designed to not only overcome the traditional market barriers to energy efficiency, but also use efficiency to advance demand response (DR) and distributed generation (DG) opportunities (including solar and renewables) uniquely suited to the industrial segment.

The four statewide sub-programs are summarized below.

- Industrial Energy Advisor: Brings together under one program all audit services offered to support the customer's (1) education; (2) participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits; and (3) awareness of greenhouse gas and water conservation activities. These services include Benchmarking, Online Energy Audit Tool, Continuous Energy Improvement (CEI) (see CEI sub-program PIP), Nonresidential Audits, Pump Efficiency Services, and retrocommissioning (RCx).
- Industrial Calculated Energy Efficiency Program: Features incentives based on calculated energy savings for measures installed as recommended by comprehensive technical and design assistance for customized and integrated energy efficiency/DR initiatives in new construction, retrofit, and RCx projects. Because it presents a calculation method that can consider system and resource interactions, the program will become the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan.
- Industrial Deemed Energy Efficiency Program: Features rebates per unit measure for installed energy-saving projects. It provides IOU representatives, equipment vendors, and customers an easy-to-use mechanism to cost-effectively subsidize and encourage adoption of mass market efficiency measures through fixed incentive amounts.
- Industrial Continuous Energy Improvement Program: Features a consultative service which targets long-term and strategic energy planning. CEI is designed to reintroduce the importance of energy management by transforming the market and to help reduce energy intensity through a comprehensive energy management approach. CEI will address technical and management opportunities for commercial customers while creating sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principles of well-known business continuous

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary IOU and non-IOU products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution.

The IOUs and CPUC have worked collaboratively to define a set of Program Performance Metrics (PPM) to measure progress made by the programs and sub-programs towards their short term goals and Market Transformation. Statewide coordination and planning will facilitate inter-IOU sharing of successes, lessons learned, and best practices in the pursuit of those targets and metrics.

Statewide coordination and planning between IOU program planning staff, IOU functional departments, government agencies, and other key partners and stakeholders will also be critical to the advancement of the Strategic Plan. In addition, leveraging national and state initiatives, tools, and resources to manage energy, use and protection of natural resources and environmental impacts will be key to optimizing the potential for California's industrial segment. The Statewide Industrial Energy Efficiency Program includes the staged integration and coordination with existing initiatives and regulations today, and later will drive or support advancements in integrated resource planning, energy management certification, industry benchmarking, workforce education and training, and sharing of industry best practices towards a goal of optimized energy utilization.

An integrated approach should be an effective way to help customers meet overall economic and green goals. In alignment with California's preferred loading order, however, the IOUs will continue to aggressively market and support energy efficiency first as the most cost-effective energy resource through education and training, as well as when pursuing strategic energy planning with customers.

## **b) List measures**

The key end-use technology categories addressed through the Statewide Industrial Energy Efficiency Program are pumping, engines, heat recovery systems, process steam, loads, and heating, air compressors, hot water systems, and insulation.

- Refrigeration
- Industrial Process
- Gas Measures

## **c) List non-incentive Industrial Energy Advisor Services**

Non-incentive Industrial Energy Advisor offered through the Statewide Industrial Energy Efficiency Program will include the following:

### Industrial Energy Advisor

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

- Remote energy audits
- Integrated energy auditsRetrocommissioning audits
- Benchmarking
- Pump tests and pumping systems technical support
- Water leak detection services

#### Continuous Energy Improvement (CEI)

- Energy management assessments
- Energy planning consulting
- Energy use baselines establishment
- Facility/customer benchmarking
- CEI education and training
- Customer recognition
- Plant certification

#### Education and Training

- System-assessment DOE training
- Basic, Intermediate and Specialist Training (in support of ANSI Certification) in industrial pumps, motors, compressed air, and steam
- Other system-specific training
  - Steam system and process heating seminar
  - Air systems
  - Industry-specific integrated energy management workshops and seminars developed by the IOUs
  - Control systems
  - Energy management systems

#### Workforce Education and Training (WE&T)

- Training to build team of highly skilled personnel to perform plant certification and assessment.

## 5. Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Information

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic

---

<sup>2</sup> California Public Utilities Commission Decision, D.98-04-063, Appendix A.

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>3</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical, dimensions 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>4</sup>. Markets are social institutions<sup>5</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed not to immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup>, as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>7</sup>. According to York<sup>8</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors, such as past market sales, that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market

# 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

transformation<sup>9</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers)."<sup>13</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the IOUs look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

for MT program developers<sup>16</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first step includes forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can (1) define and characterize markets, (2) measure baselines with better access to historical data, (3) define objectives, (4) design strategies and tactics, (5) implement programs and (6) evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of expected market effects, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Attitudinal change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer attitudes, knowledge and awareness (AKA) of energy efficiency. In order to gauge an attitudinal based metric for this sector, a battery of questions probing AKA among customers would have to be created and used to scale AKA. Examples of AKA would include knowledge of energy efficiency lighting and other specific measures. Evaluators could also draw from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The baseline response pattern to the AKA scale would need to be established early during the program cycle. Customers could be surveyed on an annual basis and changes in their AKA tracked along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

In addition, behavioral change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer past behavior and intentions about energy efficiency. In order to gauge a behavioral based metric for this sector, a battery of questions about energy efficient behaviors could be used to create a scale of Energy Behavior. Evaluators could also draw questions about specific behaviors from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The behaviors that could be probed include maintenance behaviors to keep EE measures operating correctly, and behaviors that maximize energy efficiency of existing equipment. Customers could be surveyed early in the program cycle and their responses on the scale could serve as the baseline for subsequent behavioral change. Customers could be probed annually and their Energy Behavior change measured along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

---

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

### Program Performance Metrics (PPMs)

On December 2, 2010, the Commission issued Resolution E-4385 approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle. Below are the approved PPMs and metric types for the Industrial Energy Efficiency Program (Resolution E-4385, Appendix A, pp. 32-33):

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
<b>COMMERCIAL / INDUSTRIAL / AGRICULTURAL COMBINED</b>		
* Data to be reported in disaggregate form by SW program (commercial, industrial, and agricultural)		
	*1. Number and percent (relative to all eligible customers) of commercial, industrial and agricultural customers participating in sub-programs (NRA, Deemed, Calculated, and CEI) by NAICS code, by size (+/- 200 kW per yr or +/- 50K therms per yr), and by Hard to Reach (HTR)**  ** “HTR” is as defined in the EE Policy Manual	2a
<i>Continuous Energy Improvement (CEI)</i>	*1. Number and percent of commercial, industrial, and agricultural CEI participants that meet short-term (2010-2012) milestones as identified by their long term energy plans.	2a
	*2. Lessons learned, best practices, and plan to ramp up the CEI program are developed. (Y/N)	2b
	*3. Number and percent of commercial, industrial and agricultural customers that created an energy plan via CEI will be tracked by program.	2a
<i>Energy Advisor(EA)</i>	*1. Number and percent of commercial, industrial, and agricultural customers receiving non-residential audits by NAICS and SIC code.	2b
	*2. For commercial, industrial, and agricultural customers who received audits, the number and percent of adopted audit-recommended technologies, processes and practices. (Report disaggregated data by type of audit - Basic, Integrated, and Retro-commissioning audit.) **(1)  **Data sources for reporting will come from (a) program tracking databases and (b) process evaluation to refine estimates.  (1) – An audit completed in one portfolio may have measures implemented over several years and portfolios.	2b
<i>Deemed Incentives</i>	*1. Number and percent of new, improved, or ETP measures** installed in the commercial, industrial and agricultural programs.  ** “ETP measure” defined as ET measures first introduced into the EE portfolio	2a

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
	since January 1, 2006.	
<i>Calculated Incentives</i>	*1. Number and percent of new, improved, or ETP measures installed in completed calculated projects.	2a

**b) Market Transformation Indicators (MTIs)**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in “Attachment H” are approved for this sub-program as applicable.

**c) Program Design to Overcome Barriers**

There are a multitude of significant barriers to achieving technical and economic potential for energy efficiency in the industrial sector according to the Strategic Plan (p. 46). While primarily institutional and behavioral, rather than technical, these barriers include:

- Lack of awareness of energy efficiency opportunities;
- Difficulty in accessing industry-specific technical assistance;
- Inadequate availability of plant and management personnel to foster energy efficiency;
- Prioritization of production over energy management;
- Aversion to the risk of investing in new technologies and processes with unknown impacts to industrial output or quality; and
- Limited capital and inhibiting internal investment rates.

Further, the industrial sector faces an array of barriers common to all nonresidential customers:

- A high percentage of building developers, owners, managers, and contractors build or retrofit to current standards (Title 24). Likewise, architects and engineering (A&E) firms tend to specify known and familiar equipment and designs.
- Because viable high efficiency emerging technologies are unknown to facility owners and system designers, these technologies are slow to penetrate the market, causing lost energy efficiency opportunities.
- Insufficient access to information creates barriers associated with:
  - operating best practices;
  - energy efficiency opportunities;
  - impacts of an energy efficiency project on emissions, resource consumption, or waste discharge streams;
  - difficulty in obtaining technical assistance; and
  - inadequate availability of qualified industry specialists, which can all impede adoption of energy efficiency.

# **2013-2014 Energy Efficiency Programs**

## **Statewide Industrial Energy Efficiency Program**

### **Program Implementation Plan**

The SoCalGas Industrial Energy Efficiency Program will employ all four strategies listed in the Strategic Plan to address the barriers. These strategies include:

- Integrated solutions
- Education and outreach
- Branding and certification
- Workforce training.

The Statewide Finance PIP includes plans to explore and develop additional finance tools to facilitate the adoption of integrated projects.

#### **d) Quantitative Program Targets**

**Table 5** - Program targets are provided at the sub-program level.

#### **e) Advancing Strategic Plan goals and objectives**

The SoCalGas Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector.

*Goal 1:* Support California industry's adoption of energy efficiency by integrating energy efficiency savings with achievement of GHG goals and other resource goals.

To address this goal, the strategy adopted, in line with the Strategic Plan, is to develop an interagency framework that could combine energy efficiency incentives to achieve measured performance improvements in resource management, including water, air quality, GHG emissions, and energy efficiency. This first goal focuses on developing a minimum regulatory energy efficiency requirement for individual company or industrial sub-sectors as a whole. One example is to integrate AB32 requirements to allow industries to use energy efficiency to meet or exceed regulatory requirements for GHG emission reductions. An IOU – CARB AB32 team will be formed to study the feasibility of implementing negotiated agreements between agencies SoCalGas.

*Goal 2:* Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

This second goal focuses on companies that want to exceed a minimum regulatory requirement by actively managing their energy use over time. To this end, this program offers CEI options that include participation in a recognized national effort to certify industrial facilities for energy efficiency. Industrial customers will then be able to reach their GHG emission reductions targets via a supported, structured program based on best practices and develop world wide recognition for their efforts through third-party certification e.g. DOE's SEP program, based on proven best practices. The IOUs will be partnering with DOE Industrial Technologies

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

Program or EPA Technologies program, for example, to gain access to highly skilled professionals in energy management systems.

*Goal 3:* Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

The primary interest with this goal is to provide a clearinghouse of technical knowledge and information so that industry personnel can access information on emerging technology and industry-specific research. The clearinghouse will leverage extensive knowledge on energy efficiency developed by other organizations like DOE and EPA. In alignment with the Strategic Plan, the statewide team will be developing this clearinghouse on the EDR website, which is an existing statewide resource.

## **6. Program Implementation**

### **a) Statewide IOU coordination**

**i. Program name:** Statewide Industrial Energy Efficiency Program

#### **ii. Program delivery mechanisms**

The Statewide Industrial Energy Efficiency Program will be coordinated on a statewide level to ensure the program is continuously updated and enhanced throughout the two year transition period and beyond. In addition, each of the four sub-programs in the Industrial Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. A detailed description of each of these program aspects and how they will be coordinated statewide is provided in sub-program descriptions. The two coordination systems, one for the core program and one for the sub-program level, will interact with and support one another. The broad, high-level coordination effort for the core program will be described below, focusing on how the IOUs will work together to effect the continuous improvement of the Statewide Industrial Program.

The Statewide IOU Coordination process for the Statewide Industrial Program will be as follows:

#### **1. Designate an IOU Program Lead**

The coordination process will begin with each IOU designating a Statewide Industrial Energy Efficiency Program “lead”. The IOU lead will represent one industrial sub-program, investigating new innovations, special accomplishments, and challenges experienced by sub-program managers in all IOUs. Where such innovations or challenges show potential for impacting the Statewide Industrial Energy Efficiency Program across multiple sub-programs or the Statewide program as a whole, the IOU lead will present such information to a quarterly Steering Committee meeting.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

2. Hold Periodic Steering Committee Meetings

The Industrial Steering Committee will comprise all designated IOU leads (including at least one lead for each of the four sub-programs), and possibly other contributing stakeholders identified by the IOUs. At the periodical steering committee meeting, individual innovations, challenges, and accomplishments experienced in one IOU or by one sub-program will be transmitted to all IOUs. The steering committee will evaluate these individual IOU and sub-program experiences, hear ideas for course corrections and overcoming challenges, replicate successful innovations for consistency statewide, resolve differences in implementation to stay unified, and measure the Industrial program's progress against statewide metrics and goals.

3. Adopt Program Enhancements

Once the steering committee agrees that a particular implementation policy or innovation has merit on a statewide level, each IOU lead will distribute the information to their sub-program managers for adoption and integration. Therefore, the IOU lead will act as a conduit, feeding sub-program information up to the statewide steering committee and distributing measures for adoption back to the sub-program managers. This feedback loop will assure consistency and unity in programmatic improvements across the IOUs. In some cases, it may be necessary to invite the sub-program managers to the Steering Committee meeting to get their feedback and ensure they receive the same message.

4. Evaluate Program Enhancements Against Statewide Targets

To complete the adaptive management loop, the steering committee will track the program's accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The steering committee will determine whether further course corrections are needed, and if so, rely on the above coordination process to generate the improvements necessary to stay on track.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the three-year implementation cycle will be enabled. The details of actual implementation of these coordination activities are to be determined by the IOU's industrial program managers.

**iii. Incentive levels**

Details on the incentive levels are discussed with each of the four sub-programs.

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the industrial sub-program plans.

To reach out to the diverse customer segments, IOUs will continue to foster strategic partnerships with industry and community groups, as well as trade professional associations, to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users. Specific efforts will include:

- Participation in trade association meetings to market the industrial program;
- Close partnerships with key industry associations, and participation in their annual conferences, with an effort to develop conference speaking engagements;
- Targeted integrated education and training to specific market sectors to support peer-to-peer interactions and industry advancement;
- Ads and articles, with program information and case studies, in trade magazines;
- Targeted customer efforts through IOU account representatives, program engineers, third parties, and government partnerships;
- Phone and web-based customer support and outreach;
- Development of coordinated industrial resources into a centralized “one stop shopping” clearinghouse; and
- Development of marketing collateral that drives customers to account representatives and websites for additional support.

The IOUs will raise awareness of energy efficiency programs available using a number of strategies, including:

- IOU representatives will make a regular and consistent customer calling effort to key customers within this sector; and
- IOU representatives, Energy Efficiency program management representatives, and field engineers will be available to provide additional expertise.

To help ensure that IOUs are marketing the right products to the right customer at the right time through the right channels, the IOUs need to be able to segment customers based upon their individual characteristics and energy needs. The IOU's efforts to collect this customer data will guide the development and implementation of its IDSM marketing and outreach activities.

This customer segmentation will help the IOUs develop an understanding of customers' needs and respond accordingly with products and services that customers want. The segmentation analysis looks at what the customer requires and how the customer is engaged with each IOU. This foundational segmentation will evolve with incremental insight into customer mindsets, behaviors, responses and motivations to achieve the most

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

effective level of energy use. Based upon this evolving segmentation, the IOUs will be able to identify what integrated product offerings are specific to individual customer needs, and offer those products through the most relevant channels.

Based on the segmentation analysis, the IOUs will be able to focus on providing consistent marketing and overall messaging focused on the customer's:

- Business/personal goals;
- Unique needs; and
- Green/global climate change goals

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Statewide Industrial Energy Efficiency Program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with commercial customers, as appropriate. Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. The sub-program descriptions provide more specific information on linkages with other government programs.

**vi. Similar IOU and POU programs**

Some initiatives, such as the California Advanced Lighting Controls Training Program, are joint efforts with the other California IOUs and publicly owned utilities (POUs), as well as other domestic and international utilities. In addition to these joint efforts, local third-party programs that address niche opportunities within the commercial market will be implemented in each of the IOUs service territory. These various efforts will be coordinated to ensure a consistent approach in terms of program message, delivery and measure incentives.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) program**

The long-term energy efficiency vision of California can be attained through the long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training, and market development to maximize the energy efficiency benefits of cutting-edge technologies. In recognition of the importance of emerging technologies, the program will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions..

**ii. Codes & Standards program**

The industrial offering relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As codes and standards

# **2013-2014 Energy Efficiency Programs**

## **Statewide Industrial Energy Efficiency Program**

### **Program Implementation Plan**

impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination subprogram. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will ensure that the latest cost-effective technologies/services (e.g., LEDs) are made available as these technologies transition from 1) R&D to 2) Emerging technologies to 3) Incubation to 4) Mainstream.

#### **iii. WE&T efforts**

Workforce Education & Training efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Industrial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings will take place through IOUs energy centers and technology centers. In general, the Statewide Industrial Energy Efficiency Program will interface with the Workforce Education and Training Program Implementation Plan to serve the goals of the Strategic Plan.

#### **iv. Program-specific marketing and outreach efforts (provide budget)**

In addition to the general efforts listed above in 6.a.iv., specific marketing and outreach efforts for sub-programs are found in the sub-program documents.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

#### **v. Non-energy activities of program**

Integrated comprehensive energy audits (described in the Industrial Energy Advisor sub-program) that look across the various energy efficiency program offerings, as well as complementary options available through other entities (e.g., water agencies) will be used to identify the opportunities to be recommended to the specific commercial customer.

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

The SoCalGas Industrial Energy Efficiency Program will offer information to customers about the non-energy benefits associated with recommended measures, such as improved safety, productivity, indoor air quality, comfort, and appearance.

## **vi. Non-IOU programs**

A variety of programs to be determined will be coordinated and leveraged to support program objectives. These include:

- Connecting customers with the CA Climate Action Registry;
- AB32 support through CO<sub>2</sub> tracking in program resources;
- Regulatory program coordination, including EPA air quality standards, water quality standards, and new refrigerant regulations;
- Non-IOU financing resources, including from water utilities, industry and private banking, state and federal incentives, funds, grants, and loan products to support energy and other resource management objectives;
- Water/Energy efforts within California;
- ANSI standards (see CEI section); and
- ISO international energy management standards (see CEI section).

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

## **vii. CEC**

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

## **viii. CEC work on C&S**

As indicated in Section 6.b.ii, planned enhancements to Title 20 and in eligible measures and services.

## **ix. Non-utility market initiatives**

The program will support, educate, and/or enforce such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

The Program will leverage the following efforts:

- California Green Building Initiative
- LEED
- Zero-net energy

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

- DOE
- AB1103
- AB758

#### c) **Best Practices**

The SoCalGas Statewide Industrial Energy Efficiency Program reflects the best of each IOU program's successful components of statewide Industrial program offerings, and introduces new elements from other utilities and national efforts as well. Best practices include:

- **Continuous Energy Improvement:** This approach proposes to transform the market and reduce energy intensity through addressing technical and management opportunities.
- **Technical Assistance:** Recognizing the need for personalized assistance for customers, the IOUs will offer a full-service approach starting from audits/pump tests to design and technical assistance, presentation of recommendations, resources to develop a long term plan, and potential of project management assistance, with financial incentives.
- **Vendor Partnerships:** This strategy will be coupled with vendor support and educational workshops and classes to provide the full breadth of support customers may need to influence their decision to implement energy efficient equipment and practices.
- **Statewide Coordination:** In order to take advantage of the statewide implementation of the program, the IOU program representatives will meet on a quarterly basis to improve program operations by sharing successes and areas of operational concerns.
- **Leveraging Industry-Specific Resources:** We will make full use of resources available, such as industry trade and professional associations.

#### d) **Innovation**

One innovation is that the program focuses on energy efficiency savings through not just hardware installation but also documented permanent changes in operations. Further, it covers all energy resources including energy efficiency, demand response, energy storage, combined heat and power, distributed generation, renewables, and emerging technologies.

The products and services are bundled in an integrated fashion to serve the customer's need and are geared towards a value creation solution that helps customers realize that they can run their operations efficiently and also meet their business and regulatory objectives. This approach brings to market a more customer-centric energy solution that takes into account their short- and long-term energy usage management and planning and helps overcome some of the barriers to making energy efficiency a priority. It also helps industrial customers identify, develop and document energy efficiency improvements and their economic benefits.

With the introduction of the new CEI product and services, customers now play a more active role in managing their energy usage and GHG reduction. Bundling the program offerings (energy audits, calculated energy savings, deemed energy savings, and continuous energy improvement) makes it easier for customers to participate in a one-stop shop program.

# **2013-2014 Energy Efficiency Programs**

## **Statewide Industrial Energy Efficiency Program**

### **Program Implementation Plan**

Integrated offerings will also garner significant gains in energy efficiency and make the goals envisioned in California's long-term energy efficiency Strategic Plan a reality.

In addition, this approach will enable industry to integrate AB32 requirements such that industrial facilities can use energy efficiency to meet and exceed regulatory requirements for GHG emissions and can also aid in water conservation, waste disposal and air quality improvement. It also moves the program towards a more holistic approach in managing all energy resources utilization, which includes energy efficiency, demand response, energy storage, combined heat and power, distributed generation, renewables and emerging technologies.

Another innovation used in the program design is the creation of the infrastructure for a statewide centralized technical resource to enable customers to seek energy efficiency information and best practices to manage their energy resource. It provides a resource otherwise unavailable due to business resource limitations.

A web-based technical resource is envisioned that includes tools to help customers calculate their energy savings. Also web-based training may be offered in energy efficiency and energy management. It would also link the customer to industry sites that may offer industry-specific information e.g., the latest trends in industry for energy efficiency.

This resource center will be developed on the existing EDR (Energy Design Resource) website and will be readily available to customers. It is another avenue to increase awareness of energy efficiency opportunities by customers, industry consultants and suppliers that was identified as a barrier to the adoption of energy efficiency.

Some of the outcomes from this innovative program approach are listed below:

- IOUs establish a stronger presence with trade associations and community groups, enabling a deeper understanding of customer needs and how energy efficiency can be a part of their solution to their primary concerns. This will enable a deeper and more effective penetration of energy efficiency solutions to a broader base of customers.
- Integrated Energy Efficiency Assessments are offered to provide targeted Industrial, food processing, and water customers with a holistic approach to maximizing energy efficiency, maximizing investment efficiency and maximizing GHG reductions.
- IOU assistance makes customers aware of renewable energy opportunities, with emphasis on system available for California Solar Initiative, Renewable Generation, Department of Industrial and other incentives, grants and rebates.
- Web-based services, including energy efficiency information, training, and modeling tools, are available to help customers with retrofit or new construction projects, via a new enhanced "Energy Design Resources" website.
- Training is designed to strategically target internal personnel, vendors and trade associations, and customers in a focused alignment, which will create a synergistic effort that will overcome many informational and transactional barriers.

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

- Seminars are offered to train customers on how to identify energy efficiency opportunities at their facility/in their process. Classroom software tool training is available on modeling and quantifying savings opportunities. IOUs may also provide a PDA energy efficiency tool or tools from the statewide IOU tool lending library that customers can use at their sites.
- Energy measuring and benchmarking assistance/services are offered to customers so they can see how their facility/process measures up to “best in class” systems utilizing tools such as the U.S. EPA’s Energy Star Benchmarking tool.
- Information on “green” energy opportunities is provided when doing basic audits or in-depth assessments. Education and training on green and renewable energy opportunities will be available on the EDR website.
- Assistance is offered to help customers quantify the carbon emissions savings that EE opportunities identified during audits and assessments offer.
- A web link will be developed between customers and the California Climate Registry to document a plant’s carbon footprint.
- Trained personnel help (a) identify, assess and make available to customers an integrated assessment tool and (b) train customers on the use of the tool, empowering customers to identify the best EE opportunities at their facilities.
- An application process improved for statewide consistency makes it easier for customers to participate in the program.

### **e) Integrated/coordinated Demand Side Management**

Integrating the portfolio of IOU offerings to include energy efficiency, demand response and distributed generation—as well as other resources, such as air and water as they connect to energy—supports future cost-effectiveness of the portfolio and the CA loading order instituted by the California Energy Action Plan. Integration serves the needs and wants of our customers, who are interested in any energy solution that solves their problems and meets their business needs. It also advances significantly the goals of the Strategic Plan. On a broader scale IDSM also includes the integration of Third-Party programs and Local Government Partnerships (LGP) delivery channel with the statewide industrial program.

Customers prefer a single IOU point of contact that understands multiple options. They benefit from a single, coordinated planning process that helps them prioritize integrated investment decisions based on their unique needs. To that end, the statewide IOUs have made tremendous progress in advancing integrated solutions. These include:

- Marketing

In marketing integration, the IOUs are placing major emphasis on getting the right message to the right customer at the right time. Advanced customer segmentation is being used to develop detailed integrated marketing and outreach plans which outline multiple tactics, delivery channels and key messages to target to specific customers based on their specific needs. The account representatives, who serve as the key customer point of contact, will be trained to ensure consistent delivery of portfolio offerings.

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

- Education and training

Workshops organized around a customer segment provide an ideal situation to integrate customer energy solutions. Building on past successes of providing integrated workshops to customers, the IOUs will offer workshops that provide opportunities, cross-sell solutions and share key information from other IOU departments. As appropriate, Workforce Education and Training will also cover integrated energy and system solutions, which will be increasingly important as Critical Peak Pricing matures.

- Integrated audits

These will combine funds and resources of energy efficiency and demand response programs. They will provide integrated recommendations to customers that emphasize energy management in proper sequence, as supports the CA Loading Order, which calls for permanent reductions through energy efficiency before implementing demand response. Incentives from both programs can help reduce payback cost and support advanced energy management decisions. Demand response opportunities will be targeted in the larger facilities, particularly as part of monitoring-based retro-commissioning efforts, where controls to facilitate demand response efforts would be installed.

Integrated audits combine funds and resources of energy efficiency and demand response programs to provide integrated recommendations to customers that emphasize energy management in proper sequence, in support of the California Loading Order. Incentives from both programs can help reduce payback cost and support advanced energy management decisions. Demand response opportunities will be targeted in the larger facilities, especially as part of monitoring-based retro-commissioning efforts where the controls to facilitate demand response efforts would be installed. Additionally, any energy efficiency audits required for participation in distributed generation programs will be expanded to include DR opportunities when appropriate and thus address the three facets of DSM integration.

As required, IOU distributed generation programs require that customers receive an energy audit before being eligible to receive solar audits.

- Emerging Technologies and CEC

Program collaboration with Emerging Technologies and CEC is expected to include pilot projects and market acceleration assistance for market-ready products in the general categories of day lighting, lighting, HVAC, controls, and building envelope improvements.

Over the last few years, traditional DSM programs have shown that successful customer participation in one program often leads to repeat participation in the same program or other similarly related types of programs. Nonetheless, cross-marketing DSM programs with these customers remains a challenge, due to program-specific silos. To eliminate these silos, the

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

Program will leverage lessons learned from past program experience and offer comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that these two efforts are at odds with each other, as both programs reduce the potential for each other's financial incentives to the customer. For example, energy efficiency may reduce the overall baseline that serves as the basis for the demand response program's incentives. Also, benefits from long-term energy savings derived from technological measures often outweigh the temporary demand reduction benefits derived from behavioral actions. To overcome this barrier and maximize the potential of both programs, additional incentives will be paid for energy efficiency measures that enable demand response

A secondary issue when integrating energy efficiency and demand response programs is that communication messages for both types of DSM programs are often not coordinated, since energy efficiency is typically technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer "event season" and wane throughout the remainder of the year. To overcome these differences, the program will offer integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable. Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response, as well as energy efficiency, programs.

In summary, the program seeks to overcome the many issues raised by integration of energy efficiency and demand response by focusing on several tactics:

- Promoting and setting incentives for demand response in a way that helps ensure that energy efficiency is completed first to maximize potentials;
- Integrating and coordinating year-round marketing (e.g. applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g., customer size);
- Providing unified technical assistance through enhanced energy efficiency and demand response audits through the TA Program to allow for cross-harvesting opportunities;
- Integrating presence on IOU websites; and
- Coordinating regular meetings between energy efficiency and demand response program management.

During the current cycle, funding for energy efficiency and demand response must remain non-commingled; therefore payments will be split between the two programs, as appropriate.

## **f) Integration across resource types (energy, water, air quality, etc)**

California's industrial sector faces a multitude of environmental and regulatory challenges that affect their competitiveness and, in some cases, survival. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

To help deal with these challenges, the industrial program will coordinate with the regulating agencies and the programs they are operating to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs will continue to offer targeted trainings to customers who share common regulatory challenges, in an effort to educate customers on impending regulatory requirements for their business operation and the most efficient solution options to consider for compliance. Future workshops may look at wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 industrial targets.

IOUs will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities will help reduce administrative cost and has a greater impact on societal benefits.

Where applicable, the Program will integrate topics such as GHG reduction and water conservation into targeted customer workshops, and marketing and communications, building on a strong track record from the past program cycle. Marketing and communications material will include savings opportunities and messaging.

### **g) Pilots**

The Statewide Industrial Energy Efficiency Program will coordinate on a statewide level to ensure the program is continuously updated and enhanced throughout the two-year implementation cycle. Pilots may be developed at that time in response to customer's needs or to further advance the goals of the Strategic Plan.

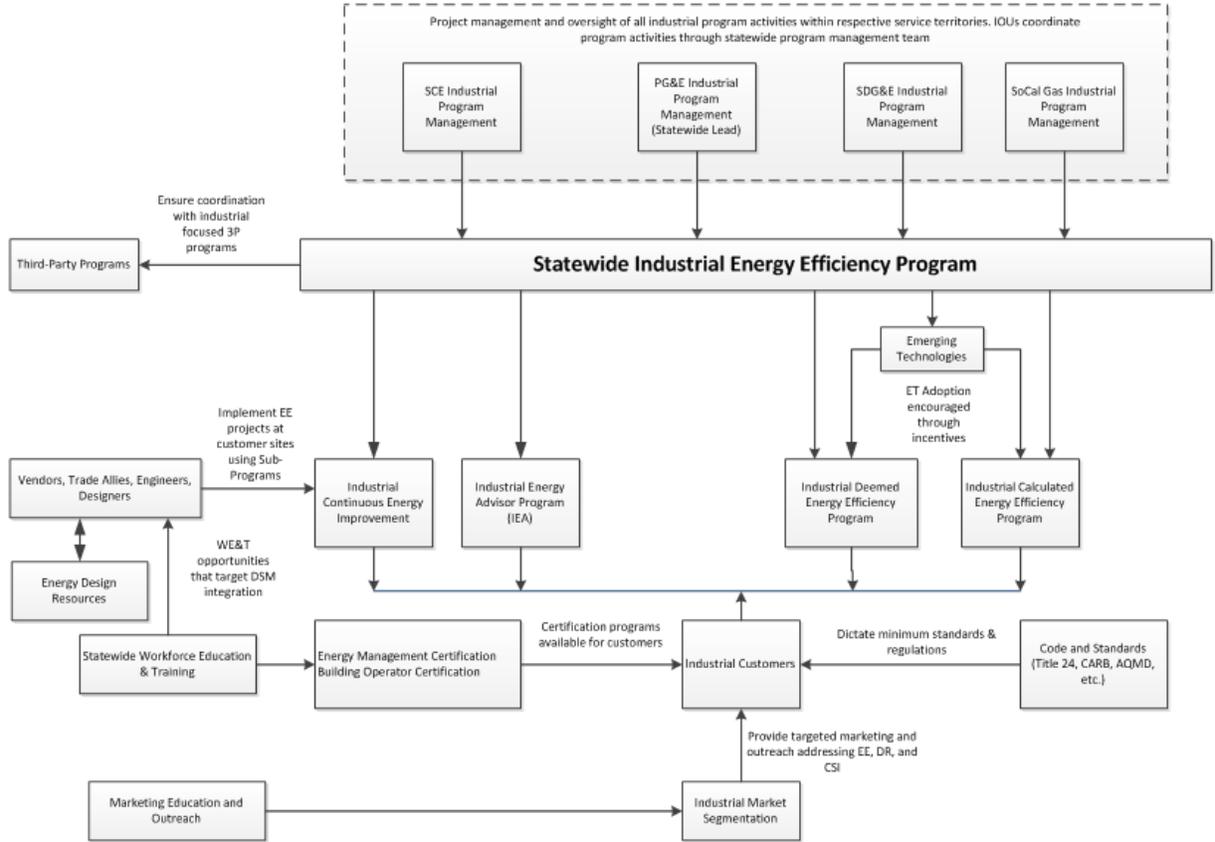

The IOUs intend to implement methods to gather and retain more detailed performance and usage data on a pilot basis. This will determine the more effective methods and achieve savings. Exploring incentives for sub-metering is an option, as is expanding the tool library in lieu of incentives.

### **h) EM&V**

SoCalGas is proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases, after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

# 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

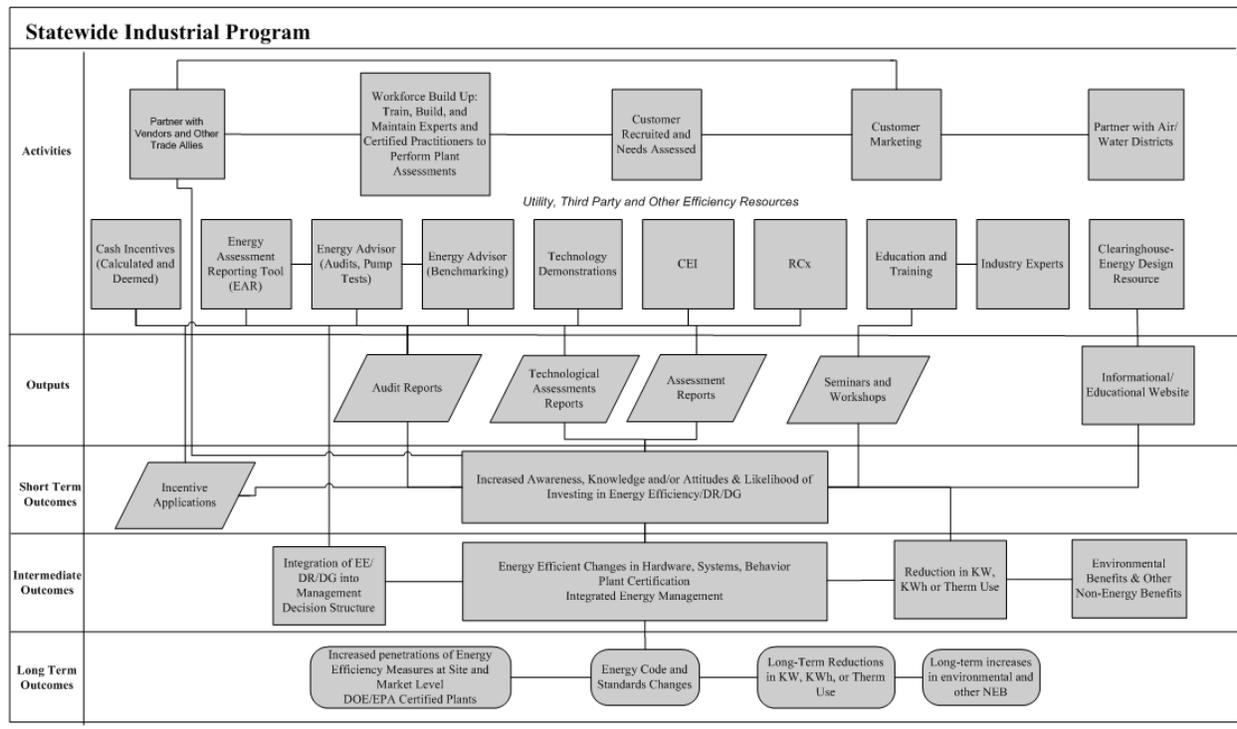

## 7. Diagram of Program

# 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

## 8. Program Logic Model

**Note:** On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statement energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Statewide Industrial Energy Efficiency Program.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name:** Industrial Energy Advisor, Core Sub-Program  
**Program ID#:** SCG-3713  
**Program Type:** Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** – See the overarching program for budget details.

3. **Projected Program Gross Impacts Table**

**Table 2** - See the overarching program for savings details.

4. **Program Description**

- a) **Describe program**

The Statewide Investor Owned Utilities (IOUs) have created the Industrial Energy Advisor (IEA) to bring together SoCalGas under one program all services offered to support customer education and participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities.

IEA was created to provide a streamlined and coordinated assignment of right-sized customer solutions. The key is to start the process with an initial analysis of a customer's needs, determination from the analysis which audit will service the customer with the highest cost/benefit, and identify additional program support and key indicators that will motivate the customer to implement energy saving recommendations.

The IOUs anticipate the restructuring of IEA will affect the way audits are provided. IEA will enhance the IOUs' ability to match customer need(s) with the right audit service. This will result in an increased cost-effective delivery of these audit services with an increased expectation for customer adoption/installation of provided customer specific recommendations.

In its offerings, IEA will place an emphasis in deep energy saving measures and emerging technologies, where appropriate. When the technologies and customer opportunities are correctly aligned, customers will become more open to the benefits these technologies offer to their business and will therefore increase their acceptance and adoption.

Together the IEA offerings will work to support the achievement of Strategic Plan objectives across all segments (agriculture, commercial and industrial).

The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

The Industrial EA package consists of five distinct offerings:

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

- **Benchmarking** is the first step for a customer to begin to understand the energy use of their building. Benchmarking is an initiative designed to educate and motivate customers to measure and track the energy use of their facilities, to educate customers of the benefits of benchmarking their facilities and to show them how they can track the impact of energy savings after implementing energy saving measures. To support the customer's efforts, the IOUs will offer technical support, hands-on workshops that will provide customers with information about how to benchmark, how benchmarking can be used as an energy management tool and what to do next after benchmarking.

The IOUs will develop or continue Benchmarking initiatives that support the customers' ability to comply with AB1103 benchmarking requirements (upon its implementation), utilizing ENERGY STAR Portfolio Manager and IOU supported Automated Benchmarking Services.

The IOUs will also continue to offer customers technical support ranging from email and phone hotlines, hands-on workshops and web-based benchmarking educational and instructional materials.

They will continue their support to identifying, evaluation and make information about other benchmarking tools available.

The primary focus for benchmarking activities will continue to be centered on commercial buildings (in alignment with the target building type of AB 1103).

- **Industrial Continuous Energy Improvement (CEI)** is a consultative service aimed at helping industrial customers (IOUs will target CEI services inline with market segment potential in their service territories and resource availability) engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of IOU customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices which address energy savings, reduction of greenhouse gas emissions and water conservation, through high-level energy commitments from executive and board-level management.

CEI offers customers the pinnacle of audit offerings, guiding executive management to levels of energy management self-actualization that make energy and environmental issues a consideration in all management/business operational decisions and in long term energy planning. For additional information about CEI, please consult the Industrial CEI Program Implementation Plan.

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

- **Non Residential Audits (NRA)** The Transition Period will provide Integrated Comprehensive Energy Audits (ICEA) that focus on customer energy savings, cost/benefits, and the targeted delivery of financial and technical assistance. Audit information must communicate complex information in a simple and understandable way to enable customers to identify energy efficiency, demand response and distributed generation opportunities. Audits use “ex ante” Deemed and Calculated methodologies for energy savings analysis information.

As stated above, NRA offers ICEA. In Appendix A, each IOU defines the sub-categories of ICEA that they provide.

In this program cycle, emphasis will be given to meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), streamlining the audit process, increasing its efficiency, lessening complexity, and increasing the effectiveness of influencing customer implementation actions through actions such as integration of the demand response technical audit component directly into NRAs offerings. In addition, the IOUs will investigate ways to implement meaningful financial measurements, such as return on investment and/or simple payback metrics, and to be effective, the financial tool selected should ensure cost assumptions are appropriate to the customer to provide meaningful information. Also, NRA may assume the audit and budget responsibilities for Demand Response’s technical audit services, as applicable. It is intended that these audits will be a critical component of the integrated comprehensive audit service offering.

- **Pump Efficiency Services** is designed to help industrial customers make informed decisions about improving inefficient pumping systems and operations through recommendations derived from pump test audit or direct observations of processes.

The Pump Efficiency Services program element, implemented by a team of trained in house or third party contractors, aims to overcome key informational, technical, and financial barriers to pump optimization by offering pump tests, retrofit incentives, and targeted education, training and technical support for customers and pump companies. Each IOUs database of pump test results will be used in the near-term to target pumps in need of retrofit as a means to capture savings. However, pump performance data aggregation at the statewide level will contribute to the development of metrics and targets for pump improvements. This will support a statewide pumping focus across segments, in agriculture, commercial and industrial, supporting their strategies and objectives.

The IOUs will continue to offer pump testing services at no or low cost and pumping system efficiency workshops through their energy education centers or other event opportunities during the Transition Period.

- **Retrocommissioning:**

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

The IOUs will continue to enhance their core Retrocommissioning (RCx) programs. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments.

The RCx element is designed to optimize existing building or system performance by identifying operational deficiencies and making necessary adjustments to correct the deficiency. RCx is offered to industrial customers, based on the market segment potential and resources of the respective IOU. The range of projects may involve measures which reset, repair or replace existing system controls and components. Simple payback for these measures is usually short in duration and must meet customer expectations. Through the RCx assessment report, comprehensive projects are identified and referred to other sub-programs for completion (i.e., Calculated and Deemed sub-programs). Energy savings from projects identified through RCx will be claimed in the Industrial Calculated Energy Efficiency Program.

Enhanced RCx program elements will explore and may include but not be limited to:

- Innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- Continuous commissioning and monitoring-based commissioning;
- Strategies to drive savings persistence;
- Appropriate alignment with retrofit activities; and
- Overall program incentives, targeting, and delivery.

The RCx program is a key offering in the Industrial Calculated Sub-Program and a more detailed description of the program is provided.

The Transition Period will be used to develop and test the EA design strategy. The strategy focuses on simplifying the way audits are provided to customers. Through various assessment functions, the IOUs will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (i.e. primarily EE, DR, and SG).

It is anticipated that IEA will allow the expansion of services across diverse class of customers, potentially across all segments and will interconnect the customer with the wide and diverse range of programs offered. From a customer perspective, the impact on customer time and resources will be reduced. The audit analyses will include DSM, greenhouse gas reduction information and will provide water conservation recommendation all in a single report. The resulting report will identify comprehensive solutions that will simplify the customer decision-making process.

The primary program objectives for 2013-2014 are:

- Support the Strategic Plan by offering integrated audits across a wide selection that address the full spectrum of energy solutions, including energy efficiency, demand

# **2013-2014 Energy Efficiency Programs**

## **Statewide Industrial Energy Efficiency Program**

### **Program Implementation Plan**

response, and distributed generation (California Solar Initiative and distributed generation) focusing on industrial facilities as defined by each IOU's market potential and resource availability.

- Continue to deliver high value audit reports to the customer. Audit reports will be designed in such a way that they will provide the customer with information which motivates them to implement energy efficiency, demand response and consider renewable generation options.
- Enhance efforts to identify and provide financial analyses focused on deeper energy savings and technologies. Identify ways different financial metrics, such as return on investment and/or simple payback, can be provided where the values presented have meaning to the customer.
- Explore and evaluate the potential of enhanced customer incentive options that are contingent on a customer's receiving an audit prior to applying to incentive programs.
- Incorporate new and/or emerging technologies appropriate for the customer's facility.
- Develop and implement enhancements to current Benchmarking workshops (targeting industrial buildings) and continue providing Benchmarking and AB1103 technical support through established and new delivery channels.
- Encourage statewide consistency by offering similar energy audits with the ultimate goal of offering customers the best energy management practices and technologies.
- Enhance the IEA offerings by including activities such as, but not limited to:
  - Highlighting emerging technologies and deep energy savings opportunities and providing education on long-term energy planning/project management strategies (in coordination with CEI program).
  - Continuing existing water saving services, leak detection services, and strategies which will be offered to customers in all customer segments, as determined by the IOUs to provide customer benefits and cost-effective administration. The services will be offered through the use of audit teams, in house and/or contracted, and may be required as a service in the delivery of all integrated comprehensive audits.
- IEA will play a key role in exploring options for identifying deep energy savings, promoting emerging technologies and providing proper support to customers who take advantage of more than three measures from Industrial Deemed Incentive subprogram.
- IEA will develop processes to assist energy audit teams and customers identify facilities and services that will provide the greatest return on benefits from the audit. The IOUs may explore leveraging tools to complete energy audits, usage analysis, assessments and/or building performance benchmarking as the first step in determining a customer's need.
- IEA may also enhance tracking and audit component capabilities to support customer needs analysis, reduce program application barriers, maximize recommendation follow up and streamlined audit report generation.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**b) List measures**

The IEA primarily offers non-resource, auditing services. It does not offer incentives, but ultimately influences the customer's implementation of energy efficiency, demand response, and self-generation opportunities in combination with incentive from the core incentive programs (refer to the Industrial Deemed and Calculated sub-programs for specific information). However, each IOU reserves the ability to offer incentives specific to IEA's individual service offerings.

**c) List non-incentive Industrial Energy Advisor Services**

The Industrial Energy Advisor (IEA) is designed to deliver a coordinated and customer specific service. IEA features a statewide integrated demand side management customer specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer's need(s).

Such activities include, but are not limited to: energy management assessments, energy planning, marketing and outreach, baselining and benchmarking, project implementation support, technical support, energy savings calculations, process evaluations and report generation, and web-based energy resources.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**c) Program Design to Overcome Barriers**

The EA offers services which change corporate/management cultures that prevent successful implementation of comprehensive energy policies. These offerings help overcome customers' lack of awareness of DSM opportunities by providing a customer focused, comprehensive package of energy solutions designed specifically to motivate the customer to implement recommendations. Information such as cost/benefit analysis (i.e. ROI, or simple payback) and identification of appropriate IOU incentive and/or finance programs, can significantly enhance the financial benefit of the energy saving recommendation. IEA also provides

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

customers with tools to measure the effects of implemented energy savings actions on their bottom line.

IEA brings together audits and related services to implement energy saving activities.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 4**

	Program Target by 2013	Program Target by 2014
Number of Audits	402	445

**e) Advancing Strategic Plan goals and objectives**

The IEA is designed to promote DSM coordination and the integration strategies of the Strategic Plan. Foremost are recognition of the linkage between energy and environmental policy and the importance of integrating energy efficiency, demand response and distributed generation to support California’s plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the IEA include the following:

- Facilitate all State-Owned and Leased Buildings having a Retrocommissioning option.

By offering a dedicated retrocommissioning program, a mechanism is created whereby IOUs can facilitate the achievement of this goal as a coordinated effort with the IOU Government and Institutional Partnership Programs.

- Strengthen Tools and Practices for Building Commissioning.

Based on the IOUs' experience with managing the Retrocommissioning program, lessons learned and best practices can be integrated into the 2013-2014 offering. To increase market adoption of these program best practices, the IOUs will work in cooperation with the California Commissioning Collaborative to disseminate relevant information to the retrocommissioning community. Services may be extended to all segments as deemed appropriate by each IOU.

- Identify New and Improved Tools and Strategies to Reduce Energy Consumption in industrial facilities.

# **2013-2014 Energy Efficiency Programs**

## **Statewide Industrial Energy Efficiency Program**

### **Program Implementation Plan**

Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the benchmarking, CEI, NRA and RCx demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, industrial/ agricultural processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing agricultural facilities contribute to California's zero net energy goals. Once implemented, recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.

- Encourage State/Local Governments and Major Corporations to Commit to Achieve EE Targets

IEA's offerings will seek to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop an actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

- Develop Tools to Reduce Energy in Industrial Facilities.

As part of the implementation of specific IEA offerings, the IOUs will partner with energy industry peers, industry associations, and DOE/CPUC-sponsored labs and consultants to enhance the use of existing tools and explore new tools to help industrial customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

- Management Standard for Energy SME2000-2008;
- DOE's Superior Energy Performance; and
- ISO-50001.

- Develop Business Models to Deliver Energy Management Solutions.

IEA's offerings will address the fundamental purpose to influence decision-making practices from Industrial customers to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the agricultural market sector.

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

In addition, IEA's offerings promote acceptable practices of accounting, auditing, and evaluation by:

- Offering integrated and focused audits, benchmarking, savings calculation assistance for retrofit and retrocommissioning opportunities; and simplifying the audit-to-project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action.
- Guiding and supporting customers as they implement technologies, processes and practices to achieve energy efficiency savings.
- Long term energy planning SoCalGas support.

## **6. Program Implementation**

- Assessment and identification of the best way to support the use of the BEARS tool
- Enhancement of current Benchmarking workshops and continuation of Benchmarking and AB1103 technical support through established and new channels
- Emphasis and support of integration in emerging technologies and deeper energy measure opportunities
- In coordination with incentive programs, identification of ways to streamline the end-to-end process for customers wanting to participate in IOU energy saving programs
- **Statewide IOU coordination**

**i. Program name:** Industrial Energy Advisor

### **ii. Program delivery mechanisms**

SoCalGas IEA will employ a variety of delivery mechanisms or channels. Most of IEA's offering will use IOU customer energy efficiency staff and contractors, service and sales representatives, website and/or marketing, and outreach efforts. Other delivery channels may also be developed.

In addition, where applicable, IOU customer SoCalGas account representatives or program management staff will support this activity within the statewide industrial sector, as well as third parties, government partnerships, and SoCalGas local programs.

### **iii. Incentive levels**

Not applicable.

### **iv. Marketing and outreach plans**

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs, in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost-effectiveness of reaching customer groups.

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

IEA's energy recommendations will continue to recognize the regulations required by other bodies. For example, information about GHG reductions resulting from AB32 and water conservation efforts may be incorporated into the customer recommendations and factored into the project's cost-effectiveness, as appropriate.

Program offerings will collaborate and support the CEC's AB1103 mandate by assisting customers with technical and awareness activities. IEA will advance the introduction of the BEARS and California Rating Tool where reasonable.

IEA recognizes the efforts of the CEC's Green Building Initiative programs, DOE "ISO plant certification" programs, EPA Energy Star Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs. IEA will leverage such activities to the customer's benefit.

**a) Program delivery and coordination**

The sub-program will be coordinated with the following activities, as applicable:

**i. Emerging Technologies (ET) program**

The IOU IEA Management Team will stay abreast of and incorporate relevant emerging technologies into audit recommendations as appropriate.

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

## **ii. Codes & Standards program**

IEA implementation will include information about pending new codes and standards that may affect planning or prioritization of retrofit or new construction projects. Audit reports will include customer recommendations that are consistent with current governing codes.

## **iii. WE&T efforts**

IEA implementation will integrate with WE&T efforts, as needed, by providing CSI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches, as required.

## **iv. Program-specific marketing and outreach efforts**

In 2013-2014, SoCalGas' IEA marketing campaigns will provide a wide range of action-oriented solutions targeting specific segments and sub-segments of business customers. In addition, IEA marketing efforts will be "bundled" as a menu of demand response, energy efficiency and conservation programs providing customers with a full array of EE and DR opportunities. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.

Marketing activities will target business customers and select effective channels to reach entities such as trade associations, local business groups, and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support may be utilized.

Marketing collateral and messages for energy efficiency will be integrated with other IOU programs. Through additional market segmentation and feedback from customers, IOUs will further adjust approaches based on the varied needs of targeted customers. Additional sub-program marketing will be accomplished by leveraging local third-party programs. Specific IOU marketing budgets are provided in Table 1 of the core industrial program.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**v. Non-energy activities of program**

The IOU IEA team will participate in Statewide and national efforts to develop and enhance audit, benchmarking and retro-commissioning, and continuous energy improvement tools and practices. Such activities will likely occur in conjunction with ongoing industry efforts managed by the California Energy Commission (CEC), Consortium for Energy Efficiency (CEE), ENERGY STAR and the California Commissioning Collaborative (CCC).

CEI implementation will include non-energy activities such as recognition awards, local area or sector competitions, awareness campaigns, education about non-energy-related LEED points and definitions, and use of computerized financial analysis tools and cost estimating and forecasting tools

**vi. Non-IOU programs**

IEA reports will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IEA will partner with programs offered by CEC, ARB, Air Quality Management Districts, ENERGY STAR, and other government and quasi-governmental agencies to capitalize on opportunities to develop co-branded program information and marketing collateral targeted to industrial sector customers, as opportunities present themselves.

With respect to water conservation, IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release notices for programs with interactive water and energy effects (ESPM, BEARS, California Rating Tool, Water Agencies and others).

**vii. CEC work on PIER**

Not applicable.

**viii. CEC work on C&S**

IEA will not be implemented with a direct linkage to codes and standards efforts. However, IEA will reflect code and standards regulation in its energy savings calculations, as deemed appropriate.

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-IOU information and guidance that IEA offering SoCalGas will provide to customers. In addition, the IOUs will participate in state and national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

**b) Best Practices**

The IOUs will continue to leverage best practices and lessons learned at regularly scheduled statewide program management meetings. These meetings are forums to discuss program

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

design and implementation issues, and as appropriate provide statewide collaborated guidance in RFP solicitations and awareness of program offerings. This will ensure that customers operating multiple facilities across IOU service territories will receive the same customer experience.

Other best practices approaches apply the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the industrial market sectors. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach will continue through the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

## **c) Innovation**

For 2013-2014, the IOUs are identifying and evaluating program processes to increase effectiveness, simplification and increase the benefits the program delivers. Each IOU's set of lessons learned from these efforts will be shared and implemented to enhance energy savings benefits to all California IOU customers.

IEA will continue to improve as a new standard for packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customers for implementing strategic energy management. Other IEA offerings may also consider specialized incentive approaches based on delivery, target markets and/or other opportunities.

## **d) Integrated/Coordinated Demand Side Management**

IEA will provide a comprehensive approach for integrated audit services. Its services will have the flexibility of meeting every level of a customer's audits needs from integrated comprehensive audits to targeted or focused audits (which center on specific systems or processes), to assessments or general walk-through audits or online "do-it-yourself" audits (currently for small business customers). When properly applied, these audits can assist in identifying the areas of the customer's greatest energy interest, the customer's financial ability to invest in improving its energy use, and other programs that can be discussed to motivate a customer to move forward with the energy saving plan.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

IEA services can coordinate the audit with retrofitting or retrocommissioning opportunities, benchmarking tools, or long-term planning. Audit reports can present a truly integrated analysis to customers, seamlessly providing information and recommendations regarding energy efficiency, distributed-generation, demand response, greenhouse gas emissions and water energy savings. Customers will be referred to other IOU programs that will help them implement the recommendations resulting from the audit report. As a result, they will receive

**e) Integration Across Resource Types**

IEA will focus on DSM integration.

IEA implementation will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IOU IEA managers will partner with the appropriate programs, when applicable, with government agencies in order to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers.

Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote IEA offerings, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, IOU program managers will collaborate with the local water districts to produce marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects.

**f) SoCalGas Pilots**

IEA services may consider the development of test markets especially in the introduction of new energy benchmarking or saving tools.

**g) EM&V**

SoCalGas is proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

- 1. Program Name:** Industrial Calculated Incentives Program  
**Program ID#:** SCG3715  
**Program Type:** Statewide Core Program

**2. Projected Program Budget Table**

**Table 1** – reference the overarching program for budget details

**3. Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the overarching program for savings details

**4. Program Description**

**a) Describe program**

The purpose of the Statewide Industrial Calculated Energy Efficiency Program is to provide services to improve the energy efficiency of industrial facilities in California, including financial incentives based on calculated energy savings. The energy savings are calculated for measures installed as recommended by comprehensive technical and design assistance for customized projects. Integrated projects are encouraged to combine energy efficiency and demand response. Eligible projects include new construction, retrofit, and retrocommissioning.

The Calculated Energy Efficiency Program is part of a suite of programs within the Statewide Industrial Energy Efficiency Program. The Calculated Energy Efficiency Program is utilized for projects where:

- a rebate is not available through the statewide Deemed Energy Savings Program,
- customized calculations provide the most accurate savings estimates, or
- interactive effects between measures are best captured through whole building or whole system modeling.

Because it presents a calculation method that can consider system and resource interactions, the program will become the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan).

Key features in the process include:

- Energy audits of facilities and processes with recommendations for energy efficiency, demand response, distributed generation technologies as well as opportunities for greenhouse gas reductions;
- Calculations/estimates of energy savings for exceeding Title 24 code or industry standard practice baselines;
- Technical assistance from IOUs through SoCalGas energy audits, facility walk-through surveys and calculated savings analyses that consider specific projects;

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

- Submission of project proposal for SoCalGas review and approval;
- Pre-inspection by SoCalGas for the preliminary approval of retrofit projects;
- Post-inspections on approved and completed projects to verify performance; and
- Payment of incentives from SoCalGas.

Energy audits may be completed by customers directly or authorized participants. Authorized participants may include contractors, design teams, vendors, and energy service companies. The completed audit may then be submitted for review and approval.

For the energy audit feature, statewide consistent calculators are publicly available. The statewide IOU-created and maintained SPC Calculator can be used for retrofits and some new construction applications and is available online. For whole building construction projects, IOUs typically accept calculations generated with programs such as Energy Pro, Trane Trace 700, Carrier HAP (available for license), and the IOU-sponsored eQuest (available for free on the statewide Energy Design Resources website [www.energydesignresources.com](http://www.energydesignresources.com)), among others. Calculations must be submitted in open, unlocked, native format for review and consideration in the IOU's programs.

Retrocommissioning (RCx) is also eligible in the program for delivering energy savings. RCx is a systematic process to identify and correct operational problems or inherent repair and maintenance deficiencies that lead to excessive energy use. Unlike retrofits, which focus on equipment replacement, or operations and maintenance, which deal with routine maintenance, RCx focuses on identifying and correcting problems that may not be readily identified by a standard energy audit.

O&M items with an effective useful life greater than three years can also be identified through this assessment. Additionally, opportunities often exist to optimize existing systems to operate more efficiently than originally designed with minimal new capital outlay.

RCx will be offered as a bundle of products/services. RCx providers will perform several tasks to identify measures. These tasks include, but are not limited to:

- Initial benchmarking;
- Collecting data to quantify the owner's operational requirements;
- Performing detailed on-site audits to evaluate operational deficiencies and/or operational optimization opportunities, inclusive of improved and enhanced preventive maintenance and repair programs;
- Defining measures, quantifying implementation costs and savings;
- Assisting customers with measure implementation;
- Verifying completion of measures;
- Providing post installation documentation and training as well as other persistence techniques; and
- Posting project benchmark.

### **b) List measures**

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

A broad range of measures is eligible for the Calculated Energy Savings Program. The current incentives are summarized in the following table. The incentives for these measures are standard across the IOUs participating in the statewide Industrial Calculated Energy Efficiency Program.

The following measure categories are eligible for Calculated Incentives:

- Refrigeration
- Gas measures

**c) List non-incentive Industrial Energy Advisor Services**

The Industrial Calculated Energy Efficiency Incentives Program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical and calculation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd the project through the process.

## **5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The Industrial Calculated Energy Efficiency Program includes numerous features designed to overcome these barriers, as identified and discussed below.

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

## **Integrated Demand Side Management Approach**

The program offers California's industrial segment a statewide suite of products and services to overcome market barriers to optimize energy management and meet the goals of the Strategic Plan. It overcomes multiple barriers through the implementation of strategies that provide an integrated solution to the customer, offer education and outreach to create awareness and promote continuous energy efficiency improvement. The program also enables a facility to attain resource management levels that exceed industry standards and gain them market and worldwide recognition.

## **CEI Program Offering**

The Continuous Energy Improvement (CEI) program compliments the Industrial Calculated Energy Efficiency Program by helping customers implement energy efficiency measures that have been identified through energy efficiency audits or in-depth facility/process assessments. Such assessments may be jointly provided by the IOUs and the U.S. Department of Energy (DOE) or ANSI. It focuses on improving production and optimizing energy efficiency and provides integrated resource management solutions including greenhouse gas reduction. This approach overcomes such barriers as lack of awareness of energy efficiency opportunities and provides a highly skilled workforce educated towards energy efficiency, process optimization, and resource management.

## **Marketing and Outreach**

To increase awareness of the program, a statewide centralized clearinghouse will be developed to give customers access to information on operating best practices in energy efficiency, industry relevant technical assistance, baselines, case studies, tools and computer based training. This clearinghouse addresses the issue of availability of information and qualified industry specialists to fully assess a building, system or process and help customers understand how energy efficiency can impact their emissions, resource consumption or waste discharge streams. It helps alleviate the problem often run into by non-residential customers of getting incorrect or out-of-date information from some local networks. It will also enable design engineers to specify energy efficient measures to exceed industry accepted baseline standards when constructing new or retrofitting existing buildings or systems, instead of specifying only what they know or what they are familiar with.

The program's information and services will be delivered primarily through account representatives, IOU call centers hotlines, local government partnerships, third parties, and IOU internet sites. Information will also be made available through industry events, such as the Plant Engineering Expo, through industry organizations, such as the California Manufacturing Association and the Building Owners and Managers Association (BOMA); and through advertising in industry and trade publications. Other avenues to reach out to customers and identify energy efficiency opportunities include non-resource programs such as Education and Outreach, Workforce Education and Training, or through Emerging Technologies Programs.

# 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

## **Education and Training**

Highly skilled Energy Management Professionals may conduct technical training and seminars to educate the public as well as develop a highly trained energy efficiency workforce that is accessible to industry.

## **Emerging Technologies (ET)**

In collaboration with ET and the CEC, ET may conduct studies, pilots, and demonstrations to prove the viability of promising emerging technologies and lower the risk of investment which in turn will speed up market penetration.

## **Financial Assistance**

Rebates and incentives properly priced and based on energy savings quantified through technical assessments or basic audits, can help customers overcome internal financial hurdle rates. Skilled energy efficiency personnel may also assist customers and provide additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, tax incentives or other local sources of project funding.

## **d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Projects	TBD	TBD

## **e) Advancing Strategic Plan goals and objectives**

The Statewide Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector. General advancement of the goals is presented in the program implementation plan for the Statewide Industrial Energy Efficiency Program. More specific support of the goals is presented here.

*Goal 1:* Support California Industry’s adoption of energy efficiency by integrating energy efficiency savings with achievement of GHG goals and other resource goals.

*Strategy 1.1:* Develop coordinated energy and resource management program for CA’s industrial sector, to enhance use of energy efficiency.

*Near-term:* Establish CARB AB32 Industry Team

The Calculated sub-program infrastructure is designed to facilitate the customer’s implementation of large-scale projects that are supported by detailed energy calculations. There is an opportunity to augment the various tools used for preparing such calculations with GHG emission information that will allow customers to immediately quantify these benefits. This activity will be managed through the IOU CARB AB32 Industry Team, which is proposed as part of the core Industrial Energy Efficiency Program.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

*Goal 2:* Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

*Strategy 2.2:* Implement certification

*Near-term:* Plan pilot and recruit host sites (8-10 facilities)

The program will seek out opportunities to recruit host sites for the certification program by surveying project submittals for potential candidates.

*Goal 3:* Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

*Strategy 3.1:* Compile technical and resource management regulatory materials into centralized assistance repository.

*Near-term:* 1) Identify and incorporate priority energy and other data; 2) Develop clearinghouse or integration system.

The Calculated Energy Efficiency Program will give support by providing information on results and experience in the program, including case studies of innovative projects.

## **5. Program Implementation**

### **a) Statewide IOU coordination**

**i. Program name:** Industrial Calculated Energy Efficiency Program

#### **ii. Program delivery mechanisms**

Program delivery mechanisms for SoCalGas will include account representatives, technical services personnel, incentives processing staff, and inspection officials. Also important to program delivery will be customer facility owners and managers; energy efficient equipment manufacturers, distributors, and service contractors; industry trade associations; and others in the energy efficiency equipment value chain.

Industrial Calculated Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The Industrial Calculated Energy Efficiency Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the implementation cycle will be enabled.

SoCalGas account representatives support this activity within the statewide industrial sector, as well as third parties, government partnerships, and SoCalGas local programs.

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

### **iii. Incentive levels**

Incentives will be at \$1.00/therm, capped at 50% of project cost.

The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division and market direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program.

### **iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The Industrial Calculated Energy Efficiency Program will be marketed through IOU's Account Executives, as well as through trade allies, education, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by Account Executives, Demand Response Program outreach, phone and e-mail support will be provided.

Marketing campaigns will provide a wide range of action-oriented solutions targeted to "personas" identified through segmentation research. In addition, marketing efforts will be "bundled." That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry, IOUs will be better able to communicate with and serve customers.

Marketing efforts will incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness, and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Market outreach to raise awareness of available EE programs will use a number of strategies, as follows:

- Providing a regular and consistent customer calling effort to key customers within this sector through account representatives;

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

- Providing additional expertise from IOU representatives, program management representatives, and field engineers;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the industrial market sector;
- Attendance at the key trade shows for each high priority sub-segment within the industrial market sector;
- Hosting IOU-sponsored training events at the IOU's Customer Training Centers and other convenient locations within the IOU's service territory;
- Hosting IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Linking written collateral pieces that give an overview of the IOU's Energy Efficiency programs to the appropriate IOU DSM web page.

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above. Furthermore, industrial facilities are recognized as large energy and water consumers. IOUs will develop proposals, as appropriate, to facilitate water-energy nexus projects.

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

### **v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Industrial Calculated Energy Efficiency Program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with industrial customers, to the extent possible. Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type.

With respect to water conservation, IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Calculated sub-program incentives for energy efficient equipment that may also reduce water and greenhouse gas emissions.

### **vi. Similar IOU and POU programs**

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

The IOUs will be delivering many third-party programs that utilize the Industrial Calculated Energy Efficiency Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program delivery and coordination**

**i. Emerging Technologies program**

The long-term energy efficiency vision of California can only be attained through the long-term and continuous development, verification, and acceptance of emerging technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the sub-program will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. In addition, portfolio staff actively works to incorporate promising emerging technologies from the ET program.

**ii. Codes and Standards program**

The program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As codes and standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost-effective technologies/services (e.g., LEDs) are made available as they transition from research and development to mainstream program offerings.

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

### **iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Industrial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings take place through IOU's energy centers and technology centers.

### **iv. Program-specific marketing and outreach efforts**

Marketing and outreach initiatives will include:

- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the industrial sector, as appropriate;
- Attendance at key trade shows within the industrial sector;
- IOU-sponsored training events at the IOU's Customer Training Centers and other convenient locations within the IOUs service territory;
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Development of case studies, web pages, and marketing material that provide an overview of the IOUs' energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

### **v. Non-energy activities of program**

The program provides a significant challenge to integrating DSM initiatives to non-energy activities due to the general industry structure, the nature of market sector resource use, limited resource savings potential with smaller businesses, and limits to small business owner and operator bandwidth. Therefore, integrated audits that look across the various energy efficiency program offerings, as well as complementary options available through other entities (e.g. water agencies), will be used to identify the opportunities to be recommended to the specific industrial customer.

With respect to water conservation, IOU program managers will contact the local water districts to co-brand marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers incentives for energy efficient equipment that may also reduce water and GHG emissions.

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

In addition, the program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

#### **vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, ARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

#### **vii. CEC**

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

#### **viii. CEC work on C&S**

Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

#### **ix. Non-utility market initiatives**

The program will support and educate customers, and/or facilitate such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

#### **c) Best Practices**

The Industrial Calculated Energy Efficiency Program builds upon the more than 10 years of experience that IOUs have offered such a program<sup>18</sup>. Deeper penetration into industrial process loads will be achieved by closely aligning the sub-program with the Industrial Energy Advisor and Industrial Continuous Energy Improvement Programs to ensure that there is an avenue for implementing a variety of customer projects. The infrastructure developed by the Industrial Calculated Energy Efficiency Program will also be used as the core processing backbone for targeted third-party programs in order to reduce the program administrative and processing costs of those programs.

#### **d) Innovation**

For the 2013-2014 program cycle, California IOUs will implement an incentive structure that emphasizes advanced controls that enable demand response motivating customers to

---

<sup>18</sup> Before 2009-2011, the Calculated Energy Efficiency Program was commonly referred to as the Standard Performance Program or “SPC.”

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

participate in energy efficiency and demand response incentive programs as well as signing up demand response programs.

IOUs will continue working collaboratively on modifications to program Policies and Procedures to address ongoing changes in customer expectations, market conditions and program flexibility. Changes will (a) target ease of program understanding and participation, (b) measure eligibility, (c) increase of customer's economic benefits, and (d) identify policy restrictions that are barriers to participation. IOUs are implementing such process based on market studies conducted on the subject and preceding discussion of the policy change. Among other modifications that would be potentially discussed and implemented are incentive caps and redesign of measure/equipment early retirement according to the CPUC concept.

IOUs are planning to elaborate and utilize positive experience obtained using SBD Simplified tool and extend it to energy efficiency retrofit projects. Such tools substantially reduce application processing and review time, and minimize the number of hand-offs, without sacrificing accuracy of energy saving calculations.

Where possible, IOUs will use an integrated approach to addressing DSM opportunities. Innovative approaches will be used, such as merging energy efficiency and demand response analysis and converting recommendations to projects. In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions, will maximize customer adoption rates for most cost-effective energy management opportunities.

IOUs are planning to consolidate various calculating software such as SPC Software, Engage and other measure specific calculating tools to standardize our calculating methodology. This will ensure that calculations will be more uniform and consistent amongst all stakeholders. This will not limit the use of nationally recognized standard DOE toolsets for certain measures.

IOUs are planning to continue and expand their core RCx program in multiple target markets. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments to correct the system. Measures may involve resetting, repair or replacement of existing system controls and components, and in general are low-cost projects with simple payback periods of less than four years.

After an energy audit is complete and applicable no-cost/low-cost measures are identified, the scope of work will be handed off to a RCx implementer who, in-turn, will follow RCx program protocols, execute the scope of work (measure implementation, EM&V plan, incentive payment for energy savings, etc.) and report final results to the core program office. The IOUs are exploring innovative means of improving the Industrial Calculated Energy Efficiency Program based on Energy Division direction. One possible method to comply

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" and to "raise incentive levels for Emerging Technologies" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Industrial Calculated Energy Efficiency Incentive Program.

## **e) Integrated/coordinated Demand Side Management**

Energy audits will include recommendations for not only energy efficiency, but also for demand response and other demand-side management opportunities. Participating customers will be encouraged to participate in other demand-side management opportunities, including demand response and distributed generation. Participating customers will also be encouraged to take a more comprehensive approach to demand-side management and strive for continuous improvement.

## **f) Integration across resource types (energy, water, air quality, etc)**

California's industrial sector faces a multitude of environmental and regulatory challenges that affect their competitiveness and, in some cases, survival. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

To help deal with these challenges, the industrial program will coordinate with the regulating agencies and the programs they are operating to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs will continue to offer targeted trainings to customers who share common regulatory challenges in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at small and medium sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 industrial targets.

IOUs will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities will help reduce administrative cost and has a greater impact on societal benefits.

Where applicable, the Program will integrate topics such as GHG reduction and water conservation into targeted customer workshops, and marketing and communications, building on a strong track record from the past program cycle. Marketing and communications material will include savings opportunities and messaging.

## **Water/Energy Nexus Strategy**

SoCalGas supports improving the efficiency of water systems as one of the most critical strategies to capture water/energy nexus benefits in the energy efficiency programs.

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

SoCalGas plans to focus its efforts in areas that use gas engines as the energy source to deliver and treat water. For water agencies within SoCalGas' territory, we plan to issue an RFP to utilize a contractor to implement leak-loss detection and remediation and pressure management services applicable to storage, pumping and distribution through SoCalGas' core or Third Party Program. SoCalGas will explore new project ideas for the water/energy nexus, as well as the calculation of ancillary water benefits (e.g. "embedded" energy savings). SoCalGas will accelerate the expansion of cost-effective water-energy nexus programs by coordinating with the other utilities, water agencies, and municipalities to study the cost effectiveness and the embedded energy savings for water/energy efforts. Our intent is to continue to offer measures and services to the water sector through the "calculated" and audit programs. SoCalGas will also explore for new direct energy measures that can be incented under the calculated program. Additionally, we will increase our efforts to capture the water-energy nexus and sustainability in the agriculture, industrial, and commercial segments.

### **g) Local Element (Negotiated Incentive Option)**

SoCalGas will provide a local component which will include incentives for energy-efficient retrofits, systems new construction, or replacements of existing equipment at SoCalGas customer sites. Participants may be either customers or energy-efficiency service providers (EESP's) acting as project sponsors for activities at customer sites. To qualify, a project must save a minimum of 1,000,000 therms per year. Associated energy, resource such as water, sewerage and emissions, and Greenhouse gas (GHG) emissions savings will be considered when evaluating a project for funding. A project may consist of a single project at a single site, or may be aggregated from multiple projects belonging to a single customer, and may include a variety of measures.

This local element is designed to serve the largest non-residential customers within the SoCalGas service territory. Non-residential customers in this group are comprised of but not limited to the following industry sub-segments: Government/Utilities, Manufacturing/Processing Industries and Institutional. Each sub-segment has distinct energy use patterns, differences in equipment and facility design, and various management structures and decision-making processes. Because each industry sub-segment is unique, this option will use a customized, customer-focused approach. Participating customers, taking into account their individual energy and resource conservation opportunities as well as internal hurdle rates, will propose or "bid" to SoCalGas the incentive level needed to enable large EE and Resource savings projects. This ensures that this option will be adaptable to the unique needs of each market segment.

The program is designed to be flexible and cost effective: The project sponsor proposes a project and desired incentives. Incentives may cover up to 50% of the incremental project costs less any additional funding received from other sources. Measurement and verification (M&V) is required for all projects. As a performance-based incentive program, the approved M&V report will ultimately determine the energy savings for each project. The total sum of incentives paid for a project may not exceed the amount "bid" by the customer and agreed to by SoCalGas.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**h) Pilots**

Not applicable.

**i) EM&V**

SoCalGas is proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

**7. Diagram of Program**

Please see the core program diagram.

**8. Program Logic Model**

Please see the Commercial Calculated Energy Efficiency Program logic model.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

- 1. Program Name:** Industrial Deemed Incentives Program  
**Program ID#:** SCG3715  
**Program Type:** Statwide Core Program

**2. Projected Program Budget Table**

**Table 1** – reference the overarching program for budget details

**3. Projected Program Gross Impacts Table**

**Table 2** - reference the overarching program for savings details

**4. Program Description**

**a) Describe program**

The purpose of the statewide Industrial Deemed Energy Efficiency Program is to provide services to improve the energy efficiency of industrial facilities in California, including financial incentives based on deemed energy savings. The energy savings are deemed for measures installed. Integrated projects are encouraged to combine energy efficiency and demand response.

The Industrial Deemed Energy Efficiency Program is part of a suite of programs within the Statewide Industrial Energy Efficiency Program.

Key features of the program include:

- Information and technical assistance from SoCalGas on energy efficiency measures and savings potential;
- Application via mail, fax, internet and phone by customer for eligible measures;
- Reservation of financial incentives by SoCalGas, if requested by customer;
- Pre- and post-installation inspection by SoCalGas, as determined by SoCalGas based on prior participation and other factors; and
- Payment of incentives from SoCalGas.

**b) List measures**

Itemized retrofit measures have prescribed energy savings and incentive amounts. These measures are categorized under the following end uses:

- Food service
- Refrigeration
- Industrial Process
- Gas Measures

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**c) List non-incentive Industrial Energy Advisor Services**

The Industrial Deemed Incentives sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical consultation and application preparation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd through the process.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The Industrial Deemed Energy Efficiency Program is designed to overcome several barriers. The program directly addresses key market factors that lead to higher energy costs for California businesses. Providing a menu of prescribed common measures simplifies the process of reviewing project proposals and provides a "per-widget" rebate that reduces the cost of retrofitting outdated and inefficient equipment. This element makes it attractive for customers to spend money in the short run in order to achieve lower energy costs in the long run.

Using itemized energy efficiency measures is intended to overcome barriers that prevent many business customers from adopting energy efficiency alternatives. The barriers are addressed by itemizing common energy efficiency measures and rebates, stimulating the supply of high efficiency equipment and products (through higher demand), and offering rebates that help offset higher start-up and down payment expenses for energy efficient retrofits.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

Furthermore, to ensure equity to all business customer segments, this program will continue to offer statewide-consistent, cost-offsetting itemized rebates to help customers with the cost of installing new energy efficient equipment.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Projects	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

The Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector. The Industrial Deemed Energy Efficiency Program supports at least two goals.

*Goal 2:* Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

*Strategy 2.5:* Implement ME&O program to educate industry and consumers

*Near-term:* Form industrial collaboration mechanisms

The Deemed Energy Efficiency Program facilitates participation by allowing customers to apply for program participation in many ways, including mail, fax, internet and phone. SoCalGas will implement marketing and outreach activities through account executives, trade associations, and in numerous other ways to stimulate participation. It will encourage participants to adopt a policy of continuous improvement.

*Goal 3:* Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

*Strategy 3.2:* Conduct statewide marketing and education effort to create demand for industrial information clearinghouse.

*Near-term:* 1) Develop ME&O Plan; 2) Implement Plan

SoCalGas will participate in the development of the plan and then encourage industrial customers to use the clearinghouse as part of the implementation of the plan.

**6. Program Implementation**

**a) Statewide IOU coordination**

**i. Program name:** Industrial Deemed Energy Efficiency Program

**ii. Program delivery mechanisms**

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

Program delivery mechanisms for SoCalGas will include account representatives, technical services personnel, incentives processing staff, and inspection officials. Also important to program delivery will be customer facility owners and managers; energy efficient equipment manufacturers, distributors, and services contractors; industry trade associations; and others in the energy efficiency equipment value chain.

At the statewide level, the Industrial Deemed Energy Efficiency Program will be coordinated to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The Industrial Deemed Energy Efficiency Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correcting program weaknesses that reveal themselves during implementation, and ensuring achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the two-year implementation cycle will be enabled.

### **iii. Incentive levels**

Incentive levels are based on measure type and will be set at uniform amounts across the state. Higher incentive levels will be provided for Emerging Technologies (ET) to spur traction in the market as feasible. The scale of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, therms, equipment cost, other market factors and cost effectiveness.

### **iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The Industrial Deemed Energy Efficiency Program will be marketed through IOU account executives, as well as through trade allies, education, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support will be provided.

Marketing efforts will incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness, and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

Market outreach to raise awareness of energy efficiency programs available will use a number of strategies, as follows:

- Providing a regular and consistent customer calling effort to key customers within this sector through account representatives;
- Providing additional expertise from IOU representatives, program management representatives, and field engineers will be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the industrial market sector;
- Attendance at the key trade shows for each high priority sub-segment within the industrial market sector;
- Hosting IOU-sponsored training events at the IOU's Customer Training Centers and other convenient locations within the IOU's service territory;
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Linking written collateral pieces that give an overview of the IOU's Energy Efficiency programs to the appropriate IOU's IDSM web page.

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above.

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

### **v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Industrial Deemed Energy Efficiency Program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with industrial customers to the extent possible. Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type.

With respect to water conservation, IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers program incentives for energy efficient equipment that may also reduce water and greenhouse gas emissions.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that are permitted to use the Industrial Deemed Energy Savings Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program delivery and coordination**

**i. Emerging Technologies program**

The long-term energy efficiency vision of California may be attained through the long-term and continuous development, verification, and acceptance of emerging technologies (ET) into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting-edge technologies. In recognition of the importance of emerging technologies, the program is poised to adopt the efficiency potential of new technologies through its programs. In addition, portfolio staff actively works to incorporate promising emerging technologies.

**ii. Codes and Standards program**

The program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As codes and standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost-effective technologies/services (e.g., LEDs) are made available as they transition from research and development to mainstream program offerings.

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Industrial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings take place through IOU’s energy centers and technology centers.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**iv. Program-specific marketing and outreach efforts (provide budget)**

Marketing and outreach initiatives will include:

- Participation and membership in key trade associations affiliated with each high-priority sub-segment within the industrial sector, as appropriate;
- Attendance at key trade shows within the industrial sector;
- Building awareness and training of vendors of energy equipment and systems about the program eligibility requirements and participation procedures;
- Educating community based organizations (CBOs), faith based organizations (FBOs), other non-profit organizations, and other non-government organizations (NGOs) with unique access to certain industry segments;
- Informing enabling partners, such as financial institutions, law firms, and environmental organizations;
- Approaching other organizations with complementary value propositions from the customers' perspective, such as energy, water, materials management, recyclables, and corporate social responsibility;
- IOU-sponsored training events at the IOU's customer training centers and other convenient locations within the IOU's service territory;
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Development of case studies, web pages, and marketing materials that provide an overview of the IOU's energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, ARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**vii. CEC**

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

incorporate promising emerging technologies and project in coordination with the applied research of CEC.

## **viii. CEC work on codes and standards**

Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

## **Non-utility market initiatives**

The program will support, educate customers, and/or facilitate such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

## **c) Best Practices**

To maximize program effectiveness, best practices in program design and implementation will be employed and shared amongst IOUs.

Best practices in Program Design include:

- Regular communication amongst IOUs, which is critical to effective program design.
- Identification of qualifying products simply and effectively (Examples; ENERGY STAR®, CEE, FSTC website).
- Seeking input from industry in the development of new programs. The IOU programs are trying to change how an industry operates from manufacturer design to the customers' purchasing and maintenance practices.
- Industry participation that increases program volume and speeds market transformation.

Best practices in Program Implementation include:

- Striving to simplify messaging and participation for the customer. (Look for the ENERGY STAR label, purchase from a qualifying products list, etc.)
- Understanding the key motivators that drive an industry and using that information to market your program. Formulating certain outreach efforts that make your program visible to your customers and the market that is catering to your customers.
- Continuously communicating program marketing and advertising plans in advance to appropriate industry channels. Advanced notice allows industry partners an opportunity to leverage off of IOU marketing efforts and reinforce the messaging we are trying to deliver to our customers.

## **d) Innovation**

Innovative aspects of the program include improving major program performance indicators, such as accuracy of energy saving calculation, higher realization rate, overcoming energy efficiency barriers, reducing application processing time and administrative costs, and integrated energy management.

## **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

For the new program cycle, California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During the 2013-2014 program cycle, the new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance, including measure bundling incentives. The IOUs will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper savings.

IOUs will continue working collaboratively on modifications to program Policies and Procedures to address ongoing changes in customer expectations, market conditions and program flexibility. Changes will (a) target ease of program understanding and participation, (b) measure eligibility, (c) increase of customer's economic benefits, and (d) identify policy restrictions that are barriers to participation. IOUs are implementing such process based on market studies conducted on the subject and preceding discussion of the policy change. Among other modifications that would be potentially discussed and implemented are incentive caps and redesign of measure/equipment early retirement according to the CPUC concept.

Where possible, IOUs will use an integrated approach to addressing DSM opportunities. Innovative approaches will be used, such as merging energy efficiency and demand response analysis and converting recommendations to projects under Retrocommissioning and/or Calculated program. In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions, will maximize customer adoption rates for most cost-effective energy management opportunities.

### **e) Integrated/coordinated Demand Side Management**

Once enrolled, participating customers will be encouraged to participate in other demand-side management opportunities, including demand response and distributed generation. Participating customers will also be encouraged to take a more comprehensive approach to demand-side management and strive for continuous improvement.

### **Integration across resource types (energy, water, air quality, etc)**

California's industrial sector faces a multitude of environmental and regulatory challenges that affect their competitiveness and, in some cases, survival. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

To help deal with these challenges, the industrial program will coordinate with the regulating agencies and the programs they are operating to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs will continue to offer targeted trainings to customers who share common regulatory

# 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

challenges in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at small and medium sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 industrial targets.

IOUs will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities will help reduce administrative cost and has a greater impact on societal benefits.

Where applicable, the Program will integrate topics such as GHG reduction and water conservation into targeted customer workshops, and marketing and communications, building on a strong track record from the past program cycle. Marketing and communications material will include savings opportunities and messaging.

**f) Pilots**

Not applicable.

**g) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

## **7. Diagram of Program**

Please see the core program diagram.

## **8. Program Logic Model**

Please see the Commercial Deemed Energy Efficiency Program logic model.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name:** Industrial Continuous Energy Improvement Program  
**Program ID#:** SCG3714  
**Program Type:** Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** – reference the overarching program for budget details

3. **Projected Program Gross Impacts Table**

**Table 2** - reference the overarching program for savings details

4. **Program Description**

- a) **Describe program**

Continuous Energy Improvement (CEI) is a consultative service that is aimed at helping industrial customers engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of IOU customers and with current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principals of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; and (5) Evaluation and Modification. At each stage of customer engagement, there are a variety of complementary IOU and non-IOU products and services that can be customized to fit different customer profiles and optimize the cost effectiveness of the delivered energy management solution.

In 2013-14, CEI will be expanded to include select group of mid-sized non-residential customers. Available options to help target these customers may include an individualized, small group, or mass-market remote deployment approach.

CEI will coordinate its services with the Industrial Energy Advisor subprogram offerings. CEI offers customers what can be considered the pinnacle of audit offerings, guiding senior management to instill energy considerations in all management/business operational decisions and in long-term energy planning.

The CEI program implements the following steps:

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

## **1. Commitment**

CEI begins with a high-level management commitment to improving energy performance, which increasingly can be combined with other environmental and regulatory commitments that energy users are developing in response to market and political pressures. A corporate commitment sends the top-down message to employees, partners, shareholders and vendors that energy—like safety—is a priority issue requiring attention. Corporate commitment also paves the way for establishing the required company resources required to implement the steps of CEI. These resources can include capital, personnel like energy champions or teams, or technical systems and software required for energy management.

Gaining true customer commitment can take time, but it is critical. In implementation, IOUs will formalize the Commitment phase with more intensive customers through a CEI participation agreement. This agreement outlines the IOU CEI services being offered as well as minimum customer expectations.

## **2. Assessment**

Following Commitment, a comprehensive assessment is critical to identifying not only technical opportunities but also systemic energy management practices and cultural shifts. These can improve overall facility management practices and sustain continuous improvements towards long-term company targets. A component to the assessment will also include tools to help identify Energy Efficiency (EE), Distributed Generation (DG), and Demand Response (DR) opportunities.

There are many tools and resources – IOU and non-IOU, free and licensed – available to support comprehensive customer energy assessment. They include ENERGY STAR's Guidelines for Energy Management; customer energy management assessment software products like those developed by Envinta; benchmarking tools; Integrated Comprehensive Energy Audits; through the Industrial Energy Advisor sub-program, or local and third-party programs that can offer specialized technical expertise and assessment.

Based on screening criteria, IOUs will offer comprehensive energy assessment services utilizing, but not limited to, vetted sources like those described below, to develop a customer specific strategic energy plan.

- ENERGY STAR's Guidelines for Energy Management is housed on the ENERGY STAR website and provides step-by-step guidelines to customers to support CEI in general. It also guides customers to ENERGY STAR's numerous assessment tools. This option is a low-cost resource for smaller and medium customers interested in CEI.
- Energy Management Assessment Tools such as Envinta's One-To-Five, Achiever, or Challenger software products offer professionally facilitated energy management

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

assessment with company decision makers. They also explore management practices and company priorities to develop a CEI roadmap for energy goals and actions.

- Integrated Comprehensive Energy Audits provide an inventory of technical facility end-uses and energy efficiency, demand response and self-generation investment opportunities. For a full description, see the Industrial Energy Advisor sub-program plan.
- Benchmarking can measure the energy performance of a company, building, process, or piece of equipment to industry standards or comparable groupings. Benchmarking is a natural first step for the CEI process. Customers with multiple facilities find benchmarking useful to prioritize efficiency projects, track progress toward energy or greenhouse gas (GHG) improvement goals, or drive competition among similar benchmarked facilities. Units of measurement vary widely. For industrial buildings, the unit is energy used/square foot for a unit of time. Benchmarking can also be applied to other resources and environmental issues such as water use, CO<sub>2</sub>, and emissions.

### 3. Planning

Strategic energy planning involves setting energy goals and action plans around energy efficiency, demand response, and generation, as appropriate. Planning for customers will typically involve Account Representatives and/or consultants. As discussed in the Strategic Plan and in Section 6.e below, strategic planning can also include complementary non-energy considerations, such as greenhouse gas (GHG) reductions, water efficiency, and waste-stream minimization, all of which have embedded energy components.

Data and findings from a comprehensive customer Assessment are critical in developing any comprehensive energy plan. These include the results from technical audits or assessments, facility benchmarks, energy management assessments, and assessments of company priorities. This information is analyzed and used to develop realistic and achievable company goals and the prioritized shorter-term tactics that are needed to achieve them. Energy plans should be living documents revisited and revised regularly.

Energy goals can vary widely and include elements such as resource utilization (“Company X will reduce its overall energy intensity by 3% over the next 3 years”), carbon reduction goals (“Company X will be carbon neutral by 2014”), or management-oriented goals (“Company X will implement energy teams by 2013”). Goals can be internal documents or can be made public through press releases as part of larger sustainability plans. Publicized goals are increasingly important for large and public companies.

CEI will assist customers in developing and implementing action plans to execute the prioritized near-term activities in support of their company’s energy goals, as well as the

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

resources, staff and schedule for tracking. Action plans typically include activities such as (a) prioritizing process systems or facilities based on benchmarking or company drivers, (b) identifying internal resources required for plan implementation, and (c) developing project justification and incentive application documentation lists and detailed schedules.

## **4. Implementation**

In the implementation stage, IOUs partner with customers to identify technical support and IOU and non-IOU resources available to support implementation of projects, such as rebates, incentives, third-party and government partnership programs, and state and national resources. These may include:

- Statewide Deemed rebates;
- Statewide Calculated incentives for new construction/tenant improvement, retrofit and retro-commissioning/repair;
- Third-Party and Government Partnership programs (described in the statewide and local third party filings);
- IOU and non-IOU financing options; and
- External and internal engineer support.

## **5. Evaluation and Modification**

In any continuous improvement program, evaluation is an ongoing process of comparing actual performance against company goals, targets and action plans. It may include repeating the benchmarking and system or facility baseline process annually, assessing advancements in organizational and management practices that facilitate energy management improvements, or evaluating cost savings per unit of product. Regular evaluation will inform changes to goals and action plans moving forward.

### **b) List measures**

CEI does not provide incentives to customers, but ultimately facilitates the customer's implementation of energy efficiency projects through incentive programs. However, depending on the outcome of the 2012 process evaluation, customer incentives may be offered.

### **c) List non-incentive Industrial Energy Advisor**

CEI is a non-resource program that provides comprehensive strategic energy planning and consulting services for industrial customers. These services include energy management assessments, energy planning, baselining and benchmarking, project implementation support, customer recognition (e.g. "corporate sustainability awards"), and web-based energy resources.

## **5. Program Rationale and Expected Outcome**

### **a) Quantitative Baseline and Market Transformation Information**

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

CEI is intended to address several market barriers that prevent wider adoption of energy efficiency practices. These barriers include:

- Lack of information: The CEI evaluation and modification process provides data that customers can use to reevaluate their commitment and/or modify their energy goals.
- Performance uncertainties: Through CEI’s comprehensive baselining and benchmarking assistance, customers will have access to real-time data that demonstrates how their facility is performing relative to their established goals.
- Organizational customs: The high-level customer commitment that is at the core of CEI increases the likelihood that corporate cultures that prevent successful implementation of comprehensive energy policies will be changed.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Number of Engagements	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

The Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector. General advancement of the goals is presented in the program implementation plan for the Industrial Energy Efficiency Program. More specific support of the goals in the Industrial CEI Program is presented here.

*Goal 1:* Support California Industry’s adoption of energy efficiency by integrating energy efficiency savings with achievement of GHG goals and other resource goals.

# 2013-2014 Energy Efficiency Programs

## Statewide Industrial Energy Efficiency Program

### Program Implementation Plan

*Strategy 1.1:* Develop coordinated energy and resource management program for CA's industrial sector, to enhance use of energy efficiency

The core deliverable through CEI is the development of a comprehensive energy management plan that customers can adopt as an operating strategy. This plan will allow customers to quantify and manage their GHG emissions in a responsible manner.

*Goal 2:* Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

*Strategy 2.2:* Implement certification

*Near-term:* Plan pilot and recruit host sites (8-10 facilities)

The Continuous Energy Improvement sub-program will manage the statewide participation in the development of an industrial certification program. This certification program will be piloted in 2013-2014. It will leverage the various industrial sub-program tactics described throughout this program implementation plan to identify the best potential host sites. The lessons learned from this pilot will be used to expand the certification in the next program cycle.

*Goal 3:* Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

*Strategy 3.1:* Compile technical and resource management regulatory materials into centralized assistance repository.

*Near-term:* 1) Identify and incorporate priority energy and other data; 2) Develop clearinghouse or integration system.

The Continuous Energy Improvement sub-program will support the development of an industrial clearinghouse by providing information on results and experience in the program, including case studies of innovative projects and best practices about implementing comprehensive energy management plans at industrial facilities.

## 6. Program Implementation

### a) Statewide IOU coordination

**i. Program name:** Industrial Continuous Energy Improvement Program

### **ii. Program delivery mechanisms**

CEI will be coordinated to unify the implementation of program aspects such as program name, program delivery mechanisms, marketing and outreach plans, and IOU program interactions. The Industrial CEI Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the two-year implementation cycle will be enabled.

Where applicable, the SoCalGas account representatives will support this activity within the statewide industrial sector, as well as third parties, government partnerships, and SoCalGas local programs.

**iii. Incentive levels**

Not applicable. (CEI is a non-resource program).

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

As with other information and education programs, CEI will be delivered primarily by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing and outreach efforts. Other channels of delivery may be developed.

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with industrial customers.

**vi. Similar IOU and POU programs**

Over the next two years, the IOUs will seek to increase their interactions with the POUs, as applicable, to promote the CEI concept throughout the state.

This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.

**b) Program delivery and coordination**

**i. Emerging Technologies program**

The CEI program management team will stay abreast of and incorporate relevant emerging technologies into audit recommendations. In addition, IOU field engineers, who play a large role in the delivery of CEI to industrial customers, are active

# **2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan**

contributors to the Emerging Technology (ET) process by their participation in ET Roundtable/Information meetings and continually seek to offer new technologies to customers.

## **ii. Codes and Standards program**

CEI implementation will include information about pending new code that may affect planning or prioritization of retrofit or new construction projects.

## **iii. WE&T efforts**

CEI implementation will integrate with WE&T efforts by providing CEI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. SoCalGas will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

SoCalGas will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches. Program costs will be shared with WE&T.

## **iv. Program-specific marketing and outreach efforts**

A broad range of marketing activities will be used to promote audits and elevate customer engagement. The Industrial CEI program will be promoted via direct communication between customers and Account Executives with the support of Project Managers from individual programs, as well as through traditional advertising activities, such as internet, bill inserts, brochures, trade shows, etc. Marketing activities will be coordinated between IOUs, and Distributed Generation departments within SoCalGas.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

## **v. Non-energy activities of program**

Integrated energy audits are a key tool for identifying non-energy opportunities for specific customers. The energy audits can identify non-energy benefits associated with recommended measures, such as improved safety, productivity, indoor air quality, comfort and appearance.

## **vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs.

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**vii. CEC**

Not applicable.

**viii. CEC work on C&S**

See Section 6.b.ii.

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-IOU information and guidance that CEI will provide customers. In addition, the IOUs will participate in national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

**c) Best Practices**

The CEI approach applies the principals of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management: Commitment, Assessment, Planning, Implementation, Evaluation and Modification in order to achieve widespread adoption of long-lasting sustainable energy management practices in the industrial market sector. This approach can now be successfully implemented given the two-year program cycle allowing longer term and deeper project development engagements with customers.

**d) Innovation**

CEI is a new way of packaging energy efficiency, demand response and self-generation products and services aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

**e) Integrated/coordinated Demand Side Management**

CEI includes project analysis and implementation support of recommendations of the Integrated Comprehensive Energy Audits, which provide customers with an inventory of facility end-use breakdown and energy efficiency, demand response and self-generation investment opportunities. Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other similarly related types of programs. While a successful program experience leads to repeat participation, there has been difficulty in cross-pollinating similarly related types of programs with these candidates due to program-specific silos. To

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

overcome the historic siloing of DSM, the CEI sub-program will leverage lessons learned from IDSM efforts by offering comprehensive, coordinated marketing and program delivery.

CEI is recognized as a strategy to advance Statewide IDSM program's goals and objectives. SoCalGas will increase IDSM messaging and coordination within CEI.

**f) Integration across resource types (energy, water, air quality, etc)**

CEI implementation will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support efforts. IOU CEI sub-program managers will partner, as appropriate, with CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers. Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will inform the customer about the mutual benefit of combining complementary resource programs.

In the effort to promote CEI, SoCalGas will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, IOU program managers will partner with the local water districts to produce co-branded marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects.

**g) Pilots**

Not applicable.

**h) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V plan after the program implementation plans are filed. This may include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies.

More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

Once results of the 2010-2012 evaluations are ready, recommendations will be reviewed for modifying the CEI PIP accordingly.

**7. Diagram of Program**

11.

#### 4. Program Description

12.

##### a) Describe program

The purpose of the Statewide Industrial Energy Efficiency Program is to provide services to improve the energy efficiency of industrial facilities in California. The primary services provided to industrial customers include:

- Energy audits covering energy efficiency and demand management opportunities;
- Technical assistance in measures specification, procurement, and project management;
- Post-installation inspection and analysis to verify performance;
- Continuous energy improvement consultation; and
- Financial incentives [and project financing](#) for installed measures

Financial incentives will be based on:

- Deemed energy savings by per unit of equipment; and
- Calculated energy savings by per unit of energy

The significance of the industrial sector in energy use in California is evident by recognizing that it is responsible for a third of energy consumption in the state, as shown in the table below, taken from the California Long-Term Energy Efficiency Strategic Plan.

Contribution of the Industrial Sector	(% of total in CA)
Electricity use	16
Natural gas use	33
Energy use	22
End-use CO <sub>2</sub>	20

There are several factors unique to the industrial sector, as compared to the residential and commercial sectors, that present challenges to achieving energy efficiency and greenhouse gas (GHG) goals for the state. As taken from the Strategic Plan, these factors include:

- Industry uses a large quantity of energy and other resources via complex proprietary processes to create and bring products to market. Products, to varying degrees, have embedded energy that traditionally cannot be “zeroed out.”

Formatted: No bullets or numbering

**Formatted:** Font: 12 pt, Not Bold, No underline

- Industrial facilities are increasingly managed by corporations that reside outside of the state or the country, and that view these facilities as mobile assets in a competitive global marketplace.
- Industry is highly diverse in type, size, and operation. -Customer types include the full range of industries from assembly plants, beverage manufacturing, and chemical production to water and wastewater treatment. Thus, uniform programs often will not match corporate or facility needs.
- Industries are subject to multiple policies and rules in resource areas (e.g. air quality, water quality, energy efficiency, GHG reductions, solid waste management), where compliance can raise competing objectives and outcomes.

To address these factors and challenges, the Statewide Industrial Energy Efficiency Program offers California’s industrial segment a statewide-consistent suite of products and services designed to:

- meet customer needs;
- overcome market barriers to energy management;
- enhance adoption of integrated demand-side management (IDSM) practices; and
- advance the industry toward achieving the goals of the California Long Term Energy Efficiency Strategic Plan.

The program overcomes barriers through policies that:

- provide integrated solutions for the customer;
- create heightened awareness through education and outreach;
- foster continuous energy improvement (CEI);
- promote the use of commonly accepted standards; and
- support training to create a highly skilled energy efficiency workforce that is accessible to industry.

The Statewide Industrial Energy Efficiency Program includes four statewide sub-program elements that together comprise the core product and service offerings. Each of the four investor-owned utilities in the state also offers local programs that complement and enhance the core offerings in their region. The local portfolio mix of **SCE SoCal Gas SGG** is specifically designed to enhance energy efficiency and DSM opportunities for industrial customers. ~~These include the AB 32 Carbon Emissions Reduction (CER) Program and financial solutions, including financial solutions.~~

Together, these offerings are designed to not only overcome the traditional market barriers to energy efficiency, but also use efficiency to advance demand response (DR) and distributed generation (DG) opportunities (including solar and renewables) uniquely suited to the industrial segment.

The four statewide sub-programs are summarized below.

- ~~Industrial Customer Services Energy Advisor: b~~Brings together under one program all audit services offered to support the customer’s (1) education; and (2) participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits; along with and (3) awareness of greenhouse gas and water conservation

**Formatted:** Underline

**Formatted:** No underline

**Formatted:** Font: TimesNewRoman

activities. These services include Benchmarking, Online Energy Audit Tool, Continuous Energy Improvement (CEI) (see CEI sub-program PIP), Nonresidential Audits, Pump Efficiency Services, and retrocommissioning (RCx),

- ~~Energy Audits Program~~ ~~Customer Services~~ ~~Energy Advisor~~ ~~Energy Audits Program:~~ ~~Basic audits, integrated audits, and (RCx) audits that provide an inventory of technical project opportunities and financial analysis information to populate a customer's short- or long-term energy plan.~~

- ~~Industrial Calculated Energy Efficiency Program:~~ Features incentives based on calculated energy savings for measures installed as recommended by comprehensive technical and design assistance for customized and integrated energy efficiency/DR initiatives in new construction, retrofit, and RCx projects. Because it presents a calculation method that can consider system and resource interactions, the program will become the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan.

- ~~Industrial Deemed Energy Efficiency Program:~~ Features rebates per unit measure for installed energy-saving projects. It provides ~~utility IOU~~ representatives, equipment vendors, and customers an easy-to-use mechanism to cost-effectively subsidize and encourage adoption of mass market efficiency measures through fixed incentive amounts.

- ~~Industrial Continuous Energy Improvement (CEI) Program:~~ ~~Features a~~ ~~consultative service which targets long-term and strategic energy planning. CEI is designed to reintroduce the importance of energy management by transforming the market and to help reduce energy intensity through a comprehensive energy management approach. CEI will address technical and management opportunities for commercial customers while creating sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary IOU and non-IOU products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution.~~

- ~~Continuous Energy Improvement (CEI) Program:~~ ~~Offers a collection of Strategic Planning tools and resources that lay the groundwork for long-term integrated energy planning and provide a platform for launching other utility and non-utility programs and services. Through analysis, benchmarking, long term goal setting, project implementation support, performance monitoring, and ultimately energy management certification, CEI aims to transform the market away from a "project-to-project" approach toward a continuous improvement pathway. In support of the Strategic Plan, the CEI also sets the stage for integration of non-energy resources, such as GHG reduction, water conservation, and regulatory compliance.~~

The ~~utilitiesIOUs~~ and CPUC have worked collaboratively to define a set of Program Performance Metrics (PPM) to measure progress made by the programs and sub-programs towards their short term goals and Market Transformation. Statewide coordination and planning will facilitate inter-~~utilityIOU~~ sharing of successes, lessons learned, and best practices in the pursuit of those targets and metrics.

Statewide coordination and planning between ~~utilityIOU~~ program planning staff, ~~utilityIOU~~ functional departments, government agencies, and other key partners and stakeholders will also be critical to the advancement of the Strategic Plan. In addition, leveraging national and state initiatives, tools, and resources to manage energy, use and protection of natural resources and environmental impacts will be key to optimizing the potential for California's industrial segment. The Statewide Industrial Energy Efficiency Program includes the staged integration and coordination with existing initiatives and regulations today, and later will drive or support advancements in integrated resource planning, energy management certification, industry benchmarking, workforce education and training, and sharing of industry best practices towards a goal of optimized energy utilization.

An integrated approach should be an effective way to help customers meet overall economic and green goals. In alignment with California's preferred loading order, however, the ~~utilitiesIOUs~~ will continue to aggressively market and support energy efficiency first as the most cost-effective energy resource through education and training, as well as when pursuing strategic energy planning with customers.

**b) List measures**

The key end-use technology categories addressed through the Statewide Industrial ~~Energy Efficiency~~ Program are pumping, ~~engines, motors,~~ heat recovery systems, process steam, loads, and heating, air compressors, hot water systems, ~~and~~ insulation, ~~plug load controls and lighting. Incentive levels will be aligned with those of the Calculated Energy Efficiency Program and the Deemed Energy Efficiency Program.~~

~~The Deemed Energy Efficiency Program offers itemized retrofit measures that have prescribed energy savings and incentive amounts. These measures are categorized under the following end-uses:~~

- ~~● Lighting~~
- ~~● Air conditioning~~
- ~~● Food service~~
- Refrigeration
- Industrial Process
- ~~● Motors~~
- ~~● Plug loads~~
- Gas Measures

## 5. Program Rationale and Expected Outcome

**Formatted:** No bullets or numbering

### a) Quantitative Baseline and Market Transformation Information

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>3</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical dimensions and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>4</sup>. Markets are social institutions<sup>5</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed ~~to~~ not to immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup>, as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>7</sup>. According to York<sup>8</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-

sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors, such as past market sales, that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>9</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers)."<sup>13</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

<sup>14</sup> CPUC (2008) Strategic Plan, p. 5.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the ~~utilities~~IOUs look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>16</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps includes forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can (1) define ~~markets, and~~ characterize markets, (2) measure baselines with better access to historical data, ~~and~~ (3) define objectives, (4) design strategies and tactics, (5) implement programs and (6) ~~then~~ evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of expected market effects ~~we can expect~~, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Attitudinal change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer attitudes, knowledge and awareness (AKA) of energy efficiency. In order to gauge an attitudinal based metric for this sector, a battery of questions probing AKA among customers would have to be created and used to scale AKA. Examples of AKA would include knowledge of energy efficiency lighting and other specific measures. Evaluators could also draw from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The baseline response pattern to the AKA scale would need to be established early during the program cycle. Customers could be surveyed on an annual basis and changes in their AKA tracked along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

In addition, behavioral change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer past behavior and intentions about energy efficiency. In order to gauge a ~~behaviorial~~behavioral based metric for this sector, a battery of questions about energy efficient behaviors could be used to create a

<sup>15</sup> Nadel, Thorne, Saches, Prindle & Elliot (2003).

<sup>16</sup> Pelozo & York, (1999).

**Formatted:** Font: 12 pt, Not Bold, No underline

scale of Energy Behavior. Evaluators could also draw questions about specific behaviors from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The behaviors that could be probed include maintenance behaviors to keep EE measures operating correctly, and behaviors that maximize energy efficiency of existing equipment. Customers could be surveyed early in the program cycle and their responses on the scale could serve as the baseline for subsequent behavioral change. Customers could be probed annually and their Energy Behavior change measured along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

**Program Performance Metrics (PPMs)**

Formatted: Font: TimesNewRoman, No underline

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency:

Formatted: Font: 11 pt, No underline

– Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise).

Formatted: Font: 11 pt, No underline

– Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Industrial Energy Efficiency Program (Resolution E-4385, Appendix A, pp. 32-33):

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
<b>COMMERCIAL / INDUSTRIAL / AGRICULTURAL COMBINED</b>		
* Data to be reported in disaggregate form by SW program (commercial, industrial, and agricultural)		
	*1. Number and percent (relative to all eligible customers) of commercial, industrial and agricultural customers participating in sub programs (NRA, Deemed, Calculated, and CEI) by NAICS code, by size (+/- 200 kW per yr or +/- 50K therms per yr), and by Hard to Reach (HTR)**	
	** "HTR" is as defined in the EE Policy Manual.	
C	*1. Number and percent of commercial, industrial, and agricultural CEI participants that meet short term (2010-2012) milestones as identified by their long term energy plans.	
a		
#		
f		
i	*2. Lessons learned, best practices, and plan to ramp up the CEI program are developed. (Y/N)	
#		
#		
s	*3. Number and percent of commercial, industrial and agricultural customers that created an energy plan via CEI will be tracked by program.

<u>Calculated Incentives</u>	*1. Number and percent of new, improved, or ETP measures installed in completed calculated projects.	2a

**b) Market Transformation Indicators (MTIs)**

~~Resolution E-4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities IOUs to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 20130-201422010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.~~

**Formatted:** Fontcolor: A uto

### c) **Program Design to Overcome Barriers**

There are a multitude of significant barriers to achieving technical and economic potential for energy efficiency in the industrial sector according to the Strategic Plan (p. 46). While primarily institutional and behavioral, rather than technical, these barriers include:

- Lack of awareness of energy efficiency opportunities;
- Difficulty in accessing industry-specific technical assistance;
- Inadequate availability of plant and management personnel to foster energy efficiency;
- Prioritization of production over energy management;
- Aversion to the risk of investing in new technologies and processes with unknown impacts to industrial output or quality; and
- Limited capital and inhibiting internal investment rates.

Formatted: Indent: Left: 0.5", Space Before: 0 pt

Formatted: Indent: Left: 0.5", Tab stops: Not at 0.5"

Formatted: No underline, Fontcolor: A auto

Formatted: No underline, Fontcolor: A auto

Formatted: No underline, Fontcolor: A auto

Further, the industrial sector faces an array of barriers common to all nonresidential customers:

- A high percentage of building developers, owners, managers, and contractors build or retrofit to current standards (Title 24). Likewise, architects and engineering (A&E) firms tend to specify known and familiar equipment and designs.
- Because viable high efficiency emerging technologies are unknown to facility owners and system designers, these technologies are slow to penetrate the market, causing lost energy efficiency opportunities.
- Insufficient access to information creates barriers associated with:
  - operating best practices;
  - energy efficiency opportunities; and
  - impacts of an energy efficiency project on emissions, resource consumption, or waste discharge streams; difficulty in obtaining technical assistance; inadequate availability of qualified industry specialists can all impede adoption of energy efficiency.
  - difficulty in obtaining technical assistance; and
  - inadequate availability of qualified industry specialists, which can all impede adoption of energy efficiency.

The Statewide SCSG So Cal Gas Industrial Energy Efficiency Program will employ all four strategies listed in the Strategic Plan to address the barriers. These strategies include:

- Integrated solutions
- Education and outreach
- Branding and certification
- Workforce training.

The Statewide Finance PIP includes plans to explore and develop additional finance tools to facilitate the adoption of integrated projects.

Formatted: Font: 12 pt, Not Bold, No underline

Formatted: No bullets or numbering, Tab stops: Not at 0.75"

Formatted: Normal

#### d) Quantitative Program Targets

Table 5 - Program targets are provided at the sub-program level.

#### e) Advancing Strategic Plan goals and objectives

The Statewide SCSO CalGas Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector.

*Goal 1: Support California Industry's-industry's adoption of energy efficiency by integrating energy efficiency savings with achievement of GHG goals and other resource goals.*

Formatted: Font: Italic, No underline, Font color: Black

To address this goal, the strategy adopted, in line with the Strategic Plan, is to develop an interagency framework that could combine energy efficiency incentives to achieve measured performance improvements in resource management, including -water, air quality, GHG emissions, and energy efficiency. This first goal focuses on developing a minimum regulatory energy efficiency requirement for individual company or industrial sub-sectors as a whole. One example is to integrate AB32 requirements to allow industries to use energy efficiency to meet or exceed regulatory requirements for GHG emission reductions. An IOU – CARB AB32 team will be formed to study the feasibility of implementing negotiated agreements between agencies. ~~In addition, SCE SoCalGas SCG will offer a local AB32 Carbon Emissions Reduction (CER) Program in conjunction with the IOU-CARB AB32 efforts. Along the same lines, the IOUs are also undertaking a pilot program with the food processing industry, under the agriculture program.~~

Formatted: Font: TimesNewRoman

*Goal 2: Build market value and demand for continuous improvement in industrial efficiency through branding and certification.*

Formatted: Font: Italic, No underline, Font color: Black

This second goal focuses on companies that want to exceed a minimum regulatory requirement by actively managing their energy use over time. To this end, this program offers CEI options that include participation in a recognized national effort to certify industrial facilities for energy efficiency. Industrial customers will then be able to reach their GHG emission reductions targets via a supported, structured program based on best practices and develop world-wide recognition for their efforts through third-party certification e.g. DOE's SEP program, based on proven best practices. The IOUs will be partnering with DOE's Industrial Technologies Program or EPA Technologies program, for example, to gain access to highly skilled professionals in energy management systems.

*Goal 3: Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.*

Formatted: Font: 12 pt, Not Bold, No underline

Formatted: Font: Italic, No underline, Font color: Black

The primary interest with this goal is to provide a clearinghouse of technical knowledge and information so that industry personnel can access information on emerging technology and industry-specific research. The clearinghouse will leverage extensive knowledge on energy efficiency developed by other organizations like DOE and EPA. In alignment with the Strategic Plan, the statewide team will be developing this clearinghouse on the EDR website, which is an existing statewide resource.

## 6. Program Implementation

14.

### a) Statewide IOU coordination

Formatted: No bullets or numbering

#### i. Program name: Statewide Industrial Energy Efficiency Program

Formatted: Font: Not Bold, No underline, Font color: Auto

#### ii. Program delivery mechanisms

The Statewide Industrial Energy Efficiency Program will be coordinated on a statewide level to ensure the program is continuously updated and enhanced throughout the ~~three-year~~ two year transition period - implementation cycle and beyond. In addition, each of the four ~~subsidiary-sub~~ programs in the Industrial Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and ~~utility IOU~~ program interactions. A detailed description of each of these program aspects and how they will be coordinated statewide is provided in sub-program descriptions. The two coordination systems, one for the core program, and one designed for the sub-program level, will interact with and support one another. The broad, high-level coordination effort for the core program will be described below, focusing on how the utilities IOUs will work together to effect the continuous improvement of the Statewide Industrial Program.

The Statewide IOU Coordination process for the Statewide Industrial Program will be as follows:

#### 1. Designate an IOU Program Lead

Formatted: Normal, Indent: Left: 0"

Formatted: Font: TimesNewRoman, 12 pt, Not Bold, No underline, Font color: Auto

The coordination process will begin with each IOU designating a Statewide Industrial Energy Efficiency Program "lead". The IOU lead will represent one industrial sub-program, investigating new innovations, special accomplishments, and challenges experienced by sub-program managers in all IOUs. Where such innovations or challenges show potential for impacting the Statewide Industrial Energy Efficiency Program across multiple sub-programs or the Statewide program as a whole, the IOU lead will present such information to a quarterly Steering Committee meeting.

Formatted: List Paragraph, Indent: Left: 0.5", Space After: 0 pt, Add space between paragraphs of the same style, Line spacing: single, Tab stops: Not at 0.5"

Formatted: Normal

Formatted: No underline, Font color: Auto

Formatted: Normal, Indent: Left: 0"

Formatted: Font: TimesNewRoman, 12 pt, Not Bold, No underline, Font color: Auto

#### 2. Hold Periodic Steering Committee Meetings

Formatted: List Paragraph, Indent: Left: 0.5", Space After: 0 pt, Add space between paragraphs of the same style, Line spacing: single, Tab stops: Not at 0.5"

The Industrial Steering Committee will comprise all designated IOU leads (including at least one lead for each of the four sub-programs), and possibly other contributing stakeholders identified by the IOUs. At the periodical steering committee meeting, individual innovations, challenges, and accomplishments experienced in one IOU or by one sub-program will be transmitted to all IOUs. The steering committee will evaluate these individual IOU and sub-program experiences, hear ideas for course corrections and overcoming challenges, replicate successful innovations for consistency statewide, resolve differences in implementation to stay unified, and measure the Industrial program's progress against statewide metrics and goals.

Formatted: Font: 12 pt, Not Bold, No underline

Formatted: Normal

Formatted: No underline, Fontcolor: Auto

Formatted: No underline, Fontcolor: Auto

Formatted: Normal, Indent: Left: 0"

### 3. Adopt Program Enhancements

Once the steering committee agrees that a particular implementation policy or innovation has merit on a statewide level, each IOU lead will distribute the information to their sub-program managers for adoption and integration. Therefore, the IOU lead will act as a conduit, feeding sub-program information up to the statewide steering committee and distributing measures for adoption back to the sub-program managers. This feedback loop will assure consistency and unity in programmatic improvements across the IOUs. In some cases, it may be necessary to invite the sub-program managers to the Steering Committee meeting to get their feedback and ensure they receive the same message.

Formatted: Font: TimesNewRoman, 12 pt, Not Bold, No underline, Fontcolor: Auto

Formatted: List Paragraph, Indent: Left: 0.5", Space After: 0 pt, Add space between paragraphs of the same style, Line spacing: single, Tab stops: Not at 0.5"

Formatted: Normal

Formatted: No underline, Fontcolor: Auto

### 4. Evaluate Program Enhancements Against Statewide Targets

To complete the adaptive management loop, the steering committee will track the program's accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The steering committee will determine whether further course corrections are needed, and if so, rely on the above coordination process to generate the improvements necessary to stay on track.

Formatted: Normal, Indent: Left: 0"

Formatted: Font: TimesNewRoman, 12 pt, Not Bold, No underline, Fontcolor: Auto

Formatted: List Paragraph, Indent: Left: 0.5", Space After: 0 pt, Add space between paragraphs of the same style, Line spacing: single, Tab stops: Not at 0.5"

Formatted: Normal

Formatted: No underline, Fontcolor: Auto

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the ~~three~~-year implementation cycle will be enabled. The details of actual implementation of these coordination activities are to be determined by the IOU's industrial program managers.

### iii. Incentive levels

Details on the incentive levels are discussed with each of the four sub-programs.

### iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target

Formatted: Font: TimesNewRoman, No underline

Formatted: Font: TimesNewRoman, No underline

**Formatted:** Font: 12 pt, Not Bold, No underline

customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the industrial sub-program plans.

**Formatted:** Font: TimesNewRoman, No underline

To reach out to the diverse customers segments, utilities IOUs will continue to foster strategic partnerships with industry and community groups, as well as trade professional associations, to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users. Specific efforts will include:

- Participation in trade association meetings to market the industrial program;
- Close partnerships with key industry associations, and participation in their annual conferences, with an effort to develop conference speaking engagements;
- Targeted integrated education and training to specific market sectors to support peer-to-peer interactions and industry advancement;
- Ads and articles, with program information and case studies, in trade magazines;
- Targeted customer efforts through utility IOU account representatives, program engineers, third parties, and government partnerships;
- Phone and web-based customer support and outreach;
- Development of coordinated industrial resources into a centralized “one stop shopping” clearinghouse; and
- Development of marketing collateral that drives customers to account representatives and websites for additional support.

The utilities IOUs will raise awareness of energy efficiency programs available using a number of strategies, including, including:

- Utility IOU representatives will make a regular and consistent customer calling effort to key customers within this sector; and
- Utility IOU representatives, Energy Efficiency program management representatives, and field engineers will be available to provide additional expertise.

To help ensure that utilities IOUs are marketing the right products to the right customer at the right time through the right channels, the IOUs need to be able to segment customers based upon their individual characteristics and energy needs. The IOU’s efforts to collect this customer data will guide the development and implementation of its IDSM marketing and outreach activities.

This customer segmentation will help the utilities IOUs develop an understanding of customers’ needs and respond accordingly with products and services that customer-s want. The segmentation analysis looks at what the customer requires and how the customer is engaged with each IOU. This foundational segmentation will evolve with incremental insight into customer mindsets, behaviors, responses and motivations to achieve the most effective level of energy use. Based upon this evolving segmentation, the utilities IOUs will be able to identify what integrated product offerings are specific to individual customer needs, and offer those products through the most relevant channels.

Based on the segmentation analysis, the utilities IOUs will be able to focus on providing consistent marketing and overall messaging focused on the customer's customers' customers:

- 1. Business/personal goals;
- 2. Unique needs; and
- 3. Green/global climate change goals

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Statewide Industrial Energy Efficiency Program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with commercial customers, as appropriate. Conventionally, each government agency and utility IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. The sub-program descriptions provide more specific information on linkages with other government programs.

**vi. Similar IOU and POU programs**

Some initiatives, such as the California Advanced Lighting Controls Training Program, are joint efforts with the other California IOUs and publicly owned utilities (POUs), as well as other domestic and international utilities. In addition to these joint efforts, local third-party programs that address niche opportunities within the segmented commercial market segmented will be implemented in each of the IOU's service territories. These various efforts will be coordinated to ensure a consistent approach in terms of program message, delivery and measure incentives.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) program**

The long-term energy efficiency vision of California can be attained through the long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training, and market development to maximize the energy efficiency benefits of cutting-edge technologies. In recognition of the importance of emerging technologies, the program will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. It is poised to adopt the efficiency potential of new technologies through its programs. In addition, portfolio staff actively works to incorporate promising emerging technologies and PIER projects.

**ii. Codes & Standards program**

The industrial offering relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As Codes and Standards impact measures, the program will act to align itself with appropriate offerings. It is

Formatted: Font: 12 pt, Not Bold, No underline

**Formatted:** Font: 12 pt, Not Bold, No underline

~~important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination subprogram.~~ Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will ~~be made to ensure that the latest cost-effective~~ technologies/services (e.g., LEDs) are made available as these technologies transition from 1) R&D to 2) Emerging technologies to 3) Incubation to 4) Mainstream.

**Formatted:** Font: TimesNewRoman, No underline, Fontcolor: A uto

**iii. WE&T efforts**

Workforce Education & Training efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Industrial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings will take place through ~~utilities~~IOUs energy centers and technology centers. In general, the Statewide Industrial Energy Efficiency Program will interface with the Workforce Education and Training Program Implementation Plan to serve the goals of the Strategic Plan.

**iv. Program-specific marketing and outreach efforts (provide budget)**

In addition to the general efforts listed above in 6.a.iv., specific marketing and outreach efforts for sub-programs are found in the sub-program documents.

~~Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.~~

**Formatted:** Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

**Formatted:** Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

**Formatted:** Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

**v. Non-energy activities of program**

Integrated comprehensive energy audits (~~described in the Industrial Customer Services~~Energy Advisor sub-program) that look across the various energy efficiency program offerings, as well as complementary options available through other entities (e.g., water agencies) will be used to identify the opportunities to be recommended to the specific commercial customer.

**Formatted:** Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

**Formatted:** Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

~~The on-going Water Efficiency Pilot Program that was approved in 2008 and implemented in 2009 will provide potential opportunities to reduce water use and the potential for associated energy efficiency savings. Since some customers~~

**Formatted:** Font: 12 pt, Not Bold, No underline

~~within the program sectors are major water users, this sector is well positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Programs.~~

The ~~StatewideSoCalGas~~ SCG Industrial Energy Efficiency Program will offer information to customers about the non-energy benefits associated with recommended measures, such as improved safety, productivity, indoor air quality, comfort, and appearance.

**vi. Non-IOU programs**

A variety of programs to be determined will be coordinated and leveraged to support program objectives. These include:

- Connecting customers with the CA Climate Action Registry;
- AB32 support through CO<sub>2</sub> tracking in program resources;
- Regulatory program coordination, including EPA air quality standards, water quality standards, and new refrigerant regulations;
- Non-~~utility~~ IOU financing resources, including from water utilities, industry and private banking, state and federal incentives, funds, grants, and loan products to support energy and other resource management objectives;
- Water/Energy efforts within California;
- ANSI standards (see CEI section); and
- ISO international energy management standards (see CEI section).

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**vii. CEC work on PIER**

~~The program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER projects. The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects. Not applicable.~~

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

**Formatted:** No underline, Fontcolor: Auto

**Formatted:** No underline, Fontcolor: Auto

**viii. CEC work on C&SS**

As indicated in Section 6.b.ii, planned enhancements to Title ~~2024 will be reflected in incentive levels and 24 will be reflected in incentive levels and~~ in eligible measures and services.

**ix. Non-utility market initiatives**

Formatted: Font: 12 pt, Not Bold, No underline

The program will support, educate ~~customers~~, and/or enforce such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

The Program will leverage the following efforts:

- California Green Building Initiative
- LEED
- Zero-net energy
- DOE
- AB1103
- AB758

Formatted: Tab stops: 0.75", Left

Formatted: Tab stops: 0.75", List tab + Not at 1.25"

c) **Best Practices**

The ~~SCESoCalGas~~ ~~SCG~~ Statewide Industrial Energy Efficiency Program reflects the best of each ~~utility~~ IOU program's successful components of statewide Industrial program offerings, and introduces new elements from other utilities and national efforts as well. Best practices include:

- Continuous Energy Improvement: This approach proposes to transform the market and reduce energy intensity through addressing technical and management opportunities.
- Technical Assistance: Recognizing the need for personalized assistance for customers, the IOUs will offer a full-service approach starting from audits/pump tests to design and technical assistance, presentation of recommendations, resources to develop a long term plan, and potential of project management assistance, with financial incentives.
- Vendor Partnerships: This strategy will be coupled with vendor support and educational workshops and classes to provide the full ~~breath~~ breadth of support customers may need to influence their decision to implement energy efficient equipment and practices.
- Statewide Coordination: In order to take advantage of the statewide implementation of the program, the IOU program representatives will meet on a quarterly basis to improve program operations by sharing successes and areas of operational concerns.
- Leveraging Industry-Specific Resources: We will make full use of resources available, such as industry trade and professional associations.

d) **Innovation**

One innovation is that the program focuses on energy efficiency savings through not just hardware installation but also documented permanent changes in operations. Further, it covers all energy resources including energy efficiency, demand response, energy storage, combined heat and power, distributed generation, renewables, and emerging technologies.

The products and services are bundled in an integrated fashion to serve the customer's need and are geared towards a value creation solution that helps customers realize that they can run their operations efficiently and also meet their business and regulatory objectives. This

approach brings to market a more customer-centric energy solution that takes into account their short- and long-term energy usage management and planning and helps overcome some of the barriers to making energy efficiency a priority. It also helps industrial customers identify, develop and document energy efficiency improvements and their economic benefits.

With the introduction of the new CEI product and services, ~~the customers~~ now play a more active role in managing their energy usage and GHG reduction. Bundling the program offerings (energy audits, calculated energy savings, deemed energy savings, and continuous energy improvement) makes it easier for customers to participate in a one-stop shop program. Integrated offerings will also garner significant gains in energy efficiency and make the goals envisioned in California's ~~long-long~~-term energy efficiency Strategic Plan a reality.

In addition, this approach will enable industry to integrate AB32 requirements such that industrial facilities can use energy efficiency to meet and exceed regulatory requirements for GHG emissions and can also aid in water conservation, waste disposal and ~~improve~~ air quality improvement. It also moves the program towards a more holistic approach in managing all energy resources utilization, which includes energy efficiency, demand response, energy storage, combined heat and power, distributed generation, renewables and emerging technologies.

Another innovation used in the program design is the creation of the infrastructure for a statewide centralized technical resource to enable customers to seek energy efficiency information and best practices to manage their energy resource. It provides a resource otherwise unavailable due to business resource limitations.

A ~~web-web~~-based technical resource is envisioned that includes tools to help customers calculate their energy savings. -Also ~~web-web~~-based training may be offered in energy efficiency and energy management. It would also link the customer to industry sites that may offer industry-specific information e.g., the latest trends in industry for energy efficiency.

This resource center will be developed on the existing EDR (Energy Design Resource) website and will be readily available to customers. It is another avenue to increase awareness of energy efficiency opportunities by customers, industry consultants and suppliers that was identified as a barrier to the adoption of energy efficiency.

Some of the outcomes from this innovative program approach are listed below:

- IOUs establish a stronger presence with trade associations and community groups, enabling a deeper understanding of customer needs and how energy efficiency can be a part of their solution to their primary concerns. This will enable a deeper and more effective penetration of energy efficiency solutions to a broader base of customers.
- Integrated Energy Efficiency Assessments are offered to provide targeted Industrial, food processing, and water customers with a holistic approach to maximizing energy efficiency, maximizing investment efficiency and maximizing GHG reductions.
- IOU assistance makes customers aware of renewable energy opportunities, with emphasis on system available for California Solar Initiative, Renewable Generation, Department of Industrial and other incentives, grants and rebates.

- Web-based services, including energy efficiency information, training, and modeling tools, are available to help customers with retrofit or new construction projects, via a new enhanced “Energy Design Resources” website.
- Training is designed to strategically target internal personnel, vendors and trade associations, and customers in a focused alignment, which will create a synergistic effort that will overcome many informational and transactional barriers.
- Seminars are offered to train customers on how to identify energy efficiency opportunities at their facility/in their process. Class-room software tool training is available on modeling and quantifying savings opportunities. ~~Utilities IOUs~~ may also provide a PDA energy efficiency tool or tools from the statewide ~~utility IOU~~ tool lending library that customers can use at their sites.
- Energy measuring and benchmarking assistance/services are offered to customers so they can see how their facility/process measures up to “best in class” systems utilizing tools such as the U.S. EPA’s Energy Star Benchmarking tool.
- Information on “green” energy opportunities is provided when doing basic audits or in-depth assessments. Education and training on green and renewable energy opportunities ~~are will~~ be available on the EDR website.
- Assistance is offered to help customers quantify the carbon emissions savings that EE opportunities identified during audits and assessments offer.
- A web link will be developed between customers and the California Climate Registry to document a plant’s carbon footprint.
- Trained personnel help ~~(a)~~ identify, assess and make available to customers an integrated assessment tool and ~~(b)~~ train customers on the use of the tool, ~~to empower~~ empowering customers to identify the best EE opportunities at their facilities.
- ~~An Application~~ Application process improved for statewide consistency, ~~making~~ it easier for customers to participate in the program.

e) **Integrated/coordinated Demand Side Management**

Integrating the portfolio of ~~utility IOU~~ offerings to include energy efficiency, demand response and distributed generation—as well as other resources, such as air and water as they connect to energy—supports ~~not only future~~ cost-cost-effectiveness of the portfolio and the CA loading order instituted by the California Energy Action Plan. Integration serves the needs and wants of our customers, who are interested in any energy solution that solves their problems and meets their business needs. It also advances significantly the goals of the Strategic Plan. On a broader scale IDSM also includes the integration of Third-Party programs and Local Government Partnerships (LGP) delivery channel with the statewide industrial program.

Customers prefer a single ~~utility IOU~~ point of contact ~~who know that understands know know~~ multiple options, ~~and~~ They benefit from a single, coordinated planning process that helps them prioritize integrated investment decisions based on their unique needs. To that end, the statewide ~~utilities IOUs~~ have made tremendous progress in advancing integrated solutions. These include:

- Marketing

In marketing integration, the IOUs are placing major emphasis on getting the right message to the right customer at the right time. Advanced customer segmentation is being used to develop detailed integrated marketing and outreach plans which outline multiple tactics, delivery channels and key messages to target to specific customers based on their specific needs. The account representatives, who serve as the key customer point of contact, will be trained to ensure consistent delivery of portfolio offerings.

- Education and training

Workshops organized around a customer segment provides an ideal situation to integrate customer energy solutions. Building on past successes of providing integrated workshops to customers, the utilities IOUs will offer workshops that provide opportunities to cross-sell solutions and share key information from other utility IOU departments. As appropriate, Workforce Education and Training will also cover integrated energy and system solutions, which will be increasingly important as Critical Peak Pricing matures.

- Integrated Audits

These will combine funds and resources of energy efficiency and demand response programs. They will provide integrated recommendations to customers that emphasize energy management in proper sequence, as supports the CA Loading Order, which calls for permanent reductions through energy efficiency before implementing demand response. Incentives from both programs can help reduce payback cost and support advanced energy management decisions. Demand response opportunities will be targeted in the larger facilities, particularly as part of monitoring-based retro-commissioning efforts, where controls to facilitate demand response efforts would be installed.

Integrated audits combine funds and resources of energy efficiency and demand response programs to provide integrated recommendations to customers that emphasize energy management in proper sequence, in support of the California Loading Order. Incentives from both programs can help reduce payback cost and support advanced energy management decisions. Demand response opportunities will be targeted in the larger facilities, especially as part of monitoring-based retro-commissioning efforts where the controls to facilitate demand response efforts would be installed. Additionally, any energy efficiency audits required for participation in distributed generation programs will be expanded to include DR opportunities when appropriate and thus address the three facets of DSM integration.

As required, utility IOU distributed generation programs require that customers receive an energy audit before being eligible to receive solar audits.

Program collaboration with Emerging Technologies and CEC is expected to include pilot projects and market acceleration assistance for market-ready products in the general categories of day lighting, lighting, HVAC, controls, and building envelope improvements.

**Formatted:** Indent: Left: 0.5"

Over the last few years, traditional DSM programs have shown that successful customer participation in one program often leads to repeat participation in the same program or other similarly related types of programs. Nonetheless, cross-marketing DSM programs with these customers remains a challenge, due to program-specific silos. To eliminate these silos, the Program will leverage lessons learned from past program experience and offer comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that these two efforts are at odds with each other, as both programs reduce the potential for each other's financial incentives to the customer. For example, energy efficiency may reduce the overall baseline that serves as the basis for the demand response program's incentives. Also, benefits from long-term energy savings derived from technological measures often outweigh the temporary demand reduction benefits derived from behavioral actions. To overcome this barrier and maximize the potential of both programs, additional incentives will be paid for energy efficiency measures that enable demand response.

A secondary issue when integrating energy efficiency and demand response programs is that communication messages for both types of DSM programs are often not coordinated, since energy efficiency is typically technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer "event season" and wane throughout the remainder of the year. To overcome these differences, the program will offer integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable. Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response, as well as energy efficiency, programs.

In summary, the program seeks to overcome the many issues raised by integration of energy efficiency and demand response by focusing on several tactics:

- Promoting and setting incentives for demand response in such a way as that helps ensure that energy efficiency is completed first to maximize potentials;
- Integrating and coordinating year-round marketing (e.g. applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g., customer size);
- Providing unified technical assistance through enhanced energy efficiency and demand response audits through the TA Program to allow for cross-harvesting opportunities;
- Integrating presence on utility IOU websites; and
- Coordinating regular meetings between energy efficiency and demand response program management.

Formatted: Font: 12 pt, Not Bold, No underline

During the current cycle, funding for energy efficiency and demand response must remain non-commingled; therefore payments will be split between the two programs, as appropriate.

**f) Integration across resource types (energy, water, air quality, etc)**

California's industrial sector faces a multitude of environmental and regulatory challenges that affect their competitiveness and, in some cases, survival. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

To help deal with these challenges, the industrial program will coordinate with the regulating agencies and the programs they are operating to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities.

~~Utilities-IOUs~~ will continue to offer targeted trainings to customers who share common regulatory challenges, in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 industrial targets.

~~Utilities-IOUs~~ will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities will help reduce administrative cost and has a greater impact on societal benefits. ~~Currently the utilities are participating in the CPUC water/energy pilots with several water agencies. The results from this pilot may spur more partnerships between the utilities.~~

Where applicable, the Program will integrate topics such as GHG reduction and water conservation into targeted customer workshops, and marketing and communications, building on a strong track record from the past program cycle. Marketing and communications material will include savings opportunities and messaging,

Formatted: Font: TimesNewRoman

Formatted: Indent: Left: 0.25"

**g) Pilots**

The Statewide Industrial Energy Efficiency Program will coordinate on a statewide level to ensure the program is continuously updated and enhanced throughout the ~~three-two~~-year implementation cycle. Pilots may be developed at that time in response to customer's needs or to further advance the goals of the Strategic Plan. ~~A current program of note is the water and energy pilot program.~~

~~The IOU's intend onto implementing methods to gather and retain more detailed performance and usage data on a pilot basis. This will to determine the more effective methods and to achieve savings. Exploring incentives for sub-metering is an option, as is expanding the tool library in lieu of incentives.~~

~~A current program of note is the water and energy pilot program.~~

Formatted: Indent: Left: 0.25", Space After: 0 pt

Formatted: Font: 12 pt, Not Bold, No underline

**h) EM&V**

SCESCG plans to continue work with other utilities and the Energy Division to develop a complete plan for 2010-12 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.

The IOUs- SoCalGasSCG is are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases, after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided here.

Formatted: Indent: Left: 0"

Because the segment approach is a significant change from recent core programs, a preliminary process evaluation will be conducted during the first program year to determine how well the new program elements are operating, and to obtain recommendations on how to improve program operations. After the beginning of the last program year, a full process evaluation will address researchable issues based on the program theory and logic model. These issues will include, but not be limited to, the following:

- Whether program incentive levels for the deemed savings and the calculated savings elements are sufficient, not enough, or more than necessary to motivate program participation, while minimizing free ridership.
- Whether direct install elements are penetrating the intended markets.
- Whether the integrated energy audit element is inducing customers to take advantage of other program offerings, like the rebates.
- Whether the continuous energy improvement element is successful in getting corporate commitments to an EE Strategic Plan.
- How well the industrial sector activities are supporting the Strategic Plan.
- How well the core industrial activities are coordinated with other industrial program offerings, to leverage resources.
- How well program marketing supports and complements the marketing efforts of other IOU demand-side management programs.

Formatted: Indent: Left: 0", Firstline: 0"

To address these issues, the following major evaluation tasks will be completed: —

Formatted: Indent: Firstline: 0"

- *Logic model and program theory.* The logic model and program theory will establish a starting point for all evaluation activities. The structure of the logic model, which links program activities and expected outcomes, will be a useful instrument for identifying specific program assumptions that can be tested using a survey or other primary data collection activities.

Formatted: Indent: Left: 0"

Formatted: Indent: Left: 0", Firstline: 0"

**Formatted:** Font: 12 pt, Not Bold, No underline

• ~~*In-depth interviews.* In-depth interviews will be conducted with program managers and other key staff members. Program staff members will clarify program goals and gauge program progress, provide valuable insight into daily operations, and proposed research topics to be addressed during the evaluation. The coordinated activities of the Business Customer Division personnel and the EE Division program managers will be an important focus of this redesigned program approach.~~

• ~~*Participant survey.* The primary data collection instrument will be a participant survey, fielded over the phone. Some will be conducted in person for selected key customers with large savings, complex projects, multiple sites, etc. The surveys will explore the participant experience with program services and address the research issues identified by the logic model.~~

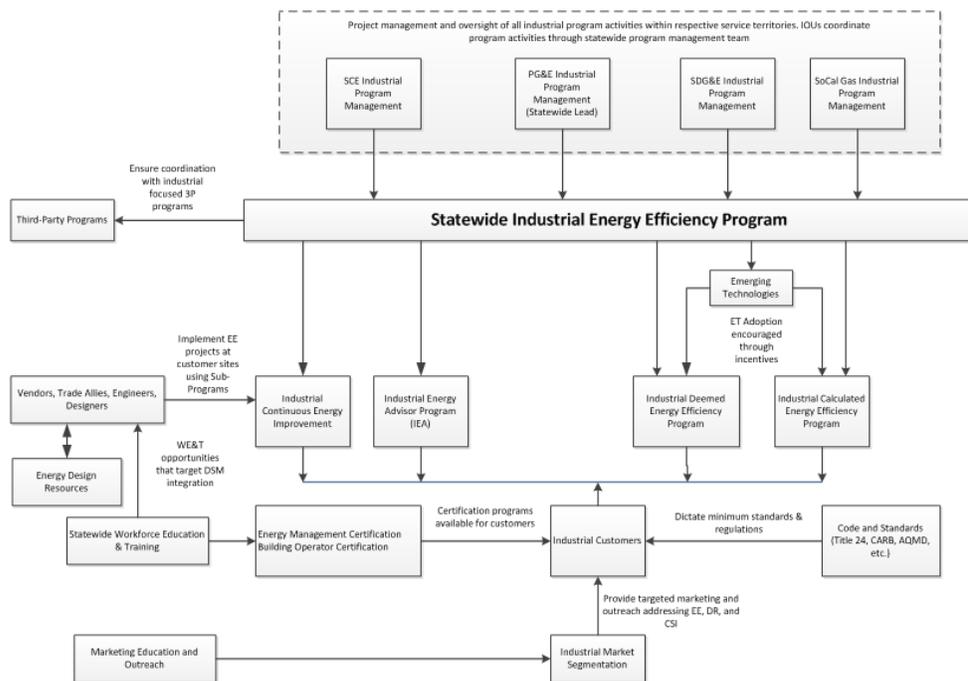

• ~~*Program specific data collection and review.* Another key evaluation activity will involve a comprehensive review of all program documents. In particular, this evaluation will assess the effectiveness of the program's marketing materials and will identify which specific recommendations have been implemented.~~

**4. Program Description**

**a) a) Describe program**

The purpose of the Statewide Investor Owned Utilities (IOUs) have created the Industrial Customer Services Energy Advisor Energy Audit Program (ICSPEA) to bring together is to provide energy analysis services leading to improving the energy efficiency of industrial facilities in California. The energy audit will recommend measures for energy efficiency, but will also include demand response and distributed generation. The audit will recommend emerging technologies and greenhouse gas reductions.

**Formatted:** Indent: Left: 0", Numbered+ Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 3 + Alignment: Left + A Ligned at: 1.63" + Tab after: 1.88" + Indent at: 1.88", Tab stops: 0.25", List tab + Not at 0.5" + 1.88"

The Industrial Energy Audit Program is part of a suite of programs within the Statewide Industrial Energy Efficiency Program. The Industrial Energy Audit Program will be designed to lead customers to the incentive and long-term programs, namely:

- Industrial Deemed Energy Savings Program
- Industrial Calculated Energy Savings Program
- Continuous Energy Improvement Program

Several types of energy audits will be available from SCE SoCal Gas SCG and standardized under one the statewide program all services :

**Remote Audit**

The Remote Audit element is designed as a “do it yourself” audit tool that is offered to support customer customers in various formats including, but not limited to, web based, mail-in, and telephone based. The audit results will be available in English as well as other languages based on particular demographics for each IOU service territory. Target customers will be those under 200 kW in maximum demand.

**Integrated Energy Audits**

The Integrated Energy Audit (IEA) is designed to help customers understand and identify their energy usage and provide concrete suggestions for maximizing energy efficiency, demand response, and distributed generation options. The goal is to educate customers and

Formatted: No underline, English(U.S.)

offer implementation guidance to bridge the education and participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities. /action gap.

IEACPS was created to provide a streamlined and coordinated assignment. A full spectrum of right-sized customer solutions. The key is to start the process with an initial analysis of a customer's needs, determination from the analysis which audit will service the customer with the highest cost/benefit, and identify additional program support and key indicators that will motivate the customer to implement energy saving recommendations.

The IOUs anticipate the restructuring of ICSPPEA will affect the way audits are provided. ICSPPEA will enhance the IOUs' ability to match customer need(s) with the right audit service. This will result in an increased cost-effective delivery of these audit services with an increased expectation for customer adoption/installation of provided customer specific recommendations.

In its offerings, ICSPPEA will place an emphasis in deep energy saving measures and emerging technologies, where appropriate. When the technologies and customer opportunities are correctly aligned, customers will become more open to the benefits these technologies offer to their business and will therefore increase their acceptance and adoption.

Together the ICSPPEA offerings will work to support the achievement of Strategic Plan objectives across all segments (agriculture, commercial and industrial).

The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

The Industrial CSPPEA package consists of five distinct offerings:

- **Benchmarking** is the first step for a customer to begin to understand the energy use of their building. Benchmarking is an initiative designed to educate and motivate customers to measure and track the energy use of their facilities, to educate customers of the benefits of benchmarking their facilities and to show them how they can track the impact of energy savings after implementing energy saving measures. To support the customer's efforts, the IOUs will offer technical support, hands-on workshops that will provide customers with information about how to benchmark, how benchmarking can be used as an energy management tool and what to do next after benchmarking.

The IOUs will develop or continue Benchmarking initiatives that support the customers' ability to comply with AB1103 benchmarking requirements (upon its implementation), utilizing ENERGY STAR Portfolio Manager and IOU supported Automated Benchmarking Services.

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

The IOUs will also continue to offer customers technical support ranging from email and phone hotlines, hands-on workshops and web-based benchmarking educational and instructional materials.

They will continue their support to identifying, evaluation and make information about other benchmarking tools available.

The primary focus for benchmarking activities will continue to be centered on commercial buildings (in alignment with the target building type of AB 1103).

- **Industrial Continuous Energy Improvement (CEI)** is a consultative service aimed at helping industrial customers (IOUs will target CEI services inline with market segment potential in their service territories and resource availability) engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of IOU customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices which address energy savings, reduction of greenhouse gas emissions and water conservation, through high-level energy commitments from executive and board-level management.

Formatted: Fontcolor: Black

Formatted: Indent: Left: 0.75", No bullets or numbering, Tab stops: 0.75", List tab

CEI offers customers the pinnacle of audit offerings, guiding executive management to levels of energy management self-actualization that make energy and environmental issues a consideration in all management/business operational decisions and in long term energy planning. For additional information about CEI, please consult the Industrial CEI Program Implementation Plan.

- **Non Residential Audits (NRA)** The Transition Period will provide ~~services will be offered to customers in support of the~~ Integrated Comprehensive Energy Audits (ICEA) that focus on customer energy savings, cost/benefits, and the targeted delivery of financial and technical assistance. Audit information must communicate complex information in a simple and understandable way to enable customers to identify energy efficiency, demand response and distributed generation opportunities. Audits use "ex ante" Deemed and Calculated methodologies for energy savings analysis information.

Formatted: No underline, Fontcolor: A uto, Not Highlight

As stated above, NRA offers ICEA. In Appendix A, each IOU defines the sub-categories of ICEA that they provide.

In this program cycle, emphasis will be given to meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), streamlining the audit process, increasing its efficiency, lessening complexity, and increasing the

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

effectiveness of influencing customer implementation actions through actions such as integration of the demand response technical audit component directly into NRAs offerings, Demand Side Management (IDSM) portfolio. In addition, the IOUs will investigate ways to implement meaningful financial measurements, such as return on investment and/or simple payback metrics, and to be effective, the financial tool selected should ensure cost assumptions are appropriate to the customer to provide meaningful information. Also, NRA may assume the audit and budget responsibilities for Demand Response's technical audit services, as applicable. It is intended that these audits will be a critical component of the integrated comprehensive audit service offering.

- Pump Efficiency Services is designed to help industrial customers make informed decisions about improving inefficient pumping. IEA will provide Savings Calculation Assistance (SCA) targeted to specific end-uses and systems and operations through recommendations derived from pump test audit or direct observations of processes.

Formatted: Tabstops: 0.75", Left

Formatted: Normal

Formatted: Normal, Indent: Left: 0.75"

The Pump Efficiency Services program element, implemented by a team of trained in house or third party contractors, aims to overcome key informational, technical, and financial barriers to pump optimization by offering pump tests, retrofit incentives, and targeted education, training and technical support for customers and pump companies. Each IOUs database of pump test results will be used in the near-term to target pumps in need of retrofit as a means to capture savings. However, pump performance data aggregation at the statewide level will contribute to the development of metrics and targets for pump improvements. This will support a statewide pumping focus across segments, in agriculture, commercial and industrial, supporting their strategies and objectives.

The IOUs will continue to offer pump testing services at no or low cost and pumping system efficiency workshops through their energy education centers or other event opportunities during the Transition Period.

Formatted: Font: Bold

Formatted: Normal

~~SCA will be provided by SCFSCG engineers or through contracted third party energy engineering firms. They will provide technical assistance by helping participating customers prepare and submit accurate, technically complete retrofit project applications to the incentive programs. This technical assistance will expedite the process and reduce expensive and time consuming rework later in the process.~~

Formatted: Font: Bold, Underline

- **Retrocommissioning:**

The IOUs will continue to enhance their core The Retrocommissioning (RCx) programs. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments.

Formatted: Fontcolor: A uto

Formatted: Normal, Indent: Left: 0.5", Tab stops: Not at 1"

Formatted: Underline

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

The RCx element is designed to optimize existing building or system performance by identifying operational deficiencies and making necessary adjustments to correct the deficiency. RCx is offered to industrial customers, based on the market segment potential and resources of the respective IOU. The range of A “Master List of Findings” results from the initial assessment that identifies low-cost projects with simple payback periods of less than 4 years. These projects may involve measures which reset, repair or replace of existing system controls and components. Simple payback for these measures is usually short in duration and must meet customer expectations. Through Larger-scale retrofit projects that result from the RCx assessment report, comprehensive projects are identified and referred to other sub-programs for completion (i.e., Calculated Energy Savings and Deemed sub-programs). Energy savings from projects identified through RCx will be claimed in the Industrial Calculated Energy Efficiency Program Savings.

Enhanced RCx program elements will explore and may include but not be limited to:

- Innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- Continuous commissioning and monitoring-based commissioning;
- Strategies to drive savings persistence;
- Appropriate alignment with retrofit activities; and
- Overall program incentives, targeting, and delivery.

The RCx program is a key offering in the Industrial Calculated Sub-Program and a more detailed description of the program is provided.

The Transition Period will be used to develop and test the CSPEA design strategy. The strategy focuses on simplifying the way audits are provided to customers. Through various assessment functions, the IOUs will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (i.e. primarily EE, DR, and SG).

It is anticipated that ICSP EA will allow the expansion of services across diverse class of customers, potentially across all segments and will interconnect the customer with the wide and diverse range of programs offered. From a customer perspective, the impact on customer time and resources will be reduced. The audit analyses will include DSM, greenhouse gas reduction information and will provide water conservation recommendation all in a single report. The resulting report will identify comprehensive solutions that will simplify the customer decision-making process.

The primary program objectives for 2013-2014 are:

- Support the Strategic Plan by offering integrated audits across a wide selection that address the full spectrum of energy solutions, including energy efficiency, demand response, and distributed generation (California Solar Initiative and distributed

generation) focusing on industrial facilities as defined by each IOU's market potential and resource availability.

~~Provide a focus on the "MUSH" (municipalities, universities, colleges, schools, and hospitals) market to test ideas for deep energy retrofit efforts~~

- Continue to deliver high value audit reports to the customer. Audit reports will be designed in such a way that they will provide the customer with information which motivates them to implement energy efficiency, demand response and consider renewable generation options.
- Enhance efforts to identify and provide financial analyses focused on deeper energy savings and technologies. Identify ways different financial metrics, such as return on investment and/or simple payback, can be provided where the values presented have meaning to the customer.
- Explore and evaluate the potential of enhanced customer incentive options that are contingent on a customer's receiving an audit prior to applying to incentive programs.
- Incorporate new and/or emerging technologies appropriate for the customer's facility.
- Develop and implement enhancements to current Benchmarking workshops (targeting industrial buildings) and continue providing Benchmarking and AB1103 technical support through established and new delivery channels.
- Encourage statewide consistency by offering similar energy audits with the ultimate goal of offering customers the best energy management practices and technologies.
- Enhance the ICSPEA offerings by including activities such as, but not limited to:
  - Highlighting emerging technologies and deep energy savings opportunities and providing education on long-term energy planning/project management strategies (in coordination with CEI program).
  - Continuing existing water saving services, leak detection services, and strategies which will be offered to customers in all customer segments, as determined by the IOUs to provide customer benefits and cost-effective administration. The services will be offered through the use of audit teams, in house and/or contracted, and may be required as a service in the delivery of all integrated comprehensive audits.
- ICSPEA will play a key role in exploring options for identifying deep energy savings, promoting emerging technologies and providing proper support to customers who take advantage of more than three measures from Industrial Deemed Incentive subprogram.
- ICSPEA will develop processes to assist energy audit teams and customers identify facilities and services that will provide the greatest return on benefits from the audit. The IOUs may explore leveraging tools to complete energy audits, usage analysis, assessments and/or building performance benchmarking as the first step in determining a customer's need.

Formatted: Tab stops: 0.94", Left

Formatted: Tab stops: Not at 0.69"

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

- ICSPEA may also enhance tracking and audit component capabilities to support customer needs analysis, reduce program application barriers, maximize recommendation follow up and streamlined audit report generation.

Features in the audit will include the following:

- Recommendations on no-cost, low-cost measures
- Recommendations on capital intensive measures
- Guidance on participating in other industrial energy efficiency and demand response programs
- Guidance on available incentives from SCE/SCG

Energy audits will be fully underwritten by SCE/SCG.

### b) List measures

The ICSPEA primarily offers non-resource, auditing services. It does not offer incentives, but ultimately influences the customer's implementation of energy efficiency, demand response, and self-generation opportunities in combination with incentive from the core incentive programs (refer to the Industrial Deemed and Calculated sub-programs for specific information). However, each IOU reserves the ability to offer incentives specific to ICSPEA's individual service offerings.

Energy audits will include the full range of applicable end-uses and measures for those end-uses. This will include process changes. The energy audit provides a tool that will lead customers to the measures and incentives offered in the other industrial programs.

### c) List non-incentive Industrial customer services Energy Advisor Services

The Activities conducted under the Industrial Customer Services Energy Advisor Program (ICSPEA) is designed to deliver a coordinated and customer specific service. ICSPEA features a statewide integrated demand side management customer specific solution Energy Audit Program are non-resource that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer's need(s).

Such with direct incentives for actions taken. These activities include, but are not limited to: energy management assessments, energy planning, marketing and outreach, baselining and benchmarking, savings calculation assistance, retrofit project implementation support, scoping, technical support, energy savings calculations, process evaluations and report generation, and web-based energy resources assistance, and incentive application assistance.

## 5. Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Information

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The ICSPEA offers services which change corporate/management cultures that prevent successful implementation of comprehensive energy policies. These offerings, Industrial Energy Audit Program will help overcome customer's lack of awareness of DSM opportunities by providing a customer focused, comprehensive package of energy solutions designed specifically to motivate that the customer to ~~can~~ implement recommendations. Information such as cost/benefit analysis (i.e. ROI, or simple payback) and identification of appropriate through relevant IOU incentive and/or finance programs, can significantly enhance. ~~The audit results summarize the financial cost/benefit of identified projects and include the energy saving effect of utility incentives on the first cost of the facility upgrade.~~ The sub program also addresses the hassle or transaction costs that prevent customers from acting upon the audit recommendation. ICSPEA also provides customers with tools to measure the effects of implemented energy savings actions on ~~This barrier is reduced through the Savings Calculation Assistance, which facilitates the customer's completion of an incentive program application for their bottom line. project(s)~~

ICSPEA brings together audits and related services to implement energy saving activities.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 45**

<u>Program Name</u>	<u>Program Target by 20130</u>	<u>Program Target by 20144</u>
<u>NumberNo. of Audits</u>	<u>25402</u>	<u>25445</u>
<u>Square Footage Benchmarked</u>	<u>1,291,000</u>	<u>1,780,000</u>

**e) Advancing Strategic Plan goals and objectives**

The ICSPEA is designed to promote DSM coordination and the integration strategies of the Industrial Energy Efficiency Program supports all three goals in the Strategic Plan. Foremost are recognition of the linkage between energy and environmental policy and the importance

of integrating energy efficiency, demand response and distributed generation to support California's plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the ICSP&EA include the following:

- Facilitate all State-Owned and Leased Buildings having a Retrocommissioning option.

By offering a dedicated retrocommissioning program, a mechanism is created whereby IOUs can facilitate the achievement of this goal as a coordinated effort with the IOU Government and Institutional Partnership Programs.

- Strengthen Tools and Practices for Building Commissioning.

Based on the IOUs' experience with managing the Retrocommissioning program, lessons learned and best practices can be integrated into the 2013-2014 offering. To increase market adoption of these program best practices, the IOUs will work in cooperation with the California Commissioning Collaborative to disseminate relevant information to the retrocommissioning community. Services may be extended to all segments as deemed appropriate by each IOU.

- Identify New and Improved Tools and Strategies to Reduce Energy Consumption in industrial facilities.

Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the benchmarking, CEI, NRA and RCx demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, industrial/ agricultural processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing agricultural facilities contribute to California's zero net energy goals. Once implemented, recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.

- Encourage State/Local Governments and Major Corporations to Commit to Achieve EE Targets

ICSP&EA's offerings will seek to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop an actionable plan to achieve these goals; (4)

Formatted: Indent: Left: 0.75", Space After: 0 pt

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

### • Develop Tools to Reduce Energy in Industrial Facilities.

As part of the the Industrial Sector. General advancement of the goals is presented in the program implementation of plan for the Industrial Energy Efficiency Program. More specific ICSPEA offerings, the IOUs will partner with energy industry peers, industry associations, and DOE/CPUC-sponsored labs and consultants to enhance the use of existing tools and explore new tools to help industrial customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

- o Management Standard for support of the goals in the Industrial Energy SME2000-2008; Audit Program is presented here.
- o LBNLDOE's Superior Energy Performance; and
- o ISO-50001.

### • Develop Business Models to Deliver Energy Management Solutions.

ICSPEA's offerings will address the fundamental purpose to influence decision-making practices from Industrial customers to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration

Goal 1: Support California Industry's adoption of energy efficiency in the agricultural market sector.

In addition, ICSPEA's offerings promote acceptable practices of accounting, auditing, and evaluation by:

- Offering integrated and focused audits, benchmarking, savings calculation assistance for retrofit and retrocommissioning opportunities; and simplifying the audit-to-project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action.
- Guiding and supporting customers as they implement technologies, processes and practices to achieve *integrating* energy efficiency savings. *with achievement of GHG goals and other resource goals.*

Long Strategy 1.1: Develop coordinated energy and resource management program for CA's industrial sector, to enhance use of energy efficiency

-Near term :- Establish CARB AB-32 Industry Team

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

### Statewide IOU coordination

#### i. Program name: Industrial Customer Services Energy Advisor Energy Audit Program

#### ii. Program delivery mechanisms

~~At the local level, program delivery mechanisms for SCE SoCalGas SCG I will include account representatives, technical services personnel, and communications resources on the telephone and the internet. Also important to program delivery will be customer facility owners and managers; energy efficient equipment manufacturers, distributors, and services contractors; industry trade associations; and others in the energy efficiency equipment value chain.~~

~~At the state level, audit program will be coordinated to unify the implementation of program aspects such as program name, program delivery mechanisms, marketing and outreach plans, and utility program interactions. The Industrial Energy Audit Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.~~

~~The CSPEA will employ a variety of delivery mechanisms or channels. Most of ICSPEA's offering will use IOU customer energy efficiency staff and contractors, service and sales representatives, website and/or marketing, and outreach efforts. Other delivery channels may also be developed.~~

~~In addition, where applicable, IOU customer high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the three year implementation cycle will be enabled.~~

~~SCE SoCalGas SCG's account representatives or program management staff will support this activity within the statewide industrial sector, as well as third parties, government partnerships, and SCE SoCalGas SCG -local programs.~~

~~-N/A. This is a non-resource program. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms~~

#### iii. Incentive levels

Not applicable.

#### iv. Marketing and outreach plans

A comprehensive audit marketing plan for the audit program will be aligned and coordinated with the marketing plans for each of the IOUs, in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs.

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

~~and/or third parties to recruit small businesses and influence them to take actions that result in The IOUs will look to partner with interested public and governmental bodies to proactively promote energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost-effectiveness of reaching customer groups.~~

~~The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, and environmental green actions, in partnership with programs such as the local government partnerships and core IOU programs, green communities.~~

Formatted: No underline, Fontcolor: Black

~~The evaluation studies for the audit program conducted for program cycles 2002, 2003, and 2004 2005 clearly identify energy audits as one of the most powerful tools in creating awareness, enforcing customers' implementation of energy conservation recommendations, and feeding energy efficiency savings realized from retrofit projects.~~

~~California's IOUs have been offering energy efficiency audits and other customer programs and services for more than 20 years. Customers have come to trust the IOUs for comprehensive, unbiased information to guide their energy decisions. The increasingly popular energy audits and information services provide the first no-cost and low-cost recommendations that lead customers to invest further in energy efficiency and other energy management programs. The audits help customers assess energy efficiency opportunities and directly link them to IOUs' energy efficiency incentives.~~

~~Energy audits are often the first step for customers who wish to improve the efficiency of their buildings and/or explore distributed generation options. They can serve as a gateway to other programs in the IOU portfolio, identifying customer options and recommending energy solutions.~~

Formatted: Indent: Left: 0.5"

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

Formatted: Numbered+ Level: 1 + NumberingStyle: i, ii, iii, ... + Startat: 1 + Alignment: Right + A linedat: 0.66" + Tab after: 0.75" + Indentat: 0.75"

~~The program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with industrial customers. **Similar IOU and POU programs** CSPEA's energy recommendations will continue to recognize the regulations required by other bodies. For example, information about GHG reductions resulting from AB32 and water conservation efforts may be incorporated into the customer recommendations and factored into the project's cost-effectiveness, as appropriate.~~

**2013-2014 Energy Efficiency Programs  
Statewide Industrial Energy Efficiency Program  
Program Implementation Plan**

**Formatted:** No underline

**Formatted:** Centered

**Formatted:** No underline, English(U.S.)

Program offerings will collaborate and support the CEC's AB1103 mandate by assisting customers with technical and awareness activities. ICSPEA will advance the introduction of the BEARS and California Rating Tool where reasonable.

ICSPEA recognizes the efforts of the CEC's Green Building Initiative programs, DOE "ISO plant certification" programs, EPA Energy Star Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs. ICSPEA will leverage such activities to the customer's benefit.

~~Over the next three years, the IOUs will seek to increase their interactions with the POUs to better align IOU and POU Non-Residential Audits programs. This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.~~

**a) Program delivery and coordination**

**Formatted:** Font: Bold, Fontcolor: Auto

The sub-program will be coordinated with the following activities, as applicable:

**Formatted:** Numbered+ Level:4 + NumberingStyle:a, b, c, ... + Startat: 1 + Alignment:Left + A lignedat: 0.25" + Tab after: 0.5" + Indentat: 0.5"

**i. Emerging Technologies (ET) program**

**Formatted:** Font: Calibri,11 pt, Underline

The IOU ICSPEA Management Team audit program management team will stay abreast of and incorporate relevant emerging technologies into audit recommendations as appropriate. In addition, IOU field engineers, who deliver IEAs, are active contributors to the Emerging Technology process by their participation in ET Roundtable/Information meetings and continually seek to offer new technologies to customers.

**Formatted:** Indent:Left: 0.63",Hanging: 0.13",Bulleted+ Lev el:3 + A lignedat: 2.13" + Tab after: 2.25" + Indentat: 2.25",Tab stops: 0.75",List tab + Notat 2.75"

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

**ii. Codes & Standards program**

ICISPEA implementation will include information about pending new codes and standards that may affect planning or prioritization of retrofit or new construction projects. Audit reports will include customer recommendations that are consistent with current governing codes.

i.—

**iii. The WE&T efforts**

ICISPEA implementation will integrate with program will work with the Codes and Standards Program to maintain an updated and relevant list of measures that will support savings. As Codes and Standards impact measures, the program will act to align itself with appropriate offerings. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 24 will be reflected recommended measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost-effective technologies/services (e.g., LEDs) made available as these technologies transition from research and development to mainstream program offerings.

Formatted: Font: TimesNewRoman, No underline, Fontcolor: A uto

Formatted: Font: TimesNewRoman, No underline, Fontcolor: A uto

WE&T efforts, as needed, by providing CSI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

Formatted: Font: NotBold, No underline, Font color: A uto

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches, as required.

**ii. WE&T efforts**

Energy audits can support Statewide Workforce Education & Training efforts by including educational information about Certified Energy Manager (CEM) programs and requirements in the audit reports. Such materials could suggest to customers that passing the CEM exam will allow them to conduct facility audits at other facilities that they may have. In addition, increased activities will create opportunities for third party providers who deliver commissioning services such as project scoping, investigations and assessments, air balancing, HVAC quality maintenance, etc.

**iv. Program-specific marketing and outreach efforts**

A broad range of marketing activities will be used to promote audits and elevate customer engagement. Marketing plans will utilize EM&V studies conducted over the years for Statewide and local utility programs which specify necessary steps

Formatted: Indent: Left: 0.63", Bulleted+ Level: 3 + Aligned at: 2.13" + Tab after: 2.25" + Indent at: 2.25", Tab stops: 0.75", List tab + Not at 2.75"

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

~~to be taken to enhance program performance. Audits will be promoted via direct communication between customers and account representatives with support of Project Managers from individual programs, as well as through traditional advertising activities, such as internet, bill inserts, brochures, trade shows, etc. Marketing activities will be coordinated between IOUs, Demand Response and Distributed Generation departments within SCE/SCG.~~

~~**Non-energy activities of program** In 2013-2014, SoCalGas/SCG's ICSPEA marketing campaigns will provide a wide range of action-oriented solutions targeting specific segments and sub-segments of business customers. In addition, ICSPEA marketing efforts will be "bundled" as a menu of demand response, energy efficiency and conservation programs providing customers with a full array of EE and DR opportunities. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.~~

~~Marketing activities will target business customers and select effective channels to reach entities such as trade associations, local business groups, and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support may be utilized.~~

~~Marketing collateral and messages for energy efficiency will be integrated with other IOU programs. Through additional market segmentation and feedback from customers, IOUs will further adjust approaches based on the varied needs of targeted customers. Additional sub-program marketing will be accomplished by leveraging local third-party programs. Specific IOU marketing budgets are provided in Table 1 of the core industrial program.~~

~~Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.~~

~~**v. Non-energy activities of program**~~

~~The IOU ICSPEA team will participate in Statewide and national efforts to develop and enhance audit, benchmarking and retro-commissioning, and continuous energy improvement tools and practices. Such activities will likely occur in conjunction with ongoing industry efforts managed by the California Energy Commission (CEC), Consortium for Energy Efficiency (CEE), ENERGY STAR and the California Commissioning Collaborative (CCC).~~

~~CEI implementation will include non-energy activities such as recognition awards, local area or sector competitions, awareness campaigns, education about non-energy-related~~

**2013-2014 Energy Efficiency Programs**

**Formatted:** Font: Calibri, 11 pt, Bold, Underline

**b) Best Practices**

The IOUs will continue to leverage best practices and lessons learned at regularly scheduled statewide program management meetings. These meetings are forums to discuss program

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

design and implementation issues, and as appropriate provide statewide collaborated guidance in RFP solicitations and awareness of program offerings. This will ensure that customers operating multiple facilities across IOU service territories will receive the same customer experience.

Other best practices approaches apply the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the industrial market sectors. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach will continue through the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

### c) Innovation

For 2013-2014, the IOUs are identifying and evaluating program processes to increase effectiveness, simplification and increase the benefits the program delivers. Each IOU's set of lessons learned from these efforts will be shared and implemented to enhance energy savings benefits to all California IOU customers.

Formatted: Font: Bold, Fontcolor: A auto

Formatted: Numbered+ Level: 4 + NumberingStyle:a, b, c, ... + Startat: 1 + Alignment:Left + A lignedat: 0.25" + Tab after: 0.5" + Indentat: 0.5"

Formatted: Font: Calibri,11 pt, Bold, Underline

ICSPEA will continue to improve as a new standard for packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSMD projects), and reward customers for implementing strategic energy management. Other ICSPEA offerings may also consider specialized incentive approaches based on delivery, target markets and/or other opportunities.

### d) Integrated/Coordinated Demand Side Management

ICSPEA will provide a comprehensive approach for integrated audit services. Its services will have the flexibility of meeting every level of a customer's audits needs from integrated comprehensive audits to targeted or focused audits (which center on specific systems or processes), to assessments or general walk-through audits or online "do-it-yourself" audits (currently for small business customers). When properly applied, these audits can assist in identifying the areas of the customer's greatest energy interest, the customer's financial ability to invest in improving its energy use, and other programs that can be discussed to motivate a customer to move forward with the energy saving plan.

Formatted: Font: Bold, Fontcolor: A auto

Formatted: Numbered+ Level: 4 + NumberingStyle:a, b, c, ... + Startat: 1 + Alignment:Left + A lignedat: 0.25" + Tab after: 0.5" + Indentat: 0.5"

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

a) ICSPEA services can coordinate the audit with retrofitting or retrocommissioning opportunities, benchmarking tools, or long-term planning. Audit reports can present a truly integrated analysis to customers, seamlessly providing information and recommendations regarding energy efficiency, distributed-generation, demand response, greenhouse gas emissions and water energy savings. Customers will be referred to other IOU programs that will help them implement the recommendations resulting from the audit report. As a result, they will receive

To maximize customer outreach, the Industrial Energy Audits Program will sponsor training to interested third party personnel to develop a workforce that will implement energy efficiency products and practices. Many third party engineering firms focus a large portion of their business on supplying the technical resources required by existing IDSM programs. To support the substantial ramp-up of goals envisioned by the Strategic Plan, SCE/SCG can increase the workforce available to California by increasing its training efforts.

One focus of the Industrial Energy Audit Program will be to improve the adoption rate of energy efficiency audit recommendations. As such, staff will provide comprehensive support and establish an extended follow-up plan.

Customers who complete an online remote audit will be targeted for follow up. Mailings and call scripts will be personalized for each customer and will reference specific audit recommendations, based on the customer's online audit report. Following on-site audits, assigned account managers, who are either target market experts or assigned account managers, will contact customers to discuss each recommendation and elicit customer feedback or commitments to implement measures.

The RCx program builds upon the initial feedback from the current RCx program and expands its reach into the industrial segment. Additionally, the audit program will improve existing tools and practices for building retrocommissioning to reduce energy consumption in industrial facilities.

**b) Innovation**

SCE/SCG and the other IOUs will discuss and consider various innovations for customer engagement in energy audits and implementation of energy efficiency, demand response and distributed generation recommendations. Several innovations will be pursued.

**Integration with RCx**

Energy efficiency measures recommended in large target customer (LTC) reports comprise three categories defined by their relative cost for implementation — no cost, low cost and capital projects. IEA is a primary source of leads for potential RCx projects which assist customers with implementation of no cost and low cost EE measures. RCx contractors also share their findings with the LTC program and can recommend that customers pursue a full Integrated Energy Audit before embarking on RCx efforts. In the 2010 — 2012 IEA program, cross training and coordination

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

between the two programs will be increased to encourage optimum effectiveness in achieving an integrated offering of non-residential retrofit (NRR) and RCx projects. To ease implementation of energy audit recommendations, SCESCG will also provide information to customers, such as contractor lists, financial resources and technical assistance, to make it easier for customers to take action in response to audit recommendations.

**Integrated Audit Tool**

To implement the integrated audits for smaller than 200 kW customers, a web-based audit (do-it-yourself or auditor-performed) will be developed that includes education on various demand side management solutions. The Integrated Audit Tool<sup>12</sup> will enable customers to conduct their own energy audits from the comfort of their home or office by logging onto the website. It will be the primary tool to provide energy conservation, energy efficiency, demand response and solar/self-generation information and analyses to customers with less than 200 kW load.

Customers will supply account information, zip code or a telephone number, which will calibrate the tool for their specific microclimate. The integrated audit tool will specifically address potential measures that qualify for rebates and incentives and provide simple payback information. By implementing such features in the integrated audit tool, the audit will extend integration concept to a broader audience.

Additional questions, presented through the latest online graphic interface, will provide robust customization of their end energy use (e.g., type of business, type of building, hours of operation, number of inhabitants, etc.). Reports will be available to customers through e-mail or U.S. mail delivery, based on the customer's request. The integrated audit tool will provide a portfolio of audits that are easily accessible to utility program managers. It will provide them with unified data resources, a central repository of recommendations and algorithms, and an interface to enable customization of energy audit formats to meet specific customer needs.

Historical data from the integrated audit tool, from previous energy audits and efficiency projects implemented at their own facilities, will be accessible to customers via web-based tools.

All IOUs are discussing developing the integrated audit tool as a joint effort to ensure statewide consistency.

**New Technologies**

<sup>12</sup> The integrated audit tool is referenced as a general term in the SW PIPs; each IOU has a specific name for its tool. PG&E's tool is the Progressive Energy Audit Tool (PEAT). SoCal Gas, SDG&E and SCE's tool is the California Integrated Customer Energy Audit Tool (CICEAT).

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

The utilities will utilize new technologies (i.e., wireless and PDA-based checklists) to better enable more audits while targeting specific customer needs.

**Engineering Support**

Third party energy engineering firms will be contracted to assist medium and large customers develop IDSM implementation plans. These customer types will benefit from an enterprise-wide plan for staged implementation of IDSM recommendations. Specialized engineering firms will supplement the customer's site and business specific knowledge with IDSM specific know-how. Together the consultant and client will build a successful plan that results in an optimum installation of energy efficient equipment and processes that enhance the customer's productivity and competitiveness.

**e) Integrated/coordinated Demand Side Management**

The Integrated Energy Audit (IEA) is a core strategy of an overall integrated customer approach. It features a technical and comprehensive survey of energy utilization throughout the customer facility—it provides a system view of equipment and processes that consume energy. In this system view, four discrete components of the Strategic Plan (Energy Conservation, Energy Efficiency, Demand Reduction and Self Generation) are blended and evaluated in various combinations. These combinations will be reviewed for their societal benefits, logical order, and customer benefits, and then presented to the customer in the recommendations section of the IEA final report.

The Integrated Energy Audit blends a site survey, customer input regarding their needs and the guidance provided by the Strategic Plan to produce a final energy audit report. The report's recommendations are designed to achieve reduced energy consumption, reduced environmental impacts and increased productivity and economic viability for the California economy.

Customers will receive a strategic plan that utilizes RCx, NRR, DR, DG and Third Party programs to long-term cost-effective energy management. The plan may lead customers to make sound decisions based on economical (ROI, payback period, etc.) and societal benefits of introduced energy management opportunities along with multiple options to participate in utility incentive programs. Audit process, final report and follow up activities are designated to integrate services and minimize disruption of customer core business activities while maximizing effects of provided recommendations. During the integrated audit process an auditor analyzes and describes multiple energy efficiency, time-of-use management, demand response, self-generation measures and recommendations. Then an auditor will recommend a course of action to craft an integrated solution that is tailored to customer specific business needs and requirements.

The following examples illustrate how the integrated process will be implemented utilizing available programs and services:

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

Formatted: No underline

Formatted: Centered

Formatted: No underline, English(U.S.)

- After an Integrated Energy Audit is completed, no-cost/low-cost energy conservation measures may be transferred to the retrocommissioning program for implementation.
- Capital investment measures selected by a customer will become a subject to a more rigorous calculation of energy savings under Saving Calculation Assistance service. These calculations may accompany the application for a retrofit project filed with incentive program to fulfill technical support requirements.
- Demand response measures can be evaluated for their applicability for daily use (they may eventually become an energy efficiency measure), load shifting and occasional response to demand response events.
- Measures that require retrofit work and are accepted by a customer for implementation would be included in the same application as energy efficiency measure for potential incentive under Technology Incentive program.
- Distributed generation opportunities and benefits will be presented to the customer with particular references to respective incentive programs.

### **Supporting Market Sectors**

The IEA will support the Industrial market segment by developing sector experts among the engineering firms that conduct LTC and by embedding artificial intelligence into the UEAT that translates sector marketing and technical expertise. In Large Integrated Audits, Target Market Project Managers (TMPMs) within the sectors will be an integral part of a team consisting of the TMPM, the assigned customer account representative and the audit firm project lead. This team will translate sector specific market and technical information into a strategic approach to the customer's energy use by incorporating Energy Conservation, Energy Efficiency, Demand Response and Self Generation.

SCE~~SCG~~ will provide training and guidance to third party program vendors to broaden their audit focus beyond their program offering in order to identify potential in other end use systems. In this way SCE~~SCG~~ will minimize inefficient and, to the customer, often annoying multiple visits. Expanding the scope of Third Party program vendor audits will provide customers with additional opportunities through combinations of equipment upgrades in conjunction with other Third Party program vendors.

Both LTC and MM audits will provide leads to appropriate Third Party program vendors based on audit report recommendations. The Integration Desk will provide this service for the LTC and the UEAT will provide potential opportunities via automated selection based on survey input.

#### **d) Integration across resource types (energy, water, air quality, etc)**

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the resource programs in order to maximize

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**Formatted:** No underline

**Formatted:** Centered

**Formatted:** No underline, English(U.S.)

effectiveness, integrate offerings, and refer customers to relevant DSM programs. SCE/SCG will also look to partner with interested public and governmental bodies to proactively promote energy efficiency and environmental green actions, in partnership with programs such as the local government partnerships and green communities.

**Formatted:** Normal

**Formatted:** No underline, Fontcolor: Auto

**Formatted:** No underline, Fontcolor: Auto

The IEA program will serve as the foundation for integrated offerings by providing customers with comprehensive information and recommendations around energy efficiency, distributed generation, demand response, green programs, such as ClimateSmart program, and other relevant programs. Customers will be referred to eligible SCE/SCG programs and will be given a complete picture of their energy usage and options for reducing costs and using energy more efficiently.

**e) Integration Across Resource Types**

ICSPEA will focus on DSM integration.

ICSPEA implementation will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IOU ICSPEA managers will partner with the appropriate programs, when applicable, with government agencies in order to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers.

Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote ICSPEA offerings, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, IOU program managers will collaborate with the local water districts to produce marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects.

**4. Program Description**

**a) Describe program**

The purpose of the Statewide Industrial Calculated Energy Efficiency Program is to provide services to improve the energy efficiency of industrial facilities in California, including financial incentives based on calculated energy savings. The energy savings are calculated for measures installed as recommended by comprehensive technical and design assistance for customized projects. Integrated projects are encouraged to combine energy efficiency and demand response. Eligible projects include new construction, retrofit, and retrocommissioning.

The Calculated Energy Efficiency Program is part of a suite of programs within the Statewide Industrial Energy Efficiency Program. The Calculated Energy Efficiency Program is utilized for projects where:

- a rebate is not available through the statewide Deemed Energy Savings Program,
- customized calculations provide the most accurate savings estimates, or
- interactive effects between measures are best captured through whole building or whole system modeling.

Formatted: Normal

Formatted: Normal, Indent: Left: 0.25"

Because it presents a calculation method that can consider system and resource interactions, the program will become the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan).

Key features in the process include:

- Energy audits of facilities and processes with recommendations for energy efficiency, demand response, distributed generation technologies as well as opportunities for ~~and~~ greenhouse gas reductions;
- Calculations/estimates of energy savings for exceeding Title 24 code or industry standard practice baselines;

Formatted: Normal

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

- Technical assistance from IOUs through SCE SoCal Gas SCG in energy audits, facility walk-through surveys and calculated savings analyses that consider specific projects;
- Submission of project proposal for IOU SCE SoCal Gas SCG review and approval;
- Pre-inspection by IOU SCE SoCal Gas SCG for the preliminary approval of approved retrofit projects;
- Post-inspections on approved and completed projects to verify performance; and
- Payment of incentives from IOU SCE SoCal Gas SCG.

Energy audits may be completed by customers directly or authorized participants. Authorized participants project sponsors. Sponsors may include contractors, design teams, vendors, and energy service companies. The completed audit may then be submitted for review and approval.

For the energy audit feature, statewide consistent calculators are publicly available. The statewide IOU utility created and maintained SPC Calculator can be used for retrofits and some new construction applications and is available online, and through CDs. For whole building construction projects, IOUs typically utilities accept calculations generated with programs such as both Energy Pro, Trane Trace 700, Carrier HAP (available for license), and the IOU utility sponsored eQuest (EQUEST, available for free on the statewide Energy Design Resources website [www.energydesignresources.com](http://www.energydesignresources.com)), among others. Calculations must be submitted in open, unlocked, native format for review and consideration in the IOU's programs [www.energydesignresources.com](http://www.energydesignresources.com).

Retrocommissioning (RCx) is also eligible in the program for delivering energy savings. RCx is a systematic process to identify and correct operational problems or inherent repair and maintenance deficiencies that lead to excessive energy use. Unlike retrofits, which focus on equipment replacement, or operations and maintenance, which deal with routine maintenance, RCx focuses on identifying and correcting problems that may not be readily identified by a standard energy audit.

O&M items with an effective useful life greater than three 3 years can also be identified through this assessment. Additionally, opportunities often exist to optimize existing systems to operate more efficiently than originally designed with minimal new capital outlay.

RCx will be offered as a bundle of products/services. RCx providers will perform several tasks to identify measures. These tasks include, but are not limited to:

- Initial benchmarking;
- Collecting data to quantify the owner's operational requirements;
- Performing detailed on-site audits to evaluate operational deficiencies and/or operational optimization opportunities, inclusive of improved and enhanced preventive maintenance and repair programs;
- Define measures, quantifying implementation costs and savings;
- Assisting customers with measure implementation;

Formatted: Normal, Indent: Left: 0.25"

Formatted: Normal, Indent: Left: 0.25"

Formatted: Normal

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

- Verifying completion of measures;
- Providing post installation documentation and training as well as other persistence techniques; and
- Posting project benchmark.

**b) List measures**

A broad range of measures is eligible for the Calculated Energy Savings Program. The current incentives are summarized, as seen in the following table. The incentives for these measures are standard across the IOU utilities participating in the statewide Industrial Calculated Energy Efficiency Program.

The following measure categories are eligible for Calculated Incentives:

- Lighting
- AC & Refrigeration
- Motors and Others
- Gas measures

<u>Measure Type</u>	<u>Incentive Level (kWh/kW)</u>
<u>Lighting</u>	<u>5 cents per kWh + \$100/pk kW</u>
<u>AC &amp; Refrigeration</u>	<u>15 cents per kWh + \$100/ pk kW</u>
<u>Motors and Others</u>	<u>9 cents per kWh + \$100/ pk kW</u>
<u>Gas measures</u>	<u>\$1 per therm</u>

Financial incentives are calculated in several steps:

- Calculations of estimated energy savings above Title 24 or from a baseline energy use
- Calculation of incentives per unit of energy savings times the estimate of energy savings by measure
- Estimate of project costs for retrofit projects or incremental cost for added load projects
- For retrofit projects, incentives are capped at 50% of the total project costs, or the calculated incentive, whichever is less.
- For added load projects, incentives are capped at 50% of the incremental project cost, or the calculated incentive, whichever is less.

**c) List non-incentive Industrial customer services Energy Advisor Services**

The Industrial Calculated Energy Efficiency Incentives Program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical and calculation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd the project through the process.

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 3 – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 4 – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The Industrial Calculated Energy Efficiency Program includes numerous features designed to overcome these barriers, as identified and discussed below.

Formatted: Tab stops: 0.25",Left

Formatted: Normal,Indent: Left: 0.25"

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**Integrated Demand Side Management Approach**

The program offers California's industrial segment a statewide suite of products and services to overcome market barriers to optimize energy management and meet the goals of the Strategic Plan. It overcomes multiple barriers through the implementation of strategies that provide an integrated solution to the customer, offer education and outreach to create awareness and promote continuous energy efficiency improvement. The program also enables a facility to attain resource management levels that exceed industry standards and gain them market and worldwideworld-wide recognition.

**CEI Program Offering**

The Continuous Energy Improvement (CEI) program compliments the Industrial Calculated Energy Efficiency Program by helping customers implement energy efficiency measures that have been identified through energy efficiency audits or in-depth facility/process assessments. Such assessments may be jointly provided by the IOUs and the U.S. Department of Energy (DOE) or ANSL. It focuses on improving production and optimizing energy efficiency and provides integrated resource management solutions including greenhouse gasGHG reduction. This approach overcomes such barriers as lack of awareness of energy efficiency opportunities and provides a highly skilled workforce educated towards energy efficiency, process optimization, and resource management.

**Marketing and Outreach**

To increase awareness of the program, a statewide centralized clearinghouse will be developed to give customers access to information on operating best practices in energy efficiency, industry relevant technical assistance, baselines, case studies, tools and computer based training. This clearinghouse addresses the issue of availability of information and qualified industry specialists to fully assess a building, system or process and help customers understand how energy efficiency can impact their emissions, resource consumption or waste discharge streams. It helps alleviate the problem often run into by non-residential customers of getting incorrect or out-of-date information from some local networks. It will also enable design engineers to specify energy efficient measures to exceed industry accepted baseline standards when constructing new or retrofitting existing buildings or systems, instead of specifying only what they know or what they are familiar with.

The program'sStatewide Program information and services will primarily be delivered primarily through account representatives, IOU; utility call centers hotlines, local government partnerships, third parties, and IOUutility internet sites. Information will also be made available through industry events, such as the Plant Engineering Expo, through industry organizations, such as the California Manufacturing Association, and the Building Owners and Managers Association (BOMA); and through advertising in industry and trade publications. Other avenues to reach out to customers and identify energy efficiency opportunities include non-resource programs such as that provide Education and Outreach, Workforce Education and Training, or through IOU-Emerging Technologies Programs.

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**Education and Training**

Highly skilled Energy Management Professionals may conduct technical training and seminars to educate the public as well as develop a highly trained energy efficiency workforce that is accessible to industry.

**Emerging Technologies (ET)**

In collaboration with ET and the CEC, ET may conduct studies, pilots, and demonstrations to prove the viability of promising emerging technologies and lower the risk of investment which in turn will speed up market penetration.

**Financial Assistance**

Rebates and incentives properly priced and based on energy savings quantified through technical assessments or basic audits, can help customers overcome internal financial hurdle rates. Skilled energy efficiency personnel may also assist customers and provide additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, tax incentives or other local sources of project funding.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	<u>Program Target by 20130</u>	<u>Program Target by 2014+</u>
<u>Projects</u>	<u>TBD+90</u>	<u>TBD230</u>

**e) Advancing Strategic Plan goals and objectives**

The Statewide Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector. General advancement of the goals is presented in the program implementation plan for the Statewide Industrial Energy Efficiency Program. More specific support of the goals is presented here.

Goal 1: Support California Industry's adoption of energy efficiency by integrating energy efficiency savings with achievement of GHG goals and other resource goals.

Strategy 1.1: Develop coordinated energy and resource management program for CA's industrial sector, to enhance use of energy efficiency.

Near-term: Establish CARB AB32AB-32 Industry Team

The Calculated sub-program infrastructure is designed to facilitate the customer's implementation of large-scale projects that are supported by detailed energy calculations. There is an opportunity to augment the various tools used for preparing such calculations with GHG emission information that will allow customers to immediately quantify these benefits. This activity will be managed

**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

through the IOU CARB AB32AB-32 Industry Team, which is proposed as part of the core Industrial Energy Efficiency Program.

Formatted: No underline, Fontcolor: A uto

Goal 2: Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

Strategy 2.2: Implement certification

Near-term: Plan pilot and recruit host sites (8-10 facilities)

Formatted: No underline, Fontcolor: A uto

The program will seek out opportunities to recruit host sites for the certification program by surveying project submittals for potential candidates.

Formatted: No underline, Fontcolor: A uto

Formatted: Normal, Indent: Hanging: 0.3"

Goal 3: Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

Strategy 3.1: Compile technical and resource management regulatory materials into centralized assistance repository.

Formatted: Normal

Near-term: 1) Identify and incorporate priority energy and other data; 2) Develop clearinghouse or integration system.

Formatted: No underline, Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

The Calculated Energy Efficiency Program will give support by providing information on results and experience in the program, including case studies of innovative projects.

Formatted: No underline, Fontcolor: A uto

**5. Program Implementation**

Formatted: Tab stops: 0.25", List tab + Not at 2.25"

**a) Statewide IOU coordination**

Formatted: No bullets or numbering

**i. Program name: Industrial Calculated Energy Efficiency Program**

**ii. Program delivery mechanisms**

Program delivery mechanisms for IOUs, SCE, SoCal Gas, SCG will include account representatives, technical services personnel, incentives processing staff, and inspection officials. Also important to program delivery will be customer facility owners and managers; energy efficient equipment manufacturers, distributors, and service contractors; industry trade associations; and others in the energy efficiency equipment value chain.

Formatted: Normal

Industrial Calculated Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU utility program interactions. The Industrial Calculated Energy Efficiency Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

continuous program improvement over the course of the ~~three year~~ implementation cycle will be enabled.

SoCalGasIOUSCESCG's account representatives support this activity within the statewide industrial~~commercial~~ sector, as well as third parties, government partnerships, and IOUSCESoCalGasSCG local programs.

**iii. Incentive levels**

Incentive levels are based on measure type as detailed below.

#	MeasureName	Per kWh Incentive	Per kW Incentive
1	Air Compressor System Replacement / Upgrade	\$0.09	\$100
2	ASD - HVAC Compressor Motors	\$0.15	\$100
3	ASD - Others	\$0.09	\$100
4	Building Shell Improvements	\$0.09	\$100
5	Carbon Monoxide Sensors	\$0.09	\$100
6	Controls - Non-Lighting	\$0.09	\$100
7	Equipment - Other not specified	\$0.09	\$100
8	Extruder System Replacement / Upgrade	\$0.09	\$100
9	Fan and Pump System Upgrades	\$0.09	\$100
10	Furnace / Energy Efficient	\$0.09	\$100
11	Heat Recovery Equipment (Process)	\$0.09	\$100
12	Heat Recovery Equipment (Space Conditioning)	\$0.15	\$100
13	HVAC - Chiller	\$0.15	\$100
14	HVAC - Complete Subsystem Replacement / Upgrade	\$0.15	\$100
15	HVAC - Heat Pump	\$0.15	\$100
16	HVAC - Other	\$0.09	\$100
17	HVAC - Package Unit	\$0.15	\$100
18	Injection Molding Machine Replacement / Upgrade	\$0.09	\$100
19	Insulation	\$0.09	\$100
20	Lighting	\$0.05	\$100
21	Lighting Controls	\$0.05	\$100
22	Motors Project (HVAC Compressor)	\$0.15	\$100
23	Motors Project (Non-HVAC Compressor)	\$0.09	\$100
24	Precooling Equipment	\$0.15	\$100
25	Process - Chiller	\$0.15	\$100
26	Process - Complete Subsystem Replacement / Upgrade	\$0.15	\$100
27	Professional Wet Cleaning	\$0.09	\$100
28	Pumping System Replacement / Upgrade	\$0.09	\$100
29	Rapid Closing Door	\$0.09	\$100
30	Refrigeration - Complete Subsystem Replacement / Upgrade	\$0.15	\$100
31	Refrigeration - Other	\$0.09	\$100
32	Series to Parallel Street Lighting	\$0.09	\$100
33	Special Window Glazing & Glazing Treatments	\$0.09	\$100
34	Vacuum Systems	\$0.09	\$100
35	Window Replacement	\$0.09	\$100

Formatted: Indent: Left: 0", Firstline: 0.5"

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

Marketing and outreach plans Incentives will be at as follows:

- Lighting, \$0.05/kWh and \$100/kW
- Air Conditioning & Refrigeration I, \$0.15/kWh and \$100/kW
- Air Conditioning & Refrigeration II, \$0.09/kWh and \$100/kW
- Other, \$0.09/kWh and \$100/kW
- Therms, \$1.00/therms, capped at 50% of project cost.

i. The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division and market direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program, e.g. research, target audience, collateral, delivery mechanisms

ii.iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms

The Industrial Calculated Energy Efficiency Program will be marketed through IOU's Account Executives, as well as through trade allies, education, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by Account Executives, Demand Response Program outreach, phone and e-mail support will be provided.

Marketing campaigns will provide a wide range of action-oriented solutions targeted to "personas" identified through segmentation research. In addition, marketing efforts will be "bundled." That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry, IOUs segment utilities will be better able to communicate with and serve customers.

Marketing efforts will incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness, and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized

## 2013-2014 Energy Efficiency Programs Statewide Industrial Energy Efficiency Program Program Implementation Plan

collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Market outreach to raise awareness of available EE programs available will use a number of strategies, as follows including:

- Providing Account representatives will make a regular and consistent customer calling effort to key customers within this sector through account representatives;
- Providing additional expertise from IOU Utility representatives, program management representatives, and field engineers will be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the industrial market sector;
- Attendance at the key trade shows for each high priority sub-segment within the industrial market sector;
- Hosting IOU Utility-sponsored training events at the IOU's utilities Customer Training Centers and other convenient locations within the IOU's utilities service territory;
- Hosting IOU utility-sponsored webinars that provide sub-segment training and program adoption; and
- Linking written Written collateral pieces that give provide an overview of the IOU's utilities Energy Efficiency programs to will be linked into the appropriate IOU utility DSM web page.

The ideal marketing mix will be assessed for maximum awareness and participation. The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above. Furthermore, industrial facilities are recognized as large energy and water consumers. IOUs will develop proposals, as appropriate, to facilitate water-energy nexus projects.

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

### v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable

The Industrial Calculated Energy Efficiency Program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with industrial commercial customers, to the extent possible.- Conventionally, each

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

government agency and IOU utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type.

With respect to water conservation, IOU utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Calculated sub-program incentives for energy efficient equipment that may also reduce water and greenhouse gas GHG emissions.

**ii. Similar IOU and POU programs**

**iii.vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that utilize the Industrial Calculated Energy Efficiency Savings Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) program**

The long-term energy efficiency vision of California can only be attained through the long-term and continuous development, verification, and acceptance of emerging new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the sub-program will consider higher initial incentives for emerging is poised to adopt the efficiency potential of new technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions through its programs. In addition, portfolio staff actively works to incorporate promising emerging technologies from the ET program IOU or PIER funded projects.

**ii. Codes and Standards program**

The program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As cCodes and sStandards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**iii. WE&T efforts**

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Industrial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings take place through IOU's utilities energy centers and technology centers.

Formatted: Font: Not Bold, No underline, Font color: A uto

Formatted: Normal

Formatted: No underline, Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

**iv. Program-specific marketing and outreach efforts**

Marketing and outreach initiatives will include:

- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the industrial sector, as appropriate;
- Attendance at key trade shows within the industrial sector;
- IOU-utility-sponsored training events at the IOU's utilities Customer Training Centers and other convenient locations within the IOU's utilities service territory;
- Hosting of IOU-utility-sponsored webinars that provide sub-segment training and program adoption; and
- Development of case studies, web pages, and marketing material that provide an overview of the IOU's utilities' energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The program provides a significant challenge to integrating DSM initiatives to non-energy activities due to the general industry structure, the nature of market sector resource use, limited resource savings potential with smaller businesses, and limits to small business owner and operator bandwidth. Therefore, integrated audits that look across the various energy efficiency program offerings, as well as complementary options available through other entities (e.g. water agencies), will be used to identify the opportunities to be recommended to the specific industrial/commercial customer.

Formatted: Normal

Formatted: No underline, Fontcolor: A uto

The Water Efficiency Pilot Program's will provide potential opportunities to reduce water use and the potential for associated energy efficiency savings.

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

~~Since some customers within the program sectors are major water users, this sector is well-positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Programs.~~

~~With respect to water conservation, IOU utility program managers will contact the local water districts to co-brand marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Calculated sub-program incentives for energy efficient equipment that may also reduce water and GHG emissions.~~

~~In addition, the program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.~~

**vi. Non-IOU programs**

~~The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.~~

**vii. CEC work on PIER**

~~Not applicable.~~

~~The program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER projects. The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects.~~

~~As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.~~

**viii. CEC work on C&S**

~~Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.~~

**ix. Non-utility market initiatives**

~~The program will support and educate customers, and/or facilitate ~~enforce~~ such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The~~

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**c) Best Practices**

The Industrial Calculated Energy Efficiency Programs sub-program builds upon the more than 10 years of experience that IOUs utilities have offered such a program<sup>1849</sup>. Deeper penetration into industrial process loads will be achieved by closely aligning the sub-program with the Industrial Customer Services Energy Advisor Energy Audits and Industrial Continuous Energy Improvement Programs sub-programs to ensure that there is an avenue for implementing a variety of customer projects. The infrastructure developed by the Industrial Calculated Energy Efficiency Programs sub-program will also be used as the core processing backbone for targeted third-party programs in order to reduce the program administrative and processing costs of those programs.

**d) Innovation**

Innovative aspects of the program include improving major program performance indicators such as accuracy of energy saving calculation, higher realization rate, overcoming energy efficiency barriers, reducing application processing time and administrative costs, and integrated energy management.

For the 2013-2014 new program cycle, California IOUs will implement an have implemented a new incentive structure that emphasizes advanced controls that enable peak demand response motivating reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency and demand response incentive programs as well as signing up demand response programs. During the 2010-2012 program cycle, the new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance.

IOUs will continue working collaboratively on modifications to program Policies and Procedures to address ongoing changes in customer expectations, market conditions and program flexibility. Changes will (a) target ease of program understanding and participation, (b) measure measures eligibility, (c) increase of customer's economic customer economical benefits, and (d) identify policy restrictions that are will be identified as barriers to participation. IOUs are implementing such process based on market studies conducted on the subject and preceding discussion of the policy change. Among other modifications that would be potentially discussed and implemented are incentive caps and, redesign of measure/equipment early retirement according to the CPUC concept and other.

<sup>18</sup> Before 2009-2011, the Calculated Energy Efficiency Program was commonly referred to as the Standard Performance Program or "SPC."

<sup>19</sup> Before 2009-2011, the Calculated Energy Efficiency Program was commonly referred to as the Standard Performance Program or "SPC."

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

IOUs are planning to elaborate and utilize positive experience obtained using SBD Simplified tool and extend it to energy efficiency retrofit projects. Such tools substantially reduce application processing and review time, and minimize the number of hand-offs, without sacrificing accuracy of energy saving calculations.

Formatted: No underline, Fontcolor: A uto

Where possible, IOUs will use an integrated approach to addressing DSM opportunities. Innovative approaches will be used, such as merging energy efficiency and demand response analysis and converting recommendations to projects. -In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions, will maximize customer adoption rates for most cost-effective energy management opportunities.

Formatted: No underline, Fontcolor: A uto

IOUs are planning to consolidate various calculating software such as SPC Software, Engage and other measure specific calculating tools to standardize our calculating methodology. This will ensure that calculations will be more uniformed and consistent amongst all stakeholders. This will not limit the use of nationally recognized standard DOE toolsets for certain measures.

Formatted: No underline, Fontcolor: A uto

IOUs are planning to continue and expand their core RCx program in multiple target markets. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments to correct the system. Measures may involve resetting, repair or replacement of existing system controls and components, and in general are low-cost projects with simple payback periods of less than four4 years.

Formatted: No underline, Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

After an energy audit is complete and applicable no-cost/low-cost measures are identified, the scope of work will be handed -off to a RCx implementer who, in-tum, will follow RCx program protocols, execute the scope of work (measure implementation, EMM&V plan, incentive payment for energy savings, etc.) and report final results to the core program office.

Formatted: No underline, Fontcolor: A uto

The IOUs are exploring innovative means of improving the Industrial Calculated Energy Efficiency Program based on Energy Division direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" and to "raise incentive levels for Emerging Technologies" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Industrial Calculated Energy Efficiency Incentive Program.

**e) Integrated/coordinated Demand Side Management**

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Energy audits will include recommendations for not only energy efficiency, but also for demand response and other demand-side management opportunities. Participating customers will be encouraged to participate in other demand-side management opportunities, including demand response and distributed generation. Participating customers will also be encouraged to take a more comprehensive approach to demand-side management and strive for continuous improvement.

**f) Integration across resource types (energy, water, air quality, etc)**

California's industrial sector faces a multitude of environmental and regulatory challenges that affect their competitiveness and, in some cases, survival. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

To help deal with these challenges, the industrial program will coordinate with the regulating agencies and the programs they are operating to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs/Utilities will continue to offer targeted trainings to customers who share common regulatory challenges in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at small and medium sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 industrial targets.

IOUs/Utilities will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities will help reduce administrative cost and has a greater impact on societal benefits. Currently the utilities are participating in the CPUC water/energy pilots with several water agencies. The results from this pilot may spur more partnerships between the utilities.

Where applicable, the Program will integrate topics such as GHG reduction and water conservation into targeted customer workshops, and marketing and communications, building on a strong track record from the past program cycle. Marketing and communications material will include savings opportunities and messaging.

**Water/Energy Nexus Strategy**

SoCalGas supports improving the efficiency of water systems as one of the most critical strategies to capture water/energy nexus benefits in the energy efficiency programs. SoCalGas plans to focus its efforts in areas that use gas engines as the energy source to deliver and treat water. For water agencies within SoCalGas' territory, we plan to issue an RFP to utilize a contractor to implement leak-loss detection and remediation and pressure

**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

management services applicable to storage, pumping and distribution through SoCalGas' core or Third Party Program. SoCalGas will explore new project ideas for the water/energy nexus, as well as the calculation of ancillary water benefits (e.g. "embedded" energy savings). SoCalGas will accelerate the expansion of cost-effective water-energy nexus programs by coordinating with the other utilities, water agencies, and municipalities to study the cost effectiveness and the embedded energy savings for water/energy efforts. Our intent is to continue to offer measures and services to the water sector through the "calculated" and audit programs. SoCalGas will also explore for new direct energy measures that can be incented under the calculated program. Additionally, we will increase our efforts to capture the water-energy nexus and sustainability in the agriculture, industrial, and commercial segments.

Formatted: Not Highlight

**g) Local Element (Negotiated Incentive Option)**

SoCalGas will provide a local component which will include incentives for energy-efficient retrofits, systems new construction, or replacements of existing equipment at SoCalGas customer sites. Participants may be either customers or energy-efficiency service providers (EESP's) acting as project sponsors for activities at customer sites. To qualify, a project must save a minimum of 1,000,000 therms per year. Associated energy, resource such as water, sewerage and emissions, and Greenhouse gas (GHG) emissions savings will be considered when evaluating a project for funding. A project may consist of a single project at a single site, or may be aggregated from multiple projects belonging to a single customer, and may include a variety of measures.

Formatted: Not Highlight

Formatted: Indent: Left: 0.25"

Formatted: Not Highlight

Formatted: Not Highlight

This local element is designed to serve the largest non-residential customers within the SoCalGas service territory. Non-residential customers in this group are comprised of but not limited to the following industry sub-segments: Government/Utilities, Manufacturing/Processing Industries and Institutional. Each sub-segment has distinct energy use patterns, differences in equipment and facility design, and various management structures and decision-making processes. Because each industry sub-segment is unique, this option will use a customized, customer-focused approach. Participating customers, taking into account their individual energy and resource conservation opportunities as well as internal hurdle rates, will propose or "bid" to SoCalGas the incentive level needed to enable large EE and Resource savings projects. This ensures that this option will be adaptable to the unique needs of each market segment.

The program is designed to be flexible and cost effective: The project sponsor proposes a project and desired incentives. Incentives may cover up to 50% of the incremental project costs less any additional funding received from other sources. Measurement and verification (M&V) is required for all projects. As a performance-based incentive program, the approved M&V report will ultimately determine the energy savings for each project. The total sum of incentives paid for a project may not exceed the amount "bid" by the customer and agreed to by SoCalGas.

Not applicable.

**b) EM&V**

~~The IOUs are proposing IDSM (Integrated Demand Side Management) for Food Processing Program partners with industry, trade allies and others to promote integrated energy management solutions to end use customers in the food processing and refrigerated warehouse segments. The integrated approach combines traditional measures (energy efficiency retrofits/upgrades) along with strategies to help customers manage/reduce their energy demand during peak periods (example: 2:00PM-5:00PM), especially during hot summer days. By combining these two approaches, the customer is provided a comprehensive solution to manage day to day energy costs as well as position their facility to respond to days of high energy use (peak periods) when energy is at it's greatest demand and can be very expensive. While the primary program focus is energy efficiency, the program emphasizes integrated solutions in proper sequence (energy efficiency → demand response) to support the most cost effective and satisfactory energy and financial solutions for these stakeholders. SoCalGasSCG is proposing to~~

~~The concepts of *Continuous Improvement* and *Best Practices* will be woven into the long term solutions provided by the program. The program will deliver an integrated solutions driven approach while leveraging the offerings of IOU's portfolio of incentive based programs. Targeted customers include agricultural: post harvest processors (ginners, nut hullers, and associated refrigerated warehouses) and food processing: fruit and vegetable processors (canners, dryers and freezers), prepared food manufacturers, wineries and other beverage manufacturers.~~

**b) EM&V**

~~SCESCG plans to work with other utilities and the Energy Division to develop and submit a comprehensive EM&V Plan a complete plan for 2010-12 studies and budgets after the program implementation plans are finalized and filed. This plan will include be submitted to the CPUC in time for approval along with the Program Implementation Plans.~~

~~Detailed plans for process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts specific to this program will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the final plans need to will be based on identified program design and implementation issues, and questions.~~

**4. Program Description**

**a) Describe program**

The purpose of the Statewide Industrial Deemed Energy Efficiency Program is to provide services to improve the energy efficiency of industrial facilities in California, including financial incentives based on deemed energy savings. The energy savings are deemed for measures installed. Integrated projects are encouraged to combine energy efficiency and demand response.

The Industrial Deemed Energy Efficiency Program is part of a suite of programs within the Statewide Industrial Energy Efficiency Program.

Key features of the program include:

- Information and technical assistance from SCE SoCal Gas SCG on energy efficiency measures and savings potential;
- Application via mail, fax, internet and phone by customer for eligible measures;
- Reservation of financial incentives by SCE SoCal Gas SCG, if requested by customer;
- Pre- and post-installation inspection by SCE SoCal Gas SCG, as determined by SCE SoCal Gas SCG based on prior participation and other factors; and
- Payment of incentives from SCE SoCal Gas SCG.

Formatted: Normal

**b) List measures**

Itemized retrofit measures have prescribed energy savings and incentive amounts. These measures are categorized under the following end uses:

- Lighting
- Air conditioning
- Food service
- Refrigeration
- Industrial Process
- Motors

**Program Implementation Plan**

**c) List non-incentive Industrial customer services Energy Advisor Services —Not applicable**

Formatted: Fontcolor: Black

Formatted: Font: NotBold

The Industrial Deemed Incentives sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical consultation and application preparation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd through the process.

Formatted: Font: Bold

**5. Program Rationale and Expected Outcome**

Formatted: Tab stops: 0.25", List tab + Not at 2.25"

Formatted: No bullets or numbering

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 3 – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 4 – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The Industrial Deemed Energy Efficiency Program is designed to overcome several barriers. The program directly addresses key market factors that lead to higher energy costs for California businesses. Providing a menu of prescribed common measures simplifies the process of reviewing project proposals and provides a "per-widget" rebate that reduces the cost of retrofitting outdated and inefficient equipment. This element makes it attractive for customers to spend money in the short run in order to achieve lower energy costs in the long run.

Formatted: Normal, Indent: Left: 0.25"

Using itemized energy efficiency measures is intended to overcome barriers that prevent many business customers from adopting energy efficiency alternatives. The barriers are addressed by itemizing common energy efficiency measures and rebates, stimulating the supply of high efficiency equipment and products (through higher demand), and offering rebates that help offset higher start-up and down payment expenses for energy efficient retrofits.

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

Furthermore, to ensure equity to all business customer segments, this program will continue to offer statewide-consistent, cost-offsetting itemized rebates to help customers with the cost of installing new energy efficient equipment.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>

**Formatted Table**

**e) Advancing Strategic Plan goals and objectives**

The Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector. The Industrial Deemed Energy Efficiency Program supports at least two goals.

**Formatted:** Normal, Indent: Left: 0.25"

**Formatted:** Normal

Goal 2: Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

Strategy 2.5: Implement ME&O program to educate industry and consumers

Near-term: Form industrial collaboration mechanisms

The Deemed Energy Efficiency Program facilitates participation by allowing customers to apply for program participation in many ways, including mail, fax, internet and phone. SCE SoCalGasSCG will implement marketing and outreach activities through account executives, trade associations, and in numerous other ways to stimulate participation. It will encourage participants to adopt a policy of continuous improvement.

**Formatted:** No underline, Fontcolor: Black

Goal 3: Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

Strategy 3.2: Conduct statewide marketing and education effort to create demand for industrial information clearinghouse.

Near-term: 1) Develop ME&O Plan; 2) Implement Plan

SCE SoCalGasSCG will participate in the development of the plan and then encourage industrial customers to use the clearinghouse as part of the implementation of the plan.

**a) Statewide IOU coordination**

**Formatted:** Indent: Left: 1.75", No bullets or numbering

**i. Program name: Industrial Deemed Energy Efficiency Program**

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**ii. Program delivery mechanisms**

Program delivery mechanisms for SCE SoCal Gas SCG will include account representatives, technical services personnel, incentives processing staff, and inspection officials. Also important to program delivery will be customer facility owners and managers; energy efficient equipment manufacturers, distributors, and services contractors; industry trade associations; and others in the energy efficiency equipment value chain.

Formatted: Tab stops: 0.75", List tab + Not at 1.75"

Formatted: Normal

At the statewide level, the Industrial Deemed Energy Efficiency Program will be coordinated to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU utility program interactions. The Industrial Deemed Energy Efficiency Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.

Formatted: No underline, Fontcolor: A auto

Formatted: No underline, Fontcolor: A auto

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correcting program weaknesses that reveal themselves during implementation, and ensuring achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the two-three-year implementation cycle will be enabled.

Formatted: No underline, Fontcolor: A auto

Formatted: No underline, Fontcolor: A auto

**iii. Incentive levels**

Incentive levels are based on measure type and will be set at uniform amounts across the state. Higher incentive levels will be provided for Emerging Technologies (ET) to spur traction in the market as feasible. The scale of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, therms, equipment cost, other market factors and cost effectiveness.

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The Industrial Deemed Energy Efficiency Program will be marketed through IOUs, account executives, as well as through trade allies, education educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support will be provided.

Formatted: Normal

Formatted: No underline, Fontcolor: A auto

Marketing efforts will incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness, and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not

Formatted: No underline, Fontcolor: A auto

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Market outreach to raise awareness of energy efficiency programs available will use a number of strategies, as follows including:

- Providing Account representatives will make a regular and consistent customer calling effort to key customers within this sector through account representatives;
- Providing additional expertise from IOU Utility representatives, program management representatives, and field engineers will be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the industrial market sector;
- Attendance at the key trade shows for each high priority sub-segment within the industrial market sector;
- Hosting IOU Utility-sponsored training events at the IOU's utilities Customer Training Centers and other convenient locations within the IOU's utilities service territory;
- Hosting of IOU utility-sponsored webinars that provide sub-segment training and program adoption; and
- Linking written Written collateral pieces that give provide an overview of the IOU's utilities Energy Efficiency programs to will be linked into the appropriate IOU's IDSM utility DSM web page.

The ideal marketing mix will be assessed for maximum awareness and participation. The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above.

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Industrial Deemed Energy Efficiency Program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

capitalize on opportunities to share program information and marketing collateral with industrial/commercial customers to the extent possible. Conventionally, each government agency and IOU/utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type.

With respect to water conservation, IOU/utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers program incentives for energy efficient equipment that may also reduce water and greenhouse gas GHG emissions.

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that are permitted to use the Industrial Deemed Energy Savings Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) program**

The long-term energy efficiency vision of California may be attained through the long-term and continuous development, verification, and acceptance of emerging/new technologies (ET) into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting-edge technologies. In recognition of the importance of emerging technologies, the program is poised to adopt the efficiency potential of new technologies through its programs. In addition, portfolio staff actively works to incorporate promising emerging technologies from IOU or PIER funded projects.

**ii. Codes and Standards program**

The program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As cCodes and sStandards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program Programs will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to

Formatted: Normal

Formatted: No underline, Fontcolor: A uto

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

each element of the bundling will be made to ensure the latest cost-effective technologies/services (e.g., LEDs) are made available as they/these technologies transition from research and development to mainstream program offerings.

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Industrial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings take place through IOU's utilities energy centers and technology centers.

Formatted: Normal

Formatted: No underline, Fontcolor: Auto

Formatted: No underline, Fontcolor: Auto

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**iv. Program-specific marketing and outreach efforts (provide budget)**

Marketing and outreach initiatives will include:

- Participation and membership in key trade associations affiliated with each high-priority sub-segment within the industrial sector, as appropriate;
- Attendance at key trade shows within the industrial sector;
- Building awareness and training of vendors of energy equipment and systems about the program eligibility requirements and participation procedures;
- Educating community based organizations (CBOs), faith based organizations (FBOs), other non-profit organizations, and other non-government organizations (NGOs) with unique access to certain industry segments;
- Informing enabling partners, such as financial institutions, law firms, and environmental organizations;
- Approaching other organizations with complementary value propositions from the customers' perspective, such as energy, water, materials management, recyclables, and corporate social responsibility; citizenry
- IOU Utility-sponsored training events at the IOU's utilities customer training centers and other convenient locations within the IOU's utilities service territory;
- Hosting of IOU utility-sponsored webinars that provide sub-segment training and program adoption; and
- Development of case studies, web pages, and marketing materials that provide an overview of the IOU's utilities' energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

—CEC work on PIER

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

~~The program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER projects. The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects. As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.~~

**viii. CEC work on codes and standards**

~~Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.~~

~~i.~~

**Non-utility market initiatives**

~~The program will support, educate customers, and/or facilitate enforce such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.~~

**c) Best Practices**

~~To maximize program effectiveness, best practices in program design and implementation will be employed and shared amongst IOUs.~~

~~Best practices in Program Design include:~~

- ~~● Regular communication amongst IOUs, which is critical to effective program design.~~
- ~~● Identification of Identify qualifying products simply and effectively (Examples; ENERGY STAR®, CEE, FSTC website).~~
- ~~● Seeking input from industry in the development of new programs. The IOU programs are trying to change how an industry operates from manufacturer design to the customers' purchasing and maintenance practices.~~
- ~~● Industry participation that increases program volume and speeds market transformation.~~

~~Best practices in Program Implementation include:~~

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

- Striving to simplify messaging and participation for the customer. (Look for the ENERGY STAR label, purchase from a qualifying products list, etc.)
- Understanding the key motivators that drive an industry and using that information to market your program. Formulating Make certain outreach efforts that make your program visible to your customers and the market that is catering to your customers.
- Continuously communicating Always communicate program marketing and advertising plans in advance to appropriate industry channels. Advanced notice allows industry partners an opportunity to leverage off of IOU utility marketing efforts and reinforce the messaging we are trying to deliver to our customers get across.

**d) Innovation**

Innovative aspects of the program include improving major program performance indicators, such as accuracy of energy saving calculation, higher realization rate, overcoming energy efficiency barriers, reducing application processing time and administrative costs, and integrated energy management.

For the new program cycle, California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During the 2013-2014 2010-2012 program cycle, the new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance, including measure bundling incentives. The IOUs will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper savings.

IOUs will continue working collaboratively on modifications to program Policies and Procedures to address ongoing changes in customer expectations, market conditions and program flexibility. Changes will (a) target ease of program understanding and participation, (b) measure measures eligibility, (c) increase of customer's economic customer economical benefits, and (d) identify policy restrictions that are will be identified as barriers to participation. IOUs are implementing such process based on market studies conducted on the subject and preceding discussion of the policy change. Among other modifications that would be potentially discussed and implemented are incentive caps and, redesign of measure/equipment early retirement according to the CPUC concept. ~~and other.~~

Where possible, IOUs will use an integrated approach to addressing DSM opportunities. Innovative approaches will be used, such as merging energy efficiency and demand response analysis and converting recommendations to projects under Retrocommissioning and/or Calculated program. In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions, will maximize customer adoption rates for most cost-effective energy management opportunities.

**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**e) Integrated/coordinated Demand Side Management**

Once enrolled, participating customers will be encouraged to participate in other demand-side management opportunities, including demand response and distributed generation. Participating customers will also be encouraged to take a more comprehensive approach to demand-side management and strive for continuous improvement.

Formatted: Indent: Left: 0.25", No bullets or numbering

**2013-2014 Energy Efficiency Programs**  
**Statewide Industrial Energy Efficiency Program**  
**Program Implementation Plan**

**Integration across resource types (energy, water, air quality, etc)**

California's industrial sector faces a multitude of environmental and regulatory challenges that affect their competitiveness and, in some cases, survival. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

To help deal with these challenges, the industrial program will coordinate with the regulating agencies and the programs they are operating to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs/Utilities will continue to offer targeted trainings to customers who share common regulatory challenges in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at small and medium sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 industrial targets.

IOUs/Utilities will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities will help reduce administrative cost and has a greater impact on societal benefits. Currently the utilities are participating in the CPUC water/energy pilots with several water agencies. The results from this pilot may spur more partnerships between the utilities.

Where applicable, the Program will integrate topics such as GHG reduction and water conservation into targeted customer workshops, and marketing and communications, building on a strong track record from the past program cycle. Marketing and communications material will include savings opportunities and messaging.

**f) Pilots N/AEM&V**

Not applicable.

**g) EM&V**

The IOUs are proposing SCE plans to work with other utilities and the Energy Division to develop and submit a comprehensive EM&V Plan a complete plan for 2013-2014 2010-12 studies and budgets after the program implementation plans are finalized and filed. This plan will include be submitted to the CPUC in time for approval along with the Program Implementation Plans.

Detailed plans for process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts specific to this program will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur

## 4. Program Description

### a) Describe program

Continuous Energy Improvement (CEI) is a consultative service that is aimed at helping large industrial customers engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of IOU utility customers and with current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principals of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; and (5) Evaluation and Modification. At each stage of customer engagement, there are a variety of complementary IOU utility and non-IOU utility products and services that can be customized to fit different customer profiles and optimize the cost effectiveness of the delivered energy management solution.

In 2013-14, CEI will be expanded to include select group of mid-sized non-residential customers. Available options to help target these customers may include an individualized, small group, or mass-market remote deployment approach.

CEI will coordinate its services with the Industrial Customer Services Energy Advisor subprogram offerings. CEI offers customers what can be considered the pinnacle of audit offerings, guiding senior management to instill energy considerations in all management/business operational decisions and in long-term energy planning.

The CEI program implements the following steps:

### 1. Commitment

CEI begins with a high-level management commitment to improving energy performance, which increasingly can be combined with other environmental and

Formatted: Font: 12 pt, Bold, No underline, Fontcolor: Auto, Kern at 16 pt

Formatted: Indent: Left: 0.25", Space Before: 0 pt, After: 0 pt

Formatted: Font: Arial, 16 pt, Not Bold, Kern at 16 pt

Formatted: Indent: Left: 0.5"

regulatory commitments that large energy users are developing in response to market and political pressures. A corporate commitment sends the top-down message to employees, partners, shareholders and vendors that energy—like safety—is a priority issue requiring attention. Corporate commitment—like safety—and also paves the way for establishing the required company resources required to implement the steps of CEI. These resources can include capital, personnel like energy champions or teams, or technical systems and software required for energy management.

Gaining true customer commitment can take time, but it is critical. In implementation, IOU utilities will formalize the Commitment phase with larger or more intensive customers through a CEI participation agreement This agreement, which outlines the IOU utility CEI services being offered as well as minimum customer expectations.

## 2. Assessment

Following Commitment, a comprehensive assessment is critical to identifying not only technical opportunities, but also systemic energy management practices and cultural shifts. These that can improve overall facility management practices and sustain continuous improvements towards long-term company targets. A component to the assessment will also include tools to help identify Energy Efficiency (EE), Distributed Generation (DG), and Demand Response (DR) opportunities.

There are many tools and resources – IOU utility and non-IOU utility, free and licensed – available to support comprehensive customer energy assessment. They include ENERGY STAR’s Guidelines for Energy Management; customer energy management assessment software products like those developed by Envinta; benchmarking tools; Integrated Comprehensive Energy Audits; through the Industrial Customer Services Energy Advisor sub-program, or, and local and third-party programs that who can offer specialized technical expertise and assessment.

Based on screening criteria, IOU utilities will offer comprehensive energy assessment services utilizing, but not limited to, vetted sources like those described below, to develop a customer specific strategic energy plan.

- ENERGY STAR’s Guidelines for Energy Management is housed on the ENERGY STAR website and provides step-by-step guidelines to customers to support CEI in general. It, and also guides customers to ENERGY STAR’s numerous assessment tools. This option is a low-cost resource for smaller and medium customers interested in CEI.

- Energy Management Assessment Tools such as Envinta’s One-To-Five, Achiever, and Challenger software products offer professionally facilitated energy management assessment with company decision makers. They also explore and explores management practices and company priorities to develop a CEI roadmap for energy goals and actions.

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.75"

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.75"

- Integrated Comprehensive Energy Audits provide an inventory of technical facility end-uses and energy efficiency, demand response and self-generation investment opportunities. For a full description, see the Industrial Customer Services Energy Advisor Statewide Non-Residential Audits sub-program plan.
- Benchmarking can measure the energy performance of a company, building, process, or piece of equipment to industry standards or comparable groupings. Benchmarking is a natural first step for the CEI process. Customers with multiple facilities find benchmarking useful to prioritize efficiency projects, track progress toward energy or greenhouse gas (GHG) improvement goals, or drive competition among similar benchmarked facilities. Units of measurement vary widely. For industrial—~~for commercial~~ buildings, the unit is energy used/square foot for a unit of time. Benchmarking can also be applied to other resources and environmental issues such as water use, CO<sub>2</sub>, and emissions.

Formatted: Indent: Left: 0.5"

### 3. Planning

Strategic energy planning involves setting energy goals and action plans around energy efficiency, demand response, and generation, as appropriate. Implementation of the Planning stage of CEI can be undertaken independently by the customer, or with utility support. Planning for larger complex customers will typically involve Account Representatives and/or consultants. As is discussed in the Strategic Plan and in the Section 6.e below, strategic planning can also include complementary non-energy considerations as well, such as greenhouse gas (GHG) reductions, water efficiency, and waste-stream minimization, all of which have embedded energy components.

Data and findings from a comprehensive customer Assessment are critical in developing any comprehensive energy plan. These include, including the results from technical audits or assessments, facility benchmarks, energy management assessments, and assessments of company priorities. This information is analyzed and used to develop realistic and achievable company goals and the prioritized shorter-term tactics that are needed to achieve them. Energy plans should be living documents revisited and revised regularly.

Energy goals can vary widely and include elements such as resource utilization (“Company X will reduce its overall energy intensity by 3% over the next 3 years”), carbon reduction goals (“Company X will be carbon neutral by 20142”), or management-oriented goals (“Company X will implement energy teams by 20130”). Goals can be internal documents or can be made public through press releases as part of larger sustainability plans. Publicized goals are, which is increasingly important for large and public companies.

CEI will assist customers in developing and implementing action plans to execute the prioritized near-term activities in support of their company’s energy goals, as well as the resources, staff and schedule for tracking. Action plans typically includes activities such as (a) prioritizing process systems or facilities based on benchmarking or company drivers, (b) identifying internal resources required for plan implementation, and (c)

developing to implement plans, develop project justification and incentive application documentation lists and detailed schedules.

#### **4. Implementation**

In the implementation stage, IOU utilities partner with customers to identify technical support and IOU utility and non-IOU utility resources available to support implementation of projects, such as rebates, incentives, third-party and government partnership programs, and state and national resources. These may include, including:

- Statewide Deemed rebates;
- Statewide Calculated incentives for new construction/tenant improvement, retrofit and retro-commissioning/repair;
- Third-Party and Government Partnership programs (described in the statewide and local third party filings);
- IOU and non-IOU Non-utility financing options; and
- External and internal Owners engineer support.

#### **5. Evaluation and Modification**

Like in any continuous improvement program, evaluation is an ongoing process of comparing actual performance against company goals, targets and action plans. It may include repeating the benchmarking and system or facility baseline process annually, assessing advancements in organizational and management practices that facilitate energy management improvements, or evaluating cost savings per unit of product. Regular evaluation will inform changes to goals and action plans moving forward.

##### **b) List measures**

CEI does not provide incentives to customers, but ultimately facilitates the customer's implementation of energy efficiency projects through statewide incentive programs. However, depending on the outcome of the 2012 process evaluation, customer incentives may be offered.

##### **c) List non-incentive Industrial customer services Energy Advisor**

CEI is a non-resource program that provides comprehensive strategic energy planning and consulting services for industrial/commercial customers. These services include: energy management assessments, energy planning, baselining and benchmarking, project implementation support, customer recognition (e.g. "corporate sustainability awards"), and web-based energy resources.

#### **5. Program Rationale and Expected Outcome**

##### **a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

CEI is intended to address several market barriers that prevent wider adoption of energy efficiency practices. These barriers include:

- Lack of information:— The CEI evaluation and modification process provides data that customers can use to reevaluate their commitment and/or modify their energy goals.
- Performance uncertainties:— Through CEI’s comprehensive baselining and benchmarking assistance, customers will have access to real-time data that demonstrates how their facility is performing relative to their established goals.
- Organizational customs:— The high-level customer commitment that is at the core of CEI increases the likelihood that corporate cultures that prevent successful implementation of comprehensive energy policies will be changed.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>Number of Engagements Square Footage Benchmarked</u>	<u>TBD 1,291,000</u>	<u>TBD 1,780,000</u>

 Formatted Table

**e) Advancing Strategic Plan goals and objectives**

The Industrial Energy Efficiency Program supports all three goals in the Strategic Plan for the Industrial Sector. General advancement of the goals is presented in the program implementation plan for the Industrial Energy Efficiency Program. More specific support of the goals in the Industrial CEI Program is presented here.

Formatted: Normal, Indent: Left: 0.25"

Goal 1: Support California Industry’s adoption of energy efficiency by integrating energy efficiency savings with achievement of GHG goals and other resource goals.

Formatted: Normal, Indent: Hanging: 0.3"

Strategy 1.1: Develop coordinated energy and resource management program for CA’s industrial sector, to enhance use of energy efficiency

Formatted: Normal  
 Formatted: Font: 12 pt, No underline, Font color: A uto

The core deliverable through CEI is the development of a comprehensive energy management plan that customers can adopt as an operating strategy. This plan

Formatted: Font: 12 pt, No underline, Font color: A uto

will allow customers to quantify and manage their GHG emissions in a responsible manner.

Goal 2: Build market value and demand for continuous improvement in industrial efficiency through branding and certification.

Strategy 2.2: Implement certification

Near-term: Plan pilot and recruit host sites (8-10 facilities)

The Continuous Energy Improvement sub-program will manage the statewide participation in the development of an industrial certification program. This certification program will be piloted in 2013-2014. It will ~~2010-2012~~ and leverage the various industrial sub-program tactics described throughout this program implementation plan to identify the best potential host sites. The lessons learned from this pilot will be used to expand the certification in the next program cycle.

Goal 3: Provide centralized technical and public policy guidance for California industrial energy and resource efficiency.

Strategy 3.1: Compile technical and resource management regulatory materials into centralized assistance repository.

Near-term: 1) Identify and incorporate priority energy and other data; 2) Develop clearinghouse or integration system.

The Continuous Energy Improvement sub-program will support the development of an industrial clearinghouse by providing information on results and experience in the program, including case studies of innovative projects and best practices about implementing comprehensive energy management plans at industrial facilities.

## 6. Program Implementation

### a) Statewide IOU coordination

#### i. Program name: Industrial Continuous Energy Improvement Program

#### ii. Program delivery mechanisms

CEI will be coordinated to unify the implementation of program aspects such as program name, program delivery mechanisms, marketing and outreach plans, and IOU utility program interactions. The Industrial CEI Program will coordinate with the core Industrial Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the two ~~three~~-year implementation cycle will be enabled.

**Formatted:** Font: 12 pt, No underline, Font color: A uto

**Formatted:** Font: 12 pt, No underline, Font color: A uto

**Formatted:** No bullets or numbering

**Formatted:** Normal

**Formatted:** Font: 12 pt, No underline, Font color: A uto

**Formatted:** Font: 12 pt, No underline, Font color: A uto

**Formatted:** Font: 12 pt, No underline, Font color: A uto

Where applicable, the IOUs, SCE, SoCalGas, SCG's account representatives will support this activity within the statewide industrial/commercial sector, as well as third parties, government partnerships, and IOU, SCE, SoCalGas, SCG local programs.

**iii. Incentive levels** –N/A. ~~This is a non-resource program.~~

Not applicable. (CEI is a non-resource program).

Formatted: Indent: Left: 0.5", No bullets or numbering, Tab stops: 1.5", List tab

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

As with other information and education programs, CEI will be primarily delivered primarily by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing and outreach efforts. Other channels of delivery may be developed.

Formatted: Normal

The IOUs will continue to develop an in-depth segmentation of the industrial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

Formatted: Indent: Left: 0.5"

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The program will leverage the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with industrial customers.

**vi. Similar IOU and POU programs**

Over the next two ~~three~~ years, the IOUs will seek to increase their interactions with the POU's, as applicable, to promote the CEI concept throughout the state. ~~This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.~~

~~Emerging Technolog~~ie–This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.

**e)b) Program delivery and coordination**

**i. Emerging Technologies program**

The CEI program management team will stay abreast of and incorporate relevant emerging technologies into audit recommendations. In addition, IOU field engineers, who play a large role in the delivery of CEI to industrial customers, are active contributors to the Emerging Technology (ET) process by their participation in ET Roundtable/Information meetings and continually seek to offer new technologies to customers.

Formatted: Indent: Left: 0.5", No bullets or numbering, Tab stops: 1.5", List tab

**ii. Codes and Standards program**

CEI implementation will include information about pending new code that may affect planning or prioritization of retrofit or new construction projects. The program will work with the Codes and Standards Program to maintain an updated and relevant list of measures that will support savings. As Codes and Standards impact measures, the program will act to align itself with appropriate offerings. Planned enhancements to Title 24 will be reflected recommended measures and services. As the market moves toward "low energy" or "zero net energy" buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) made available as these technologies transition from research and development to mainstream program offerings.

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single, No bullets or numbering

Formatted: Font: 11 pt, No underline, Font color: Auto

Formatted: List Paragraph, Indent: Left: 0", Add space between paragraphs of the same style

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single, No bullets or numbering

**iii. WE&T efforts**

CEI implementation will integrate with WE&T efforts by providing CEI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs/SoCalGas will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs/SoCalGas will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches. Program costs will be shared with WE&T.

CEI's interaction with Statewide Workforce Education & Training efforts will be centered on the offering of a national certification curriculum that supports the pilot program described in Section 5.e. Development of this curriculum will be conducted in partnership with established industry efforts currently sponsored by the Department of Energy and others and will ultimately be offered to customers in order to provide them with knowledge and tools required to implement and validate energy efficiency improvements.

**iv. Program-specific marketing and outreach efforts (provide budget)**

A broad range of marketing activities will be used to promote audits and elevate customer engagement. The Industrial CEI program will be promoted via direct communication between customers and Account Executives with the support of Project Managers from individual programs, as well as through traditional advertising activities, such as internet, bill inserts, brochures, trade shows, etc. Marketing activities will be coordinated between IOUs, Demand Response and Distributed Generation departments within each IOU/SoCalGas/SCG.

Formatted: Normal

Formatted: Font: 12 pt, No underline, Font color: Auto

Formatted: Font: 12 pt, No underline, Font color: Auto

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among

nonresidential customers. The statewide effort will provide the first level with IOU-specific programs providing reinforcement at a local level.

Formatted: Normal

**v. Non-energy activities of program**

Integrated energy audits are a key tool for identifying non-energy opportunities for specific customers. The energy audits can identify non-energy benefits associated with recommended measures, such as improved safety, productivity, indoor air quality, comfort and appearance.

Formatted: Normal

Formatted: Font: 12 pt, No underline, Font color: Auto

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs.

Formatted: Normal

**vii. CEC work on PIER**

Not applicable.

CEI will include the CEC's PIER and Green Building Initiative programs, DOE's "ISO plant certification" programs, EPA Energy Star Portfolio Manager benchmarking and other programs, USGBC LEED certification, local and other government incentive programs as applicable.

Formatted: Normal, Indent: Left: 0.25"

**viii. CEC work on C&S**

See Section 6.b.ii.

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-IOU utility information and guidance that CEI will provide customers. In addition, the IOUs will participate in national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

Formatted: Normal

Formatted: Font: 12 pt, No underline, Font color: Auto

**c) Best Practices**

The CEI approach applies the principals of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management: Commitment, Assessment, Planning, Implementation, Evaluation and Modification in order to achieve widespread adoption of long-lasting sustainable energy management practices in the industrial-commercial market sector. This approach can now be successfully implemented given the two-three-year programs cycle allowing longer term and deeper project development engagements with customers. In addition, PG&E will continue to lead the utility's efforts in the industrial customer area by participating in a national effort to develop an ANSI recognized standard for industrial energy efficiency. By participating in the development of such a standard, the utilities are in a unique position to integrate aspects of the standard into current programs prior to ANSI recognition.

Formatted: Normal, Indent: Left: 0.25"

**d) Innovation**

CEI is a new way of packaging energy efficiency, demand response and self-generation products and services aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSMS projects), and reward customer for implementing strategic energy management.

#### **e) Integrated/coordinated Demand Side Management**

CEI includes project analysis and implementation support of recommendations of the Statewide Integrated Comprehensive Energy Audits, which provide customers with an inventory of facility end-use breakdown and energy efficiency, demand response and self-generation investment opportunities. Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other similarly related types of programs. While a successful program experience leads to repeat participation, there has been difficulty in cross-pollinating similarly related types of programs with these candidates due to program-specific silos. To overcome the historic siloing of DSM, the CEI sub-program will leverage lessons learned from IDSMS efforts by offering comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that the two programs are at financial odds with one another, as both programs often reduce the potential for each other's financial incentives. For example, energy efficiency may reduce the overall baseline by which the demand response program's incentives are based upon. Since benefits from long-term energy savings derived from technological measures outweigh the temporary demand reduction benefits derived from behavioral actions, the CEI sub-program will offer additional support and services incentives for energy efficiency measures that enable demand response when customers enroll, or are already enrolled, in demand response programs. In so doing, the program seeks to maximize the potential for both types of programs.

A secondary issue when integrating energy efficiency and demand response programs is that communications of both types of DSM programs are often non-coordinated, since energy efficiency is typically technology-based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer "event season" and wane throughout the remainder of the year. To overcome these differences, the Program will offer integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable.

Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response programs in addition to energy efficiency programs.

Formatted: Indent: Left: 0.25"

Formatted: Indent: Left: 0.25"

To support the integration of energy efficiency and demand response programs, the sub-program will focus on several tactics:

- Offering promotions and incentives for demand response in such a way as to stimulate energy efficiency first;
- Providing integrated and coordinated year-round marketing (e.g. applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g. customer size);
- Providing unified technical assistance through enhanced EE/DR Audits through the TA Program to allow for cross-harvesting opportunities;
- Providing integrated presence on IOU utility websites; and
- Regular coordination of meetings between energy efficiency and demand response program management.

CEI is recognized as a strategy to advance Statewide IDSM program's goals and objectives. IOUs SoCalGas will increase IDSM messaging and coordination within CEI. During the 2010-12 program cycle, funding for energy efficiency and demand response must not be commingled; therefore payments will be split between the two programs as appropriate.

**f) Integration across resource types (energy, water, air quality, etc)**

CEI implementation will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support efforts. IOU CEI sub-program managers will partner, as appropriate, with CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers. Conventionally, each government agency and IOU utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will inform the customer about the mutual benefit of combining complementary resource programs.

In the effort to promote CEI, IOUs SoCalGas will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, IOU utility program managers will partner with the local water districts to produce co-branded marketing collateral, attend trade shows and release joint notices for programs with interactive water and energy effects.

**g) Pilots**

Based on Energy Division feedback, a potential pilot that will be explored in the 2010-12 program cycle is that of a "Resource Energy Manager" (REM). REMs are essentially energy managers who are placed at the customer's facility to be a project champion and shepherd energy efficiency projects through to completion. Their salary is typically paid for through the energy savings they generate. REMs have been successfully used by IOUs in the government sector (typically military bases) in past program cycles and a similar program has been available for commercial customers in the Pacific Northwest. The concept of using REMs in the commercial

Formatted: Indent: Left: 0"

~~segment will be explored to determine the viability and cost effectiveness of such an approach. An appropriate EM&V plan will also be required prior to launching an REM pilot such that the affects of the pilot on achieving higher levels of energy efficiency can easily be determined. EM&V Not applicable.~~

**Formatted:** Font: Bold

**h) EM&V**

~~The IOUs are proposing SCESCG plans to work with other utilities and the Energy Division to develop and submit a comprehensive EM&V a complete plan for 2010-12 studies and budgets after the program implementation plans are finalized and filed. This may include plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.~~

~~Detailed plans for process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies.~~

~~More detailed plans for process evaluation and other program-specific evaluation efforts cannot specific to this program will be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since final plans need to will be based on identified program design and implementation issues, and questions.~~

		<b>Program Cycle</b>	2013-2014

This form is to be used to document any required changes to the Program Implementation Plans (PIPs). The following are triggers that will require a PIP change:

1. Changes to eligibiity rules
2. Changes affecting incentive levels (indicate advice letter approval below if required)
3. Fund shifts (indicate advice letter approval below if required)
4. Portfolio Budget and Other Commission-Directed Changes
5. Changes to Program Theory/Logic Models
6. Addition or elimination of programs and/or sub-programs (indicate advice letter approval below)
7. Changes in program targets
8. Change in sub-program approach - unless the IOUs submit logic models for the sub-programs (to be defined) with IOUs
9. Changes in incented measures
10. Changes in adopted PPMs/MTIs (indicate advice letter approval below if required)

**Identify Specific Trigger (above) requiring the PIP change**

4. Portfolio Budget and Other Commission-Directed Changes ▼

**Driver of Change:**

Aim to reduce the complexity in IOUs' portfolios while increasing customer participation.

**Description of Change (if advice letter approval required, indicate Commission resolution or approval and provide hyperlink to advice letter):**

The 2010-2012 Agricultural Energy Efficiency Program Program Implementation Plan (PIP) reflects the following sub-programs:

1. Nonresidential Audits Program
2. Calculated Incentives Program
3. Deemed Incentives Program
4. Continuous Energy Improvement (CEI)

The new 2013-2014 Agricultural Energy Efficiency Program will be simplified and consist of the following sub-programs:

1. Energy Advisor Program
2. Commercial Calculated Incentives Program
3. Commercial Deemed Incentives Program
4. Continuous Energy Improvement (CEI)

Revision Date: 11/22/2011

**PIP Section and/or Wording to be Changed or replaced:**

Changes are throughout the 2013-2014 Statewide Agricultural Energy Efficiency Program.

**Replacement Language or Information**

Refer to Description of Program of 2013-2014 Statewide Agricultural Energy Efficiency Program PIP for details on changes.

**Revised Energy Savings (If Any):**

Refer to 2013-2014 Statewide Agricultural Energy Efficiency Program PIP for details.

**Other PIP Changes Required:**

Refer to 2013-2014 Statewide Agricultural Energy Efficiency Program PIP for details of other changes.

## 2013-2014 PIP Addendum

**4. Program Description**

**a) Describe program**

The Statewide Agricultural Energy Efficiency Program facilitates the delivery of integrated energy management solutions—including energy efficiency, demand response, and distributed generation—to California’s agricultural customers. The Program offers a suite of products and services (for example, through strategic energy planning support, technical support services, facility audits, pump tests, calculation/design assistance, financing options, and financial support through rebates and incentives). In addition, the program adopts and supports the strategies and actions of the Agricultural and Industrial chapters of the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan).

The Statewide Agricultural Energy Efficiency Program targets end-users such as irrigated Agricultural growers (crops, fruits, vegetable, and nuts), greenhouses, post-harvest processors (ginners, nut hullers, and associated refrigerated warehouses), and dairies. Traditionally food processors, due to NAICS designation, have received IOU services

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

through the Industrial program offering. However, there are those facilities with on-site processing that are integrated with a growers and their products, as is the case with some fruit and vegetable processors (canners, dryers, and freezers), prepared food manufacturers, wineries, and water distribution customers that may be addressed by this program's offerings.

To address the potential in these markets, the Statewide Agricultural Energy Efficiency Program offers four sub-programs. A brief description is provided below. For a detailed accounting of the sub-programs' activity refer to the sub-program's specific program implementation plan:

1. **Agricultural Energy Advisor** provides online and onsite audits, including benchmarking (offices and other "commercial" building areas), focused and integrated comprehensive energy audits, pump tests and may include Continuous Energy Improvement (CEI) audits/services across the agricultural segment depending on the IOU's market segment potentials and available resources. The Program provides an inventory of technical project opportunities and financial analysis information for a customer's short- or long-term energy plan, and overcomes both informational and technical customer barriers.
2. **Agricultural Calculated Energy Efficiency Program** offers customers a standardized incentive approach for customized and integrated energy efficiency, and CEI projects, which may include comprehensive technical and design assistance. It overcomes information, technical, and financial barriers across the agricultural segment. As a more customized calculation method that can consider system and resource interactions, it will also be the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan.
3. **Agricultural Deemed Energy Efficiency Program** provides IOU representatives, equipment vendors, and customers with an easy-to-use mechanism to cost-effectively subsidize and encourage adoption of mass market efficiency measures through fixed incentive amounts per unit.
4. **Agricultural Continuous Energy Improvement (CEI)** is a non-resource sub-program that includes a collection of strategic planning tools and resources for long-term integrated energy planning. CEI serves as a launching platform for other IOU and non-IOU programs and services. CEI offers analysis, benchmarking, long-term goal setting, project implementation support, performance monitoring, and potential energy management certification offered through evolving Department of Energy (DOE) and International Organization for Standardization (ISO) efforts. CEI aims to transform the market from a "project-to-project" approach toward a continuous improvement pathway. In support of the Strategic Plan, the CEI approach also sets the stage for non-energy resource integration, such as greenhouse gas (GHG) reduction, water conservation strategies, and regulatory compliance. CEI will be offered by the IOUs, based on their

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

market segment potential and resource availability. CEI services will be offered in the Agricultural Energy Advisor sub-program as applicable.

The New Construction Whole Building Approach (WBA) will be extended to existing buildings as one example of the customized bundling outlined in the Strategic Plan. This approach will make available the tools and resources necessary for customers to adopt a comprehensive approach to energy efficiency. This approach may include the deployment of energy management and information systems in demonstration projects that can be used to quantify and analyze energy savings based on various forms of data, including interval meter data.

In addition to these four sub-programs, each of the four investor-owned utilities (IOUs) in the state also offers local programs that complement and enhance the core offerings in their region. The IOU local portfolio mix is designed to enhance energy efficiency and DSM opportunities for Agricultural customers. Additional information regarding the local efforts can be found in the sub-program descriptions and in section 6.g of this program implementation plan. The portfolio mix includes water conservation education information.

### **Market Characterization**

California's agricultural customer base consists primarily of a broad mix of smaller accounts and consumes approximately 7%<sup>1</sup> of total statewide electricity. The business models and energy efficiency needs for these market segments vary widely and thus require targeted marketing and program delivery strategies. A review of the primary segments addressed by this Program is included below.

### **Irrigated Agriculture**

Irrigated agriculture represents an estimated 80% of the total electricity and 73% of total natural gas used by the agricultural segment. This energy is predominately used to lift, move, and pressurize irrigation water. Increased reliance on ground water is increasing energy intensity, giving high priority to improving the current average pumping efficiency from 53% towards the technical potential for 68-70% through optimizing pump operation. Increasing pressures from international competition, land and water use policy decisions, labor force uncertainties, and consolidation of smaller family farms into larger agribusiness enterprises make this segment increasingly receptive to new technologies and practices balanced by financial concerns from risks of crop failure.

### **Greenhouses**

This specialty segment is in transition from the cut flowers industry to ornamental plants and vegetable transplants. Increased mechanization and consolidation in this segment presents opportunities for energy efficiency. Top opportunities for energy savings are in boiler improvements, building envelope improvements, and temperature control enhancements (for example, heat curtains).

---

<sup>1</sup> 1980-2005 California Electricity Consumption by Sector - California Energy Commission, [http://www.energy.ca.gov/electricity/consumption\\_by\\_sector.html](http://www.energy.ca.gov/electricity/consumption_by_sector.html).

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**Post-Harvest Processing Facilities**

Post-harvest facilities associated with or near agricultural growing facilities, process, package and store agricultural commodities, such as cotton ginneries, nut harvesters and bag-houses, and fruit and vegetable packing plants. Their operations are typically seasonal and driven by harvest schedules. Nut hullers are a growing market due to new more productive strains of almonds. Key technical opportunities in this segment include industrial refrigeration improvements and process improvements.

**Dairies and Confined Animal Feeding Operations**

California's more than 1,900 dairies are primarily located in Tulare, Fresno, Kern, Merced, Stanislaus, and San Joaquin counties. Dairy farms are consolidating, with larger farms facing increased regulatory challenges related to air and water quality, creating opportunities for the adoption of new technologies and practices. Energy efficiency opportunities are focused in refrigeration, ventilation, and waste handling. Benchmarking will be developed as a key foundational activity to drive customer awareness and continuous energy improvement. Improved dairy waste management offers significant potential for distributed generation, as well as potential reduction of air and water quality problems and the capture and sale of greenhouse gas credits. Like dairies, feedlots and poultry operations for meat and egg production have drawn recent food safety and regulatory attention that may make them more receptive to new technologies and practices for improved efficiencies and waste to energy opportunities. Animal waste streams within this segment offer biogas development potential.

**Food Processing, General**

Off site Food Processing may include breweries, meat and poultry processing, dairy processors (e.g., creameries), canned, dried or frozen fruits and vegetables, grain products, baked goods, sugar and confectionary products, oils, snack manufacturing, soft drink manufacturers and seafood processing. The market is characterized by a small number of large users representing a disproportionate percentage of the energy consumed, offering an ideal opportunity for delivering a large customer strategy. The segment has high energy-intensity in relation to profit margins and is highly seasonal, with the majority of natural gas and over half of the electricity used during the peak summer season. Increased global competition and environmental regulations like AB 32 position this market for reductions in energy, water, emissions, greenhouse gasses and raw materials. An integrated resource management strategy, focusing on long-term continuous improvements, is expected to improve energy efficiency performance in the segment. The majority of the energy savings potential comes from process system improvements such as in refrigeration, boilers and steam systems, compressed air and motors. Distributed generation and demand response opportunities include using waste heat/steam for production processes such as pasteurization, cooking and heating.

**Food Processing, Wineries**

California's more than 2000 wineries produce 90% of all US wine. The segment is comprised of a small number of very large wineries and conglomerates, and a large number of small and medium facilities. This environmentally progressive segment of tightly knit and organized peer-to-peer networks has established environmental programs and web-based

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

environmental benchmarking tools, and has launched a winery carbon calculator to support energy efficiency. The wine segment offers a model for other agricultural segments to follow. These efforts have been led by the California Sustainable Winegrowing Alliance (CSWA), which is eager to continue working with interested IOUs on outreach, education, training, and benchmarking. These efforts will promote best practices in resource management including energy, water, air and GHGs. Energy savings potential is predominantly in refrigeration, pumping, and water heating and treatment. The wine segment's demand peaks in summer and fall, related to refrigeration during crush, making refrigeration improvements especially attractive. Interest in emerging technologies has been strong.

**Food Processing, Refrigerated Warehouses**

Off-site refrigerated warehouses are highly specialized, energy-intensive, technology-oriented facilities focused on staying competitive with operators in nearby markets. They are comprised of, or associated with, wholesale facilities, public and private refrigerated warehouses, food and beverage processors, and perishable product cooling and packaging operations. As they handle a wide variety of seasonal products, loads can vary dramatically between facilities. Significant energy savings opportunities exist in facility retrofits and improved new facility design, as captured in the Agricultural Strategic Plan. Activities identified in the Agricultural Strategic Plan include expanded education and training and best practices dissemination directed at facilities designers and operators, the refinement of the DOE-2.2R energy modeling tool utilizing national funding and support, and incorporating codes and standards. The ability to float refrigeration loads through peak periods with controls software has shown great initial success in the 2006-2008 program cycle for demand response.

**Water Irrigation Districts and Agencies**

The water and wastewater industry (North American Industry Classification System prefix 221) collects surface water or groundwater, treats water to agricultural or potable standards, transports water to local distribution networks, delivers water to end users, and finally, collects and treats wastewater for discharge into the environment. IOU customers in this sector include large public agencies and private water supply utilities, can include wastewater treatment districts, and integrated water and wastewater utilities. IOUs may address the last two sub-segments in Commercial or Industrial segments. Irrigation and power districts located in California's Central Valley are also large users of electricity and natural gas.

**b) List measures**

Technologies addressed through this program effort include pumping, refrigeration, process loads, process heating, lighting, and plug loads. Incentive levels will be offered through the Agricultural Calculated Energy Efficiency Program and the Agricultural Deemed Energy Efficiency Program, described in full in their respective Program Implementation Plans.

**c) List of non-incentive Agricultural Energy Advisor Services**

The Statewide Agricultural Energy Efficiency Program includes a wide variety of non-incentive program services. These services are intended to support customer strategic

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

planning, educate and train customers and the workforce about energy efficiency, and provide customized technical and project support. The service list may include and is not limited to:

- Energy Audits
  - Remote energy audits;
  - Integrated energy audits;
  
  - Benchmarking (currently limited to portions of an agricultural facility with commercial spaces);
  - Pump tests and pumping systems technical support; and
  - Water leak detection services (new service).
  
- Continuous Energy Improvement (CEI)
  - Energy management assessments;
  - Energy planning;
  - Baselineing and benchmarking;
  - Project implementation support; and
  - Customer recognition.
  
- Customer Education and Training
  - DOE basic, intermediate and specialist training on agricultural and industrial pumps, motors, compressed air, and steam;
  - Other industrial process systems training;
  - Agricultural pumping efficiency seminars;
  - Workshops merging regulatory compliance with energy efficiency opportunities (such as with NO<sub>x</sub> compliance and boiler retrofits); and
  - Integrated industry-focused workshops, such as for wineries, dairies, greenhouses, and food processors.
  
- Workforce Education and Training
  - The Statewide WE&T crosscutting program effort will be leveraged to deliver targeted training to the agricultural sector to support Superior Energy Performance (SEP), ANSI and ISO energy management certification;
  - Title 24 training, such as for refrigerated warehouses; and
  - Industrial refrigeration best practices (for designers), in support of the Strategic Plan focus on refrigeration.

## **5. Program Rationale and Expected Outcome**

### **a) Quantitative Baseline and Market Transformation Information**

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by

## 2013-2014 Energy Efficiency Programs Statewide Agricultural Energy Efficiency Program Program Implementation Plan

reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>3</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical, 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>4</sup>. Markets are social institutions<sup>5</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>7</sup>. According to York<sup>8</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program’s activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for

## **2013-2014 Energy Efficiency Programs Statewide Agricultural Energy Efficiency Program Program Implementation Plan**

programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are.

First and foremost, they need to be designed specifically to address market transformation. “The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)”<sup>13</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC’s directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the IOUs look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin’s guide for MT program developers<sup>16</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Attitudinal change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer attitudes, knowledge and awareness (AKA) of energy efficiency. In order to gauge an attitudinal based metric for this sector a battery of questions probing AKA among customers would have to be created and used to scale AKA. Examples of AKA would include knowledge of energy efficiency lighting and other specific measures. Evaluators could also draw from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The baseline response pattern to the AKA scale

<sup>16</sup> Pelosa & York, (1999).

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

would need to be established early during the program cycle. Customers could be surveyed on an annual basis and changes in their AKA tracked along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

In addition, behavioral change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer past behavior and intentions about energy efficiency. In order to gauge a behavioral-based metric for this sector, a battery of questions about energy efficient behaviors could be used to create a scale of Energy Behavior. Evaluators could also draw questions about specific behaviors from customer surveys used in past program evaluation studies, to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The behaviors that could be probed include maintenance behaviors to keep EE measures operating correctly, and behaviors that maximize energy efficiency of existing equipment. Customers could be surveyed early in the program cycle and their responses on the scale could serve as the baseline for subsequent behavioral change. Customers could be probed annually and their Energy Behavior change measured along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

Therefore, for the Agricultural sector, the following approach to quantitative baseline and market transformation information is as follows:

**Program Performance Metrics (PPMs)**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Statewide Agricultural Energy Efficiency Program (Resolution E-4385, Appendix A, pp. 32-34).

<b>SW PROGRAM / Sub-Program</b>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>
<b>COMMERCIAL / INDUSTRIAL / AGRICULTURAL COMBINED</b> * Data to be reported in disaggregate form by SW program (commercial, industrial, and agricultural)		
	*1. Number and percent (relative to all eligible customers) of commercial, industrial and agricultural customers participating in sub-programs (NRA, Deemed, Calculated, and CEI) by NAICS code, by size (+/- 200 kW per yr or +/- 50K therms per yr), and	2a

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

	by Hard to Reach (HTR)**	
	** “HTR” is as defined in the EE Policy Manual	
<i>Continuous Energy Improvement (CEI)</i>	*1. Number and percent of commercial, industrial, and agricultural CEI participants that meet short-term (2010-2012) milestones as identified by their long term energy plans.	2a
	*2. Lessons learned, best practices, and plan to ramp up the CEI program are developed. (Y/N)	2b
	*3. Number and percent of commercial, industrial and agricultural customers that created an energy plan via CEI will be tracked by program.	2a
<i>Energy Advisor (EA)</i>	*1. Number and percent of commercial, industrial, and agricultural customers receiving non-residential audits by NAICS and SIC code.	2b
	*2. For commercial, industrial, and agricultural customers who received audits, the number and percent of adopted audit-recommended technologies, processes and practices. (Report disaggregated data by type of audit – Basic and Integrated, ) **(1)  **Data sources for reporting will come from (a) program tracking databases and (b) process evaluation to refine estimates.  (1) – An audit completed in one portfolio may have measures implemented over several years and portfolios.	2b
<i>Deemed Incentives</i>	*1. Number and percent of new, improved, or ETP measures** installed in the commercial, industrial and agricultural programs.  ** “ETP measure” defined as ET measures first introduced into the EE portfolio since January 1, 2006.	2a
<i>Calculated Incentives</i>	*1. Number and percent of new, improved, or ETP measures installed in completed calculated projects.	2a
<b>AGRICULTURAL</b>		
	1. Number and percent of first-time** participants in energy efficiency programs. (Report disaggregate data by sub-program.)  ***“First time” means customer has not participated in energy efficiency programs since December 31, 2005.	2b
<i>Pump and Test Repair</i>	1. Percent of agricultural pump tests that lead to a repair or replacement.	2b

**b) Market Transformation Indicators (MTIs)**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in “Attachment H” are approved for this sub-program as applicable.

**c) Program Design to Overcome Barriers**

The Statewide Agricultural Energy Efficiency Program builds on past program successes and best practices to overcome both market wide and segment specific barriers to efficiency, including:

- Market-wide barriers:
  - Agriculture is a diverse and geographically widespread sector, dependent on regional resources for information, and traditionally needs significant experiences to warrant changing practices that has served them well for years.
  - Capital constraints, combined with variable commodity pricing, limit the availability of funds for investing in projects.
  - The Statewide Finance PIP includes plans to explore and develop additional finance tools to facilitate the adoption of integrated projects.
  - Low energy costs relative to other operating expenses reduces the motivation to invest in energy efficiency.
  - Lack of awareness of the benefits of energy efficiency, and uncertainty and skepticism over long-term energy and cost savings hinder investment.
  - As in many industries, cyclical budgeting processes makes it difficult for customers to commit to a plan of action if their decision making occurs out of sync with budget planning.
- Food processing and industrial refrigeration barriers:
  - Few firms maintain facility level energy managers, and finding technically qualified staff is an ongoing challenge.
  - Regulatory compliance issues further strain limited internal resources.
  - International competition drives short-term survival attitudes versus a long-term continuous improvement approach.
  - The industrial refrigeration industry lacks design standards and best practices, resulting in substandard design and maintenance.
  - Huge capital outlay requirements in industrial refrigeration can delay or offset efficiency projects.
  - Efficient design alternatives can be lost in low-cost bidding scenarios.
  - Whole system opportunities are missed by individual equipment vendors.
  - Customers are often not aware of systems operating sub-optimally.

The Statewide Agricultural Energy Efficiency Program takes these barriers into account with the features described below for continuous improvement, trade ally workforce education and training, and technical support.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**Continuous Energy Improvement**

The long-term strategic energy planning approach of CEI, especially the emphasis on benchmarking, goal setting, and performance tracking, will help customers overcome short-term attitudes. CEI also fosters integration of non-energy business objectives into energy planning and leveraging of the co-benefits of water conservation, GHG reduction, and other relevant issues. This integration elevates the importance of energy efficiency and improves uptake and market penetration. In addition, top-down corporate attention and tracking of energy performance will positively affect facility staff performance.

**Trade Allies/Workforce Education and Training**

Customers in the agricultural and food processing markets often treat vendors, designers, and engineers as ad hoc outsourced technical resources. These customers ask for everything from new equipment design to emergency equipment repair or replacement. Because these transactions often happen without IOU knowledge, it becomes critical to continually inform and equip these vendors about efficiency technologies, practices, programs, and rebates. Vendor Participation Agreements, training, and outreach collaboration allow participating vendors to up-sell customers to efficient options and differentiate themselves on energy efficiency. IOUs gain an additional sales force in the field with customers, minimizing lost opportunities.

**Technical Support Services**

The role of the IOU as an unbiased, trusted energy advisor cannot be overstated, both in evaluating proposed vendor projects and in identifying new technical opportunities in retrofit and new construction projects. The combination of technical support and the availability and commitment of approved IOU incentive funds – based on a rigorous technical review and followed by an EM&V process – are essential drivers to overcome key customer barriers, including the lack of in-house technical resources and the tendency for efficiency options to get eliminated in low-cost vendor bidding scenarios.

**Agricultural Energy Advisor (AEA)**

AEA is designed to deliver a coordinated and customer-specific audit service. AEA features a statewide integrated demand-side management customer-specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies, as appropriate, to the customer's need(s).

The AEA is designed to support the goals of the Strategic Plan by providing customers with comprehensive building-specific information on cost-effective DSM opportunities. The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

**d) Quantitative Program Targets**

**Table 5** - Program targets are provided at the sub-program level.

**e) Advancing Strategic Plan Goals and Objectives**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The teams of statewide agricultural program supported the development of the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan), and the 2013-2014 program design integrates the goals and strategies of the Strategic Plan. Specifically, the following actions will be advanced during the 2013-2014 program cycle.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

*Strategy 1.1:* Develop knowledge base of efficiency solutions.

*Near term:* Conduct an energy use characterization and efficiency potential study for the statewide agricultural market. Include potential for waste streams to offset energy consumption. Study plan (6/2009) and study completed (12/2010).

*Near term:* Collect data on key programs and measures best practices for energy efficiency in the agricultural sector. Study completed (6/10).

IOUs will continue to coordinate with the California Energy Commission (CEC) and other resources to identify a study plan, scope, and deliverables for a statewide agricultural market characterization that considers integrated energy opportunities in the segment. If possible, the plan will be coordinated with other agricultural characterization plans planned or underway in the state focusing on renewable energy potentials, such as the California Department of Food and Agricultural's strategic plan for agriculture. The IOUs will defer to the Commission and the CEC to determine the best method and timeline for this study, and will ensure coordination between each IOU's EM&V groups towards study objectives.

Such a marketing characterization will support the development of future program baseline data and metrics to help set targets and show market progress. The resulting study will be posted on appropriate websites, including the IOU websites and the statewide websites.

To develop a "one stop shopping" clearinghouse of energy management and related information for the agricultural segment, the IOUs will organize and post all relevant existing technical information on the IOU and statewide websites, as needed. This information includes best practices, continuous energy improvement resources, emerging technologies data, tools, programs, and other information.

*Strategy 1.2:* Ensure workforce has information and training necessary to apply efficiency solutions.

*Near term:* Conduct workforce training needs assessment and next steps (12/2010).

*Near term:* Develop training curricula and modules identified by needs assessment. (12/2011)

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

IOUs will assemble technical sub-groups, including IOU and industry experts, to focus on the key technical areas identified in the Strategic Plan, such as pumping, refrigeration and process heating. Coordinating with Statewide WE&T Program, the Statewide Agricultural Energy Efficiency Program will develop a scoping document that outlines training objectives and partners. The group will identify priority topics, resource needs and industry partners for key workforce education and training, and will closely coordinate with the national ANSI Superior Energy Performance standards development work towards workforce certification. Additionally, IOUs will offer prerequisite training to support future Department of Energy certification classes.

Workforce training needs assessment will be included in the agricultural market characterization study, and results communicated to the Statewide WE&T team for coordination and development of a detailed WE&T plan and associated curricula. Furthermore, marketing for WE&T will be incorporated into program specific marketing and outreach efforts. Such efforts, pending timely completion of the characterization study, are targeted for completion by the close of the 2010-2012 program cycle.

*Strategy 1.3:* Conduct research & development of new technologies and practices for agricultural efficiency.

*Near term:* Conduct an Energy Technologies/RD&D gap analysis. Identify and prioritize needed RD&D/ET projects. (12/2011).

*Near term:* Coordinate research activities across government, IOUs, agricultural extension and university programs, and equipment manufacturer proprietary efforts.

The IOU's ET teams will continue to closely coordinate with the CEC, universities and industry associations to identify key potential areas for emerging technologies development and research needs, such as, for agriculture, in irrigation pumping, refrigeration, and process heating applications. IOUs will identify the most promising technologies that can play a role of providing multiple solutions, both for energy efficiency and greenhouse gas mitigation, as well as water efficiency purposes.

*Goal 2:* California regulations, financing mechanisms, and incentive programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

*Strategy 2.1:* Set objectives and framework for agriculture to attain multi-resource management goals.

*Near term:* Establish a task force to coordinate resource management policies, action goals, and program designs targeting California's agricultural sector.

*Near term:* Identify where goal conflicts arise and resolve these conflicts.

*Near term:* Assess potential for integrated approaches.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

In support of statewide regulatory coordination, the IOUs will establish a task force with the California Department of Food and Agriculture (CDFA), CEC, Environmental Protection Agency (EPA), and the California Air Resources Board (CARB). The task force will be empowered to coordinate strategies and goals, and also assess the potential for integrated approaches, on behalf of their agencies. In order to facilitate this complex, multi-agency coordination, intervention at the governor's level is likely to be required.

*Strategy 2.2:* Coordinate technical assistance, funding, and incentive mechanisms.

*Near term:* Identify the programs and major funding sources affecting the management of energy, air and water resources, and climate change.

*Near term:* Create a collaborative forum to facilitate sharing of information and coordination of programs.

As challenges to the national and state economies arise, deploying financial resources in support of energy efficiency and other resource efficiency will be increasingly important. In support of financial coordination, IOUs will work with appropriate agencies, utilities, industry and private banking to assemble a comprehensive list of incentives, resources, funds, grants, loan products, and federal economic stimulus monies. This list will support energy and other resource management objectives, made available to customers through the planned Information Clearinghouse on Energy Design Resources.

In addition, financial resources will be integrated into marketing and outreach, education and training, and other program efforts, as appropriate.

*Goal 3:* Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

*Strategy 3.1:* Make information on efficiency solutions readily available to motivate efficiency improvements.

*Near term:* Develop benchmarking resources, tools and methods for the agricultural sub-sectors.

*Near term:* Design and launch focused program for irrigation efficiency, refrigeration, and process heating.

The IOUs will post relevant market data, technical information, education and training resources, and benchmarking tools, other than proprietary material or information, on the planned Energy Design Resources or other statewide clearinghouse websites. This information will cover relevant technologies in agricultural and food processing segments, but will have a focus on irrigation efficiency, refrigeration, and process heating. The Continuous Energy Improvement Program will also support this strategy. On benchmarking, the IOUs will continue to work with industry associations (for example, the Wine Institute, Almond Board, and Farm Bureau) to prioritize benchmarking needs and to

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

develop tools and methods, as well as to market benchmarking once resources are available.

*Strategy 3.2:* Conduct marketing & outreach to stimulate efficiency actions.

*Near term:* Develop ME&O strategy, addressing communication channels, partners, and effective messaging.

*Near term:* Begin pilot implementation.

For details on marketing and outreach planned to stimulate energy efficiency actions, please refer to Section 6.b.iv.

*Strategy 3.3:* Resolve metrics for embedded energy in water savings.

*Near term:* Update evaluation measurement & verification protocols to define energy impacts of water efficiency actions.

*Near term:* Design and conduct appropriate water/energy efficiency pilots for agriculture.

In support of the significant efforts underway in California to conserve water resources and to optimize public funds where energy and water converge, the IOUs will work with the Commission, water resources boards, and others to resolve metrics around embedded energy in water conveyance and treatment. Furthermore, IOUs will explore opportunities for saving energy on-site related to water, such as that in heating, cooling, pumping, and treating water. Lessons learned from current water-energy pilots, underway in one IOU's territory, will be shared with the other IOUs. The IOUs are willing and available to work with the Commission to advance these important multi-resource efforts through studies, pilots and partnerships with water agencies as appropriate.

## **6. Program Implementation**

### **a) Statewide IOU Coordination**

**i. Program name:** Statewide Agricultural Energy Efficiency Program

### **ii. Program delivery mechanisms**

The SoCalGas Agricultural Energy Efficiency Program will ensure the program is continuously updated and enhanced throughout the two-year implementation cycle. This also includes coordination with crosscutting program elements, including Emerging Technologies, Codes and Standards, Workforce Education and Training, Marketing and Outreach, and Non-IOU programs and market initiatives. Each designated IOU program lead will be responsible for representing key updates from each crosscutting program element in order to discuss opportunities for statewide program enhancements, modifications and further coordination as needed. IOU leads will then be responsible for incorporating program modifications at the IOU level to support statewide consistency when appropriate. Such items will be tracked in the meeting minutes to facilitate a record of statewide initiatives.

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

In addition, the four agricultural sub-programs will be coordinated statewide to unify program implementation including delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The two coordination systems (one for the broad core program and one designed for the five sub-programs) will interact with and support one another. The broad, high-level coordination effort is described below, focusing on how the IOUs will work together to effect the continuous improvement of the Statewide Agricultural Energy Efficiency Program.

The Statewide IOU Coordination process for the SoCalGas Agricultural Energy Efficiency Program will be as follows:

- **Designate an IOU Program Lead** – The coordination process will begin with each IOU designating a Statewide Agricultural Energy Efficiency Program lead. The IOU lead will represent one agricultural sub-program and liaise with the crosscutting program element managers, investigating new innovations, special accomplishments, and challenges experienced by sub-program managers in all IOUs. Where such innovations or challenges may impact the Statewide Agricultural Energy Efficiency Program across multiple sub-programs or the statewide program as a whole, the IOU lead will present such information to a quarterly Steering Committee meeting.
- **Establish protocols for Steering Committee Meetings** – The IOUs will coordinate to establish protocols around scheduling meetings, agenda setting, interstate travel, meeting minutes and tracking of action items identified.
- **Hold Quarterly Steering Committee Meetings** – The Agricultural Steering Committee will be comprised of all designated IOU leads (including at least one lead for each of the five sub-programs), and possibly other contributing stakeholders identified by the IOUs. At the quarterly Steering Committee meeting, individual innovations, challenges, and accomplishments experienced in one IOU or by one sub-program will be shared with all IOUs. The Steering Committee will evaluate these individual IOU and sub-program experiences, hear ideas for course corrections and overcoming challenges, replicate successful innovations for consistency statewide, resolve differences in implementation to stay unified, and measure the agricultural program's progress against statewide metrics and goals.
- **Adopt Program Enhancements** – After the Steering Committee agrees that a particular implementation policy or innovation has merit on a statewide level, each IOU lead will distribute the information to their sub-program managers for adoption and integration. Therefore, the IOU lead will act as a conduit, feeding sub-program information up to the statewide Steering Committee and distributing measures for adoption back to the sub-program managers. This feedback loop will assure consistency and unity in programmatic improvements across the IOUs. In some cases, it may be necessary to invite the sub-program managers to the Steering Committee meeting to get their feedback and ensure they receive the same message.
- **Evaluate Program Enhancements Against Statewide Targets** – To complete the adaptive management loop, the Steering Committee will track the program's accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The Steering Committee will

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

determine whether further course corrections are needed, and if so, rely on the above coordination process to generate the improvements necessary to stay on track.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and help ensure achievement of statewide targets across IOU service territories.

**iii. Incentive levels**

Details on the incentive levels are discussed with each of the four sub-programs.

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The IOUs will continue to develop in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the agricultural sub-program plans.

To specifically address this highly diverse and dispersed group of agriculture, food processing and related water customers, IOUs will continue to foster strategic partnerships with industry and commodity groups, as well as with regional farm and food associations. These partnerships engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users. These strategies leverage both past program successes as well as best practices studies that have confirmed that the targeted market segments rely substantially on local and industry-specific organizations for information and support.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The SoCalGas Agricultural Energy Efficiency Program will support integrated marketing opportunities for distributed generation from biogas, biomass, solar, fuel cells, and wind, as well as agricultural-based community-scale generation projects. These efforts support customer needs and wants, state renewable energy targets (through newly available small generator Power Purchase Agreement contracts), AB 32 greenhouse gas reduction targets, and emerging carbon markets and offset programs (such as the Chicago Climate Exchange or through the California Climate Action Registry). Consistent with California's preferred loading order, however, the IOUs will continue to aggressively market and support energy efficiency first, as California's most cost-effective energy resource, while also being mindful of the customer's ultimate interests and goals.

**vi. Similar IOU and POU programs**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

IOU program activities will be coordinated with other agencies' and organizations' territories containing a substantial agricultural base, as opportunities present themselves. This will ensure that California's agricultural customers receive consistent messages.

**b) Program delivery and coordination**

**i. Emerging Technologies program (ET)**

The long-term energy efficiency vision of California can be attained through the continuous development, verification, and acceptance of new technologies into the market. IOU portfolio staff actively works with statewide emerging technologies staff to identify new emerging technologies, support evaluation and demonstration, develop and promote case studies, and market results to applicable customers towards total market penetration. The programs coordinate specifically with universities to supply market-ready and viable technologies into the ET portfolio.

The IOUs will use a formal technology integration process for incorporating emerging technologies into the program. This process will be designed to track technologies/tools to be assessed, timeline to deployment, integration, codes and standards actions, expected actions of other players (such as manufacturers and ENERGY STAR) and other related information. The statewide program management team will work with other partners to update and execute the technology integration process, based on developments in technology, the program, and the market context. This process will be updated regularly to reflect current conditions.

**ii. Codes and Standards program**

The SoCalGas Agricultural Energy Efficiency Program relies on the Codes and Standards Program to help maintain an updated and relevant list of measures that will support agricultural savings. As codes and standards evolve, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning and Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. In the Statewide Agricultural Energy Efficiency Program, current work focuses on transitioning the market to accept new refrigerated warehouse code changes, and incorporating best practices and advanced refrigeration practices into that marketing and outreach effort. Towards that end, the Statewide Agricultural Energy Efficiency Program will continue to coordinate closely with crosscutting Codes and Standards, Workforce Education and Training, and industry partners and associations, and will utilize the Statewide Agricultural Steering Committee to enhance the coordination effort.

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others supporting the market transformation strategies of the Strategic Plan. In general, the

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

SoCalGas Agricultural Energy Efficiency Program will interface with the WE&T Program Implementation Plan to serve the goals of the Strategic Plan.

WE&T efforts will include specific activities to support the various sub-programs. In addition, training on Title 24 code changes, industrial refrigeration best practices, and ANSI Superior Energy Performance certification will also be provided. The latter will be contingent on program developments occurring at the national level.

In the interim, the statewide agricultural program will support the same superior energy performance concepts and principals through Continuous Energy Improvement workshops available for customers and trade allies. Additionally, DOE process system trainings (pumps, motors, steam, and compressed air) will be offered by IOUs statewide to lay the groundwork for certification level classes, once they have been developed nationally and are ready for rollout. The IOUs will be coordinating closely with national efforts and have expressed openness to discuss piloting certification classes. As a result, California will be poised to adopt this national standard and be a leader in this effort.

The education and training generally takes place through IOU energy centers, technology test centers, and education and training program offerings. Working with the Statewide WE&T team, the agricultural program managers will also expand training opportunities to local universities and academic institutions that have agricultural-based programs (e.g. Cal Poly Pomona and San Luis Obispo).

**iv. Program-specific marketing and outreach efforts**

The IOUs are currently engaged in in-depth market segmentation analyses. The results of this work will be shared among the IOUs and incorporated into detailed marketing and sales strategies to ensure the IOUs are targeting the right products to the right customer at the right time, and utilizing the preferred method of communication.

This foundational segmentation and integration of programs and services will provide insight into customer mindsets, behaviors, responses and motivations to achieve the most effective level of energy use. Based on this in-process segmentation analysis, the IOUs will be able to focus on providing consistent marketing and overall messaging focused on customers' business and personal goals, unique needs, and specific environmental considerations.

The results of this strategic planning effort will help define successful program outreach efforts to address the diverse agricultural, food processing and related water customers segments. Such efforts are customized to suit the unique needs of each segment and customer profile. See the marketing section of 5.c, Program Design to Overcome Market Barriers.

For example, IOUs will continue to foster strategic partnerships with industry and commodity groups, and regional farm and food associations to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

Specific efforts may include:

- Attending Farm Bureau meetings and providing information in monthly newsletters;
- Close partnerships with key industry associations and participation in their annual conferences, with an effort to develop conference speaking engagements;
- Presence at technical conferences, targeting customers and trade allies;
- Targeted integrated education and training to specific market sectors to support peer-to-peer interactions and industry advancement;
- Media campaigns focusing on trade magazine ads and articles, discussing IOU program information and case studies;
- Targeted customer efforts through assigned IOU account representatives and program engineers, third parties, and government partnerships;
- Phone and web-based customer support and outreach;
- Development of coordinated statewide agricultural and food processing resources into a centralized “one stop shopping” clearinghouse, on Energy Design Resources; and
- Market sector specific collateral that drives customers to account representatives and/or Web sites for additional support.

Such efforts have already shown success in California’s IOU programs and are identified as best practices in the American Council for an Energy Efficient Economy (ACEEE) comparative analysis of national agricultural energy efficiency programs.

Where possible and applicable, the IOUs will coordinate statewide in these targeted marketing efforts and partnerships to ensure cost-effectiveness and a consistent approach to customer-facing activities. Cost-sharing at industry conferences, co-sponsoring workshops, and identifying opportunities for statewide media campaigns as well as co-development of web-based tools and resources will be pursued.

The Energy Design Resources website will be used as a statewide clearinghouse of best practices, technology information, case studies, updates on upcoming education and training, and to promote new tools and resources available to support the Continuous Energy Improvement approach, such as benchmarking and performance tracking tools.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

Refer to Section 6.f on “integration across resource types.”

**vi. Non-IOU programs**

There are a variety of programs that will be coordinated with and leveraged in support of the program objectives. These include:

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

- Connecting customers with the CA Climate Action Registry;
- AB 32 support through CO2 tracking in program resources;
- Regulatory program coordination, including EPA air quality standards, water quality standards, and new refrigerant regulations;
- Non-IOU financing resources, including from water utilities, industry and private banking, state and federal incentives, funds, grants, and loan products to support energy and other resource management objectives;
- Water/Energy efforts within California;
- ANSI, for the Superior Energy Performance Standard; and
- ISO international energy management standards.

The program will continue to engage with Air Quality Management Districts, the California Energy Commission, the California Air Resources Board, the Department of Energy, water agencies, and other government agencies on programs impacting regulatory compliance and resource management.

**vi. CEC**

As of June 2012, PIER no longer exists. However, the program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies.

**viii. CEC Work on Codes and Standards**

As indicated in Section 6.b.ii, planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

**ix. Non-utility market initiatives**

The Statewide Agricultural Energy Efficiency Program will coordinate with applicable market initiatives to leverage market momentum and areas of mutual advantage.

Modeling on the success of the IOU partnership with the wine industry California Sustainable Winegrowers Alliance, the program may leverage the following efforts:

- California League of Food Processing;
- California Farm Bureau Federation;
- California Citrus Grower;
- Almond industry sustainability energy planning;
- Wine Industry – CSWA Program initiative;
- Dairy Industry;
- Irrigation Districts; and
- ASHRAE / ARI efforts to develop refrigeration best practices.

**c) Best Practices**

- As described in prior sections, the SoCalGas Agricultural Energy Efficiency Program reflects the best of each IOU program's successful components of statewide agricultural

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

program offerings, and introduces new elements from other utilities and national efforts. These best practices include: Leveraging Local Agricultural Resources: i.e., industry associations and farm bureaus;

- Continuous Energy Improvement: An approach to transform the market and reduce energy intensity through addressing technical and management opportunities;
- Technical Assistance: Recognizes the need for personalized assistance for agricultural customers, which includes a full service approach starting from audits/pump tests to design and technical assistance, presentation of recommendations, resources to develop a long term plan, potential of project management assistance, with financial incentives and guidance on best practices.
- Vendor Partnerships: This strategy will be coupled with vendor support and educational workshops and classes provide the full breadth of support customers may need to influence their decision to implement energy efficient equipment and practices.
- Statewide Coordination: In order to take advantage of the statewide implementation of the program, the IOU program representatives will meet on a quarterly basis to improve program operations by sharing successes and areas of operational concerns.

**d) Innovation**

A bundled and integrated product and service offering will integrate with multiple resource management solutions, offering a new and customer-centric approach to programs. This is supported by innovative customer segmentation work by the Marketing and Outreach IOU teams. Significant innovative aspects of the SoCalGas Agricultural Energy Efficiency Program include:

**Integration**

The Statewide Agricultural Energy Efficiency Program integrates demand side management strategies, and develops methods and pilots to promote integration of interlinked environmental and resource management issues. By improving the coordination of these issues of paramount importance to the industries being served, more face-time will be possible with large customers, projects will become more cost effective, and multiple problems will be solved concurrently. Specifically:

- Continuous Energy Improvement will foster a long-term energy management approach and support integrated demand side management.
- An innovative food processing pilot will integrate energy, air, water, GHG, and (potentially) waste streams.
- Integrated Comprehensive Energy Audits will provide targeted customers with integrated solutions in efficiency, DR, and DG, and may advise customers on other sustainability practices (for example, water conservation opportunities, CO2 reduction potential, and other programs references).
- IOUs will link customers with the California Climate Registry to identify the carbon footprint of a customer's plant.
- IOUs will promote innovative agricultural opportunities such as dairy biogas to energy, biogas injection, waste stream utilization, and community scale generation opportunities.

**Marketing**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

- A market-sector approach to designing and delivering programs will allow IOUs to delve more deeply into market opportunities and overcome specific market barriers. This approach is supported by innovative market segmentation work currently underway at IOUs that will support development of new, precisely targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs.
- Closer coordination with third parties, government partnerships, core programs, and other delivery channels will optimize portfolio performance.
- IOUs will increase outreach to new trade and community-based associations, leveraging best practices identified in ACEEE study of IOU agricultural programs.
- Expanded workforce education and training efforts with vendors, design teams, industry association members and other key market actors will help overcome many customer informational and transactional barriers
- Energy Design Resources, developed statewide by IOUs, will be expanded as a web-based hub of agricultural and food processing best practice information, training, modeling and performance tracking tools.
- Training will be provided on modeling and quantifying savings opportunities through tools such as eQUEST and Energy Pro.
- Non-IOU financing tools and resources will be coordinated and communicated to help customers leverage available sources of funds to complete targeted projects.

**Implementation**

- IOUs will coordinate on process improvements to statewide programs to ease participation barriers.
- Energy performance measuring and benchmarking assistance/services to customers will enable customers to compare themselves to “best in class” peers utilizing tools such as the U.S. EPA’s ENERGY STAR Benchmarking tool.

**e) Integrated/Coordinated Demand Side Management**

An integrated portfolio is cost-effective, captures program delivery efficiencies, and serves the needs and wants of customers who prefer a single, informed IOU point of contact to help inform and prioritize their energy investment decisions based on their unique needs.

Consistent with Commission direction and with the Strategic Plan, the Statewide Agricultural Energy Efficiency Program includes integration of energy efficiency, demand response and distributed generation programs in integrated audits, marketing materials and industry-specific workshops. To this end, the statewide IOUs and the Statewide Agricultural Energy Efficiency Program has made progress in advancing integrated solutions.

The IOUs are placing major emphasis on marketing to get the right message to the right customer at the right time. Advanced customer segmentation is being used to develop detailed integrated marketing and outreach plans which outline multiple tactics, delivery channels and key messages to target to specific customers based on their specific needs. The IOU account representatives, who serve as the key customer point of contact, will be attending an integrated sales strategy and training program to ensure consistent delivery of portfolio offerings.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

Education and training, particularly workshops organized around a customer segment, provides an ideal situation to integrate customer energy solutions. IOUs will provide integrated workshops to dairies, wineries, and food processors. These workshops will cover topics, such as resources analysis and methods, conservation, efficiency, demand response, and generation topics and resources. These workshops provide opportunities for IOUs to cross-sell solutions and share key information from other IOU departments (for example, sharing biogas injection information at dairy workshops). They also provide opportunities to look at water, air, carbon credit and waste management issues.

As appropriate, Workforce Education and Training (WE&T) will also cover integrated energy and system solutions, which will be increasingly important as Critical Peak Pricing matures. The Agricultural Program will coordinate with the WE&T group on curricula development and class planning.

The availability of a Continuous Energy Improvement approach, especially for the largest, most strategic customer accounts, will facilitate a thoughtful, integrated energy plan and will allow IOUs to stay engaged in supporting the progress of that plan.

Integrated comprehensive energy audits combine funds and resources of energy efficiency (EE) and demand response (DR) programs to provide integrated recommendations to customers. These audits provide customers with EE and DR recommendations and also provide general feasibility assessments for distributed generation (DG). Integrated comprehensive energy audits will be offered to customers with loads greater than 500 kW and all integrated audits will focus on EE, DR and DG options. In addition, the IOUs are developing an enhanced web-based integrated audit tool<sup>17</sup> for customers and internal IOU personnel. The integrated audit tool will be the principal tool to provide IDSM information to customers with loads less than 200 kW and will be used by the CSI program for determining EE opportunities prior to installation of solar equipment. It will be capable of generating customer reports that include specific information on the costs and benefits of IDSM programs.

Emerging Technologies and CEC collaboration is expected to include pilot projects and market acceleration assistance for market-ready products in the general categories of day lighting, lighting, HVAC, controls, and building envelope improvements.

**f) Integration across resource types (energy, water, air quality, etc)**

California's agricultural and related food processing sectors face a multitude of environmental and regulatory challenges that threaten their survival and competitiveness. In 2009, a severe drought is impacting California's farmers and increasing water pumping costs. In addition, new regulations aimed at improving air quality, water quality and reducing toxic

---

<sup>17</sup> Integrated audit tool is referenced as a general term in the statewide PIPs; each IOU has a specific name for its tool. PG&E's tool is the Progressive Energy Audit Tool (PEAT). SDG&E, SoCalGas, and SCE's, tool is the California Integrated Customer Energy Audit Tool (CICEAT).

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

environmental pollutants are proving to be expensive and disruptive to business as usual. Both these are impacting energy use and compliance.

The Agricultural Energy Efficiency Program proposes to leverage these challenges to coordinate with the regulating agencies and the programs they are operating in order to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. For example, the IOUs will continue to offer targeted trainings to customers who are sharing common regulatory challenges. In 2008 PG&E hosted three very successful workshops called NO<sub>x</sub> – Comply and Save, which educated customers on impending regulations, requirements for their boilers, and the most efficient project options to consider for compliance. This workshop will be expanded statewide and offered at the other IOU energy centers. In addition, additional workshops will look at wastewater treatment options, refrigeration upgrades, and energy efficiency to meet AB32 targets.

IOUs will pursue opportunities to partner with water agencies to offer joint energy and water incentives to support projects that reduce both resources, which reduces project costs and improves payback.

An IOU is currently conducting a study to evaluate emerging water quality requirements in the state, and address best practices in comprehensive water related energy management in seven agricultural/food processing sub segments. The study will reflect statewide practice as much as possible. The results will be shared with the other IOUs, as well as posted on Energy Design Resources.

Where applicable, the program will integrate topics like GHG reduction and water conservation into targeted customer workshops, marketing and communications, building on a strong track record from the 2010-12 program cycle. For example, one IOU is currently conducting a series of winery workshops focusing on GHG reduction strategies, water management, Energy Management 101, and Green Building which includes materials and water. Ads and articles featured water savings opportunities and messaging.

**g) Pilots**

Traditionally agricultural customers are a high cost group to provide significant energy education to. They are geographically dispersed and typically time constrained. Energy efficiency is not a primary concern, and although the IOUs have established high value relationships with these customers, many times it takes more to get them to accommodate new technologies.

**IOU Test Strategic Approach for Agricultural Segment**

The IOUs may implement a Test Strategic Approach (TSA). The TSA is based on identifying agricultural sub-segments where the IOU(s) have strong relationships with an industry or trade association. The objective is to leverage the trade association's needs with IOU's knowledge and experience with energy efficiency, demand response and self-

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

generation opportunity and solutions and in collaboration with the trade association leadership, educate sustainability and energy efficiency solutions to their membership.

This model is based on a successful effort implemented by the California Association of Winegrape Growers with Pacific Gas and Electric. For more information on their efforts, website link:

<http://www.cawg.org/CAWGProjects/SustainableWinegrowing/ProjectDescription.aspx>.

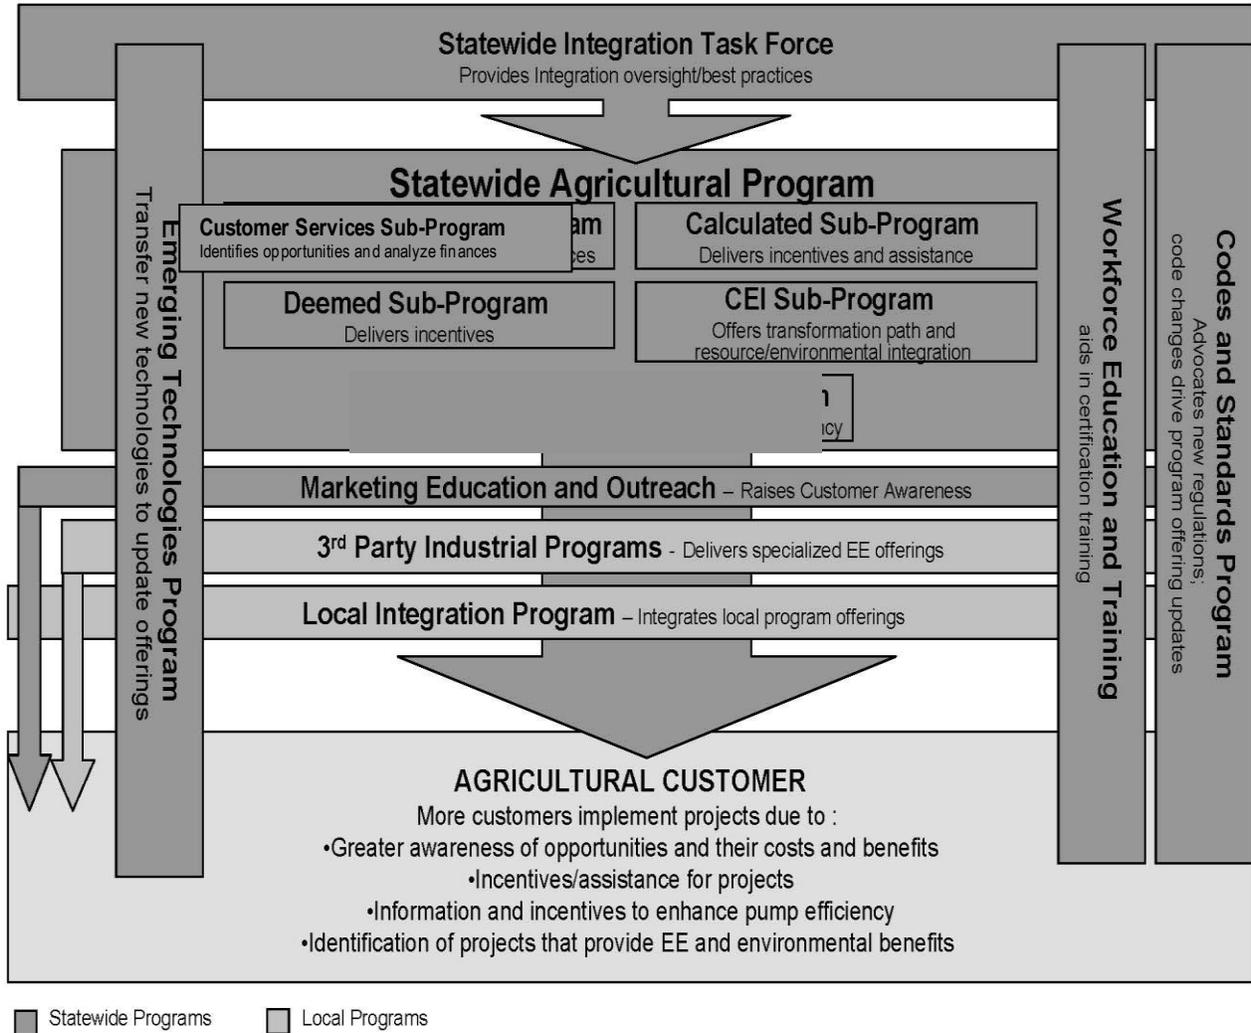

The IOU's intend on implementing methods to gather and retain more detailed performance and usage data on a pilot basis to determine the more effective methods to achieve savings. Exploring incentives for sub-metering is an option as is expanding the tool library in lieu of incentives.

**h) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

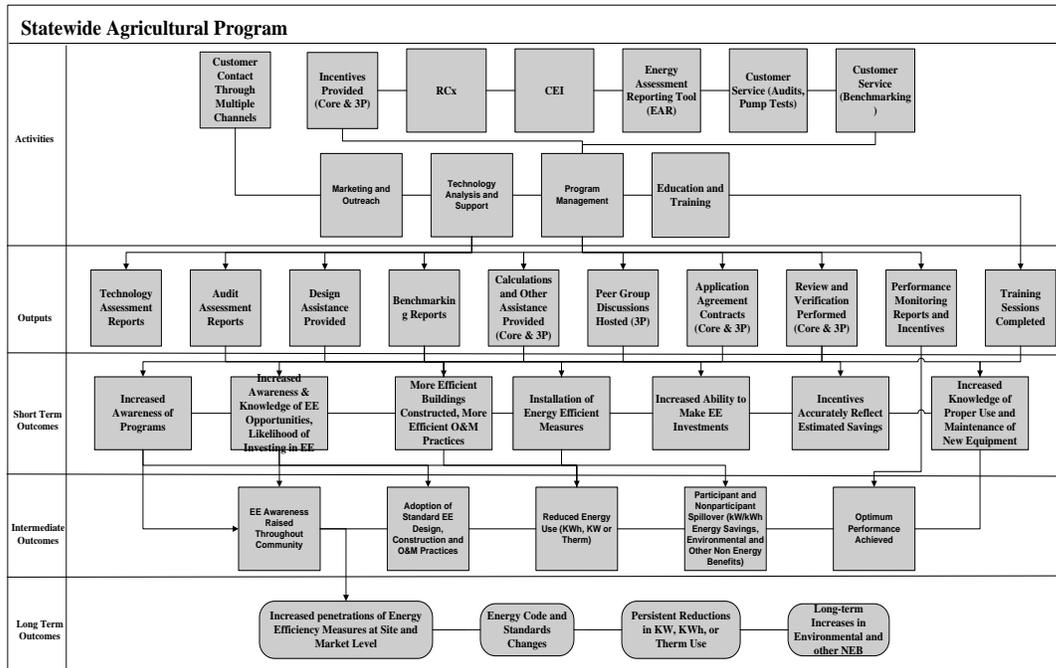

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**7. Diagram of Program**

# 2013-2014 Energy Efficiency Programs Statewide Agricultural Energy Efficiency Program Program Implementation Plan

## 8. Program Logic Model

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name:** Agricultural Energy Advisor  
**Program ID#:** SoCalGas 3717  
**Program Type:** Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** – See the overarching program for budget details.

3. **Projected Program Gross Impacts Table** – by calendar year

**Table 2** - See the overarching program for savings details.

4. **Program Description**

- a) **Describe program**

The Statewide Investor Owned Utilities (IOUs) have created the Agricultural Energy Advisor (AEA) to bring together under one program all services offered to support customer education and participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities.

CPS was created to provide a streamlined and coordinated assignment of right-sized customer solutions. The key is to start the process with an initial analysis of a customer's needs, determination from the analysis which audit will service the customer with the highest cost/benefit, identify additional program support and key indicators that will motivate the customer to implement energy saving recommendations

The IOUs anticipate the restructuring of AEA will affect the way audits are provided. AEA will enhance the IOUs' ability to match customers' need(s) with the right audit service. This will result in an increased cost-effective delivery of these audit services with an increased expectation for customer adoption/installation of provided customer specific recommendations.

In its offerings, AEA will place an emphasis in deep energy saving measures and emerging technologies where appropriate. When the technologies and customer opportunities are correctly aligned, the customer will become more open to the benefits these technologies offer to their business and will therefore increase their acceptance and adoption.

Together the AEA offerings will work to support the achievement of Strategic Plan objectives across the agricultural sector.

The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The Agricultural EA package, consists of five distinct offerings:

- **Benchmarking** is the first step for a customer to begin to understand the energy use of their building. Benchmarking is an initiative designed to educate and motivate customers to measure and track the energy use of their facilities, educate customers of the benefits of benchmarking their facilities and how they can track the impact of energy savings after implementing energy saving measures. To support the customer's efforts, the IOUs will offer technical support, hands-on workshops that will provide customers with information on how to benchmark, how benchmarking can be used as an energy management tool and what to do next after benchmarking.

The IOUs will develop or continue Benchmarking initiatives that supports the customers' ability to comply with AB1103's benchmarking requirements (upon its implementation), utilizing ENERGY STAR Portfolio Manager and IOU supported Automated Benchmarking Services.

The IOUs will also continue to offer customers technical support ranging from email and phone hotlines, hands-on workshops and web-based benchmarking educational and instructional materials.

The IOUs will continue their support to identifying, evaluating and making information about other benchmarking tools available.

The primary focus for benchmarking activities will continue to be centered on commercial buildings within the agricultural sector (in alignment with the target building type of AB 1103).

- **Agricultural Continuous Energy Improvement (CEI)** Continuous Energy Improvement (CEI) is a consultative service aimed at helping agricultural customers (IOUs will target CEI services inline with market segment potential in their service territories and resource availability) engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of IOU customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices which address energy savings, reduction of greenhouse gas emissions and water conservation, through high-level energy commitments from executive and board-level management.

CEI offers customers the pinnacle of audit offerings guiding executive management to levels of energy management self-actualization that makes energy and environmental issues a consideration in all management/business operational

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

decisions and in long term energy planning. For additional information about CEI, please consult the Agricultural CEI Program Implementation Plan.

- **Non Residential Audits (NRA)** for the Transition Period will provide Integrated Comprehensive Energy Audits (ICEA) that focus on customer energy savings, cost/benefits, and the targeted delivery of financial and technical assistance. Audit information must communicate complex information in a simple and understandable way to enable customers in identifying energy efficiency, demand response and distributed generation opportunities. Audits use “ex ante” Deemed and Calculated methodologies for energy savings analysis information.

As stated above, NRA offers ICEA. In Appendix A, each IOU defines the sub-categories of ICEA that they provide.

In this program cycle, emphasis will be given to meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), streamlining the audit process, increasing its efficiency, lessening complexity, and increasing the effectiveness of influencing customer implementation actions through actions such as integration of the demand response technical audit component directly into NRAs offerings. In addition, the IOUs will investigate ways to implement meaningful financial measurements such as return on investment and/or simple payback metrics. The key is ensuring that financial tools selected provide the customer with meaningful information by ensuring cost assumptions are appropriate to the customer. Also, NRA will assume the audit and budget responsibilities for Demand Response’s technical audit services, as applicable. It is intended that these audits will be a critical component of the integrated comprehensive audit service offering.

- **Pump Efficiency Services** is designed to help agricultural customers make informed decisions about improving inefficient pumping systems and operations through recommendations derived from pump test audit or direct observations of processes. Pumping of water is estimated to account for more than 80% of the electric load and 73% of the natural gas requirement in California’s agricultural segment, and this load is growing as the state’s water users increase their reliance on pumping water to meet their needs. Pumping is also estimated to account for 20 to 25% of energy usage within the nation.

The Pump Efficiency Services program element, implemented by a team of trained in house or third party contractors, aims to overcome key informational, technical, and financial barriers to pump optimization by offering pump tests, retrofit incentives, and targeted education, training and technical support for customers and pump companies. Each IOUs database of pump test results will be used in the near-term to target pumps in need of retrofit as a means to capture savings. However, pump performance data aggregation at the statewide level will contribute to the development of metrics and targets for pump improvements, in support of a statewide pumping focus on agriculture, supporting their strategies and objectives.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The IOUs will continue to offer pump testing services at no or low cost and pumping system efficiency workshops through their energy education centers or other event opportunities during the Transition Period.

- **Retro-commissioning:**

Not Applicable.

The Transition Period will be used to develop and test the AEA design strategy. The strategy focuses on simplifying the way audits are provided to customers. Through various assessment functions, the IOUs will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (i.e. primarily EE, DR, and SG).

It is anticipated AEA will allow the expansion of audit serves across diverse class of customers, potentially across all segments and will interconnect the customer with the wide and diverse range of programs offered. From a customer perspective, the impact on customer time and resources will be reduced, the audit analyses will include DSM, greenhouse gas reduction information, provide water conservation recommendation all in a single report. The resulting report will identify comprehensive solutions that will simplify the customer decision-making process.

The primary program objectives for 2013-2014 are:

- Support the Strategic Plan by offering integrated audits across a wide selection that address the full spectrum of energy solutions, including energy efficiency, demand response, and distributed generation (California Solar Initiative and distributed generation), focusing on agricultural facilities as defined by each IOU's market potential and resource availability.
- The continuation of delivering high value audit reports to the customer. Audit reports will be designed in such a way that they will provide the customer with information which motivates them to implement energy efficiency, demand response and consider renewable generation options.
- Enhance efforts to identify and provide financial analyses focused on deeper energy savings and technologies. Identify ways different financial metrics, such as return on investment and/or simple payback, can be provided where the values presented have meaning to the customer.
- The IOUs will explore and evaluate the potential of enhanced customer incentive options that are contingent on a customer's receiving an audit prior to applying to incentive programs.
- Incorporate new and/or emerging technologies appropriate for the customer's facility.
- Develop and implement enhancements to current Benchmarking workshops (targeting agricultural buildings) and continue providing Benchmarking and AB 1103 technical support through established and new delivery channels.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

- Encourage Statewide consistency by offering a similar energy audits with the ultimate goal of offering customers the best energy management practices and technologies.
- Enhance the AEA' offerings by including activities such as, but not limited to:
  - The highlighting of emerging technologies and deep energy savings opportunities and providing education on long-term energy planning/project management strategies (in coordination with CEI program).
  - Will continue existing water saving services and develop Leak detection services and strategies which will offer the service to customers in all customer segments as determined by the IOUs to provide customer benefits and cost-effective to administer. The services will, be offered through the use of audit teams, in house and/or contracted, and may be required as a service in the delivery of all integrated comprehensive audits.
- AEA will play a key role in exploring options regarding identifying deep energy savings, promotion of emerging technologies and providing the proper support to those customers who take advantage of more than three measures from Agricultural Deemed Incentive sub-program.
- AEA will develop processes to help energy audit teams and customers identify facilities and services that will provide the greatest return on benefits from the audit. The IOUs may explore leveraging tools to complete energy audits, usage analysis, assessments and/or building performance benchmarking as the first step in determining a customer's need.
- AEA may also enhance tracking and audit component capabilities to support customer needs analysis, reduce program application barriers, maximize recommendation follow up and streamline audit report generation.

**b) List measures**

The AEA primarily offers non-resource, auditing services. It does not offer incentives, but ultimately influences the customer's implementation of energy efficiency, demand response, and self-generation opportunities in combination with incentive from the core Agricultural incentive programs (refer to the Agricultural Deemed and Calculated sub-programs for specific information). However, each IOU reserves the ability to offer incentives specific to AEA's individual service offerings.

**c) List non-incentive Agricultural Energy Advisor Services**

The Agricultural Energy Advisor sub-program (AEA) is designed to deliver a coordinated and customer-specific service. AEA features a statewide integrated demand side management customer-specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer's need(s).

Such activities include, but are not limited to: energy management assessments, energy planning, marketing and outreach, baselining and benchmarking, project implementation

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

support, technical support, energy savings calculations, process evaluations and report generation, and web-based energy resources.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The AEA offers services which change corporate/management cultures that prevent successful implementation of comprehensive energy policies. These offerings help overcome customers' lack of awareness of DSM opportunities by providing a customer focused, comprehensive package of energy solutions designed specifically to motivate the customer to implement recommendations. Information such as cost/benefit analysis (i.e. ROI or simple payback) and identification of appropriate IOU incentive and/or finance programs, can significantly enhance the financial benefit of the energy saving recommendation. AEA also provides customers with tools to measure the effects of implemented energy savings actions on their bottom line.

AEA brings together audits and related services to implement energy saving activities.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Number of Audits	63	65

**e) Advancing Strategic Plan goals and objectives**

The AEA is designed to promote DSM coordination and the integration strategies of the Strategic Plan. Foremost are recognition of the linkage between energy and environmental

e)

e)

e)

e)

e)

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

policy and the importance of integrating energy efficiency, demand response and distributed generation to support California's plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the AEA include:

- Identify New and Improved Tools and Strategies to Reduce Energy Consumption in agricultural facilities.

Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the benchmarking, CEI, and NRA demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, industrial/ agricultural processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing agricultural facilities contribute to California's zero net energy goals. Once implemented, recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.

- State/Local Governments and Major Corporations Commit to Achieve EE Targets

AEA's offerings will seek to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop an actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

- Develop Tools to Reduce Energy in Agricultural Facilities.

As part of the implementation of specific AEA offerings, the IOUs will partner with energy industry peers, industry associations, and DOE/CPUC-sponsored labs and consultants to enhance the use of existing tools and explore new tools to help agricultural customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

- Management Standard for Energy SME2000-2008;
- LBNL Superior Energy Performance; and
- ISO-50001.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

- Develop Business Models to Deliver Energy Management Solutions

AEA's offerings will address the fundamental purpose to influence decision making practices from Agricultural, customers to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the agricultural market sector.

In addition, AEA's offerings promote acceptable practices of accounting, auditing, and evaluation by:

- Offering integrated and focused audits, benchmarking, savings calculation assistance for retrofit and simplifying the audit-to-project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action;
- Guiding and supporting customers as they implement technologies, processes and practices to achieve energy efficiency savings; and
- Long term energy planning support.

## **6. Program Implementation**

- Assess and identify the best way to support the use of the BEARS tool.
- Enhanced current Benchmarking workshops and continue providing Benchmarking and AB 1103 technical support through established and new channels.
- Emphasize and support integration in emerging technologies and deeper energy measure opportunities.
- In coordination with incentive programs, identify ways to streamline the end to end process for customers wanting to participate in IOU energy saving programs.
- **Statewide IOU coordination**

**i. Program name:** Agricultural Energy Advisor Program

### **ii. Program delivery mechanisms**

AEA will employ a variety of delivery mechanisms or channels. Most of AEA's offering will use IOU customer energy efficiency staff and contractors, service and sales representatives, website and/or marketing and outreach efforts. Other delivery channels may also be developed.

In addition, where applicable, IOU customer account representatives or program management staff will support this activity within the statewide agricultural sector, as well as third parties, government partnerships, and local programs.

### **iii. Incentive levels**

Not applicable.

### **iv. Marketing and outreach plans**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs, in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs. Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost effectiveness of reaching customer groups.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

AEA's energy recommendations will continue to recognize the regulations required by other bodies. For example, information about GHG reductions resulting from AB 32 may be incorporated into the customer recommendations and to factor into the projects cost-effectiveness and water conservation information will be included in the reports as appropriate.

Program offerings will collaborate and support the CEC's AB 1103 mandate by assisting customers with technical and awareness activities. AEA will advance the introduction of the BEARS and California Rating Tool, where reasonable.

AEA recognizes the efforts of the CEC's Green Building Initiative programs, DOE's "ISO plant certification" programs, EPA EnergyStar Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs and will leverage such activities to the customer's benefit.

**a) Program delivery and coordination**

The sub-program will be coordinated with the following activities, as applicable:

**i. Emerging Technologies program**

The SW AEA Management Team will stay abreast of and incorporate relevant emerging technologies into audit recommendations as appropriate.

**ii. Codes and Standards program**

AEA implementation will include information about pending new codes and standards that may affect planning or prioritization of retrofit or new construction projects. Audits

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

reports will include customer recommendations that are consistent with current governing codes.

**iii. WE&T efforts**

AEA implementation will integrate with WE&T efforts, as needed, by providing CSI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with WE&T coordination to integrate sector strategy approaches, as required.

**iv. Program-specific marketing and outreach efforts**

In 2013-2014, AEA marketing campaigns will provide a wide range of action-oriented solutions targeted to specific segments and subsegments of business customers. In addition, AEA marketing efforts too will be “bundled” as menu of demand response, energy efficiency and conservation programs providing customers with a full array of EE and DR opportunities. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.

Marketing activities will target business customers and select effective channels to reach entities such as: trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support may be utilized.

Marketing collateral and messages for energy efficiency will be integrated with other IOU programs. Through additional market segmentation and feedback from customers, IOUs will further adjust approaches based on the varied needs of targeted customers. Additional sub-program marketing will be accomplished by leveraging local third-party programs. Specific IOU marketing budgets are provided in Table 1 of the core agricultural program.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The IOU’s AEA team will participate in Statewide and national efforts to develop and enhance audit, benchmarking and continuous energy improvement tools and practices. Such activities will likely occur in conjunction with ongoing industry efforts managed by

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

the California Energy Commission (CEC), Consortium for Energy Efficiency (CEE), ENERGY STAR and the California Commissioning Collaborative (CCC).

CEI implementation will include non-energy activities such as recognition awards, local area or sector competitions, awareness campaigns, education about non-energy-related LEED points and definitions, and use of computerized financial analysis tools and cost estimating and forecasting tools

**vi. Non-IOU programs**

AEA reports will include information on non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. AEA will partner with programs offered by CEC, ARB, Air Quality Management Districts, ENERGY STAR, and other government and quasi-governmental agencies to capitalize on opportunities to develop co-branded program information and marketing collateral target to agricultural -sector customers, as opportunities present themselves.

With respect to water conservation, IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects (ESPM, BEARS, California Rating Tool, Water Agencies and others)

**vii. CEC**

SoCalGas will continue collaboration efforts with the CEC in energy efficiency tool development and seek to promote adoption of new technologies developed through the CEC's processes and to educate customers to demonstration, research and/or pilot projects. Specific AEA offerings will encourage recommendations addressing new technologies, processes, and methods, as identified in CEC projects, which will enable customers to achieve energy efficiency "stretch" goals that produce significant energy savings beyond an established baseline in a cost-effective manner.

**viii. CEC work on Codes and Standards**

AEA will not be implemented with a direct linkage to codes and standards efforts. Although AEA will reflect code regulation in its energy savings calculations as deemed appropriate.

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-IOU information and guidance that AEA offerings will provide to customers. In addition, the IOUs will participate in state and national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

**b) Best Practices**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The IOUs will continue to leverage best practices and lessons learned at regularly scheduled statewide program management meetings. These meetings are forums to discuss program design and implementation issues, and as appropriate, provide statewide collaborated guidance in RFP solicitations and awareness of program offerings so customers operating multiple facilities across IOU service territories receive the same customer experience.

Other best practices approaches apply the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the agricultural market sector. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach will continue through the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

**c) Innovation**

For 2013-2014, the IOUs are identifying and evaluating program processes to increase effectiveness, simplification and increase the benefits the program delivers. Each IOUs set of lessons learned from these efforts will be shared and implemented to enhance energy savings benefits to all California IOU customers.

AEA will engage in a process of continuing improve as a new standard way of packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

Other AEA offerings may also consider specialized incentives approaches based on delivery, target markets and/or other opportunities.

**d) Integrated/Coordinated Demand Side Management**

AEA will provide a comprehensive approach for integrated audit services. Its services will have the flexibility of meeting every level of a customer's audits needs from integrated comprehensive audits to targeted or focused audits, which centers on specific systems or processes, to assessments or general walk through audits or online "do-it-yourself" audits (currently for small business customers), which when properly applied can assist in identifying the areas of a customer's greatest energy interest, financial capabilities of the customer's ability to invest in improving its energy use, and identification of other programs that can be brought into the discussion to motivate a customer to move forward with the energy saving plan.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The scope of services offered can coordinate the audit to look for retrofit opportunities; with benchmarking tools, or long term planning. Audit reports can present a truly integrated analysis to customers, seamlessly providing them with information and recommendations regarding energy efficiency, distributed-generation, demand response, greenhouse gas emissions and water energy savings, Customers will be referred to other IOU programs that will help them implement the recommendations resulting from the audit report and thus will be given a complete picture of their energy usage and options for reducing costs and using energy more efficiently.

**e) Integration Across Resource Types**

AEA will focus on DSM integration.

AEA implementation will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IOU AEA managers will partner with the appropriate programs, when applicable, with government agencies to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers.

Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote AEA offerings, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, IOU program managers will collaborate with the local water districts to produce marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects.

**f) Pilots**

AEA services may consider the development of test markets especially in the introduction of new energy benchmarking or saving tools.

**g) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

**7. Diagram of Program**

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name:** Agricultural Calculated Energy Efficiency Program  
**Program ID#:** SCG3719  
**Program Type:** Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** – reference the core program for budget details

3. **Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the core program for savings details

4. **Program Description**

a) **Describe program**

The purpose of the statewide Agricultural Calculated Energy Efficiency Program is to provide services to improve the energy efficiency of agricultural facilities in California, including financial incentives based on calculated energy savings. The energy savings are calculated for measures installed as recommended by comprehensive technical and design assistance for customized projects. Integrated projects are encouraged to combine energy efficiency and demand response. Eligible projects include new construction, and retrofit .

The Agricultural Calculated Energy Efficiency Program is part of a suite of programs within the Statewide Agricultural Energy Efficiency Program.

The Agricultural Calculated Energy Efficiency Program is utilized for projects where a rebate is not available through the statewide Agricultural Deemed Energy Efficiency Program, customized calculations provide the most accurate savings estimates, or interactive effects between measures are best captured through whole building or whole system modeling.

Because it presents a calculation method that can consider system and resource interactions, the program will become the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan.

Key features in the process include:

- Energy audits of facilities and processes which recommend efficient design alternatives and detailing energy savings and CO<sub>2</sub> reductions;
- Calculations/estimates of energy savings for exceeding Title 24 code or industry standard practice baselines;
- Technical assistance from IOUs in energy audits and calculated savings;
- Submission of project proposal for IOUs review and approval;
- Pre-inspection by IOUs for approved retrofit projects;
- Post-inspections on approved and completed projects to verify performance; and
- Payment of incentives from IOUs.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

Energy audits may be completed by customers directly or by authorized participants. Sponsors may include contractors, design teams, vendors, and energy service companies. The completed audit may then be submitted for review and approval.

For the energy audit feature, statewide consistent calculators are publicly available. The statewide IOU-created and maintained SPC Calculator can be used for retrofits and some new construction applications and is available online. For whole building construction projects, IOUs accept both Energy Pro, available for license, and the IOU-sponsored eQuest, available for free on the statewide Energy Design Resources website at [www.energydesignresources.com](http://www.energydesignresources.com), among others. Calculations must be submitted in open, unlocked, native format for review and consideration in the IOU's programs.

**b) List measures**

The broad range of measures eligible for incentives is summarized in the table below along with the current incentive levels. For detailed measure incentives, *see* Section 6.a.iii below.

The following measure categories are eligible for Calculated Incentives:

- Refrigeration
- Gas measures

**c) List non-incentive Agricultural Energy Advisor**

The Agricultural Calculated Incentives Program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical and calculation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd the project through the process.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors including projects/programs; not single project or sub-program. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**c) Program Design to Overcome Barriers**

The Calculated Energy Efficiency Program includes numerous features designed to overcome these barriers, as identified and discussed below.

**Integrated Demand Side Management Approach**

The program offers California's agricultural segment a statewide suite of products and services to help overcome market barriers to optimize energy management and meet the goals of the Strategic Plan. It overcomes multiple barriers through the implementation of strategies and tactics that provide an integrated solution to the customer, offer education and outreach to create awareness and promote continuous energy efficiency improvement. The program also enables a facility to attain resource management levels that exceed industry standards and gain them market and worldwide recognition.

**CEI Program Offering**

The Continuous Energy Improvement (CEI) program compliments the Calculated Energy Efficiency Program by helping customers implement energy efficiency measures that have been identified through energy efficiency audits or in-depth facility/process assessments. Such assessment may be jointly provided by the IOUs and the U.S. Department of Energy (DOE) or ANSI. It focuses on improving production and optimizing energy efficiency and provides integrated resource management solutions including GHG reduction. This approach overcomes such barriers as lack of awareness of energy efficiency opportunities and provides highly skilled workforce of energy efficiency, process optimization, and resource management.

**Marketing and Outreach**

To increase awareness of the program, a statewide centralized clearinghouse may be developed to give customers access to information on operating best practices in energy efficiency, industry relevant technical assistance, baselines, case studies, tools and computer based training. This clearinghouse addresses the issue of availability of information and qualified industry specialists to fully assess a building, system or process and help customers understand how energy efficiency can impact their emissions, resource consumption or waste discharge streams. A clearinghouse helps alleviate the problem often run into by Non-Residential customers of getting incorrect or out-of-date information from some local networks. It will also enable design engineers to specify energy efficient measures to exceed industry accepted baseline standards when constructing new or retrofitting existing buildings or systems, instead of specifying only what they know or what they are familiar with.

The Statewide Program information and services will primarily be delivered through account representatives, IOU call centers hotlines, local government partnerships, third parties, and IOU internet sites. Information may also be made available through industry events, through industry organizations, and through advertising in industry and trade publications. Other avenues to reach out to customers and identify energy efficiency opportunities include non-resource programs that provide education and outreach, workforce education and training, or through IOU Emerging Technologies Programs.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**Education and Training**

Highly skilled energy management professionals may conduct technical training and seminars to educate the public as well as develop a highly trained energy efficiency workforce that is accessible to industry.

**Emerging Technologies**

In collaboration with ET and the CEC, ET may conduct studies, pilots, and demonstrations to prove the viability of promising emerging technologies and lower the risk of investment which in turn will speed up market penetration.

**Financial Assistance**

Rebates and incentives properly priced and based on energy savings quantified through technical assessments or basic audits, can help customers overcome internal financial hurdle rates. Skilled energy efficiency personnel may also assist customers and provide additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, tax incentives or other local sources of project funding.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Projects	TBD	TBD

**e) Advancing Strategic Plan Goals and Objectives**

The Agricultural Energy Efficiency Program supports all three goals in the Strategic Plan for the Agricultural Sector. General advancement of the goals is presented in the program implementation plan for the Agricultural Energy Efficiency Program. More specific support of the goals in the Agricultural Calculated Energy Efficiency Program is presented here.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

The Agricultural Calculated Energy Efficiency Program supports strategies to develop a knowledge base of efficiency solutions, foster workforce education and training, and encourage applications of new technologies.

*Goal 2:* California regulations, financing mechanisms, and incentives programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The program supports strategies to attain multi-resource management goals and to coordinate technical assistance, funding and incentive mechanisms.

*Goal 3:* Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

The program supports strategies to make information on efficiency solutions readily available as well as conduct marketing and outreach to stimulate efficiency actions.

**6. Program Implementation**

**a) Statewide IOU coordination**

**i. Program name:** Agricultural Calculated Energy Efficiency Program.

**ii. Program delivery mechanisms**

Agricultural Calculated Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The Agricultural Calculated Energy Efficiency Program will coordinate with the core Agricultural Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the implementation cycle will be enabled.

**iii. Incentive levels**

A broad range of measures is eligible for the Calculated Energy Savings Program, as seen in the following table. The current incentives for these measures are standard across the IOUs participating in the Statewide Agricultural Calculated Energy Efficiency Program.

Incentives will be as follows:

- Therms, \$1.00/therms, Capped at 50% of project cost

The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division and market direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The Calculated Energy Efficiency Program may be marketed through IOU Account Executives, as well as through trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. The Program may also provide direct customer contact by account executives, demand response program outreach, phone and e-mail support.

Marketing campaigns may provide a wide range of pro-active solutions targeted by segmentation research. In addition, marketing efforts may be integrated in a menu of demand response, energy efficiency and conservation programs. This menu will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment, IOUs will better communicate with and serve customers.

Marketing efforts may incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness and outreach efforts may use targeted multi-media communication channels. This will ensure the message reaches the intended audiences with enough frequency to create awareness, educate and engage the customer to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars. The strategy will also include energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Market outreach to raise awareness of EE programs available may use a number of multi-media strategies, including:

- Account representatives may make a regular and consistent customer calling effort to key customers within this sector;
- IOU representatives, program management representatives, and field engineers may be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the agricultural market sector;
- Attendance at the key trade shows for each high priority sub-segment within the agricultural market sector;
- IOU-sponsored training events at the IOU's Customer Training Centers and other convenient locations within the IOU's service territory;
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Written collateral pieces that provide an overview of the IOU's Energy Efficiency programs will be linked into the appropriate IOU's DSM web page.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination may be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above. Furthermore, agricultural facilities are recognized as large energy and water consumers. IOUs will develop proposals, as appropriate, to facilitate water-energy nexus projects.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Agricultural Calculated Energy Efficiency Program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with agricultural customers, to the extent possible. In the past, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who manage more than one resource type.

Regarding water conservation, IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Calculated sub-program incentives for energy efficient equipment that may also reduce water and GHG emissions.

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that utilize the Agricultural Calculated Energy Efficiency Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program Delivery and Coordination**

**i. Emerging Technologies (ET) program**

California's long-term energy efficiency vision can be attained through long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the energy efficiency benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the Calculated sub-program will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. In addition, portfolio staff actively works to incorporate promising emerging technologies

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

from the ET program.

**ii. Codes and Standards program**

The Calculated sub-program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. As codes and standards impact measures, the program will act to align itself with appropriate offerings. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) are made available. These technologies will begin as R&D, transition to Emerging Technologies, then to Incubation and finally to Mainstream.

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the Agricultural Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings take place through IOU’s energy centers and technology centers.

**iv. Program-specific marketing and outreach efforts**

Marketing and outreach initiatives may include but not limited to

- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the agricultural sector, as appropriate;
- Attendance at key trade shows within the agricultural sector;
- IOU-sponsored training events at the IOU’s Customer Training Centers and other convenient locations within the IOU’s service territory;
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Development of case studies, web pages, and marketing material that provide an overview of the IOU’s energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The program provides a significant challenge to integrating DSM initiatives to non-energy activities due to the general industry structure, the nature of market sector resource use, limited resource savings potential specific to smaller businesses, and limited bandwidth. Therefore, integrated audits across the various energy efficiency program offerings, with complementary options available through other entities (for example, water agencies) may identify the opportunities recommended to the specific agricultural customer.

Concerning water conservation, IOU program managers will contact the local water districts to share marketing collateral, attend trade shows, and mutually release notices for programs with interactive water and energy effects. IOUs will also offer Calculated sub-program incentives to ARB and Air Quality Management District customers. These incentives include energy efficient equipment that may also reduce both water and GHG emissions.

In addition, the program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, ARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**vii. CEC**

As of June 2012, PIER no longer exists. However, the program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies.

**viii. CEC work on C&S**

Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

**ix. Non-utility market initiatives**

The program will support and educate customers. It will also facilitate initiatives (for example, AB 32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, and California Green Building Initiative). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**c) Best Practices**

The CEI program builds upon the initial feedback from the current CEI program and expands its reach into the Agricultural segment.

**d) Innovation**

For the 2013-2014 program cycle, California IOUs will implement an incentive structure that emphasizes advanced controls that enable demand response motivating customers to participate in energy efficiency and demand response incentive programs as well as enrollment in demand response programs.

IOUs will continue working collaboratively to modify program policies and procedures to address ongoing changes in customer expectations, market conditions and program flexibility. These changes will improve program understanding and participation, promote measures eligibility, increase customer economical benefits, and reduce policy restrictions identified as barriers to participation. IOUs are implementing such processes based on market studies and policy discussions conducted on the subject. Among modifications that would be potentially discussed and implemented are incentive caps and redesign of early retirement measures and equipment in conformance with Commission guidelines.

IOUs are planning to elaborate and utilize positive experience obtained using the SBD Simplified tool to include energy efficiency retrofit projects. Such tools substantially reduce application processing and review time and minimize number of hand-offs without sacrificing accuracy of energy saving calculations.

IOUs will use an integrated approach to addressing DSM opportunities (for example, merging energy efficiency and demand response analysis, and converting recommendations to Calculated programs). In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, and providing analytical information about applicable distributed generation solutions, will maximize customer adoption rates for the most cost-effective energy management opportunities.

IOUs will consolidate various calculating software such as SPC Software, Engage and other measure specific calculating tools to standardize calculating methodologies. This will ensure that calculations will be more uniformed and consistent amongst all stakeholders. This will not limit the use of nationally recognized standard DOE toolsets for certain measures.

The IOUs are exploring innovative means of improving the Agricultural Calculated Incentive sub-program based on Energy Division direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" and to "raise incentive levels for Emerging Technologies", is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Agricultural Calculated Incentive sub-program.

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

**e) Integrated/Coordinated Demand Side Management**

The IOU's have identified integrated Demand Side Management (IDSM) as an important priority. As a result they have proposed the establishment of a Statewide Integration Task Force (Task Force). The program plans to work closely with the Task Force to identify comprehensive integration approaches that feed into the overall statewide strategy and to implement best practices as rapidly as practical.

**f) Integration across resource types (energy, water, air quality, etc)**

California's agricultural sector faces a multitude of environmental and regulatory challenges that affect their survival and competitiveness. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to conventional businesses, and complying with these regulations may actually cause increased energy use.

To help deal with these challenges, the program will coordinate with the regulating agencies and their programs to support common program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs will continue to offer targeted trainings to customers who share common regulatory challenges in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at small and medium sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 targets.

IOUs will partner with water agencies to offer joint energy and water conservation incentives to support projects that reduce both energy and water consumption. This partnering will reduce administrative costs and increase the program's societal benefits and impacts.

The Program will integrate applicable topics such as GHG reduction and water conservation into targeted customer workshops, marketing efforts, and communications to build on efforts from the previous program cycle.

**Water/Energy Nexus Strategy**

SoCalGas supports improving the efficiency of water systems as one of the most critical strategies to capture water/energy nexus benefits in the energy efficiency programs. SoCalGas plans to focus its efforts in areas that use gas engines as the energy source to deliver and treat water. For water agencies within SoCalGas's territory, we plan to issue an RFP to utilize a contractor to implement leak-loss detection and remediation and pressure management services applicable to storage, pumping and distribution through SoCalGas's core or Third Party Program. SoCalGas will explore new project ideas for the water/energy nexus, as well as the calculation of ancillary water benefits (e.g. "embedded" energy savings). SoCalGas will accelerate the expansion of cost-effective water-energy nexus programs by coordinating with the other utilities, water agencies, and municipalities to study the cost effectiveness and the embedded energy savings for water/energy efforts. Our intent

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

is to continue to offer measures and services to the water sector through the “calculated” and audit programs. SoCalGas will also explore for new direct energy measures that can be incented under the calculated program. Additionally, we will increase our efforts to capture the water-energy nexus and sustainability in the agricultural, industrial, and commercial segments.

**g) Local Element (Negotiated Incentive Option)**

SoCalGas will provide a local component which will include incentives for energy-efficient retrofits, systems new construction, or replacements of existing equipment at SoCalGas customer sites. Participants may be either customers or energy-efficiency service providers (EESP’s) acting as project sponsors for activities at customer sites. To qualify, a project must save a minimum of 1,000,000 therms per year. Associated energy, resource such as water, sewerage and emissions, and GHG savings will be considered when evaluating a project for funding. A project may consist of a single project at a single site, or may be aggregated from multiple projects belonging to a single customer, and may include a variety of measures.

This local element is designed to serve the largest non-residential customers within the SoCalGas service territory. Non-residential customers in this group are comprised of but not limited to the following industry sub-segments: Government/Utilities, Manufacturing/Processing Industries and Institutional. Each sub-segment has distinct energy use patterns, differences in equipment and facility design, and various management structures and decision-making processes. Because each industry sub-segment is unique, this option will use a customized, customer-focused approach. Participating customers, taking into account their individual energy and resource conservation opportunities as well as internal hurdle rates, will propose or “bid” to SoCalGas the incentive level needed to enable large EE and Resource savings projects. This ensures that this option will be adaptable to the unique needs of each market segment.

The program is designed to be flexible and cost effective: The project sponsor proposes a project and desired incentives. Incentives may cover up to 50% of the incremental project costs less any additional funding received from other sources. Measurement and verification (M&V) is required for all projects. As a performance-based incentive program, the approved M&V report will ultimately determine the energy savings for each project. The total sum of incentives paid for a project may not exceed the amount “bid” by the customer and agreed to by SoCalGas.

**h) Pilots**

Not applicable.

**i) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

**7. Diagram of Program**

Please see the core program diagram.

**8. Program Logic Model**

Please see the Commercial Calculated Energy Efficiency Program logic model.

- 1. Program Name:** Agricultural Deemed Energy Efficiency Program  
**Program ID#:** SCG3720  
**Program Type:** Statewide Core Program

**2. Projected Program Budget Table**

**Table 1** – reference the core program for budget details

**a) Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the core program for savings details

**b) Program Description**

**a) Describe program**

The purpose of the statewide Agricultural Deemed Energy Efficiency Program is to provide services to improve the energy efficiency of agricultural facilities in California, including financial incentives based on deemed energy savings. The energy savings are deemed for installed measures. Integrated projects are encouraged to combine energy efficiency and demand response.

The Agricultural Deemed Energy Efficiency Program is part of a suite of programs within the Statewide Agricultural Energy Efficiency Program.

Key features of the program include:

- Information and technical assistance from SoCalGas on energy efficiency measures and savings potential;
- Application via mail, fax, internet and phone by customer for eligible measures;
- Reservation of financial incentives by SoCalGas, if requested by customer;
- Pre- and post-installation inspection by SoCalGas, as determined by SoCalGas based on prior participation and other factors; and
- Payment of incentives from SoCalGas.

**b) List measures**

Itemized retrofit measures have prescribed energy savings and incentive amounts. These measures are categorized under the following end uses:

- Food service
- Boilers and water heaters
- Pipe and tank insulation
- Greenhouse Curtain
- Infrared film

**c) List non-incentive Agricultural Energy Advisor Services**

The deemed sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical consultation and application preparation assistance to help customers

navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd through the process.

## 5. Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Information

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

### b) Market Transformation Information

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

### c) Program Design to Overcome Barriers

The Agricultural Deemed Energy Efficiency Program is designed overcome several barriers. The program directly addresses key market factors that lead to higher energy costs for California businesses. Providing a menu of prescribed common measures simplifies the process of reviewing project proposals and provides a "per-widget" rebate that reduces the cost of retrofitting outdated and inefficient equipment. This element makes it attractive for customers to spend money in the short run in order to achieve lower energy costs in the long run.

Using itemized energy efficiency measures is intended to overcome barriers that inhibit many agricultural customers from adopting energy efficiency alternatives. The barriers are addressed by itemizing common energy efficiency measures and rebates, stimulating the supply of high efficiency equipment and products (through higher demand), and offering rebates that help offset higher start up and down payment expenses for energy efficient retrofits.

Furthermore, to ensure equity to all business customer segments, this program will continue to offer statewide-consistent, cost-offsetting itemized rebates to help customers with the cost of installing new energy efficient equipment.

### d) Quantitative Program Targets

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Projects	TBD	TBD

**e) Advancing Strategic Plan Goals and Objectives**

The Statewide Agricultural Energy Efficiency Program supports all three goals in the Strategic Plan for the Agricultural Sector. General advancement of the goals is presented in the program implementation plan for the Statewide Agricultural Energy Efficiency Program. More specific support of the goals in the Agricultural Deemed Energy Efficiency Program is presented here.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

The Agricultural Deemed Energy Efficiency Program supports strategies to develop a knowledge base of efficiency solutions, foster workforce education and training, and encourage applications of new technologies.

*Goal 2:* California regulations, financing mechanisms, and incentives programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

The program supports strategies to attain multi-resource management goals and to coordinate technical assistance, funding and incentive mechanisms.

*Goal 3:* Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

The program supports strategies to make information on efficiency solutions readily available as well as conduct marketing and outreach to stimulate efficiency actions.

**6. Program Implementation**

**a) Statewide IOU coordination**

**i. Program name:** Agricultural Deemed Energy Efficiency Program

**ii. Program delivery mechanisms**

Agricultural Deemed Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The Agricultural Deemed Energy Efficiency Program will coordinate with the core Agricultural Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the three year implementation cycle will be enabled.

### **iii. Incentive levels**

Incentive levels are based on measure type and will be set at uniform amounts across the state. Higher incentive levels will be provided for Emerging Technologies to spur traction in the market as feasible. The scale of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, therms, equipment cost, other market factors and cost effectiveness.

### **iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The Agricultural Deemed Energy Efficiency Program will be marketed through IOUs account executives, as well as through trade allies, educational, outreach and other marketing activities. Marketing activities will target agricultural customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support will be provided.

Marketing efforts will incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness and outreach efforts will rely on a combination of targeted multi-media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to create awareness, educate and motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Market outreach to raise awareness of energy efficiency programs available will use a number of strategies, including:

- Account representatives will make a regular and consistent customer calling effort to key customers within this sector;
- IOU representatives, program management representatives, and field engineers will be available to provide additional expertise;
- Participation and membership in key trade associations affiliated with each high priority sub-segment within the agricultural market sector;
- Attendance at the key trade shows for each high priority sub-segment within the agricultural market sector;

- IOU-sponsored training events at the IOU's customer training centers and other convenient locations within the IOU's service territory;
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Written collateral pieces that provide an overview of the IOU's Energy Efficiency programs will be linked into the appropriate IOU's DSM web page.

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Agricultural Deemed Energy Efficiency Program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with agricultural customers, to the extent possible. Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type.

With respect to water conservation, IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers program incentives for energy efficient equipment that may also reduce air and greenhouse gas emissions.

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that are permitted to use the Agricultural Deemed Energy Savings Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program Delivery and Coordination**

**i. Emerging Technologies (ET) program**

The long-term energy efficiency vision of California may be attained through the long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the

program is poised to adopt the efficiency potential of new technologies through its programs. In addition, portfolio staff actively works to incorporate promising emerging technologies.

## **ii. Codes and Standards program**

The program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As codes and standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will ensure the latest cost effective technologies/services (e.g., LEDs) are available. These technologies will begin as R&D, transition to Emerging Technologies, then to Incubation and finally to Mainstream.

## **iii. WE&T efforts**

Workforce Education & Training efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the near term, WE&T efforts will focus on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems training to lay the groundwork for certification level trainings. These education and training offerings take place through IOU’s energy centers and technology centers.

## **iv. Program-specific marketing and outreach efforts**

Marketing and outreach initiatives will include:

- Non-contracted vendors are a key delivery channel of the Deemed sub-program. Emphasis will be placed on building awareness with more vendors in the territory. Training vendors how to participate effectively in the program will also be a focus in the new program cycle.
- Community Based Organizations (CBOs), Faith Based Organizations (FBOs), Non-Profit organizations, and Non-Government Organizations (NGOs) with unique access and following are expected to be emphasized as a delivery channel.
- Trade associations and industry networks.
- Enabling partners (financial institutions, trade associations, service providers, law firms, environmental organizations, etc.).
- Unique channels that offer complementary value propositions from the customers’ perspective (for example, energy, water, materials management, recyclables, and corporate social responsibility).

- IOU-sponsored training events at the IOU's Customer Training Centers and other convenient locations within the IOU's service territory.
- Hosting of IOU-sponsored webinars that provide sub-segment training and program adoption.
- Development of case studies, web pages, and marketing material that provide an overview of the IOU's energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, ARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible..

**vii. CEC**

Not applicable. As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

**viii. CEC work on C&S**

Planned Title 20 and 24 enhancements will be reflected in incentive levels and in eligible measures and services.

**ix. Non-utility market initiatives**

The program will educate and support customers, and/or facilitate such initiatives as AB 32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**c) Best Practices**

To maximize program effectiveness, best practices in program design and implementation will be employed and shared amongst IOUs.

#### Best practices in Program Design:

- Regular communication among IOUs.
- Identify qualifying products simply and effectively (Examples; ENERGY STAR®, CEE, FSTC website).
- Seek input from industry in the development of new programs. The IOU programs are trying to change how an industry operates from manufacturer design to the customers' purchasing and maintenance practices.
- Industry participation increases program volume and speeds market transformation.

#### Best practices in Program Implementation:

- Strive to simplify messaging and participation for the customer. (Look for the ENERGY STAR® label, purchase from a qualifying products list, etc.)
- Understand the key motivators that drive an industry and use that information to market the program. Make certain outreach efforts make the program visible to customers and the market catering to customers.
- Always communicate program marketing and advertising plans in advance to appropriate industry channels. Advanced notice allows industry partners an opportunity to leverage off of IOU marketing efforts and reinforce the program messaging.

#### **d) Innovation**

Innovative aspects of the program include improving major program performance indicators (for example, increasing the accuracy of energy saving calculations, higher realization rates, overcoming energy efficiency barriers, reducing application processing times and administrative costs, and integrated energy management).

For the new program cycle, California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During the 2013-2014 program cycle, the new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance, including measure bundling incentives. The IOU's will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper savings.

IOUs will continue working collaboratively on modifications to program policies and procedures to address ongoing changes in customer expectations, market conditions and program flexibility. These modifications include changes that have been and will be targeting ease of program understanding and participation, measures eligibility, increase of customer economical benefits and policy restrictions identified as barriers to participation. IOUs are implementing such processes based on market studies conducted on the subject and after discussion of the policy change. Among potential modifications are incentive caps, and redesign of early retirement measures and equipment.

Where possible, IOUs will use an integrated approach to addressing DSM opportunities. These approaches include merging energy efficiency and demand response analysis and

converting recommendations to Calculated program projects. In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions will maximize customer adoption rates for most cost-effective energy management opportunities.

**e) Integrated/Coordinated Demand Side Management**

The program will integrate the portfolio of IOU offerings to include energy efficiency, demand response and distributed generation and other resources, such as air and water as they connect to energy. This supports not only cost effectiveness of the portfolio and the CA Loading order, but also customer requirements. It also advances significantly the Strategic Plan's goals. On a broader scale, IDSM also includes the integration of third party programs and Local Government Partnerships (LGP) delivery channel with the statewide agricultural program.

**f) Integration Across Resource Types (energy, water, air quality, etc.)**

California's agricultural sector faces a multitude of environmental and regulatory challenges that threaten its survival and competitiveness. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual. Both these are impacting energy use and compliance.

To help deal with these challenges, the agricultural program will coordinate with the regulating agencies and their programs to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. IOUs will continue to offer targeted trainings to customers who share common regulatory challenges to educate customers on impending regulatory requirements for their business operations, and the most efficient solution options for their compliance. Future workshops may look at small-and-medium sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 targets.

IOUs will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other IOUs will help reduce administrative cost and has a greater impact on societal benefits.

The Program will integrate applicable topics (for example, GHG reduction and water conservation) into targeted customer workshops, and marketing communications, based on work done in the earlier program cycle.

**g) Pilots**

Not applicable.

**h) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader

IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

## **7. Diagram of Program**

Please see the core program diagram.

## **8. Program Logic Model**

Please see the Commercial Deemed Energy Efficiency Program logic model.

- 1. Program Name:** Agricultural Continuous Energy Improvement Program  
**Program ID#:** SCG - 3718  
**Program Type:** Core

**2. Projected Program Budget Table**

**Table 1** – reference the overarching program for budget details

**3. Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the overarching program for savings details

**4. Program Description**

**a) Describe program**

The purpose of the Statewide Agricultural Continuous Energy Improvement (CEI) Program is to help agricultural customers engage in long-term, strategic energy planning. Target agricultural customers will be identified and approached selectively.

The program features:

- Management assessment of energy priorities;
- Integrated comprehensive energy audits with recommendations on energy efficiency, demand response, and self-generation;
- Benchmarking of energy usage and other resources;
- Development of a strategic plan with actions for implementation;
- Implementation including incentives from each IOU; and
- Evaluation of performance leading to modifications for continuous improvement

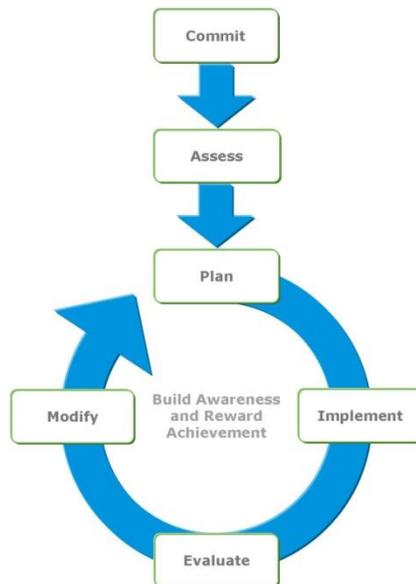

The CEI Program is part of a suite of programs within the Statewide Agricultural Energy Efficiency Program. The CEI will be designed to complement statewide agricultural energy audit and incentive programs, namely:

- Statewide Agricultural Energy Efficiency Program;
- Agricultural Deemed Energy Efficiency Program;
- Agricultural Calculated Energy Efficiency Program; and
- Agricultural Energy Advisor.

The audit and planning services of the IOUs will be provided at no charge to the participating customer. Costs for capital investments by the customer will be shared by the IOUs to the extent they are tied to measures installed under the agricultural programs.

The program seeks to help transform energy markets and reduce energy intensity. The program represents a comprehensive approach that addresses both technical and management opportunities. Background information on continuous improvement and details on implementation are provided below.

A CEI approach applies the six principals of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management: Commit, Assess, Plan, Implement, Evaluate, and Modify.

At each stage of customer engagement, there are a variety of IOU and non-IOU products and services that can be offered to fit different customer profiles and optimize the cost effectiveness of each IOU's portfolios.

In implementation, IOUs will screen customers for certain CEI services based on factors such as customer energy use, complexity, number of facilities, energy decision making structure, environmental commitment or demonstrated motivation to take action. Screening criteria and specific product offerings will be IOU-specific.

In 2013-2014, CEI will be expanded to include select group of mid-sized nonresidential customers. Available options to help target these customers may include an individualized, a small group, or a mass-market, remote deployment approach.

CEI will coordinate its services with the Agricultural Energy Advisor sub-program offerings. CEI offers customers what can be considered the pinnacle of audit offerings guiding senior management to instill energy considerations in all management/business operational decisions and in long-term energy planning.

### **CEI Commitment**

CEI begins with a high level management commitment by the customer to improving energy performance, combined with other environmental and regulatory commitments being developed by energy users in response to market and political pressures. A corporate commitment sends the top-down message to employees, partners, shareholders and vendors that energy is a priority issue requiring attention. The message also paves the way for establishing the company resources required to implement the steps of CEI. These resources

can include capital, personnel, i.e., energy champions or teams, or technical systems and software required for energy management.

Gaining true customer commitment can take time, but is critical. In implementation, IOUs will formalize the Commitment phase with more intensive customers through a CEI participation agreement, which outlines the IOU CEI services being offered as well as minimum customer expectations.

### **CEI Assessment**

After the CEI Commitment, a comprehensive assessment identifies not only technical opportunities, but also systemic energy management practices and cultural shifts. This can improve overall facility management practices and sustain continuous improvements towards long-term company targets. A component to the assessment will also include tools to help identify Energy Efficiency (EE), Distributed Generation (DG), and Demand Response (DR) opportunities.

There are many tools and resources, both IOU and non-IOU, free and licensed, available to support comprehensive customer energy assessment. They include ENERGY STAR®'s *Guidelines for Energy Management*, customer energy management assessment software products like those developed by Envinta, benchmarking tools, Integrated Comprehensive Energy Audits through the Agricultural Energy Advisor sub-program, or local and statewide third parties who can offer specialized technical expertise and assessment.

Based on screening criteria, IOUs will offer comprehensive energy assessment services utilizing, but not limited to, vetted sources like those described below, to develop a customer specific strategic energy plan.

### **ENERGY STAR®'s Guidelines for Energy Management**

ENERGY STAR®'s Guidelines for Energy Management is housed on the ENERGY STAR® website and provides step by step guidelines to customers to support CEI, and also guides customers to ENERGY STAR®'s numerous assessment tools. This option is a low cost resource for smaller and medium customers interested in CEI, with details available at [http://www.energystar.gov/index.cfm?c=guidelines.guidelines\\_index](http://www.energystar.gov/index.cfm?c=guidelines.guidelines_index).

### **Energy Management Assessment Tools**

*Envinta One-To-Five, Achiever, Challenger*: A professionally facilitated energy management assessment with company decision makers. The assessment explores management practices and company priorities to develop a CEI roadmap for energy goals and actions. Available tools are:

- Each IOU's website tools
- EPA website tools
- DOE website tools.

### **Integrated Comprehensive Energy Audits**

Integrated Comprehensive Energy Audits provide an inventory of technical facility end-uses and energy efficiency, demand response and self-generation investment opportunities. For a full description, see the Agricultural Energy Advisor sub-program plan.

### **Benchmarking**

Benchmarking can measure energy performance of a company, building, process, or piece of equipment to industry standards or comparable groupings. Benchmarking is a natural first step for the CEI process. Customers with multiple facilities find benchmarking useful to prioritize efficiency projects, track progress toward energy or green house gas improvement goals, or drive competition among similar benchmarked facilities. Units of measurement vary widely. For commercial buildings, the unit is energy used/square foot for a unit of time. For agriculture or agricultural facilities, however, benchmarking utilizes energy/unit of production for a unit of time.

Benchmarking can also be applied to other resources and environmental issues, such as water use and CO<sub>2</sub> emissions.

The statewide IOUs can currently utilize a variety of benchmarking tools and resources including those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab with CEC funding:

- ENERGY STAR® Portfolio Manager *Commercial* Benchmarking: Benchmarks customer facility against a national database of similar NAICS codes for an ENERGY STAR® score (0-100), kBtu/sq ft-yr, lbs CO<sub>2</sub>/yr;
- ENERGY STAR® *Cement Plant* Energy Performance Indicator;
- ENERGY STAR® *Auto Assembly Plant* Energy Performance Indicator; and
- LBNL BEST *Winery*: Benchmarks a winery's energy and water use against a theoretical best practice winery and allows user to model efficiency improvements.

Other benchmarking tools are under development including:

- ENERGY STAR® *Food Processing* Energy Performance Indicator;
- ENERGY STAR® *Glass Manufacturing* Energy Performance Indicator;
- ENERGY STAR® *Pharmaceutical Manufacturing* Energy Performance Indicator;
- LBNL BEST *Dairy Processing*: Benchmarks a dairy processors energy and water use against a theoretical best practice facility allows modeling of improvements;
- Management Standard for Energy SME 2000-2008;
- DOE sponsored ISO Plant Certification; and
- LBNL Superior Energy Performance.

In implementation, the statewide agricultural program teams will continue to partner with energy industry peers, industry associations and DOE/Commission sponsored labs and consultants, to enhance the use of existing tools, and develop new tools for key California industries. Benchmarking will be coordinated with the Agricultural Energy Advisor sub-program.

### **CEI Planning**

Strategic energy planning involves setting energy goals and action plans around energy efficiency, demand response, and generation as appropriate. Planning for customers will typically involve Account Representatives and/or consultants. As is discussed in the Strategic Plan and in the PIP Integration Section, strategic planning can also include complementary non-energy considerations as well, such as greenhouse gas reductions, water efficiency, and waste-stream minimization, all which have embedded energy components.

Data and findings from a comprehensive customer assessment are critical in developing any comprehensive energy plan, including the results from technical audits or assessments, facility benchmarks, energy management assessments, and assessments of company priorities. This information is analyzed and used to develop realistic and achievable company goals and prioritized shorter-term tactics needed to achieve them. Energy plans should be living documents revisited and revised regularly.

Energy goals can vary widely and include elements such as resource utilization (“Company X will reduce its overall energy intensity by 3% over the 2013-2014 program cycle”), carbon reduction goals (“Company X will be carbon neutral by 2014”), or management oriented goals (“Company X will implement energy teams by 2013”). Goals can be internal documents or can be made public through press releases as part of larger sustainability plans, which is increasingly important for large and public companies.

CEI will assist customers in developing and implementing action plans to execute the prioritized near-term activities in support of their company’s energy goals, as well as assistance with planning for the resources, staff and schedule for tracking. Action plans typically include activities such as prioritizing process systems or facilities based on benchmarking or company drivers, identifying internal resources required to implement plans, develop project justification and incentive application documentation lists and detailed schedules.

### **CEI Implementation**

In the implementation stage, IOUs partner with customers to identify technical support and IOU and non-IOU resources available to support implementation of projects, such as rebates, incentives, third party and government partnership programs, and state and national resources, including:

- Statewide Deemed rebates;
- Statewide Calculated incentives for new construction/tenant improvement, and retrofit ;
- Third Party and Government Partnership programs (described in the statewide and local third party filings);
- IOU and non-IOU financing options and owners engineer support; and
- External and internal engineer support.

### **CEI Evaluation and Modification**

In any continuous improvement program, evaluation is an ongoing process of evaluating actual performance against company goals, targets and action plans. It may include repeating the benchmarking and system or facility baseline process annually, assessing advancements in organizational and management practices that facilitate energy management

improvements, or evaluating cost savings per unit of product. Regular evaluation will inform changes to goals and action plans moving forward.

CEI will be available to all Non-Residential customers meeting certain eligibility criteria to justify the cost of the offering. Criteria will include but not be limited to customer energy use, complexity, number of facilities, energy decision making structure, environmental commitment and demonstrated motivation. Marketing and outreach plans include training of the IOU in-house staff and customer groups. Collateral materials such as fact sheets, how-to documents, and Power Point slides will be produced and distributed during sales calls, public events or trade shows.

**b) List measures**

Integrated energy audits under the CEI program will include the full range of applicable end-uses and measures for those end-uses. This will include process changes. The energy audit provides a tool that will lead customers to the measures and incentives offered in the other agricultural programs. However, depending on the outcome of the 2012 process evaluation, customer incentives may be offered.

**c) List non-incentive Agricultural Energy Advisor**

Activities conducted under the CEI Program are non-resource activities with no associated incentives. These activities include: marketing and outreach, savings calculation assistance, retrofit project scoping, technical assistance, and incentive application assistance.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

CEI is intended to address several market barriers that prevent wider adoption of energy efficiency practices. These barriers include:

- Lack of information – The CEI evaluation and modification process provides data that customers can use to reevaluate their commitment and/or modify their energy goals.

- Performance uncertainties – Through CEI’s comprehensive baselining and benchmarking assistance, customers will have access to real-time data that demonstrates how their facility is performing relative to their established goals.
- Organizational customs – The high-level customer commitment that is at the core of CEI increases the likelihood that corporate cultures that prevent successful implementation of comprehensive energy policies will be changed.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Number of Engagements	TBD	TBD

**e) Advancing Strategic Plan Goals and Objectives**

The Agricultural Energy Efficiency Program supports all three goals in the Strategic Plan for the Agricultural Sector. General advancement of the goals is presented in the program implementation plan for the Agricultural Energy Efficiency Program. More specific support of the goals in the Agricultural Deemed Energy Efficiency Program is presented here.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

The Agricultural CEI Program supports strategies to develop a knowledge base of efficiency solutions, foster workforce education and training, and encourage applications of new technologies.

*Goal 2:* California regulations, financing mechanisms, and incentives programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

The program supports strategies to attain multi-resource management goals and to coordinate technical assistance, funding and incentive mechanisms.

*Goal 3:* Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

The program supports strategies to make information on efficiency solutions readily available as well as conduct marketing and outreach to stimulate efficiency actions.

## 6. **Program Implementation**

### a) **Statewide IOU coordination**

i. **Program name:** Agricultural Continuous Energy Improvement Program

#### ii. **Program delivery mechanisms**

The Agricultural CEI Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, marketing and outreach plans, and IOU program interactions. The Agricultural CEI Program will coordinate with the core Agricultural Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the two-year implementation cycle will be assured.

#### iii. **Incentive levels**

Not applicable.

#### iv. **Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

As with other information and education programs, CEI will be primarily delivered by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing and outreach efforts. Other channels of delivery may be developed.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

#### v. **IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with agricultural customers.

#### vi. **Similar IOU and POU programs**

Over the next two years, the IOUs will seek to increase their interactions with the POUs, as applicable, to promote the CEI concept throughout the state. This may involve the creation of periodic California energy efficiency program summits that seek to increase

awareness of the STRATEGIC PLAN and how programs could/should be designed to help meet its aggressive targets.

**b) Program Delivery and Coordination**

**i. Emerging Technologies (ET) Program**

The audit program management team will stay abreast of and incorporate relevant emerging technologies into audit recommendations. In addition, IOU field engineers, who deliver IEAs, are active contributors to the Emerging Technology process by their participation in ET Roundtable/Information meetings and continually seek to offer new technologies to customers.

**ii. Codes and Standards Program**

CEI implementation will include information about pending new codes and standards that may affect planning or prioritization of retrofit or new construction projects.

**iii. WE&T efforts**

CEI implementation will integrate with WE&T efforts by providing CEI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches. Program costs will be shared with WE&T.

**iv. Program-specific marketing and outreach efforts**

A broad range of marketing activities will be used to promote audits and elevate customer engagement. The Agricultural CEI program will be promoted via direct communication between customers and Account Executives with support of Project Managers from individual programs, as well as through traditional advertising activities, such as internet, bill inserts, brochures, trade shows, etc. Marketing activities will be coordinated between IOUs, Demand Response and Distributed Generation departments within each IOU.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

Integrated Comprehensive Energy Audits are a key tool for identifying non-energy opportunities for specific customers. The energy audits can identify non-energy benefits associated with recommended measures, such as improved safety, productivity, indoor air quality, comfort and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs.

**vii. CEC**

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

**viii. CEC work on C&S**

The program will not be implemented with a direct linkage to codes and standards efforts

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-IOU information and guidance that CEI will provide customers. In addition, the IOUs will participate in national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

**c) Best Practices**

A CEI approach applies the principals of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management: Commit, Assess, Plan, Implement, Evaluate, and Modify.

**d) Innovation**

The program seeks to help transform energy markets and reduce energy intensity. The program represents a comprehensive approach that addresses both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

**e) Integrated/Coordinated Demand Side Management**

CEI includes project analysis and implementation support of recommendations of Integrated Comprehensive Energy Audits, which provide customers with an inventory of facility end-use breakdown and energy efficiency, demand response and self-generation investment opportunities. Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other, similar programs, but because of siloing – thinking of programs as

separate, unrelated efforts – this has proved difficult. To overcome this, the CEI sub-program will leverage lessons learned from IDSM efforts by offering comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that the two programs are at financial odds with one another, as both programs often reduce the potential for each other's financial incentives. For example, energy efficiency may reduce the overall baseline by which the demand response program's incentives are based upon. Since benefits from long-term energy savings derived from technological measures outweigh the temporary demand reduction benefits derived from behavioral actions, the CEI sub-program will offer additional support and services for energy efficiency measures that enable demand response when customers enroll, or are already enrolled, in demand response programs. In so doing, the program seeks to maximize the potential for both types of programs.

A secondary issue when integrating energy efficiency and demand response programs is that communications of both types of DSM program are often non-coordinated, since energy efficiency is typically technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer "event season" and wane throughout the remainder of the year. To overcome these differences, the Program will offer integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable.

Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response programs in addition to energy efficiency programs.

To support the integration of energy efficiency and demand response programs, the sub-program will focus on several tactics:

- Promotion and incentives for demand response in such a way as to stimulate energy efficiency first;
- Integrated and coordinated year-round marketing (e.g. applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g. customer size);
- Provide unified technical assistance through enhanced EE/DR Audits through the TA Program to allow for cross-harvesting opportunities;
- Integrated presence on IOU websites; and
- Regular coordination meetings between energy efficiency and demand response program management

CEI is recognized as a strategy to advance the statewide IDSM program's goals and objectives. The IOUs will increase IDSM messaging and coordination within CEI.

**f) Integration Across Resource Types (energy, water, air quality, etc)**

CEI implementation will include information on non-IOU Programs to expose customers to available funding, such as from air or water agencies to support efforts. IOU CEI sub-

program managers will partner, as appropriate, with CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information, marketing collateral and financial incentive analysis with customers. Conventionally, each government agency and IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will inform the customer about the mutual benefit of combining complementary resource programs.

To promote the CEI, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. Concerning water conservation, IOU program managers will partner with the local water districts to produce co-branded marketing collateral, attend trade shows, and co-release notices for programs with interactive water and energy effects.

**g) Pilots**

Not applicable.

**h) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V plan after the program implementation plans are filed. This may include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies.

More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

Once results of the 2010-2012 evaluations are ready, recommendations will be reviewed for modifying the CEI PIP accordingly.

**7. Diagram of Program**

Please see the core program diagram.

**8. Program Logic Model**

Please see the Commercial Continuous Energy Improvement program logic model.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

**12.4. Program Description**

**a) Describe program**

The ~~Statewide Agricultural~~ Energy Efficiency Program facilitates the delivery of integrated energy management solutions—including energy efficiency, demand response, and distributed generation—to California’s ~~agricultural~~ customers. The Program offers a suite of products and services (for example, through strategic energy planning support, technical support services, facility audits, pump tests, calculation/design assistance, ~~financing options~~, and financial support through rebates and incentives). In addition, the program adopts and supports the strategies and actions of the ~~Agricultural~~ and Industrial chapters of the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan).

~~The Statewide Agricultural Energy Efficiency Program targets end-users such as irrigated agricultural growers (crops, fruits, vegetable, and nuts), greenhouses, post-harvest processors (ginners, nut hullers, and associated refrigerated warehouses), and dairies. Traditionally food processors, due to NAICS designation, have received IOU services through the Industrial program offering. However, there are those facilities with on-site processing that are integrated with a growers and their products, as is the case with some fruit and vegetable processors (canners, dryers, and freezers), prepared food manufacturers, wineries, and water distribution customers that may be addressed by this program’s offerings. Traditionally food processors due to NAICS designation have received IOU services through the Industrial program offering. However, there are those facilities that are integrated with a growers and their products, as is the case with some fruit and vegetable processors (canners, dryers, and freezers), prepared food manufacturers, wineries, and water distribution customers that may be addressed by this program’s offerings. The program may also target food processors, especially those facilities that are integrated with a growers product, as is the case with some such as fruit and vegetable processors (canners, dryers, and freezers), prepared food manufacturers, wineries, and water distribution customers.~~

To address the potential in these markets, the Statewide ~~Agricultural~~ Energy Efficiency Program offers ~~five-four~~ sub-programs. A brief description is provided below. For a detailed accounting of the sub-programs’ activity refer to the sub-program’s specific program implementation plan:  
~~A brief description is provided below. For a detailed accounting of the sub programs’ activities, refer to the sub program’s specific program implementation plan:~~

1. ~~Agricultural~~ ~~Customer Services~~ ~~Energy Advisor~~ ~~Energy Audit~~ Program provides ~~basic remote online audits, and onsite audits, including benchmarking (offices and other “commercial” building areas), focused and integrated comprehensive energy audits, pump tests, and retro-commissioning (RCx) audits and may include Continuous Energy Improvement (CEI) audits/services across the agricultural, commercial, and industrial (CIA) segments depending on the IOU’s market segment potentials and available resources.~~ The Program provides an inventory of technical

Formatted: Fontcolor: A uto

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

~~Pump Test Services Program reduces energy used for water pumping by offering pump tests, incentives, and targeted education, training and technical support for agriculture, industrial and commercial customers and pump companies. Each IOU's database of pump test results will be used in the near term to target pumps in need of improvements as a means to capture savings. However in the mid-term, pump performance data, aggregated at the statewide level, will contribute to the development of metrics and targets for long-term pumping efficiency improvements.~~

**Formatted:** Font: TimesNewRoman,Font color: A uto

**Formatted:** Not Highlight

**Formatted:** Font: TimesNewRoman,Font color: A uto

**Formatted:** Highlight

In addition to these ~~five threefousixfour (4364)~~ sub-programs, each of the four investor-owned utilities (IOUs) in the state also offers local programs that complement and enhance the core offerings in their region. The IOU local portfolio mix ~~of SCE is specifically~~ designed to enhance energy efficiency and DSM opportunities for ~~agriculture~~Agricultural customers. ~~Additional information regarding the local efforts can be found in the sub-program descriptions and in section 6.g) of this program implementation plan. The local portfolio mix includes the AB 32 Carbon Emissions Reduction (CER) Program and water conservation education information.~~

**Formatted:** Font: TimesNewRoman,Font color: A uto

**Formatted:** Font: TimesNewRoman,Font color: A uto

**Market Characterization:**

California's ~~agriculture~~agricultural customer base consists primarily of a broad mix of smaller accounts and consumes approximately 7%<sup>1</sup> of total statewide electricity. The business models and energy efficiency needs for these market segments vary widely and thus require targeted marketing and program delivery strategies. A review of the primary segments addressed by this Program is included below.

**Formatted:** Font: Bold

**Formatted:** Font: Bold

**Irrigated ~~Agrieulture~~Agriculture**

~~Irrigated agriculture~~e represents an estimated 80% of the total electricity ~~and 73% of total~~natural gas used by the ~~agricultural~~agricultural segment. This energy is predominately used to lift, move, and pressurize irrigation water. Increased reliance on ground water is increasing energy intensity, giving high priority to improving the current average pumping efficiency from 53% towards the technical potential for 68-70% through optimizing pump operation. Increasing pressures from international competition, land and water use policy decisions, labor force uncertainties, and consolidation of smaller family farms into larger agribusiness enterprises make this segment increasingly receptive to new technologies and practices balanced by financial concerns from risks of crop failure.

**Greenhouses:**

This specialty segment is in transition from the cut flowers industry to ornamental plants and vegetable transplants. Increased mechanization and consolidation in this segment presents opportunities for energy efficiency. Top opportunities for energy savings are in boiler improvements, building envelope improvements, and temperature control enhancements (for example, heat curtains).

<sup>1</sup> 1980-2005 California Electricity Consumption by Sector - California Energy Commission, [http://www.energy.ca.gov/electricity/consumption\\_by\\_sector.html](http://www.energy.ca.gov/electricity/consumption_by_sector.html).

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

**Post-Harvest Processing Facilities:**

Post-harvest facilities associated with or near agricultural growing facilities, process, package and store agricultural commodities, such as cotton ginneries, nut harvesters and bag-houses, and fruit and vegetable packing plants. Their operations are typically seasonal and driven by harvest schedules. Nut hullers are a growing market due to new more productive strains of almonds. Key technical opportunities in this segment include industrial refrigeration improvements and process improvements.

**Dairies and Confined Animal Feeding Operations:**

California's more than 1,900 dairies are primarily located in Tulare, Fresno, Kern, Merced, Stanislaus, and San Joaquin counties. Dairy farms are consolidating, with larger farms facing increased regulatory challenges related to air and water quality, creating opportunities for the adoption of new technologies and practices. Energy efficiency opportunities are focused in refrigeration, ventilation, and waste handling. Benchmarking will be developed as a key foundational activity to drive customer awareness and continuous energy improvement. Improved dairy waste management offers significant potential for distributed generation, as well as potential reduction of air and water quality problems and the capture and sale of greenhouse gas credits. Like dairies, feedlots and poultry operations for meat and egg production have drawn recent food safety and regulatory attention that may make them more receptive to new technologies and practices for improved efficiencies and waste to energy opportunities. Animal waste streams within this segment offer biogas development potential.

**Food Processing, General:**

**Off site** Food Processing **may** include breweries, meat and poultry processing, dairy processors (e.g., creameries), canned, dried or frozen fruits and vegetables, grain products, baked goods, sugar and confectionary products, oils, snack manufacturing, soft drink manufacturers and seafood processing. The market is characterized by a small number of large users representing a disproportionate percentage of the energy consumed, offering an ideal opportunity for delivering a large customer strategy. The segment has high energy-intensity in relation to profit margins and is highly seasonal, with the majority of natural gas and over half of the electricity used during the peak summer season. Increased global competition and environmental regulations like AB 32 position this market for reductions in energy, water, emissions, greenhouse gasses and raw materials. An integrated resource management strategy, focusing on long-term continuous improvements, is expected to improve energy efficiency performance in the segment. The majority of the energy savings potential comes from process system improvements such as in refrigeration, boilers and steam systems, compressed air and motors. Distributed generation and demand response opportunities include using waste heat/steam for production processes such as pasteurization, cooking and heating.

**Food Processing, Wineries:**

California's more than 2000 wineries produce 90% of all US wine. The segment is comprised of a small number of very large wineries and conglomerates, and a large number of small and medium facilities. This environmentally progressive segment of tightly knit and organized peer-to-peer networks has established environmental programs and web-based

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

environmental benchmarking tools, and has launched a winery carbon calculator to support energy efficiency. The wine segment offers a model for other agricultural segments to follow. These efforts have been led by the California Sustainable Winegrowing Alliance (CSWA), which is eager to continue working with interested IOUs on outreach, education, training, and benchmarking. These efforts will promote best practices in resource management including energy, water, air and GHGs. Energy savings potential is predominantly in refrigeration, pumping, and water heating and treatment. The wine segment's demand peaks in summer and fall, related to refrigeration during crush, making refrigeration improvements especially attractive. Interest in emerging technologies has been strong.

**Food Processing, Refrigerated Warehouses:**

Off-site rRefrigerated warehouses are highly specialized, energy-intensive, technology-oriented facilities focused on staying competitive with operators in nearby markets. They are comprised of, or associated with, wholesale facilities, public and private refrigerated warehouses, food and beverage processors, and perishable product cooling and packaging operations. As they handle a wide variety of seasonal products, loads can vary dramatically between facilities. Significant energy savings opportunities exist in facility retrofits ~~and and~~ ~~retro commissioning and~~ improved new facility design, as captured in the AgricultureAgricultural Strategic Plan. Activities identified in the AgricultureAgricultural Strategic Plan include expanded education and training and best practices dissemination directed at facilities designers and operators, the refinement of the DOE-2.2R energy modeling tool utilizing national funding and support, and incorporating codes and standards. The ability to float refrigeration loads through peak periods with controls software has shown great initial success in the 2006-2008 program cycle for demand response.

**Water Irrigation Districts and Agencies:**

The water and wastewater industry (North American Industry Classification System prefix 221) collects surface water or groundwater, treats water to agricultural or potable standards, transports water to local distribution networks, delivers water to end users, and finally, collects and treats wastewater for discharge into the environment. IOU customers in this sector include large public agencies and private water supply utilities, can include wastewater treatment districts, and integrated water and wastewater utilities. IOUs may address the last two sub-segments in Commercial or Industrial segments). Irrigation and power districts located in California's Central Valley are also large users of electricity and natural gas.

**b) List measures**

Technologies addressed through this program effort include pumping, refrigeration, process loads, process heating, ~~and lighting, and plug loads~~. Incentive levels will be offered through the AgricultureAgricultural Calculated Energy Efficiency Program and the AgricultureAgricultural Deemed Energy Efficiency Program, described in full in their respective Program Implementation Plans.

Formatted: Font: TimesNewRoman,Bold, Fontcolor: A uto

Formatted: Font: TimesNewRoman,Bold, Fontcolor: A uto

Formatted: Font: TimesNewRoman,12 pt, Fontcolor: A uto

Formatted: Font: TimesNewRoman,Font color: A uto

**2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan**

The Deemed Energy Efficiency Program offers itemized retrofit measures with prescribed energy savings and incentive amounts. These measures are categorized under the following end-uses:

- Lighting
- Air conditioning
- Food service
- Refrigeration
- Industrial
- Motors
- Plug Loads
- Irrigation
- Process

The IOUs will also explore the development of a statewide consistent deemed measure catalog that includes measures specific to the agriculture and food processing end-users.

In brief, statewide incentive levels for the Calculated Energy Efficiency Program are as follows:

Measure Type	Incentive level (kWh/kW)
Lighting	05 cents per kWh + \$100/pk kW
AC and refrigeration	15 cents per kWh + \$100/ pk kW
Motors and others	09 cents per kWh + \$100/ pk kW
Gas measures	\$1.00 per therm

For the Calculated Energy Efficiency Program, statewide incentive levels are currently based on type of measure and savings in kilowatt hours (kWh) and kilowatts (kW).

The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" and to "raise incentive levels for Emerging Technologies", is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program.

**c) List of non-incentive customer services Agricultural Energy Advisor Services**

The Statewide Agriculture Agricultural Energy Efficiency Program includes a wide variety of non-incentive program services. These services are intended to support customer strategic planning, educate and train customers and the workforce about energy efficiency, and provide customized technical and project support. The service list may include and is not limited to:

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

- Energy Audits
  - Remote energy audits;
  - Integrated energy audits;
  - RCx audits;
  - Benchmarking (currently limited to portions of an agricultural facility with commercial spaces);
  - Pump tests and pumping systems technical support; and
  - Water leak detection services (new service).
  
- Continuous Energy Improvement (CEI)
  - Energy management assessments;
  - Energy planning;
  - Baseline and benchmarking;
  - Project implementation support; and
  - Customer recognition.

● Resources on Energy Design Resources website
  
- Customer Education and Training
  - DOE basic, intermediate and specialist training on agricultural and industrial pumps, motors, compressed air, and steam;
  - Other industrial process systems training;
  - Agriculture Agricultural pumping efficiency seminars;
  - Workshops merging regulatory compliance with energy efficiency opportunities (such as with NO<sub>x</sub> compliance and boiler retrofits); and
  - Integrated industry-focused workshops, such as for wineries, dairies, greenhouses, and food processors.
  
- Workforce Education and Training
  - The Statewide WE&T crosscutting program effort will be leveraged to deliver targeted training to the agricultural sector to support Superior Energy Performance (SEP), ANSI and ISO energy management certification;
  - Title 24 training, such as for refrigerated warehouses; and
  - Industrial refrigeration best practices (for designers), in support of the Strategic Plan focus on refrigeration.

● Pump tests and technical support

● Design assistance and calculation support

13-5. Program Rationale and Expected Outcome

a) Quantitative Baseline and Market Transformation Information

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>3</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical, and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>4</sup>. Markets are social institutions<sup>5</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>7</sup>. According to York<sup>8</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

~~The question of what constitutes successful transformation is controversial because of a Catch 22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these~~

Program Implementation Plan

~~baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate—particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>9</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.~~

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are.

First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>13</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the ~~utilities~~IOUs look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>16</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Attitudinal change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer attitudes, knowledge and awareness (AKA) of energy efficiency. In order to gauge an attitudinal based metric for this sector a battery of questions probing AKA among customers would have to be created and used to scale AKA. Examples of AKA would include knowledge of energy efficiency lighting and other specific measures. Evaluators could also draw from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The baseline response pattern to the AKA scale would need to be established early during the program cycle. Customers could be surveyed on an annual basis and changes in their AKA tracked along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

In addition, behavioral change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer past behavior and intentions about energy efficiency. In order to gauge a ~~behaviorial~~behavioral based metric for this sector, a battery of questions about energy efficient behaviors could be used to create a scale of Energy Behavior. Evaluators could also draw questions about specific behaviors from customer surveys used in past program evaluation studies, to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale need to be selected by the MT collaborative. The behaviors that could be probed include maintenance behaviors to keep EE measures operating correctly, and behaviors that maximize energy efficiency of existing equipment. Customers could be

<sup>16</sup> Pelozo & York, (1999).

Formatted: Font: TimesNewRoman

Formatted: Indent: Left: 0.25"

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

surveyed early in the program cycle and their responses on the scale could serve as the baseline for subsequent behavioral change. Customers could be probed annually and their Energy Behavior change measured along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

Therefore, for the Agricultural sector, the following approach to quantitative baseline and market transformation information is as follows:

**Program Performance Metrics (PPMs)**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Statewide Agricultural Energy Efficiency Program (Resolution E-4385, Appendix A, pp. 32-34).

<b>SW PROGRAM / Sub-Program</b>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>
<b>COMMERCIAL / INDUSTRIAL / AGRICULTURAL COMBINED</b>		
* Data to be reported in disaggregate form by SW program (commercial, industrial, and agricultural)		
	*1. Number and percent (relative to all eligible customers) of commercial, industrial and agricultural customers participating in sub-programs (NRA, Deemed, Calculated, and CEI) by NAICS code, by size (+/- 200 kW per yr or +/- 50K therms per yr), and by Hard to Reach (HTR)**  ** "HTR" is as defined in the EE Policy Manual	<u>2a</u>
<i>Continuous Energy Improvement (CEI)</i>	*1. Number and percent of commercial, industrial, and agricultural CEI participants that meet short-term (2010-2012) milestones as identified by their long term energy plans.	<u>2a</u>
	*2. Lessons learned, best practices, and plan to ramp up the CEI program are developed. (Y/N)	<u>2b</u>
	*3. Number and percent of commercial, industrial and	<u>2a</u>

**b) Market Transformation Indicators (MTIs)**

~~Resolution E 4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms sub programs. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities IOUs to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 201013-20142 energy efficiency evaluation, monitoring and verification (EM&V) activities.~~

Formatted: Fontcolor: A uto

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in "Attachment H" are approved for this sub-program as applicable.

Formatted: Fontcolor: Auto, Not Highlight

**c) Program Design to Overcome Barriers**

The ~~2010-2012~~ Statewide ~~Agriculture~~ **Agricultural Energy Efficiency** Program builds on past program successes and best practices to overcome both market wide and segment specific barriers to efficiency, including:

- Market-wide barriers:
  - Agriculture is a diverse and geographically widespread sector, dependent on regional resources for information, and traditionally ~~resistant to change~~ needs significant experiences to warrant changing practices that has served them well for years.
  - Capital constraints, combined with variable commodity pricing, limit the availability of funds for investing in projects.
  - ~~Utilities will expand the On-Bill Financing Program, which offers unique benefits to government departments by allowing them to retain rebates and cost savings from EE projects without having to upstream these financial benefits to the General Fund. The Statewide Finance PIP includes plans to explore and develop additional finance tools to facilitate the adoption of integrated projects.~~
  - Low energy costs relative to other operating expenses reduces the motivation to invest in energy efficiency.
  - ~~Regulatory compliance issues further strain limited internal resources. Customers, like in many areas, are tired and frustrated of being told how to run their business.~~
  - Lack of awareness of the benefits of energy efficiency, and uncertainty and skepticism over long-term energy and cost savings hinders investment.
  - As in many industries, cyclical budgeting processes makes it impossible difficult for customers to commit to a plan of action, if their decision making occurs out of sync with budget planning.
- Food processing and industrial refrigeration barriers:
  - Few firms maintain facility level energy managers, and finding technically qualified staff is an ongoing challenge.
  - Regulatory compliance issues further strain limited internal resources.
  - International competition drives short-term survival attitudes versus a long-term continuous improvement approach.
  - The industrial refrigeration industry lacks design standards and best practices, resulting in substandard design and maintenance.
  - Huge capital outlay requirements in industrial refrigeration can delay or offset efficiency projects.
  - Efficient design alternatives can be lost in low-cost bidding scenarios.

Formatted: SpaceAfter: 0 pt, Tab stops: None at 0.5"

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

- Whole system opportunities are missed by individual equipment vendors.
- Customers are often not aware of systems operating sub-optimally.

The Statewide ~~Agriculture~~Agricultural Energy Efficiency Program takes these barriers into account with the features described below for continuous improvement, trade ally workforce education and training, and technical support.

**Continuous Energy Improvement**

The long-term strategic energy planning approach of CEI, especially the emphasis on benchmarking, goal setting, and performance tracking, will help customers overcome short-term attitudes. CEI also fosters integration of non-energy business objectives into energy planning and leveraging of the co-benefits of water conservation, GHG reduction, and other relevant issues. This integration elevates the importance of energy efficiency and improves uptake and market penetration. In addition, top-down corporate attention and tracking of energy performance will positively affect facility staff performance.

**Trade Allies/Workforce Education and Training**

Customers in the agricultural~~ale~~ and food processing markets often treat vendors, designers, and engineers as ad hoc outsourced technical resources. These customers ask for everything from new equipment design to emergency equipment repair or replacement. Because these transactions often happen without ~~utility~~IOU knowledge, it becomes critical to continually inform and equip these vendors about efficiency technologies, practices, programs, and rebates. Vendor Participation Agreements, training, and outreach collaboration allow participating vendors to up-sell customers to efficient options and differentiate themselves on energy efficiency. ~~Utilities~~IOUs gain an additional sales force in the field with customers, minimizing lost opportunities.

**Technical Support Services: ~~Audits, Pump Tests, Incentives Calculation Support~~**

The role of the ~~utility~~IOU as an unbiased, trusted energy advisor cannot be overstated, both in evaluating proposed vendor projects and in identifying new technical opportunities in retrofit and new construction projects. The combination of technical support and the availability and commitment of approved ~~utility~~IOU incentive funds – based on a rigorous technical review and followed by an EM&V process – are essential drivers to overcome key customer barriers, including the lack of in-house technical resources and the tendency for efficiency options to get eliminated in low-cost vendor bidding scenarios.

**~~The C~~Customer Services~~Agricultural Energy Advisor sub-program~~Program  
(CSPAEA):**

CSPAEA is designed to deliver a coordinated and customer-specific audit service. CSPAEA features a statewide integrated demand-side management customer-specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies, as appropriate, to the customer's need(s).

The CSPAEA is designed to support the goals of the Strategic Plan by providing customers with comprehensive building-specific information on cost-effective DSM opportunities. The

Formatted: Font: Bold

Formatted: Font: Not Bold

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

The CSPFA umbrella, consists of six (6) distinct components:

- ~~— Benchmarking is an initiative designed to educate and motivate customers to benchmark their facilities. It will offer technical support, hands-on workshops that will provide customers with information enabling them to utilize benchmarking as an energy management tool. The program is also designed to support the implementation of AB 1103.~~
- ~~— Online Energy Audit Tool (Small Business): The Online Energy Audit Tool is designed as an enhanced, customer friendly "do-it-yourself" online audit tool that targets small business customers. Currently the tool identifies customized energy efficiency, demand response and solar recommendations for eight (8) business types.~~
- ~~— Continuous Energy Improvement (CEI) Continuous Energy Improvement (CEI) is a consultative service aimed at helping Agricultural customers engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices through a high level energy commitment from executive and board level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution.~~
- ~~— Continuous Energy Improvement (CEI) Continuous Energy Improvement (CEI) is a consultative service aimed at helping Agricultural customers engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. Program Implementation Plan

~~transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices through a high-level energy commitment from executive and board level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost effectiveness of the delivered energy management solution.~~

~~Non Residential Audits (NRA) design for the Transition Period is focused on cost efficiency and the delivery of financial and technical assistance that the customer needs to make energy saving decisions. Audit information must communicate complex information in a simple and understandable way to identify energy efficiency, demand response and renewable generation opportunities.~~

~~The goal is to use a “one-stop shop” approach to maximize the benefits for the customer and reduce any associated negative impacts. This program cycle, emphasis will be given on meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan) and streamlining the audit process increasing efficiency, lessening complexity, and increasing the effectiveness of influencing customer implementation actions.~~

~~Onsite audits will take the form of providing to our customers, opportunities for integrated comprehensive audits and focused audits.~~

~~Pump Efficiency Services is designed to help commercial, industrial and agriculture customers make informed decisions about improving inefficient pumping systems before they stop moving water and start wasting excessive amounts of energy. Pumping of potable water is estimated to account for more than 80% of the electric load in California’s agriculture segment, and this load is growing as the state’s water users increase their reliance on pumping water to meet their needs.~~

~~All California investor-owned utilities (IOUs) will offer pump services and workshops at no or low cost through in-house or contracted resources during the Transition Period.~~

~~Retro-commissioning:~~

~~The RCx element is designed to optimize existing building or system performance by identifying operational deficiencies and making necessary~~

Formatted: Underline

Formatted: Underline

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

adjustments to correct the deficiency. A “Master List of Findings” results from the initial assessment that identifies low-cost projects with simple payback periods of less than 4 years. These projects may involve resetting, repair or replacing of existing system controls and components. Through the RCx assessment report, comprehensive projects are identified and referred to other sub-programs for completion (i.e., Calculated and Deemed Incentives). Energy savings from projects identified through RCx will be claimed in the Calculated Incentives Program.

strategy is designed to simplify the process by which customer are aware of the vast and varied auditing services that the utility has to offer. Through assessment functions, the utility will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (EE/DR/SG/Water Conservation).

CSP will serve a diverse class of customers and will bridge offerings across different IOU programs. From a customer perspective, the audit analyses will appear as a single package, identifying comprehensive options that simplifies the customer decision-making process.

Utility technical resources evaluate customer project opportunities and recommend design alternatives, including energy savings, cost savings, and available rebates and incentives for exceeding program baselines. In the future, utilities will be exploring providing regulatory benefits and opportunities for CO<sub>2</sub> reductions and non-energy benefits, such as production and safety data. The calculated approach provides for a “whole systems” integrated approach (such as incorporating controls and optimization with other systems). This technical data, in conjunction with financial data like payback periods, net present value, and/or ROI, allows facility managers to easily “sell” efficiency projects internally to management. Incentives improve ROI, accelerate project schedules, and can prevent efficiency options from being “value engineered” out at a later time.

A comprehensive retrocommissioning effort will be developed with an agriculture focus to help identify sub-optimal systems and improve operating performance. By being more of a maintenance-based offering, Agriculture Commissioning (ACx), allows customers to complete projects with short paybacks through their operations budget rather than their capital budget. This overcomes a common financial barrier related to capital budget approvals. Incentives sweeten the project opportunity, while ACx also requires a customer to complete any project with less than a one-year payback, improving the uptake of projects.

**d) Quantitative Program Targets**

Table 5 - Program targets are provided at the sub-program level.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

**e) Advancing Strategic Plan Goals and Objectives**

The teams of statewide agricultural program supported the development of the California ~~Long-Long~~-Term Energy Efficiency Strategic Plan (Strategic Plan), and the 201~~30~~-201~~42~~ program design integrates the goals and strategies of the Strategic Plan. Specifically, the following actions will be advanced during the 201~~30~~-201~~42~~ program cycle.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

*Strategy 1.1:* Develop knowledge base of efficiency solutions.

*Near term:* Conduct an energy use characterization and efficiency potential study for the statewide agricultural market. Include potential for waste streams to offset energy consumption. Study plan (6/2009) and study completed (12/2010).

*Near term:* Collect data on key programs and measures, best practices for energy efficiency in the agricultural sector. Study completed (6/10).

~~Utilities IOUs~~ will continue to coordinate with the California Energy Commission (CEC), ~~Commission,~~ and other resources to identify a study plan, scope, and deliverables for a statewide agricultural market characterization that considers integrated energy opportunities in the segment. If possible, the plan will be coordinated with other agricultural characterization plans planned or underway in the state focusing on renewable energy potentials, such as the California Department of Food and Agriculture's strategic plan for agriculture. The IOUs will defer to the Commission and the CEC to determine the best method and timeline for this study, and will ensure coordination between each IOU's EM&V groups towards study objectives.

Such a marketing characterization will support the development of future program baseline data and metrics to help set targets and show market progress. The resulting study will be posted on appropriate websites, including the IOU websites and the ~~Energy Design Resources~~-statewide websites.

To develop a "one stop shopping" clearinghouse of energy management and related information for the agricultural segment, the ~~utilities IOUs~~ will organize and post all relevant existing technical information on the ~~IOU and~~ statewide ~~Energy Design Resources~~ websites, as needed. This information includes best practices, continuous energy improvement resources, emerging technologies data, tools, programs, and other information.

*Strategy 1.2:* Ensure workforce has information and training necessary to apply efficiency solutions.

*Near term:* Conduct workforce training needs assessment and next steps (12/2010).

*Near term:* Develop training curricula and modules identified by needs assessment. (12/2011)

Formatted: Font: Italic

Formatted: Indent: Left: 0.5"

Formatted: Font: Italic

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

Utilities IOUs will assemble technical sub-groups, including utility IOU and industry experts, to focus on the key technical areas identified in the Strategic Plan, such as pumping, refrigeration and process heating. Coordinating with Statewide WE&T Program, the Statewide Agriculture Agricultural Energy Efficiency Program will develop a scoping document that outlines training objectives and partners. The group will identify priority topics, resource needs and industry partners for key workforce education and training, and will closely coordinate with the national ANSI Superior Energy Performance standards development work towards workforce certification. Additionally, utilities IOUs will offer prerequisite training to support future Department of Energy certification classes.

Workforce training needs assessment will be included in the agricultural market characterization study, and results communicated to the Statewide WE&T team for coordination and development of a detailed WE&T plan and associated curricula. Furthermore, marketing for WE&T will be incorporated into program specific marketing and outreach efforts. Such efforts, pending timely completion of the characterization study, are targeted for completion by the close of the 2010-2012 program cycle.

*Strategy 1.3:* Conduct research & development of new technologies and practices for agricultural efficiency.

*Near term:* Conduct an Energy Technologies/RD&D gap analysis. Identify and prioritize needed RD&D/ET projects. (12/2011).

*Near term:* Coordinate research activities across government, utilities IOUs, agricultural extension and university programs, and equipment manufacturer proprietary efforts.

The IOU's ET teams will continue to closely coordinate with the CEC, universities and industry associations to identify key potential areas for emerging technologies development and research needs, such as, for agriculture, in irrigation pumping, refrigeration, and process heating applications. Utilities IOUs will identify the most promising technologies that can play a role of providing multiple solutions, both for energy efficiency and greenhouse gas mitigation, as well as water efficiency purposes.

*Goal 2:* California regulations, financing mechanisms, and incentive programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

*Strategy 2.1:* Set objectives and framework for agriculture to attain multi-resource management goals.

*Near term:* Establish a task force to coordinate resource management policies, action goals, and program designs targeting California's agricultural sector.

*Near term:* Identify where goal conflicts arise and resolve these conflicts.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

*Near term:* Assess potential for integrated approaches.

In support of statewide regulatory coordination, the IOUs will establish a task force with the California Department of Food and Agriculture (CDFA), CEC, Environmental Protection Agency (EPA), and the California Air Resources Board (CARB). The task force will be empowered to coordinate strategies and goals, and also assess the potential for integrated approaches, on behalf of their agencies. In order to facilitate this complex, multi-agency coordination, intervention at the governor's level is likely to be required.

~~Other efforts planned by the Agriculture Energy Efficiency Program (for example, the pilot project for Integrated Demand Side Management for Food Processing) will allow California's IOUs and regulatory agencies to assess the potential for integrated approaches.~~

*Strategy 2.2:* Coordinate technical assistance, funding, and incentive mechanisms.

*Near term:* Identify the programs and major funding sources affecting the management of energy, air and water resources, and climate change.

*Near term:* Create a collaborative forum to facilitate sharing of information and coordination of programs.

As challenges to the national and state economies arise, deploying financial resources in support of energy efficiency and other resource efficiency will be increasingly important. In support of financial coordination, ~~utilities~~ IOUs will work with appropriate agencies, utilities, industry and private banking to assemble a comprehensive list of incentives, resources, funds, grants, loan products, and federal economic stimulus monies. This list will support energy and other resource management objectives, made available to customers through the planned Information Clearinghouse on Energy Design Resources.

In addition, financial resources will be integrated into marketing and outreach, education and training, and other program efforts, as appropriate.

*Goal 3:* Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

*Strategy 3.1:* Make information on efficiency solutions readily available to motivate efficiency improvements.

*Near term:* Develop benchmarking resources, tools and methods for the agricultural le sub-sectors.

*Near term:* Design and launch focused program for irrigation efficiency, refrigeration, and process heating.

The IOUs will post relevant market data, technical information, education and training resources, and benchmarking tools, other than proprietary- material or information, on the planned Energy Design Resources or other statewide

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

clearinghouse websites. This information will cover relevant technologies in agriculture and food processing segments, but will have a focus on irrigation efficiency, refrigeration, and process heating. The Continuous Energy Improvement Program will also support this strategy. On benchmarking, the IOUs will continue to work with industry associations (for example, the Wine Institute, Almond Board, and Farm Bureau) to prioritize benchmarking needs and to develop tools and methods, as well as to market benchmarking once resources are available.

*Strategy 3.2:* Conduct marketing & outreach to stimulate efficiency actions.

*Near term:* Develop ME&O strategy, addressing communication channels, partners, and effective messaging.

*Near term:* Begin pilot implementation.

For details on marketing and outreach planned to stimulate energy efficiency actions, please refer to Section 6.b.iv.

*Strategy 3.3:* Resolve metrics for embedded energy in water savings.

*Near term:* Update evaluation measurement & verification protocols to define energy impacts of water efficiency actions.

*Near term:* Design and conduct appropriate water/energy efficiency pilots for agriculture.

In support of the significant efforts underway in California to conserve water resources, and to optimize public funds where energy and water converge, the utilities IOUs will work with the Commission, water resources boards, and others to resolve metrics around embedded energy in water conveyance and treatment. Furthermore, IOUs will explore opportunities for saving energy on-site related to water, such as that in heating, cooling, pumping, and treating water. Lessons learned from current water-energy pilots underway in one utility IOU's territory will be shared with the other IOUs. The IOUs are willing and available to work with the Commission to advance these important multi-resource efforts through studies, pilots and partnerships with water agencies as appropriate.

**14.6. Program Implementation**

**a) Statewide IOU Coordination**

**i. Program name:** ~~Statewide~~ ~~SOCAL GAS Agriculture~~ ~~Statewide~~ ~~SOCAL GAS Agriculture~~ Energy Efficiency Program

**ii. Program delivery mechanisms**

The ~~Statewide~~ ~~SoCal Gas~~ ~~OAL GAS~~ ~~Agriculture~~ ~~Agricultural~~ Energy Efficiency Program will ensure the program is continuously updated and enhanced throughout the ~~three~~ ~~two~~-year implementation cycle. This also includes coordination with crosscutting program elements, including Emerging Technologies, Codes and Standards, Workforce Education and Training, Marketing and Outreach, and Non-IOU programs and market initiatives.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

Each designated IOU program lead will be responsible for representing key updates from each crosscutting program element in order to discuss opportunities for statewide program enhancements, modifications and further coordination as needed. IOU leads will then be responsible for incorporating program modifications at the IOU level to support statewide consistency when appropriate. Such items will be tracked in the meeting minutes to facilitate a record of statewide initiatives.

In addition, the ~~five~~ ~~three~~ ~~four~~ (4) agricultural sub-programs will be coordinated statewide to unify program implementation including delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The two coordination systems (one for the broad core program and one designed for the five sub-programs) will interact with and support one another. The broad, high-level coordination effort is described below, focusing on how the IOUs will work together to effect the continuous improvement of the Statewide ~~Agriculture~~ ~~Agricultural~~ Energy Efficiency Program.

Formatted: Not Highlight

Formatted: Not Highlight

The Statewide IOU Coordination process for the ~~Statewide Agriculture~~ ~~Statewide SoCal Gas~~ ~~OCAL GAS~~ ~~Agriculture~~ ~~Agricultural~~ Energy Efficiency Program will be as follows:

- **Designate an IOU Program Lead** – The coordination process will begin with each IOU designating a Statewide ~~Agriculture~~ ~~Agricultural~~ Energy Efficiency Program lead. The IOU lead will represent one agricultural sub-program and liaise with the crosscutting program element managers, investigating new innovations, special accomplishments, and challenges experienced by sub-program managers in all IOUs. Where such innovations or challenges may impact the Statewide ~~Agriculture~~ ~~Agricultural~~ Energy Efficiency Program across multiple sub-programs or the statewide program as a whole, the IOU lead will present such information to a quarterly Steering Committee meeting.
- **Establish protocols for Steering Committee Meetings** – The IOUs will coordinate to establish protocols around scheduling meetings, agenda setting, interstate travel, meeting minutes and tracking of action items identified.
- **Hold Quarterly Steering Committee Meetings** – The ~~Agriculture~~ ~~Agricultural~~ Steering Committee will be comprised of all designated IOU leads (including at least one lead for each of the five sub-programs), and possibly other contributing stakeholders identified by the IOUs. At the quarterly Steering Committee meeting, individual innovations, challenges, and accomplishments experienced in one IOU or by one sub-program will be shared with all IOUs. The Steering Committee will evaluate these individual IOU and sub-program experiences, hear ideas for course corrections and overcoming challenges, replicate successful innovations for consistency statewide, resolve differences in implementation to stay unified, and measure the agricultural program's progress against statewide metrics and goals.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

- **Adopt Program Enhancements** – After the Steering Committee agrees that a particular implementation policy or innovation has merit on a statewide level, each IOU lead will distribute the information to their sub-program managers for adoption and integration. Therefore, the IOU lead will act as a conduit, feeding sub-program information up to the statewide Steering Committee and distributing measures for adoption back to the sub-program managers. This feedback loop will assure consistency and unity in programmatic improvements across the IOUs. In some cases, it may be necessary to invite the sub-program managers to the Steering Committee meeting to get their feedback and ensure they receive the same message.
- **Evaluate Program Enhancements Against Statewide Targets** – To complete the adaptive management loop, the Steering Committee will track the program’s accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The Steering Committee will determine whether further course corrections are needed, and if so, rely on the above coordination process to generate the improvements necessary to stay on track.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and help ensure achievement of statewide targets across IOU service territories.

**iii. Incentive levels**

~~Details on the incentive levels are discussed with each of the four sub-programs. Incentives for industrial agricultural customers will be provided through both the deemed prescriptive and customized-calculated approaches. The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division direction. One possible method to comply with the Energy Division’s guidance to “achieve deeper energy savings retrofits and packages of measures” and to “raise incentive levels for Emerging Technologies”, is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects.~~

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

~~The IOUs will continue to develop in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the agricultural sub-program plans.~~

To specifically address this highly diverse and dispersed group of agriculture, food processing and related water customers, ~~utilities~~ IOUs will continue to foster strategic

Formatted: Fontcolor: A uto

Formatted: Fontcolor: A uto

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

partnerships with industry and commodity groups, as well as with regional farm and food associations. These partnerships engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users. These strategies leverage both past program successes as well as best practices studies that have confirmed that the targeted market segments rely substantially on local and industry-specific organizations for information and support.

~~The key food processing industry association partnerships include the Wine Institute's California Sustainable Winegrowers Alliance and the California League of Food Processors. The partnerships will reach large and small customers with key messages and emerging technologies information through association communications, presence at industry conferences and trade shows—and to pursue mutually advantageous benchmarking and pilot opportunities. To reach the more broadly dispersed agriculture segments, the IOUs will coordinate with the state and regional farm bureaus on communicating program offerings in the Ag Alert newsletters, through regional meetings, through market sector workshops and trainings, and through media plans targeting ads and articles in trade publications.~~

~~The utilities will also inventory and coordinate relevant agriculture and food processing technical and programmatic resources into a centralized one stop shopping clearinghouse. The clearinghouse will be part of the enhanced statewide Energy Design Resources website with specific market segment portals to assist customers with project design and implementation. For more discussion about the enhance Energy Design Resources website, see the Workforce Education and Training Program Plan.~~

~~The IOUIOUIOUsThe IOUs haveThe IOUs~~

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

~~The StatewideSoCalGasOCALGAS, Statewide AgricultureAgricultural Energy Efficiency Program will support integrated marketing opportunities for distributed generation from biogas, biomass, solar, fuel cells, and wind, as well as agriculturalale-based community-scale generation projects. These efforts support customer needs and wants, state renewable energy targets (through newly available small generator Power Purchase Agreement contracts), AB 32 greenhouse gas reduction targets, and emerging carbon markets and offset programs (such as the Chicago Climate Exchange or through the California Climate Action Registry). Consistent with California's preferred loading order, however, the utilitiesIOUs will continue to aggressively market and support energy efficiency first, as California's most cost-effective energy resource, while also being mindful of the customer's ultimate interests and goals.~~

**vi. Similar IOU and POU programs**

~~During the Transition Period, POU program activities will be coordinated with the Sacramento Municipal Utility District (SMUD) and the Imperial Irrigation District (IID) other agencies' and organizations', territories with containing a substantial~~

Formatted: Indent: Left: 0"

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

agricultural base, as opportunities present themselves. This will ensure that California's agricultural customers receive a consistent message, and program approach and removes a common barrier to program participation (i.e. processing or transaction costs).

**b) Program delivery and coordination**

**i. Emerging Technologies program (ET)**

The long-term energy efficiency vision of California can be attained through the continuous development, verification, and acceptance of new technologies into the market. IOU portfolio staff actively works with statewide emerging technologies staff to identify new emerging technologies, support evaluation and demonstration, develop and promote case studies, and market results to applicable customers towards total market penetration. The programs coordinate specifically with ~~the CEC's PIER program, and~~ universities to supply market-ready and viable technologies into the ET portfolio.

~~The Agriculture Program is currently working to support a diverse list of emerging technologies including winery electro dialysis, wastewater treatment technologies, forklift battery chargers, dairy refrigeration advancements, industrial refrigeration design enhancements, field pre-cooling advancements, and solar thermal applications.~~

The ~~utilities~~ IOUs will use a formal technology integration process for incorporating emerging technologies into the program. This process will be designed to track technologies/tools to be assessed, timeline to deployment, integration, codes and standards actions, expected actions of other players (such as manufacturers and ENERGY STAR) and other related information. The statewide program management team will work with other partners to update and execute the technology integration process, based on developments in technology, the program, and the market context. This process will be updated regularly to reflect current conditions.

**ii. Codes and Standards program**

The ~~Statewide~~ SoCalGas ~~Agriculture~~ Agricultural Energy Efficiency Program relies on the Codes and Standards Program to help maintain an updated and relevant list of measures that will support agricultural savings. As ~~c~~Codes and ~~s~~Standards evolve, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. In the ~~Statewide~~ ~~Agriculture~~ Agricultural Energy Efficiency Program, current work focuses on transitioning the market to accept new refrigerated warehouse code changes, and incorporating best practices and advanced refrigeration practices into that marketing and outreach effort. Towards that end, the Statewide ~~Agriculture~~ Agricultural Energy Efficiency Program will continue to coordinate closely with crosscutting Codes and Standards, Workforce Education and Training, and industry

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

partners and associations, and will utilize the Statewide AgricultureAgricultural Steering Committee to enhance the coordination effort.

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others supporting the market transformation strategies of the Strategic Plan. In general, the Statewide SoCalGas OALGAS AgricultureAgricultural Energy Efficiency Program will interface with the Workforce Education and Training WE&T&E Program Implementation Plan to serve the goals of the Strategic Plan.

WE&T efforts will include specific activities to support the various sub-programs. In addition, training on Title 24 code changes, industrial refrigeration best practices, and ANSI Superior Energy Performance certification will also be provided. The latter will be contingent on program developments occurring at the national level.

In the interim, the statewide agricultural program will support the same superior energy performance concepts and principals through Continuous Energy Improvement workshops available for customers and trade allies. -Additionally, DOE process system trainings (pumps, motors, steam, and compressed air) will be offered by IOUs statewide to lay the groundwork for certification level classes, once they have been developed nationally and are ready for rollout. The IOUs will be coordinating closely with national efforts and have expressed openness to discuss piloting certification classes. As a result, California will be poised to adopt this national standard and be a leader in this effort.

The education and training generally takes place through IOU energy centers, technology test centers, and education and training program offerings. Working with the Statewide WE&T team, the agricultural program managers will also expand training opportunities to local universities and academic institutions that have agricultural-based programs (e.g. Cal Poly Pomona and San Luis Obispo).

**iv. Program-specific marketing and outreach efforts**

The IOUs are currently engaged in in-depth market segmentation analyses. -The results of this work will be shared among the IOUs and incorporated into detailed marketing and sales strategies to ensure the IOUs are targeting the right products to the right customer at the right time, and utilizing the right-preferred method of communication channels.

This foundational segmentation and integration of programs and -services will evolve with provide incremental insight into customer mindsets, behaviors, responses and motivations to achieve the most effective level of energy use. Based on this in-process segmentation analysis, the utilities IOUs will be able to focus on providing consistent marketing and overall messaging focused on customers' business and personal goals, unique needs, and specific environmental considerations.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

The results of this strategic planning effort will help define successful program outreach efforts to address the diverse agricultural, food processing and related water customers segments. Such efforts are customized to suit the unique needs of each segment and customer profile. See the marketing section of 5.6, Program Design to Overcome Market Barriers.

For example, utilities IOUs will continue to foster strategic partnerships with industry and commodity groups, and regional farm and food associations to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users.

Specific efforts will may include:

- Attending Farm Bureau meetings and providing information in monthly newsletters;
- Close partnerships with key industry associations and participation in their annual conferences, with an effort to develop conference speaking engagements;
- Presence at technical conferences, targeting customers and trade allies;
- Targeted integrated education and training to specific market sectors to support peer-to-peer interactions and industry advancement;
- Media campaigns focusing on trade magazine ads and articles, discussing IOU program information and case studies;
- Targeted customer efforts through assigned IOU account representatives and program engineers, third parties, and government partnerships;
- Phone and web-based customer support and outreach;
- Development of coordinated statewide agricultural and food processing resources into a centralized “one stop shopping” clearinghouse, on Energy Design Resources and
- Market sector specific collateral that drives customers to account representatives and/or Web sites for additional support.

Such efforts have already shown success in California’s IOU programs and are identified as best practices in the American Council for an Energy Efficient Economy (ACEEE) comparative analysis of national agricultural energy efficiency programs.

Where possible and applicable, the IOUs will coordinate statewide in these targeted marketing efforts and partnerships to ensure cost-effectiveness and a consistent approach to customer-facing activities. Cost-sharing at industry conferences, co-sponsoring workshops, and identifying opportunities for statewide media campaigns as well as co-development of web-based tools and resources will be pursued.

The Energy Design Resources website will be used as a statewide clearinghouse of best practices, technology information, case studies, updates on upcoming education and training, and to promote new tools and resources available to support the Continuous Energy Improvement approach, such as benchmarking and performance tracking tools.

Formatted: Indent: Left: 0"

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

Formatted: Font: TimesNewRoman, 12 pt, Fontcolor: A auto

Formatted: Font: TimesNewRoman, 12 pt, Fontcolor: A auto

**v. Non-energy activities of program**

Refer to Section 6.f on "integration across resource types."

**vi. Non-IOU programs**

There are a variety of programs that will be coordinated with and leveraged in support of the program objectives. ~~Those~~ These include:

Formatted: Fontcolor: A auto

- Connecting customers with the CA Climate Action Registry;
- AB 32 support through CO2 tracking in program resources;
- Regulatory program coordination, including EPA air quality standards, water quality standards, and new refrigerant regulations;
- Non-~~utility~~ IOU financing resources, including from water utilities, industry and private banking, state and federal incentives, funds, grants, and loan products to support energy and other resource management objectives;
- Water/Energy efforts within California;
- ANSI, for the Superior Energy Performance Standard; and
- ISO international energy management standards.

The program will continue to engage with Air Quality Management Districts, the California Energy Commission, the California Air Resources Board, the Department of Energy, water agencies, and other government agencies on programs impacting regulatory compliance and resource management.

**vii. CEC**

**viii. CEC work on PIER**

~~Not applicable.~~

As of June 2012, PIER no longer exists. However, the program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies.

Formatted: Font: NotBold

Formatted: Normal

Formatted: Font: TimesNewRoman

~~The program will not be implemented with a direct linkage to PIER.~~

Formatted: Indent: Left: 0.5", Space After: 0 pt, No bullets or numbering

**viii. CEC Work on Codes and Standards**

As indicated in Section 6.b.ii, planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

Formatted: Indent: Left: 0.5"

~~The program will not be implemented with a direct linkage to codes and standards efforts.~~

Formatted: Indent: Left: 0"

**ix. Non-utility market initiatives**

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

The ~~Statewide Agriculture~~Agricultural Energy Efficiency Program will coordinate with applicable market initiatives to leverage market momentum and areas of mutual advantage. Modeling on the success of the ~~utility IOU~~ partnership with the wine industry California Sustainable Winegrowers Alliance, the program ~~will may~~ leverage the following efforts:

- ~~California League of Food Processing; Efficiency Alliance~~
- ~~California Farm Bureau Federation;~~
- ~~California Citrus Grower;~~
- Almond industry sustainability energy planning;
- Wine Industry – CSWA Program initiative;
- ~~Dairy Industry;~~
- ~~Irrigation Districts; and~~
- ~~ASHRAE / ARI efforts to develop refrigeration best practices.~~
- ~~National dairy sustainability effort.~~

Formatted: Indent: Left: 0.5", No bullets or numbering, Tab stops: Not at 0.75"

**c) Best Practices**

As described in prior sections, the ~~SoCal Gas Statewide~~SOCAL GAS ~~Agricultural~~Energy Efficiency Program reflects the best of each ~~utility IOU~~ program's successful components of statewide agricultural energy program offerings, and introduces new elements from other utilities and national efforts. These best practices include:

- Leveraging Local Agricultural Resources: i.e., industry associations and farm bureaus;
- Continuous Energy Improvement: An approach to transform the market and reduce energy intensity through addressing technical and management opportunities;
- Technical Assistance: Recognizes the need for personalized assistance for ~~commercial, industrial and~~ agricultural customers, which includes a full service approach starting from audits/pump tests to design and technical assistance, presentation of recommendations, resources to develop a long term plan, potential of project management assistance, with financial incentives and guidance on best practices.
- Vendor Partnerships: This strategy will be coupled with vendor support and educational workshops and classes provide the full breadth of support customers may need to influence their decision to implement energy efficient equipment and practices.
- Statewide Coordination: In order to take advantage of the statewide implementation of the program, the IOU program representatives will meet on a quarterly basis to improve program operations by sharing successes and areas of operational concerns.

Formatted: Indent: Left: 0.25"

**d) Innovation**

A bundled and integrated product and service offering will integrate with multiple resource management solutions, offering a new and customer-centric approach to programs. This is supported by innovative customer segmentation work by the Marketing and Outreach IOU teams. Significant innovative aspects of the ~~Statewide SoCal Gas~~SOCAL GAS ~~Agricultural~~Energy Efficiency Program include:

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

**Integration**

The Statewide ~~Agriculture~~Agricultural Energy Efficiency Program integrates demand side management strategies, and develops methods and pilots to promote integration of interlinked environmental and resource management issues. By improving the coordination of these issues of paramount importance to the industries being served, more face-time will be possible with large customers, projects will become more cost effective, and multiple problems will be solved concurrently. Specifically:

- Continuous Energy Improvement will foster a long-term energy management approach and support integrated demand side management.
- An innovative food processing pilot will integrate energy, air, water, GHG, and (potentially) waste streams.
- Integrated Comprehensive Energy Audits will provide targeted customers with integrated solutions in efficiency, DR, and DG, and may advise customers on other sustainability practices (for example, water conservation opportunities, CO2 reduction potential, and other programs references).
- IOU-s will link customers with the California Climate Registry to identify the carbon footprint of a customer's plant.
- ~~Utilities~~IOUs will promote innovative agriculturalle opportunities such as dairy biogas to energy, biogas injection, waste stream utilization, and community scale generation opportunities.

**Marketing**

- A market-sector approach to designing and delivering programs will allow IOUs to delve more deeply into market opportunities and overcome specific market barriers. This approach is supported by innovative market segmentation work currently underway at IOUs that will support development of new, precisely targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs.
- Closer coordination with third parties, government partnerships, core programs, and other delivery channels will optimize portfolio performance.
- ~~Utilities~~IOUs will increase outreach to new trade and community-based associations, leveraging best practices identified in ACEEE study of ~~utility~~IOU agriculturalle programs.
- Expanded workforce education and training efforts with vendors, design teams, industry association members and other key market actors will help overcome many customer informational and transactional barriers
- Energy Design Resources, developed statewide by IOUs, will be expanded as a web-based hub of agriculturalle and food processing best practice information, training, modeling and performance tracking tools.
- Training will be provided on modeling and quantifying savings opportunities through tools such as eQUEST and Energy Pro.
- Non-~~utility~~IOU financing tools and resources will be coordinated and communicated to help customers leverage available sources of funds to complete targeted projects.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

**Implementation**

- Utilities IOUs will coordinate on process improvements to statewide programs to ease participation barriers.
- Energy performance measuring and benchmarking assistance/services to customers will enable customers to compare themselves to “best in class” peers utilizing tools such as the U.S. EPA’s ENERGY STAR Benchmarking tool.

**e) Integrated/Coordinated Demand Side Management**

An integrated portfolio is cost-effective, captures program delivery efficiencies, and serves the needs and wants of customers who prefer a single, informed utility IOU point of contact ~~who can~~ help inform and prioritize their energy investment decisions based on their unique needs. Consistent with Commission direction and with the Strategic Plan, the Statewide Agriculture Agricultural Energy Efficiency Program includes integration of energy efficiency, demand response and distributed generation programs in integrated audits, marketing materials and industry-specific workshops. To this end, the statewide utilities IOUs and the Statewide Agriculture Agricultural Energy Efficiency Program has made progress in advancing integrated solutions.

The IOUs are placing major emphasis on marketing to get the right message to the right customer at the right time. Advanced customer segmentation is being used to develop detailed integrated marketing and outreach plans which outline multiple tactics, delivery channels and key messages to target to specific customers based on their specific needs. The IOU account representatives, who serve as the key customer point of contact, will be attending an integrated sales strategy and training program to ensure consistent delivery of portfolio offerings.

Education and training, particularly workshops organized around a customer segment, provides an ideal situation to integrate customer energy solutions. Utilities IOUs will provide integrated workshops to dairies, wineries, and food processors. These workshops will cover topics, such as resources analysis and methods, conservation, efficiency, demand response, and generation topics and resources. These workshops provide opportunities for utilities IOUs to cross-sell solutions and share key information from other utility IOU departments (for example, sharing biogas injection information at dairy workshops). They also provide opportunities to look at water, air, carbon credit and waste management issues.

As appropriate, Workforce Education and Training (WE&T) will also cover integrated energy and system solutions, which will be increasingly important as Critical Peak Pricing matures. The Agriculture Agricultural Program will coordinate with the WE&T group on curricula development and class planning.

The availability of a Continuous Energy Improvement approach, especially for the largest, most strategic customer accounts, will facilitate a thoughtful, integrated energy plan and will allow utilities IOUs to stay engaged in supporting the progress of that plan.

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

Integrated comprehensive Energy audits combine funds and resources of energy efficiency (EE) and demand response (DR) programs to provide integrated recommendations to customers. These audits provide customers with EE and DR recommendations and also provide general feasibility assessments for distributed generation (DG). ~~Detailed~~ Integrated comprehensive energy audits will be offered to customers with loads greater than 500 kW and all integrated audits will focus on EE, DR and DG options. In addition, the utilities IOUs are developing an enhanced web-based integrated audit tool<sup>17</sup> for customers and internal utility IOU personnel. The integrated audit tool will be the principal tool to provide IDSM information to customers with loads less than 200 kW and will be used by the CSI program for determining EE opportunities prior to installation of solar equipment. It will be capable of generating customer reports that include specific information on the costs and benefits of IDSM programs.

Emerging Technologies and CEC-PIER collaboration is expected to include pilot projects and market acceleration assistance for market-ready products in the general categories of day lighting, lighting, HVAC, controls, and building envelope improvements.

**f) Integration across resource types (energy, water, air quality, etc)**

California's agricultural and related food processing sectors face a multitude of environmental and regulatory challenges that threaten their survival and competitiveness. In 2009, a severe drought is impacting California's farmers and increasing water pumping costs. In addition, new regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual. Both these are impacting energy use and compliance.

The Agriculture Agricultural Energy Efficiency Program proposes to leverage these challenges to coordinate with the regulating agencies and the programs they are operating in order to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities. For example, the IOUs will continue to offer targeted trainings to customers who are sharing common regulatory challenges. In 2008 PG&E hosted three very successful workshops called NO<sub>x</sub> – Comply and Save, which educated customers on impending regulations, requirements for their boilers, and the most efficient project options to consider for compliance. This workshop will be expanded statewide and offered at the other IOU energy centers. In addition, additional workshops will look at wastewater treatment options, refrigeration upgrades, and energy efficiency to meet AB32 targets.

Utilities IOUs will pursue opportunities to partner with water agencies to offer joint energy and water incentives to support projects that reduce both resources, which reduces project costs and improves payback.

---

<sup>17</sup> Integrated audit tool is referenced as a general term in the statewide PIPs; each IOU has a specific name for its tool. PG&E's tool is the Progressive Energy Audit Tool (PEAT). SDG&E, SoCalGas, and SCE's, tool is the California Integrated Customer Energy Audit Tool (CICEAT).

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

An IOU is currently conducting a study to evaluate emerging water quality requirements in the state, and address best practices in comprehensive water related energy management in seven agricultural/food processing sub segments. The study will reflect statewide practice as much as possible. The results will be shared with the other IOUs, as well as posted on Energy Design Resources.

~~The Integrated Demand Side Management Pilot with Food Processors is still under development, but aims to coordinate air, energy, and water/waste streams management. Ideally, learning from the current Commission water/energy pilot, which includes wineries, will be useful in advancing the objectives of this effort.~~

Where applicable, the program will integrate topics like GHG reduction and water conservation into targeted customer workshops, marketing and communications, building on a strong track record from the ~~2006~~2010-128 program cycle. For example, one IOU is currently conducting a series of winery workshops focusing on GHG reduction strategies, water management, Energy Management 101, and Green Building which includes materials and water. Ads and articles featured water savings opportunities and messaging.

**g) Pilots**

~~IOUs will pilot and develop methods to use more detailed performance and usage data that can be measured, stored and used to improve energy efficiency offerings and services for greater customer impact. The Agriculture Program will support the pilot proposed by the California League of Food Processors tentatively titled the Integrated Demand Side Management Pilot for Food Processing Program. The pilot forms an alliance between the food industry, the Commission, IOUs, and other state and national stakeholders and promotes integrated energy management solutions to end-use customers in the food processing segment.~~

~~The pilot aims to explore the relationship between energy, demand, air, water, and other resources and develop integrated strategic plans for pilot participants that will optimize their management. This comprehensive strategic approach to resource efficiency is warranted due to the close interconnection with the demand for energy and water, air and wastewater emissions. The pilot will support the need for industrial managers, plant supervisors and workers to have new skills and abilities to engage in technical deliberations to ensure the integration across resources achieves the desired resource optimization objectives.~~

~~The end result is expected to be that food processors reduce, reuse and recycle water resources; limit air pollution emissions; capture solid and liquid waste streams to generate bio-energy products; and continuously achieves energy efficiency through best practices and personal development. The reward will be energy efficiently made products with the lowest level possible of impacts on natural resources and the environment.~~

~~The scope of the pilot is still under development. In 2010, utilities will coordinate with the California League of Food Processors, Commission, CEC, ANSI and the International Standardization Organization to clarify and refine pilot design, budget, timelines, partners,~~

Formatted: Indent: Left: 0.25"

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

and goals. Candidates will ultimately be selected from the food processing and potentially industrial segments. If possible, non-utility funding sources will be leveraged to support pilot activities as the resource benefits cross multiple agencies and jurisdictions. The pilot is expected to be planned during the bridge period and be rolled out in the six month period after 2010-2012 program cycle begins.

— Test Strategic Approach for Agricultural Segment (SCE)

Traditionally agricultural customers are a high cost group to provide significant energy education to. They are gGeographically they're dispersed and typically time constrained, over much of the middle of the state. Time is very important to them. Energy efficiency is not a primary concern, and although the IOUs have established high value relationships with these customers, many times it takes more to get them to accommodate new technologies.

— IOU Test Strategic Approach for Agriculture Segment

The IOUs may implement a Test Strategic Approach (TSA). The TSA is based on identifying agricultural sub-segments where the IOU(s) have strong relationships with an industry or trade association. The objective is to leverage the trade association's needs with IOU's knowledge and experience with energy efficiency, demand response and self-generation opportunity and solutions and in collaboration with the trade association leadership, educate sustainability and energy efficiency solutions to their membership.

This model is based on a successful effort implemented by the California Association of Winegrape Growers with Pacific Gas and Electric. For more information on their efforts, website link: <http://www.cawg.org/CAWGProjects/SustainableWinegrowing/ProjectDescription.aspx>.

— This Test Strategic Approach is based on identifying at least two agricultural subsegments where SCE has strong relationships with their industry or trade association. The objective is to leverage the trade association's needs with SCE's knowledge and experience with energy efficiency, demand response and self-generation issues and in collaboration present sustainability and energy efficiency solutions to their membership (1).

— The anticipated benefits:

- Influence for installation of kWh and KW
- Customer satisfaction, and
- Cost efficiency delivery of DSM services
- Identification of appropriate emerging technologies

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

M&E study support: (i.e. suggested market research, researchable questions based on theory, high level research plan ...)

- Customer satisfaction
- Energy issues related to other AG subsegments
- Evaluation of other AG trade associations in SCE service territory

(1) This model is based on successful effort implemented by the California Association of Winegrape Growers and Pacific Gas and Electric. For more information on their efforts, website link: <http://www.cawg.org/CAWGProjects/SustainableWinegrowing/ProjectDescription.aspx>

The IOU's intend on implementing methods to gather and retain more detailed performance and usage data on a pilot basis to determine the most cost-effective methods and to support a greater realization rate to achieve savings. Exploring incentives for sub-metering is an option as is expanding the tool library in lieu of incentives.

**h) EM&V**

The utilities IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2010-2012 after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader utility IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

**Formatted:** No underline

# 24a4a

1. **Program Name:** ~~Agriculture~~Agricultural ~~Customer Services~~Energy Advisor Program  
**Program ID#:** ~~SoCalGas~~OCALGAS 3717  
**Program Type:** Statewide Core Program

## 2. Projected Program Budget Table

Table 1 – See the overarching program for budget details.

## 3. Projected Program Gross Impacts Table – by calendar year

Table 2 - See the overarching program for savings details.

## 4. “SubProgram Description

### a) Describe program

The Statewide Investor Owned Utilities (IOUs) have created the ~~Customer Services~~Agricultural Energy Advisor SubProgram (CSPAEA) to bring together under one program all services offered to support customer education and participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities.

CPS was created to provide a streamlined and coordinated assignment of right-sized customer solutions. The key is to start the process with an initial analysis of a customer’s needs, determination from the analysis which audit will service the customer with the highest cost/benefit, identify additional program support and key indicators that will motivate the customer to implement energy saving recommendations

The ~~utilities~~IOUs anticipate the restructuring of ACSPEA will affect the way audits are provided. ACSPEA will enhance the IOUs’ ability to match customers’ need(s) with the right audit service. This will result in an increased cost-effective delivery of these audit services with an increased expectation for customer adoption/installation of provided customer specific recommendations.

~~The ~~Customer Services~~Energy Advisor sub-program (CSPEA) is designed to deliver a coordinated and customer specific audit service. CSPEA features a statewide integrated demand side management customer specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer’s need(s).~~

In its offerings, ACSPEA will place an emphasis in deep energy saving measures and emerging technologies where appropriate. When the technologies and customer

Formatted: Font: Not Bold, No underline

Formatted: Left: 1", Right: 1"

Formatted: Indent: Firstline: 0"

Formatted: Indent: Left: 0"

Formatted: Font: Not Bold, No underline

opportunities are correctly aligned, the customer will become more open to the benefits these technologies offer to their business and will therefore increase their acceptance and adoption.

Together the ACSPEA offerings will work to support the achievement of Strategic Plan objectives across ~~the all-segments (agricultural, commercial and industrial)~~ sector.

~~The CSPEA is designed to support the goals of the Strategic Plan by providing customers with comprehensive building specific information on cost effective DSM opportunities. The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.~~

The ~~Agriculture~~ Agricultural CSPEA ~~umbrella~~ package, consists of ~~six~~ five (5) distinct offerings ~~components~~:

- **Benchmarking** is the first step for a customer to begin to understand the energy use of their building. Benchmarking is an initiative designed to educate and motivate customers to ~~benchmark~~ measure and track the energy use of their facilities, educate customers of the benefits of benchmarking their facilities and how they can track the impact of energy savings after implementing energy saving measures. To support the customer's efforts, the IOUs ~~it~~ will offer technical support, hands-on workshops that will provide customers with information ~~enabling them to~~ on how to benchmark, how ~~utilize~~ benchmarking can be used as an energy management tool and what to do next after benchmarking.;

Formatted: Indent: Left: 0.75", No bullets or numbering

The IOUs will develop or continue Benchmarking initiatives that supports the customers' ability to comply with AB1103's benchmarking requirements (upon its implementation), utilizing ENERGY STAR Portfolio Manager and IOU supported Automated Benchmarking Services.

The IOUs will also continue to offer customers technical support ranging from email and phone hotlines, hands-on workshops and web-based benchmarking educational and instructional materials.

~~And~~The IOUs will continue their support to identifying, evaluationg and making information about other benchmarking tools available.

The primary focus for benchmarking activities will continue to be centered on ~~commercial agriculture~~ commercial buildings within the agricultural sector (in alignment with the target building type of AB 1103).

~~The program is also designed to support the implementation of AB 1103.~~

Formatted: Indent: Left: 0.75"

~~Online Energy Audit Tool (Small Business); Business Energy Adviser (California Integrated Customer Energy Audit Tool (CA-ICEAT)); BEAThe Online Audit Tool (OAT) is designed as an enhanced, customer friendly "do it yourself" online web-based audit tool that targetings small business customers. OAT offers an~~

~~integrated auditing approach providing energy efficiency, demand response and self generation recommendation and education.~~

Formatted: Indent: Left: 0.5", Bulleted+ Level: 1 + A lignedat: 0.75" + Tab after: 1" + Indentat: 1", Tab stops: 0.75", List tab

~~With large numbers of small business customers in each IOU's service territory, it is necessary to offer and test different cost-effective strategies that can help small business customers maximize their energy use.~~

~~The IOUs will confirm their implementation timelines and once their tool is rolled out, they will initiate a continuous improvement cycle to ensure the benefits and features of the tool are meaningful for customers use. As the timing is appropriate, the IOUs will initiate marketing campaigns to raise small business customer awareness of the tool's availability and benefits.~~

~~Per the Final Transtition Period Decision, IOUs with implementation timelines occurring beyond 2012 will be listed in Appendix XX.~~

~~**Currently the tool identifies customized energy efficiency, demand response and solar recommendations for eight (8) business types.**~~

**• Agriculturale Continuous Energy Improvement (CEI) Continuous Energy Improvement (CEI) is a consultative service aimed at helping aAgricultural, commercial and industrial- customers (utilitiesIOUs will target CEI services in line with market segment potential in their service territories and resource availability) engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility IOU customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices which address energy savings, reduction of greenhouse gas emissions and water conservation, through a high-level energy commitments from executive and board-level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and Intemational Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost effectiveness of the delivered energy management solution.**

Formatted: Fontcolor: A uto

CEI offers customers the pinnacle of audit offerings guiding executive management to levels of energy management self-actualization that makes energy and environmental issues a consideration in all management/business operational decisions and in long term energy planning. For additional information about CEI, please consult the [Agriculture Agricultural CEI Program Implementation Plan](#).

- **The Integrated Demand Side Management Energy Non Residential Audits (IDANRA)** design for the Transition Period is will provide focused Basic and on Integrated Comprehensive Energy Audits (ICEA) that focus on customer energy savings, cost/benefits efficiency and, the and the targeted delivery of financial and technical assistance. that the customer needs to make energy saving decisions. Audit information must communicate complex information in a simple and understandable way to enable customers in identifying energy efficiency, demand response and renewable distributed generation opportunities. Audits uses -Deemed, or "ex ante" Deemed, and Calculated methodologies for energy savings analysis information.

As stated above, NRA offers ICEA. In Appendix A, each IOU defines the sub-categories of ICEA that they provide. As stated above NRA offers two (2) categories of audits — Basic and ICA. In (cite appendix location here) each IOU defines the sub category of Basic and ICA they provide.

The goal is to use a "one stop shop" approach to maximize the benefits for the customer and reduce any associated negative impacts. This In this program cycle, emphasis will be given on to meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), and streamlining the audit process, increasing its efficiency, lessening complexity, and increasing the effectiveness of influencing customer implementation actions through actions such as integration of the demand response technical audit component directly into NRAs offerings. In addition, the IOUs- will investigate ways to implement meaningful financial measurements such as return on investment and/or simple payback metrics. The key is ensuring that whatever financial tools is selected used it must provide the customer with meaningful information by ensuring cost assumptions are appropriate to the customer. - Also, NRA will assume the audit and budget responsibilities for Demand Response's technical audit services, as applicable. It is intended that these audits will be a critical component of the integrated comprehensive audit service offering.

Onsite audits will take the form of providing to our customers, opportunities for integrated comprehensive audits and focused audits.

- **Pump Testing Efficiency Services** is designed to help agricultural, commercial, and industrial and agriculture customers make informed decisions about improving inefficient pumping systems and operations through recommendations derived from

Formatted: Font: Not Bold, No underline

Formatted: Font: NotBold, No underline

pump test audit or direct observations of processes before they stop moving water and start wasting excessive amounts of energy. Pumping of potable water is estimated to account for more than 80% of the electric load and 73% of the natural gas requirement in California's agricultural segment, and this load is growing as the state's water users increase their reliance on pumping water to meet their needs. Pumping is also estimated to account for 20 to 25% of energy usage within the nation.

Formatted: Indent: Left: 0.75", No bullets or numbering, Tab stops: 0.75", List tab

The Pump Efficiency Services sub-program program element, implemented by a team of trained in house or third party contractors, aims to overcome key informational, technical, and financial barriers to pump optimization by offering pump tests, retrofit incentives, and targeted education, training and technical support for customers and pump companies. Each IOU's database of pump test results will be used in the near-term to target pumps in need of retrofit as a means to capture savings. However, pump performance data aggregation at the statewide level will contribute to the development of metrics and targets for pump improvements, in support of a statewide pumping focus across segments, inon agriculture, commercial and industrial, supporting their strategies and objectives.

Formatted: Font: 12 pt, No underline, Font color: Auto

Formatted: Font: TimesNewRoman

Formatted: Indent: Left: 0.75", No bullets or numbering, Tab stops: 0.75", List tab

**Retro-commissioning:**

The IOUs are planning to continue andto enhance their core Retro-commissioning (RCx) programs. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments.

The RCx element is designed to optimize existing building or system performance by identifying operational deficiencies and making necessary adjustments to correct the deficiency. A "Master List of Findings" results from the initial assessment that identifies low cost projects with simple payback periods of less than 4 years. RCx is offered to agricultural, commercial and/or industrial customers, based on the market segment potential and resources of the respective IOU. These range of projects may involve measures which resetting, repair or replacing of existing system controls and components. Simple payback for these measures are usually short in duration and must meet customer expectations. Through the RCx assessment report, comprehensive projects are identified and referred to other sub programs for completion (i.e., Calculated and Deemed Incentives). Energy savings from projects identified through RCx will be claimed in the Calculated Incentives Program.

Formatted: Indent: Left: 0.75"

Formatted: Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

Formatted: Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

Formatted: Indent: Left: 0.75"

Formatted: Font: TimesNewRoman, 12 pt, No underline, Fontcolor: A uto

Enhanced RCx program elements will explore and may include but not be limited to:

- Innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- Continuous commissioning and monitoring based commissioning;

- ~~— Solutions for small and medium commercial customers;~~
- ~~— Strategies to drive savings persistence;~~
- ~~— Appropriate alignment with retrofit activities; and~~
- ~~— Overall program incentives, targeting, and delivery.~~

~~The RCx program is a key offering in the Agriculture Calculated Sub-Program and a more detailed description of the program is provided. Not Applicable.~~

~~The Transition Period will be used to develop and test the A The CSPEA design strategy. The strategy focuses on is designed to simplifying the process way audits are provided to customers. by which customer are aware of the vast and varied auditing services that the utility has to offer. Through various assessment functions, the utility IOUs will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (i.e. primarily EE, DR, and SG/Water Conservation).~~

~~It is anticipated ACSPEA will allow the expansion of audit serves across diverse class of customers, potentially across all segments and will bridge-interconnect the customer with offerings across different the wide and diverse range of programs offered. IOU programs. From a customer perspective, the impact on customer time and resources will be reduced, the audit analyses will include DSM, greenhouse gas reduction information, provide water conservation recommendation all appear as in a single package report. The resulting report will identify ing comprehensive options solutions that will simplifies the customer decision-making process.~~

~~The primary program objectives for 2013-2014 are:~~

- ~~● Support the Strategic Plan by offering integrated audits across a wide selection that address the full spectrum of energy solutions, including energy efficiency, demand response, and distributed generation (California Solar Initiative and distributed generation), focusing on agricultural, commercial, and industrial facilities as defined by each IOU's market potential and resource availability. (Applicable to: General)~~
- ~~● Provide a focus on the "MUSH" market (municipalities, universities, colleges, schools, and hospitals) to test ideas for deep energy retrofit efforts. (P22 Move towards The continuation of delivering high value audit reports to the customer. - and away from doing audits to meet a "number of audits performed" goal. Audit reports will be designed in such a way that they will provide the customer with information which motivates them to implement energy efficiency, demand response and consider renewable generation options. (Applicable to: General IEA, Pump Tests, RCx, CEI)~~
- ~~— Integrate audit offerings (Benchmarking, non-residential audits, pump tests, Retrocommissioning, and Continuous Energy Improvements) in to a consolidated "Customer Service" offering for our customers. SCE will develop the metrics to become more proficient in providing our customers with the specific audits and incentives to influence their decision to implement integrated energy recommendations. (Applicable to: General)~~

Formatted: Font: Not Bold, No underline

- Enhance efforts to identify and provide financial analyses focused on deeper energy savings ~~measures~~ and technologies. Identify ways different financial metrics, such as return on investment and/or simple payback, can be provided where the values presented have meaning to the customer. ~~(Note: Project cost is an elusive variable unless provided by the customer. Need to identify the challenges and investigate the solutions).~~ (Applicable to: General)
- The IOUs will explore and evaluate the potential of enhanced customer incentive options that are contingent on a customer's receiving an audit prior to applying to incentive programs.
- ~~Enhance and develop new channels to incorporate recommend~~ new and/or emerging technologies appropriate for the customer's facility. (Applicable to: General)
- ~~Develop and implement enhancements to~~ current Benchmarking workshops (targeting ~~commercial~~ agricultural buildings) and continue providing Benchmarking and AB 1103 technical support through established and new delivery channels. (Applicable to: Benchmarking)
- ~~Enhance customer benchmarking of their facilities (Applicable to: IEA, Benchmarking, RCx, CEI, )~~
- Encourage Statewide consistency by offering a similar energy audits with the ultimate goal of offering customers the best energy management practices and technologies.
- Enhance the ~~audit process~~ CSPEA' offerings by including activities such as, but not limited to:
  - ~~Integrated Benchmarking score in the Energy Assessment Reporting tool (EAR). SCE will pilot integrating the California Rating Tool methodology within EAR. This also may be an opportunity to Review and evaluate test the CEC's Building Energy Asset Rating System tool (BEARS). This will be further evaluated) once the BEARS tool is completed and review the CEC has completed developing the tool. (The successful implementation of testing the new BEARS audit tool will depend on its timely release.. BEARS is currently slated for completion at the end 2012. If the release of the BEARS tool is significantly delayed then the implementation of a successful pilot will also be delayed.)~~
  - The highlighting of emerging technologies and deep energy ~~measures~~ savings opportunities and providing education on ~~long~~ long-term energy planning/project management strategies (in coordination with CEI program).
  - Will continue existing water saving services and develop ~~it~~
  - ~~Evaluating the potential to integrate Return On Investment metrics as part of the Customer Audit Report. (Applicable to: IEA)~~
  - ~~Enhance CSP offerings by pursuing process streamlining and increasing the cost effectiveness of the service offered.~~
  - ~~(SCE: A key project for the Transition Period is to complete the development of the Energy Assessment Reporting tool, an auto or semi-automated auditing tool (both of~~

Formatted: Font: 11 pt, Strikethrough

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

~~these will be notepad based) and interconnecting these tools with a single database which will provide an automated Customer Audit Report tool (CAR) and the capability to directly populate SCE's online audit application].~~

- ~~Leak detection services will and strategies which will offer the service to customers in all customer segments as determined by the IOUs to provide customer benefits and cost-effective to administer. The services will, be offered by SCE's Pump Test and Hydraulic Services staff and through the use of audit teams, in house and/or contracted, and may be required as a service in the to-delivery of all integrated comprehensive audits. (Applicable to: IEA, Pump Tests).~~

#### A

- ~~CSPEA will play a key role in exploring options regarding identifying deeper measures energy savings, promotion of emerging technologies and providing the proper support to those customers who authorize take advantage of more than three (3) measures from Agriculture Agricultural Deemed Incentive subprograms sub-program. the programs such as Direct Install and others program.~~
- ~~ACSPEA will develop processes to assist help energy audit teams and customers identify facilities and services that will provide the greatest return on benefits from the audit. The IOUs may explore leveraging tools to complete energy audits, usage analysis, assessments and/or building performance benchmarking as the first step in determining a customer's need.~~
- ~~ACSPEA may also enhance tracking and audit component capabilities to support customer needs analysis, reduce program application barriers, maximize recommendation follow up and streamline audit report generation.~~

#### **b) List measures**

~~The ACSPEA primarily offers non-resource, auditing services. It does not offer incentives, but ultimately influences the customer's implementation of energy efficiency, demand response, and self-self-generation opportunities in combination with incentive from the core Agricultural incentive programs (refer to the I Agriculture Agricultural Deemed and Calculated sub-programs for specific information). However, each utility IOU reserves the ability to offer incentives specific to ACSPEA's individual service offerings.~~

#### **c) List non-incentive customer services Agricultural Energy Advisor Services**

~~The Customer Services Agricultural Energy Advisor sub-program (CSPA EA) is designed to deliver a coordinated and customer customer-specific audit service. CSPA EA features a statewide integrated demand side management customer customer-specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer's need(s).~~

~~Such activities include, but are not limited to: energy management assessments, energy planning, marketing and outreach, baselining and benchmarking, project implementation~~

support, technical support, energy savings calculations, process evaluations and report generation, and web-based energy resources.

## 5. Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Information

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 3 – Refer to the overarching program for quantitative baseline metrics

### b) Market Transformation Information

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 4 – Refer to the overarching program for market transformation metrics

### c) Program Design to Overcome Barriers

The ACSPEA offers services which change corporate/management cultures that prevent successful implementation of comprehensive energy policies. These offerings help overcome customers' lack of awareness of DSM opportunities by providing a customer focused, comprehensive package of energy solutions designed specifically to motivate the customer to implement recommendations. Information such as cost/benefit analysis (i.e. ROI or simple payback) and identification of appropriate IOU incentive and/or finance programs, can significantly enhance the financial benefit of the energy saving recommendation. ACSPEA also provides customers with tools to measure the effects of implemented energy savings actions on their bottom line.

~~ACSPEA brings together audits and related services to implement energy saving activities. This is in direct response to evaluation studies conducted for program cycles 2002, 2003, and 2004-2005 which clearly identify energy audits as one of the most powerful tools in creating awareness, enforcing customers' implementation of energy conservation recommendations~~

Formatted: Space After: 0 pt

Formatted: Indent: Left: 0.25"

### d) Quantitative Program Targets

The targets provided herein are best estimates, but nonetheless are forecasts.

Table 5

~~[TARGETS FOR CSP SUB COMPONENTS ADDED HERE]~~

<u>Influence Targets</u> <u>(Proposed)</u>	<u>Program Target by</u> <u>2013</u>	<u>Program Target by</u> <u>2014</u>
<u>Number of Audits</u>	<u>63</u>	<u>65</u>

<u>Influence Targets (Proposed)</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>

**e) Advancing Strategic Plan goals and objectives**

May Need other connectivity to CALTEESP goals from RCx}

Formatted: Font: 12 pt, No underline, Font color: Auto

The ACSPEA is designed to promote DSM coordination and the integration strategies of the Strategic Plan. Foremost are recognition of the linkage between energy and environmental policy and the importance of integrating energy efficiency, demand response and distributed generation to support California's plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the ACSPEA include:

Ensure Facilitate all State Owned and Leased Buildings are having a Retro-Commissioning Retrocommissioning optioned

By offering a dedicated retro-commissioning program, a mechanism is created whereby IOUs can facilitate the achievement of this goal as a coordinated effort with the IOU Government and Institutional Partnership Programs.

Strengthen Tools and Practices for Building Commissioning

Based on the IOUs' experience with managing the 2006-2008 Retro-commissioning program, lessons learned and best practices can be be integrated into the 20130-20142 offering. To increase market adoption of these program best practices, the IOUs will work in cooperation with the California Commissioning Collaborative to disseminate relevant information to the retro-commissioning community and services may be extended to all segments as deemed appropriate by each IOU.

- Identify New and Improved Tools and Strategies to Reduce Energy Consumption in agricultural, commercial and industrial facilities.

Formatted: Font: Not Bold, No underline

Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the ~~audits~~, benchmarking, CEI, and NRA and ~~RCx~~, demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, industrial/ agricultural processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing agricultural facilities contribute to California's zero net energy goals. Once implemented, recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.

● State/Local Governments and Major Corporations Commit to Achieve EE Targets

ACSPEA's offerings will seek to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop an actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

Formatted: Indent: Left: 0.75", Space After: 0 pt, Line spacing: single

● Develop Tools to Reduce Energy in ~~a~~ Agricultural, commercial, and industrial Agricultural Facilities.

Formatted: Indent: Left: 0.25"

Formatted: Not Highlight

Formatted: Font: 12 pt, No underline, Font color: Auto

As part of the implementation of specific ACSPEA offerings, the IOUs will partner with energy industry peers, industry associations, and DOE/CPUC-sponsored labs and consultants to enhance the use of existing tools and ~~develop~~ explore new tools to help agricultural customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

- Management Standard for Energy SME2000-2008;
- LBNL Superior Energy Performance-; and
- ISO-50001.

● Develop Business Models to Deliver Energy Management Solutions

ACSPEA's offerings will address the fundamental purpose to ~~achieve~~ influence corporate level decision making practices ~~commitments~~ from Agricultural, commercial and industrial customers to ~~change their existing business models to~~ consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the agricultural market sector.

Formatted: Indent: Left: 0.75"

Formatted: Font: Not Bold, No underline

In addition, ACSPEA's offerings promote acceptable practices of accounting, auditing, and evaluation by:

- Offering integrated and focused audits, benchmarking, savings calculation assistance for retrofit ~~and retro-commissioning opportunities~~, and simplifying the audit-to-project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action;
- Guiding and supporting customers as they implement technologies, processes and practices to achieve energy efficiency savings--; and
- Long term energy planning support.

Formatted: Indent: Left: 0.5", Space After: 0 pt, Tabstops: 0.75", List tab

Formatted: Space After: 0 pt

Formatted: Bulleted+ Level: 1 + A lignedat: 0.25" + Indentat: 0.5"

## 6. Program Implementation

- Assess and identify the best way to support the use of the BEARS tool.
- Enhanced current Benchmarking workshops and continue providing Benchmarking and AB 1103 technical support through established and new channels.
- Emphasize and support integration in emerging technologies and deeper energy measure opportunities.
- In coordination with incentive programs, identify ways to streamline the end to end process for customers wanting to participate in ~~utility~~ IOU energy saving programs.
- Continuation of Statewide IOU coordination

Formatted: Bulleted+ Level: 1 + A lignedat: 0.25" + Indentat: 0.5"

**i. Program name:** ~~Agriculture~~ Agricultural Customer Services Energy Advisor Program

### ii. Program delivery mechanisms

~~A~~ CSPEA will employ a variety of delivery mechanisms or channels. Most of ACSPEA's offering will use IOU customer energy efficiency staff and contractors, service and sales representatives, website and/or marketing and outreach efforts. Other delivery channels may also be developed.

In addition, where applicable, ~~Utility~~ IOU customer account representatives or program management staff will support this activity within the statewide agricultural sector, as well as third parties, government partnerships, and local programs.

Formatted: Indent: Left: 0.25", Space After: 0 pt

Formatted: Indent: Left: 0.5"

### iii. Incentive levels

N/A Not applicable. ~~(this sub program is a non resource offering).~~

Formatted: Space After: 0 pt

### iv. Marketing and outreach plans

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs, in order to maximize effectiveness, integrate

Formatted: Font: Not Bold, No underline

offerings, and as appropriate refer customers to relevant DSM programs. The IOUs will look to partner with interested public and governmental bodies to proactively promote energy efficiency and environmental green actions, in partnership with programs such as the local government partnerships and green communities.

Non-Residential Audit program evaluation studies conducted for program cycles 2002, 2003, and 2004 2005 clearly identify energy audits as one of the most powerful tools in creating awareness, enforcing customers' implementation of energy conservation recommendations.

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost effectiveness of reaching customer groups.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

Formatted: Font: 12 pt, No underline, Font color: A uto

In this Transition Period, the IOUs may test and evaluate a "pay for performance" or capitation fee for contracted organizations ("channel partners") that successfully deliver energy efficiency programs, measures and/or solutions to small business customers.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

Formatted: SpaceAfter: 0 pt

ACSPEA's energy ~~audit~~ recommendations will continue to recognize the regulations required by other bodies. For example, information about GHG reductions resulting from AB 32 may be incorporated into the customer recommendations and to factor into the projects cost-effectiveness and water conservation information will be included in the reports as appropriate.

Program offerings will collaborate and support the CEC's AB 1103 mandate by assisting customers with technical and awareness activities. ACSPEA will advance the introduction of the BEARS and California Rating Tool, where reasonable.

ACSPEA will recognize the efforts of ~~include the~~ the CEC's PIER's ~~and~~ Green Building Initiative programs, DOE's "ISO plant certification" programs, EPA EnergyStar Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs and will leverage such activities to the customer's benefit.

Formatted: Font: Not Bold, No underline

**a) Program delivery and coordination**

The sub-program will be coordinated with the following activities, as applicable:

Formatted: Font: 12 pt, Bold, Fontcolor: Auto

Formatted: Font: 12 pt, Bold, Underline

**i. Emerging Technologies (ET) program**

The IOUW ACSPEA Management Team will stay abreast of and incorporate relevant emerging technologies into audit recommendations as appropriate.

**ii. Codes and Standards program**

ACSPEA implementation will include information about pending new codes and standards program that may affect planning or prioritization of retrofit or new construction projects. Audits reports will include customer recommendations that are consistent with current governing codes.

**iii. WE&T efforts**

ACSPEA implementation will integrate with WE&T efforts, as needed, by providing CSI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches, as required.

**iv. Program-specific marketing and outreach efforts**

In 2013-2014, ACSPEA marketing campaigns will provide a wide range of action-oriented solutions targeted to "personas" identified through segmentation research. In addition, as ACSPEA is a bundled or package of services offerings, marketing efforts too will be "bundled"—that is, as menu of demand response, energy efficiency and conservation programs will provide customers with a full array of EE and DR options opportunities. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.

Formatted: Font: 12 pt, No underline, Font color: Auto, Not Highlight

Marketing activities will target business customers and select effective channels to reach entities such as ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support may be utilized.

Marketing collateral and messages for energy efficiency will be integrated with other IOU programs. Through additional market segmentation and feedback from customers, IOUs will further adjust approaches based on the varied needs of targeted customers.

Formatted: Font: Not Bold, No underline

Additional sub-program marketing will be accomplished by leveraging local third-party programs. Specific IOU marketing budgets are provided in Table 1 of the core agricultural program.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

#### v. Non-energy activities of program

The IOU's ACSPEA team will participate in Statewide and national efforts to develop and enhance audit, benchmarking and ~~retro commissioning~~, continuous energy improvement tools and practices. Such activities will likely occur in conjunction with ongoing industry efforts managed by the California Energy Commission (CEC), Consortium for Energy Efficiency (CEE), ENERGY STAR and the California Commissioning Collaborative (CCC).

CEI implementation will include non-energy activities such as recognition awards, local area or sector competitions, awareness campaigns, education about non-energy-related LEED points and definitions, and use of computerized financial analysis tools and cost estimating and forecasting tools

#### vi. Non-IOU programs

ACSPEA reports will include information on ~~n~~Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. ~~A Non-Residential Audits~~ ACSPEA will partner with programs offered by CEC, ARB, Air Quality Management Districts, ENERGY STAR, and other government and quasi-governmental agencies to capitalize on opportunities to develop co-branded program information and marketing collateral target to agricultural -sector customers, as opportunities present themselves.

With respect to water conservation, ~~utility~~ IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects (ESPM, BEARS, California Rating Tool, Water Agencies and others)

#### vii. CEC ~~work on~~ PIER Collaboration

~~CSP implementation will continue collaboration efforts with the CEC and ally seek to promote the adoption of new technologies developed through the PIER CEC's processes and to expose educate customers to demonstration, research and/or pilot projects. Specific CSP offerings will provide encourage recommendations addressing new equipment technologies, processes, and methods, as identified in CEC projects, that which~~

Formatted: Indent: Left: 0.5"

Formatted: No underline, Fontcolor: A uto

Formatted: Font: 12 pt, No underline, Font color: A uto

Formatted: Font: Not Bold, No underline

~~will enable customers to achieve energy efficiency "stretch" goals that produce significant energy savings beyond an established baseline in a cost effective manner. Not applicable.~~

SoCalGas/OCALGAS will continue collaboration efforts with the CEC in energy efficiency tool development and seek to promote adoption of new technologies developed through the CEC's processes and to educate customers to demonstration, research and/or pilot projects. Specific AEA offerings will encourage recommendations addressing new technologies, processes, and methods, as identified in CEC projects, which will enable customers to achieve energy efficiency "stretch" goals that produce significant energy savings beyond an established baseline in a cost-effective manner.

#### **viii. CEC work on Codes and Standards**

ACSPEA will not be implemented with a direct linkage to codes and standards efforts. Although ACSPEA will reflect code ~~and standards~~ regulation in its energy savings calculations as deemed appropriate.

#### **ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-utility IOU information and guidance that ACSPEA offerings will provide to customers. In addition, the IOUs will participate in state and national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

#### **b) Best Practices**

The IOUs will continue to leverage best practices and lessons learned at regularly scheduled statewide program management meetings. These meetings are forums to discuss program design and implementation issues, and as appropriate, provide statewide collaborated guidance in consistent RFP process solicitations for selecting third-party vendors and to ensure awareness of that program offerings are delivered consistently and consistently and it approaches/report outputs to ensure so that customers operating multiple facilities across IOU service territories receive the same information customer experience.

Other best practices approaches apply the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the agricultural-agricultural, commercial and industrial market sectors. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach can now will be successfully continue implemented given through the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

#### **c) Innovation**

Formatted: Font: 12 pt, Bold, Fontcolor: Auto

Formatted: Font: 12 pt, Bold, Underline

Formatted: Font: 12 pt, Bold, Fontcolor: Auto

Formatted: Font: 12 pt, Bold, Underline

Formatted: Font: Not Bold, No underline

For 2013-2014, the IOUs are identifying and evaluating program processes to increase effectiveness, simplification and increase the benefits the program delivers. Each IOUs set of lessons learned from these efforts will be shared and implemented to enhance energy savings benefits to all California IOU customers.

ACSPEA will engage in a process of continuing improve as a new standard way of packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

Formatted: Font: 12 pt, No underline, Font color: A uto,Not Highlight

Other ACSPEA offerings may also consider specialized incentives approaches based on delivery, target markets and/or other opportunities.

Formatted: Font: 12 pt, No underline, Font color: A uto,Not Highlight

Formatted: Font: 12 pt, No underline, Font color: A uto,Not Highlight

Formatted: Font: 12 pt, No underline, Font color: A uto,Not Highlight

**d) -Integrated/Coordinated Demand Side Management**

AEACS P will serve as the foundation will provide a comprehensive approach for integrated audit services. Its services will have the flexibility of meeting every level of a customer's audits needs from integrated comprehensive audits to targeted or focused audits, which centers on specific systems or processes, to assessments or general walk through audits or online "do-it-yourself" audits (currently for small business customers), which when properly applied can assist in identifying the areas of a customer's greatest energy interest, financial capabilities of the customer's ability to invest in improving its energy use, and identification of other programs that can be brought into the discussion to motivate a customer to move forward with the energy saving plan.

Formatted: Font: 12 pt, Bold, Fontcolor: A uto

Formatted: Font: 12 pt, Bold, Underline

The scope of services offered can coordinate the audit to look for retrofit ~~or retro-commissioning~~ opportunities; with benchmarking tools, or long term planning. Audit reports can present a truly integrated analysis to customers, seamlessly providing them with information and recommendations regarding energy efficiency, distributed-generation, demand response, greenhouse gas emissions and water energy savings, Customers will be referred to other IOU programs that will help them implement the recommendations resulting from the audit report and thus will be given a complete picture of their energy usage and options for reducing costs and using energy more efficiently.

**e) Integration Across Resource Types**

~~A~~The core focus of CSPEA is will focus on ~~to implement~~ DSM integration.

Formatted: Font: 12 pt, Bold, Fontcolor: A uto

Formatted: Font: 12 pt, Bold, Underline

ACSPEA implementation will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IOU ACSPEA managers will partner with the CEC, ARB, Air Quality Management Districts appropriate programs, when applicable, with government agencies ~~, and other~~

Formatted: Font: Not Bold, No underline

government agencies to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers.

Conventionally, each government agency and utility IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote ACSPEA offerings, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, utility IOU program managers will ~~partner~~ collaborate with the local water districts to produce ~~co-branded~~ marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects.

**f) Pilots**

~~Depending on the outcome of the 2012 process evaluation, CEI may pilot customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.~~

~~Other CSPEA offerings may consider specialized incentives approaches based on delivery, target markets or other opportunities. CSPEA services may consider the development of test markets especially in the introduction of new energy benchmarking or saving tools.~~

**g) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan ~~for 2013-2014~~ after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader utility IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

4b

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

1. **Program Name:** ~~Agriculture~~Agricultural Calculated Energy Efficiency Program  
**Program ID#:** ~~SCGOCALGAS~~3719  
**Program Type:** ~~Sub-Program~~Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** – reference the core program for budget details

3. **Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the core program for savings details

4. **Program Description**

a) **Describe program**

The purpose of the ~~s~~Statewide ~~Agriculture~~Agricultural Calculated Energy Efficiency Program is to provide services to improve the energy efficiency of agricultural facilities in California, including financial incentives based on calculated energy savings. The energy savings are calculated for measures installed as recommended by comprehensive technical and design assistance for customized projects. Integrated projects are encouraged to combine energy efficiency and demand response. Eligible projects include new construction, and retrofit ~~, and retrocommissioning.~~

The ~~Agriculture~~Agricultural Calculated Energy Efficiency Program is part of a suite of programs within the Statewide ~~Agriculture~~Agricultural Energy Efficiency Program.

The ~~Agriculture~~Agricultural Calculated Energy Efficiency Program is utilized for projects where ~~÷~~

a rebate is not available through the statewide ~~Agriculture~~Agricultural Deemed Energy ~~Savings~~ Efficiency Program, ~~ec~~customized calculations provide the most accurate savings estimates, or interactive effects between measures are best captured through whole building or whole system modeling.

Because it presents a calculation method that can consider system and resource interactions, the program will become the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan.

Key features in the process include:

- Energy audits of facilities and processes which recommend efficient design alternatives and detailing energy savings and CO<sub>2</sub> reductions;
- Calculations/estimates of energy savings for exceeding Title 24 code or industry standard practice baselines;
- Technical assistance from ~~SCE~~IOUs in energy audits and calculated savings;
- Submission of project proposal for ~~SCE~~IOUs review and approval;
- Pre-inspection by ~~SCE~~IOUs for approved retrofit projects;

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

- ~~Post-inspections on approved and completed projects to verify performance; and~~
- ~~Payment of incentives from SCE IOUs.~~

Energy audits may be completed by customers directly or ~~project-by authorized participants/sponsors~~. Sponsors may include contractors, design teams, vendors, and energy service companies. The completed audit may then be submitted for review and approval.

For the energy audit feature, statewide consistent calculators are publicly available. The statewide ~~utility IOU~~-created and maintained SPC Calculator can be used for retrofits and some new construction applications and is available online ~~and through CDs~~. For whole building construction projects, ~~utilities IOUs~~ accept both Energy Pro, available for license, and the ~~utility IOU~~-sponsored ~~eEQQuest/EST~~, available for free on the statewide Energy Design Resources website at [www.energydesignresources.com](http://www.energydesignresources.com), ~~among others~~. ~~Calculations must be submitted in open, unlocked, native format for review and consideration in the IOU's programs.-~~

~~Retro commissioning (RCx) is also eligible in the program for delivering energy savings. RCx is a systematic process to identify and correct operational problems or inherent repair and maintenance deficiencies that lead to excessive energy use. Unlike retrofits, which focus on equipment replacement, or operations and maintenance, which deal with routine maintenance, retro commissioning focuses on identifying and correcting problems that may not be readily identified by a standard energy audit.~~

~~O&M items with an effective useful life greater than three3 years can also be identified through this assessment. Additionally, opportunities often exist to optimize existing systems to operate more efficiently than originally designed with minimal new capital outlay.~~

~~RCx will be offered as a bundle of products/services. RCx providers will perform several tasks to identify measures. These tasks include, but are not limited to:~~

- ~~Initial benchmark;~~
- ~~Collect data to quantify the owner's operational requirements;~~
- ~~Perform detailed on-site audits to evaluate operational deficiencies and/or operational optimization opportunities inclusive of improved and enhanced preventive maintenance and repair programs;~~
- ~~Define measures, quantifying implementation costs and savings;~~
- ~~Assist customers with measure implementation;~~
- ~~Verify completion of measures;~~
- ~~Provide post installation documentation and training as well as other persistence techniques; and~~
- ~~Post project benchmark.~~

**b) List measures**

The broad range of measures eligible for incentives is summarized in the table below along with [the current](#) incentive levels. For detailed measure incentives, *see* Section 6.a.iii below.

**Formatted:** Font: 12 pt, No underline, Font color: A uto

**Formatted:** Fontcolor: A uto

**Formatted:** Fontcolor: A uto

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

The following measure categories are eligible for Calculated Incentives:

- Lighting
- AC & Refrigeration
- Motors and Others
- Gas measures

Measure Type	Incentive level (kWh/kW)
Lighting	5 cents per kWh + \$100/pk kW
AC & Refrigeration	15 cents per kWh + \$100/ pk kW
Motors and Others	9 cents per kWh + \$100/ pk kW
Gas measures	\$1 per therm

Financial incentives are calculated in several steps:

- ~~Calculations of estimated energy savings above Title 24 or from a baseline energy use~~
- ~~Calculation of incentives per unit of energy savings times the estimate of energy savings by measure~~
- ~~Estimate of project costs for retrofit projects or incremental cost for added load projects~~
- ~~For retrofit projects, incentives are capped at 50% of the total project costs, or the calculated incentive, whichever is less.~~
- ~~For added load projects, incentives are capped at 50% of the incremental project cost, or the calculated incentive, whichever is less.~~

**c) List non-incentive customer services Agricultural Energy Advisor**

The ~~Agriculture~~Agricultural Calculated Incentives Program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical and calculation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd the project through the process.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

By its nature, market transformation occurs as a result of numerous factors including projects/and programs; not single project or sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The Calculated Energy Efficiency Program includes numerous features designed to overcome these barriers, as identified and discussed below.

**Integrated Demand Side Management Approach**

The program offers California's agricultural able segment a statewide suite of products and services to help overcome market barriers to optimize energy management and meet the goals of the Strategic Plan. It overcomes multiple barriers through the implementation of strategies and the tactics that provide an integrated solution to the customer, offer education and outreach to create awareness and promote continuous energy efficiency improvement. The program also enables a facility to attain resource management levels that exceed industry standards and gain them market and world-wide recognition.

**CEI Program Offering**

The Continuous Energy Improvement (CEI) program compliments the Calculated Energy Efficiency Program by helping customers implement energy efficiency measures that have been identified through energy efficiency audits or in-depth facility/process assessments. Such assessment may be jointly provided by the IOUs and the U.S. Department of Energy (DOE) or ANSI. It focuses on improving production and optimizing energy efficiency and provides integrated resource management solutions including GHG reduction. This approach overcomes such barriers as lack of awareness of energy efficiency opportunities and provides highly skilled workforce of energy efficiency, process optimization, and resource management.

**Marketing and Outreach**

To increase awareness of the program, a statewide centralized clearinghouse will may be developed to give customers access to information on operating best practices in energy efficiency, industry relevant technical assistance, baselines, case studies, tools and computer based training. This clearinghouse addresses the issue of availability of information and qualified industry specialists to fully assess a building, system or process and help customers understand how energy efficiency can impact their emissions, resource consumption or waste discharge streams. A clearinghouse helps alleviate the problem often run into by Non-Residential customers of getting incorrect or out-of-date information from some local networks. It will also enable design engineers to specify energy efficient measures to exceed industry accepted baseline standards when constructing new or retrofitting existing buildings or systems, instead of specifying only what they know or what they are familiar with.

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

The Statewide Program information and services will primarily be delivered through account representatives, ~~utility~~IOU call centers hotlines, local government partnerships, third parties, and ~~utility~~IOU internet sites. Information ~~will~~ may also be made available through industry events, through industry organizations, and through advertising in industry and trade publications. Other avenues to reach out to customers and identify energy efficiency opportunities include non-resource programs that provide education and outreach, workforce education and training, or through IOU Emerging Technologies Programs.

**Education and Training**

Highly skilled energy management professionals may conduct technical training and seminars to educate the public as well as develop a highly trained energy efficiency workforce that is accessible to industry.

**Emerging Technologies**

In collaboration with ET and the CEC, ET may conduct studies, pilots, and demonstrations to prove the viability of promising emerging technologies and lower the risk of investment which in turn will speed up market penetration.

**Financial Assistance**

Rebates and incentives properly priced and based on energy savings quantified through technical assessments or basic audits, can help customers overcome internal financial hurdle rates. Skilled energy efficiency personnel may also assist customers and provide additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, tax incentives or other local sources of project funding.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

<del>Program</del> Name	Program Target by 201 <del>0</del> <u>3</u>	Program Target by <del>2011</del> <u>2014</u>
Projects	<del>75</del> TBD	<del>90</del> TBD

**e) Advancing Strategic Plan Goals and Objectives**

The Agricultural ~~le~~ Energy Efficiency Program supports all three goals in the Strategic Plan for the ~~Agriculture~~Agricultural Sector. General advancement of the goals is presented in the program implementation plan for the ~~Agriculture~~Agricultural Energy Efficiency Program. More specific support of the goals in the ~~Agriculture~~Agricultural Calculated Energy Efficiency Program is presented here.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

**Formatted:** No underline, Fontcolor: A uto

**Formatted:** Fontcolor: A uto

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

The ~~Agriculture~~Agricultural Calculated Energy Efficiency Program supports strategies to develop a knowledge base of efficiency solutions, foster workforce education and training, and encourage applications of new technologies.

**Goal 2:** California regulations, financing mechanisms, and incentives programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

The program supports strategies to attain multi-resource management goals and to coordinate technical assistance, funding and incentive mechanisms.

**Goal 3:** Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

The program supports strategies to make information on efficiency solutions readily available as well as conduct marketing and outreach to stimulate efficiency actions.

## 6. Program Implementation

### a) Statewide IOU coordination

i. **Program name:** ~~Agriculture~~Agricultural Calculated Energy Efficiency Program.

#### ii. Program delivery mechanisms

~~Agriculture~~Agricultural Calculated Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and ~~utility~~IOU program interactions. The ~~Agriculture~~Agricultural Calculated Energy Efficiency Program will coordinate with the core ~~Agriculture~~Agricultural Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the ~~three-year~~ implementation cycle will be enabled.

#### iii. Incentive levels

A broad range of measures is eligible for the Calculated Energy Savings Program, as seen in the following table. The current incentives for these measures are standard across the ~~utilities~~IOUs participating in the ~~s~~Statewide ~~Agriculture~~Agricultural Calculated Energy Efficiency Program.

Incentives will be as follows:

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

- ~~— Lighting, \$0.05/kWh and \$100/kW~~
- ~~— Air Conditioning & Refrigeration I, \$0.15/kWh and \$100/kW~~
- ~~— Air Conditioning & Refrigeration II, \$0.09/kWh and \$100/kW~~
- ~~— Other, \$0.09/kWh and \$100/kW~~
- Therms, \$1.00/therms, Capped at 50% of project cost

#	MeasureName	Per kWh Incentive	Per kW Incentive
1	Air Compressor System Replacement / Upgrade	\$0.09	\$100
2	ASD - HVAC Compressor Motors	\$0.15	\$100
3	ASD - Others	\$0.09	\$100
4	Building Shell Improvements	\$0.09	\$100
5	Carbon Monoxide Sensors	\$0.09	\$100
6	Controls - Non-Lighting	\$0.09	\$100
7	Equipment - Other not specified	\$0.09	\$100
8	Extruder System Replacement / Upgrade	\$0.09	\$100
9	Fan and Pump System Upgrades	\$0.09	\$100
10	Furnace / Energy Efficient	\$0.09	\$100
11	Heat Recovery Equipment (Process)	\$0.09	\$100
12	Heat Recovery Equipment (Space Conditioning)	\$0.15	\$100
13	HVAC - Chiller	\$0.15	\$100
14	HVAC - Complete Subsystem Replacement / Upgrade	\$0.15	\$100
15	HVAC - Heat Pump	\$0.15	\$100
16	HVAC - Other	\$0.09	\$100
17	HVAC - Package Unit	\$0.15	\$100
18	Injection Molding Machine Replacement / Upgrade	\$0.09	\$100
19	Insulation	\$0.09	\$100
20	Lighting	\$0.05	\$100
21	Lighting Controls	\$0.05	\$100
22	Motors Project (HVAC Compressor)	\$0.15	\$100
23	Motors Project (Non-HVAC Compressor)	\$0.09	\$100
24	Precooling Equipment	\$0.15	\$100
25	Process - Chiller	\$0.15	\$100
26	Process - Complete Subsystem Replacement / Upgrade	\$0.15	\$100
27	Professional Wet Cleaning	\$0.09	\$100
28	Pumping System Replacement / Upgrade	\$0.09	\$100
29	Rapid Closing Door	\$0.09	\$100
30	Refrigeration - Complete Subsystem Replacement / Upgrade	\$0.15	\$100
31	Refrigeration - Other	\$0.09	\$100
32	Series to Parallel Street Lighting	\$0.09	\$100
33	Special Window Glazing & Glazing Treatments	\$0.09	\$100
34	Vacuum Systems	\$0.09	\$100
35	Window Replacement	\$0.09	\$100

The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division and market direction. One possible method to comply with the Energy Division’s guidance to “achieve deeper energy savings retrofits and packages of measures” is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from

**Formatted:** Indent: Left: 0.44"

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program.

~~The IOUs are soliciting input from stakeholders and may replace the fixed incentive methodology described above with a scaled incentive mechanism for the Calculated Incentive sub-program. A scaled incentive mechanism would provide higher incentives for more comprehensive projects to achieve deeper energy savings retrofits and packages of measures and to raise incentive levels for Emerging Technologies.~~

~~Higher incentive levels will be provided for Emerging Technologies to spur traction in the market as feasible. The level of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, equipment cost, other market factors and cost effectiveness.~~

**Formatted:** No underline, Fontcolor: Auto, Not Highlight

**Formatted:** Indent: Left: 0.5"

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

~~The Calculated Energy Efficiency Program will may be marketed through IOU Account Executives, as well as through trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. The Program will may also provide direct customer contact by account executives, demand response program outreach, phone and e-mail support.~~

~~Marketing campaigns will may provide a wide range of pro-active solutions targeted by segmentation research. In addition, marketing efforts will may be bundled- integrated in a menu of demand response, energy efficiency and conservation programs. This menu will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment, utilities IOUs will better communicate with and serve customers.~~

~~Marketing efforts will incorporate may incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness and outreach efforts will may use targeted mass-multi- media communication and targeted communication channels. This will ensure the messages reaches the intended audiences with enough frequency to create awareness, educate and engage the customer to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars. The strategy will also include energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.~~

~~Market outreach to raise awareness of EE programs available will may use a number of multi-media strategies, including:~~

- ~~• Account representatives will may make a regular and consistent customer calling effort to key customers within this sector;~~

**Formatted:** No underline, Fontcolor: Auto

**Formatted:** Fontcolor: Auto

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

- Utility IOU representatives, program management representatives, and field engineers will may be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the agricultural market sector;
- Attendance at the key trade shows for each high priority sub-segment within the agricultural market sector;
- Utility IOU-sponsored training events at the utilities IOU's Customer Training Centers and other convenient locations within the utilities IOU's service territory;
- Hosting of utility IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Written collateral pieces that provide an overview of the utilities IOU's Energy Efficiency programs will be linked into the appropriate utility IOU's DSM web page.

The ideal marketing mix will be assessed evaluated for efficiency for and for assessed for maximum awareness and participation. Marketing and outreach coordination will may be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above. Furthermore, agricultural facilities are recognized as large energy and water consumers. Utilities IOUs will develop proposals, as appropriate, to facilitate water-energy nexus projects.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

**iv.—**

The Calculated Energy Efficiency Program will be marketed through IOU Account Executives, as well as through trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. The Program will also provide direct customer contact by account executives, demand response program outreach, phone and e-mail support.

Marketing campaigns will provide a wide range of pro-active solutions targeted by segmentation research. In addition, marketing efforts will be bundled in a menu of demand response, energy efficiency and conservation programs. This menu will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment, utilities will better communicate with and serve customers.

- Formatted: Indent: Left: 0.5", No bullets or numbering, Tab stops: 1.75", List tab

The Agriculture Agricultural Calculated Energy Efficiency Program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with commercial agricultural customers, to the extent possible. In the past, each government agency and utility IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who manage more than one resource type.

**2013-2014 Energy Efficiency Programs**  
**Statewide Agricultural Energy Efficiency Program**  
**Program Implementation Plan**

Regarding water conservation, ~~utility~~ IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Calculated sub-program incentives for energy efficient equipment that may also reduce ~~air-water~~ and GHG emissions.

**v. vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that utilize the ~~Agriculture~~ Agricultural Calculated Energy ~~Savings-Efficiency~~ Program infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program Delivery and Coordination**

**i. Emerging Technologies (ET) program**

California's long-term energy efficiency vision can be attained through long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the energy efficiency benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the Calculated sub-program ~~will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. is poised to adopt the efficiency potential of new technologies.~~ In addition, portfolio staff actively works to incorporate promising emerging technologies from ~~IOU or PIER-funded projects~~ the ET program.

**ii. Codes and Standards program**

The Calculated sub-program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into Codes and Standards. ~~The program will coordinate with the Codes and Standards Planning & Coordination sub-program.~~ As ~~c~~Codes and ~~S~~Standards impact measures, the program will act to align itself with appropriate offerings. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward "low energy" or "zero net energy" buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) are made available. These technologies will begin as R&D, transition to Emerging Technologies, then to Incubation and finally to Mainstream.

**iii. WE&T efforts**

Workforce Education & Training (WE&T) efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who

**Formatted:** No underline, Fontcolor: A uto, Not Highlight

**Formatted:** No underline, Fontcolor: A uto, Not Highlight

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

can support the market transformation strategies of the Strategic Plan. In the ~~Agriculture~~Agricultural Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings. These education and training offerings take place through ~~utilities-~~IOU's energy centers and technology centers.

**iv. Program-specific marketing and outreach efforts**

Marketing and outreach initiatives ~~will~~may include ~~but not limited to:~~

- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the agriculturalale sector, as appropriate;
- Attendance at key trade shows within the agriculturalale sector;
- Utility-~~IOU-~~sponsored training events at the ~~utilities-~~IOU's Customer Training Centers and other convenient locations within the ~~utilities-~~IOU's service territory;
- Hosting of ~~utility-~~IOU-sponsored webinars that provide sub-segment training and program adoption; and
- Development of case studies, web pages, and marketing material that provide an overview of the ~~utilities'-~~IOU's energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

**v. Non-energy activities of program**

The program provides a significant challenge to integrating DSM initiatives to non-energy activities due to the general industry structure, the nature of market sector resource use, limited resource savings potential ~~with~~specific -smaller to smaller businesses, and limited ~~eds to small business owner and operator~~ bandwidth. Therefore, integrated audits across the various energy efficiency program offerings, with complementary options available through other entities (for example, water agencies) ~~will~~may identify the opportunities ~~to be~~ recommended to the specific ~~commercial~~agricultural customer.

~~The Water Efficiency Pilot Program provides potential opportunities to reduce water use and the potential for associated energy efficiency savings. Since some customers within the program sectors are major water users, this sector is well positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Program.~~

Agriculture facilities are recognized as large energy and water consumers. Utilities will develop proposals, as appropriate, to facilitate water energy nexus projects.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

Concerning water conservation, ~~utility~~ IOU program managers will contact the local water districts to share marketing collateral, attend trade shows, and mutually release notices for programs with interactive water and energy effects. IOUs will also offer Calculated sub-program incentives to ARB and Air Quality Management District customers. These incentives include energy efficient equipment that may also reduce both ~~air-water~~ and GHG emissions.

In addition, the program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, ~~CARB~~, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**vii. CEC ~~work on PIER~~**

~~The program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER projects. The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects. Not applicable.~~

Formatted: No underline, Fontcolor: A auto

As of June 2012, PIER no longer exists. However, the program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies.

Formatted: No underline, Fontcolor: A auto

Formatted: Indent: Left: 0.44"

**viii. CEC work on C&S**

Planned enhancements to Title ~~20 and~~ 24 will be reflected in incentive levels and in eligible measures and services.

**ix. Non-utility market initiatives**

The program will support and educate customers. It will also ~~enforce~~ facilitate initiatives (for example, AB\_32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, and California Green Building Initiative). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**c) Best Practices**

The ~~RCx-CEI~~ program builds upon the initial feedback from the current ~~RCx-CEI~~ program and expands its reach into the ~~Agriculture~~ Agricultural segment.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

**d) Innovation**

~~Innovative aspects of the program include improving major program performance indicators such as accuracy of energy saving calculation, higher realization rate, overcoming energy efficiency barriers, reducing application processing time and administrative costs, and integrated energy management.~~

~~For the new program cycle, California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During the 2010-2012 program cycle, new incentive structures will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance.~~

~~For the 2013-2014 program cycle, California IOUs will implement an incentive structure that emphasizes advanced controls that enable demand response motivating customers to participate in energy efficiency and demand response incentive programs as well as signing up enrollment in demand response programs. An additional incentive will be provided, as a test, to customers that choose a certified installer of Advanced Lighting controls. The certified installer must be listed on the CALCTP (California Advanced Lighting Controls Training Program).~~

IOUs will continue working collaboratively to modify program policies and procedures to address ongoing changes in customer expectations, market conditions and program flexibility. These changes will improve program understanding and participation, promote measures eligibility, increase customer economical benefits, and reduce policy restrictions identified as barriers to participation. IOUs are implementing such processes based on market studies and policy discussions conducted on the subject. Among modifications that would be potentially discussed and implemented are incentive caps and redesign of early retirement measures and equipment in conformance with Commission guidelines.

IOUs are planning to elaborate and utilize positive experience obtained using the SBD Simplified tool to include energy efficiency retrofit projects. Such tools substantially reduce application processing and review time and minimize number of hand-offs without sacrificing accuracy of energy saving calculations.

IOUs will use an integrated approach to addressing DSM opportunities (for example, merging energy efficiency and demand response analysis, and converting recommendations to ~~Retrocommissioning and/or~~ Calculated programs). In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, and providing analytical information about applicable distributed generation solutions, will maximize customer adoption rates for the most cost-effective energy management opportunities.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

IOUs will consolidate various calculating software such as SPC Software, Engage and other measure specific calculating tools to standardize calculating methodologies. This will ensure that calculations will be more uniformed and consistent amongst all stakeholders. This will not limit the use of nationally recognized standard DOE toolsets for certain measures.

~~IOUs are planning to continue and expand their core RCx program in multiple target markets.~~

The IOUs are exploring innovative means of improving the Agricultural Calculated Incentive sub-program based on Energy Division direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" and to "raise incentive levels for Emerging Technologies", is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Agricultural Calculated Incentive sub-program.

**e) Integrated/Coordinated Demand Side Management**

The IOUs have identified integrated Demand Side Management (IDSM) as an important priority. As a result they have proposed the establishment of a Statewide Integration Task Force (Task Force). The program plans to work closely with the Task Force to identify comprehensive integration approaches that feed into the overall statewide strategy and to implement best practices as rapidly as practical.

**f) Integration across resource types (energy, water, air quality, etc)**

California's agricultural sector faces a multitude of environmental and regulatory challenges that affect their survival and competitiveness. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to conventional businesses, and complying with these regulations may actually cause increased energy use.

To help deal with these challenges, the program will coordinate with the regulating agencies and their programs to support common program designs, customer incentives, marketing opportunities, and implementation opportunities. Utilities IOUs will continue to offer targeted trainings to customers who share common regulatory challenges in an effort to educate customers on impending regulatory requirements for their business operation, and the most efficient solution options to consider for compliance. Future workshops may look at small- and medium-sized water and wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 targets.

Utilities IOUs will partner with water agencies to offer joint energy and water conservation incentives to support projects that reduce both energy and water consumption. This partnering will reduce administrative costs and increase the program's societal benefits and impacts.

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

~~The utilities currently participate in the Commission water/energy pilots with several water agencies. The results may spur more partnerships between the utilities.~~

The Program will integrate applicable topics such as GHG reduction and water conservation into targeted customer workshops, marketing efforts, and communications to build on efforts from the previous program cycle.

Water/Energy Nexus Strategy

SoCalGas supports improving the efficiency of water systems as one of the most critical strategies to capture water/energy nexus benefits in the energy efficiency programs. SoCalGas plans to focus its efforts in areas that use gas engines as the energy source to deliver and treat water. For water agencies within SoCalGas's territory, we plan to issue an RFP to utilize a contractor to implement leak-loss detection and remediation and pressure management services applicable to storage, pumping and distribution through SoCalGas's core or Third Party Program. SoCalGas will explore new project ideas for the water/energy nexus, as well as the calculation of ancillary water benefits (e.g. "embedded" energy savings). SoCalGas will accelerate the expansion of cost-effective water-energy nexus programs by coordinating with the other utilities, water agencies, and municipalities to study the cost effectiveness and the embedded energy savings for water/energy efforts. Our intent is to continue to offer measures and services to the water sector through the "calculated" and audit programs. SoCalGas will also explore for new direct energy measures that can be incented under the calculated program. Additionally, we will increase our efforts to capture the water-energy nexus and sustainability in the agricultural, industrial, and commercial segments.

g) Local Element (Negotiated Incentive Option)

SoCalGas will provide a local component which will include incentives for energy-efficient retrofits, systems new construction, or replacements of existing equipment at SoCalGas customer sites. Participants may be either customers or energy-efficiency service providers (EESP's) acting as project sponsors for activities at customer sites. To qualify, a project must save a minimum of 1,000,000 therms per year. Associated energy, resource such as water, sewerage and emissions, and GHG savings will be considered when evaluating a project for funding. A project may consist of a single project at a single site, or may be aggregated from multiple projects belonging to a single customer, and may include a variety of measures.

This local element is designed to serve the largest non-residential customers within the SoCalGas service territory. Non-residential customers in this group are comprised of but not limited to the following industry sub-segments: Government/Utilities, Manufacturing/Processing Industries and Institutional. Each sub-segment has distinct energy use patterns, differences in equipment and facility design, and various management structures and decision-making processes. Because each industry sub-segment is unique, this option will use a customized, customer-focused approach. Participating customers, taking

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

into account their individual energy and resource conservation opportunities as well as internal hurdle rates, will propose or “bid” to SoCalGas the incentive level needed to enable large EE and Resource savings projects. This ensures that this option will be adaptable to the unique needs of each market segment.

Formatted: Not Highlight

The program is designed to be flexible and cost effective: The project sponsor proposes a project and desired incentives. Incentives may cover up to 50% of the incremental project costs less any additional funding received from other sources. Measurement and verification (M&V) is required for all projects. As a performance-based incentive program, the approved M&V report will ultimately determine the energy savings for each project. The total sum of incentives paid for a project may not exceed the amount “bid” by the customer and agreed to by SoCalGas.

Formatted: No underline, Fontcolor: Auto, Not Highlight

**hg) Pilots**

~~The IDSM (Integrated Demand Side Management) for Food Processing Program partners with industry, trade allies and others to promote integrated energy management solutions to end-use customers in the food processing and refrigerated warehouse segments. The integrated approach combines traditional measures (energy efficiency retrofits/upgrades) with strategies to help customers manage and reduce their energy demand during peak afternoon periods, especially during the summer season. By combining these two approaches, customers manages energy costs and enables their facilities to respond to periods of high energy use and costs. While the primary program focus is energy efficiency, the program emphasizes integrated solutions in proper sequence (first energy efficiency, then demand response) to support the most cost effective and satisfactory energy and financial solutions for these stakeholders. The concepts of *Continuous Improvement* and *Best Practices* will be woven into the long term solutions provided by the program.~~

~~The program will deliver an integrated solutions driven approach while leveraging the offerings of IOU’s portfolio of incentive based programs.~~

~~Targeted customers include agriculture: post harvest processors (ginners, nut hullers, and associated refrigerated warehouses) and food processing: fruit and vegetable processors (canners, dryers and freezers), prepared food manufacturers, wineries and other beverage manufacturers. Not applicable.~~

**ih) EM&V**

The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation

2013-2014 Energy Efficiency Programs  
Statewide Agricultural Energy Efficiency Program  
Program Implementation Plan

has begun, since the plans need to be based on identified program design and implementation issues.

Refer to the overarching PIP section

b) **Program Description**

a) **Describe program**

The purpose of the sStatewide AgricultureAgricultural Deemed Energy Efficiency Program is to provide services to improve the energy efficiency of agriculturale facilities in California, including financial incentives based on deemed energy savings. The energy savings are deemed for installed measures. Integrated projects are encouraged to combine energy efficiency and demand response.

The AgricultureAgricultural Deemed Energy Efficiency Program is part of a suite of programs within the Statewide AgricultureAgricultural Energy Efficiency Program.

Key features of the program include:

- Information and technical assistance from SoCalGas on energy efficiency measures and savings potential.
- Application via mail, fax, internet and phone by customer for eligible measures.
- Reservation of financial incentives by SoCalGas, if requested by customer.
- Pre- and post-installation inspection by SoCalGas, as determined by SoCalGas based on prior participation and other factors; and
- Payment of incentives from SoCalGas.

b) **List measures**

Itemized retrofit measures have prescribed energy savings and incentive amounts. These measures are categorized under the following end uses:

- Lighting
- Air conditioning
- Food service
- Boilers and water heaters
- Pipe and tank insulation
- Greenhouse Curtain
- Infrared film
- Refrigeration

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

The Agriculture Agricultural Deemed Energy Efficiency Program is designed overcome several barriers. The program directly addresses key market factors that lead to higher energy costs for California businesses. Providing a menu of prescribed common measures simplifies the process of reviewing project proposals and provides a "per-widget" rebate that reduces the cost of retrofitting outdated and inefficient equipment. This element makes it attractive for customers to spend money in the short run in order to achieve lower energy costs in the long run.

Using itemized energy efficiency measures is intended to overcome barriers that inhibit many agricultural customers from adopting energy efficiency alternatives. The barriers are addressed by itemizing common energy efficiency measures and rebates, stimulating the supply of high efficiency equipment and products (through higher demand), and offering rebates that help offset higher start up and down payment expenses for energy efficient retrofits.

**Formatted:** Numbered+ Level: 1 + NumberingStyle: a, b, c, ... + Startat: 2 + Alignment: Left + Alignedat: 0.25" + Tab after: 0.5" + Indentat: 0.5", Tab stops: 0.75", List tab

Projects	TBD <b>115</b>	TBD <b>140</b>

**e)e) Advancing Strategic Plan Goals and Objectives**

The Statewide AgricultureAgricultural Energy Efficiency Program supports all three goals in the Strategic Plan for the AgricultureAgricultural Sector. General advancement of the goals is presented in the program implementation plan for the Statewide AgricultureAgricultural Energy Efficiency Program.

**Formatted:** Numbered+ Level: 1 + NumberingStyle:a, b, c, ... + Startat: 2 + Alignment:Left + A lignedat: 0.25" + Tab after: 0.5" + Indentat: 0.5", Tabstops: 0.75", List tab

More specific support of the goals in the AgricultureAgricultural Deemed Energy Efficiency Program is presented here.

**Goal 1:** Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

**Formatted:** No underline, Fontcolor: A uto

The AgricultureAgricultural Deemed Energy Efficiency Program supports strategies to develop a knowledge base of efficiency solutions, foster workforce education and training, and encourage applications of new technologies.

**Formatted:** Fontcolor: A uto

**Goal 2:** California regulations, financing mechanisms, and incentives programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

**Formatted:** No underline, Fontcolor: A uto

The program supports strategies to attain multi-resource management goals and to coordinate technical assistance, funding and incentive mechanisms.

**Formatted:** Fontcolor: A uto

**Goal 3:** Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

**Formatted:** No underline, Fontcolor: A uto

The program supports strategies to make information on efficiency solutions readily available as well as conduct marketing and outreach to stimulate efficiency actions.

**Formatted:** Fontcolor: A uto

**6. Program Implementation**

**a) Statewide IOU coordination**

**i. Program name:** AgricultureAgricultural Deemed Energy Efficiency Program

## ii. Program delivery mechanisms

~~Agriculture~~Agricultural Deemed Energy Efficiency Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and ~~utility~~IOU program interactions. The ~~Agriculture~~Agricultural Deemed Energy Efficiency Program will coordinate with the core ~~Agriculture~~Agricultural Energy Efficiency Program to provide mutual support.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the three year implementation cycle will be enabled.

## iii. Incentive levels

Incentive levels are based on measure type and will be set at uniform amounts across the state. Higher incentive levels will be provided for Emerging Technologies to spur traction in the market as feasible. The scale of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, therms, equipment cost, other market factors and cost effectiveness.

## iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms

The ~~Agriculture~~Agricultural Deemed Energy Efficiency Program will be marketed through IOUs account executives, as well as through trade allies, educational, outreach and other marketing activities. Marketing activities will target agricultural customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, phone and e-mail support will be provided.

Marketing efforts will incorporate a variety of marketing tactics/activities to promote the solutions in the program. Education, awareness and outreach efforts will rely on a combination of ~~mass-targeted multi~~-media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to create awareness, educate and motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, radio, TV, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Market outreach to raise awareness of energy efficiency programs available will use a number of strategies, including:

- ⊖ Account representatives will make a regular and consistent customer calling effort to key customers within this sector;
- ⊖ Utility IOU representatives, program management representatives, and field engineers will be available to provide additional expertise;
- ⊖ Participation and membership in key trade associations affiliated with each high priority sub-segment within the agricultural market sector;
- ⊖ Attendance at the key trade shows for each high priority sub-segment within the agricultural market sector;
- ⊖ Utility IOU-sponsored training events at the utilities IOU's customer training centers and other convenient locations within the utilities IOU's service territory;
- ⊖ Hosting of utility IOU-sponsored webinars that provide sub-segment training and program adoption; and
- ⊖ Written collateral pieces that provide an overview of the utilities IOU's Energy Efficiency programs will be linked into the appropriate utility IOU's DSM web page.

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated, to the extent possible, among the IOUs utilizing the statewide coordination process described above.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Agriculture Agricultural Deemed Energy Efficiency Program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with commercial-agricultural customers, to the extent possible. Conventionally, each government agency and utility IOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type.

With respect to water conservation, utility IOU program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers program incentives for energy efficient equipment that may also reduce air and GHG-greenhouse gas emissions.

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that are permitted to use the Agriculture Agricultural Deemed Energy Savings Program infrastructure. This will

Formatted: Font: 14 pt, Not Bold, No underline

Formatted

Formatted: No underline, Fontcolor: A uto

Formatted: Font: 14 pt, Not Bold, No underline

ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program Delivery and Coordination**

**i. Emerging Technologies (ET) program**

The long-term energy efficiency vision of California may be attained through the long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the program is poised to adopt the efficiency potential of new technologies through its programs. In addition, portfolio staff actively works to incorporate promising emerging technologies ~~from IOU or PIER funded projects.~~

**ii. Codes and Standards program**

The program relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As ~~C~~odes and ~~S~~tandards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into ~~c~~Codes and Standards. The program will coordinate with the Codes and Standards Planning & Coordination sub-program. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will ensure the latest cost effective technologies/services (e.g., LEDs) are available. These technologies will begin as R&D, transition to Emerging Technologies, then to Incubation and finally to Mainstream.

Formatted: No underline, Fontcolor: A uto, Not Highlight

Formatted: No underline, Fontcolor: A uto, Not Highlight

**iii. WE&T efforts**

Workforce Education & Training efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. In the near term, WE&T efforts will focus on supporting national ANSI Energy Management Certification development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems training to lay the groundwork for certification level trainings. These education and training offerings take place through ~~utilities-IOU's~~ energy centers and technology centers.

**iv. Program-specific marketing and outreach efforts**

Marketing and outreach initiatives will include:

- Non-contracted vendors are a key delivery channel of the Deemed sub-program. Emphasis will be placed on building awareness with more vendors in the territory.

Training vendors how to participate effectively in the program will also be a focus in the new program cycle.

- Community Based Organizations (CBOs), Faith Based Organizations (FBOs), Non-Profit organizations, and Non-Government Organizations (NGOs) with unique access and following are expected to be emphasized as a delivery channel.
- Trade associations and industry networks.
- Enabling partners (financial institutions, trade associations, service providers, law firms, environmental organizations, etc.).
- Unique channels that offer complementary value propositions from the customers' perspective (for example, energy, water, materials management, recyclables, and corporate ~~citizenry~~ social responsibility).
- Utility IOU-sponsored training events at the utilities IOU's Customer Training Centers and other convenient locations within the utilities IOU's service territory.
- Hosting of utility IOU-sponsored webinars that provide sub-segment training and program adoption.
- Development of case studies, web pages, and marketing material that provide an overview of the utilities IOU's energy efficiency programs.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.

#### **v. Non-energy activities of program**

The program will offer customers educational information about the non-energy benefits associated with energy efficiency measures, such as improved safety, indoor air quality, productivity, comfort, and appearance.

#### **vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, ~~CARB~~, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

#### **vii. CEC work on PIER**

~~The program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER projects.~~

~~The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects. Not applicable.~~

Formatted: Font: 14 pt, Not Bold, No underline

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

**viii. CEC work on C&S**

Planned Title 20 and 24 enhancements will be reflected in incentive levels and in eligible measures and services.

**ix. Non-utility market initiatives**

The program will educate and support customers, and/or facilitate/enforce such initiatives as AB 32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**c) Best Practices**

To maximize program effectiveness, best practices in program design and implementation will be employed and shared amongst IOUs.

Best practices in Program Design:

- Regular communication among IOUs.
- Identify qualifying products simply and effectively (Examples; ENERGY STAR®, CEE, FSTC website).
- Seek input from industry in the development of new programs. The IOU programs are trying to change how an industry operates from manufacturer design to the customers' purchasing and maintenance practices.
- Industry participation increases program volume and speeds market transformation.

Best practices in Program Implementation:

- Strive to simplify messaging and participation for the customer. (Look for the ENERGY STAR® label, purchase from a qualifying products list, etc.)
- Understand the key motivators that drive an industry and use that information to market the program. Make certain outreach efforts make the program visible to customers and the market catering to customers.
- Always communicate program marketing and advertising plans in advance to appropriate industry channels. Advanced notice allows industry partners an opportunity to leverage off of utility IOU marketing efforts and reinforce the program messaging.

- Formatted: Fontcolor: A uto

**d) Innovation**

Innovative aspects of the program include improving major program performance indicators (for example, increasing the accuracy of energy saving calculations, higher realization rates,

overcoming energy efficiency barriers, reducing application processing times and administrative costs, and integrated energy management).

For the new program cycle, California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During the 2013-2014 2010-2012 program cycle, the new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance, including measure bundling incentives. The IOU's will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper savings.

IOUs will continue working collaboratively on modifications to program policies and procedures to address ongoing changes in customer expectations, market conditions and program flexibility. These modifications include changes that have been and will be targeting ease of program understanding and participation, measures eligibility, increase of customer economical benefits and policy restrictions identified as barriers to participation. IOUs are implementing such processes based on market studies conducted on the subject and after discussion of the policy change. Among potential modifications are incentive caps, and redesign of early retirement measures and equipment.

Where possible, IOUs will use an integrated approach to addressing DSM opportunities. These approaches include merging energy efficiency and demand response analysis and converting recommendations to ~~Retrocommissioning and/or~~ Calculated program projects. In addition, streamlining programs through processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions will maximize customer adoption rates for most cost-effective energy management opportunities.

**e) Integrated/Coordinated Demand Side Management**

The program will integrate the portfolio of ~~utility~~-IOU offerings to include energy efficiency, demand response and distributed generation and other resources, such as air and water as they connect to energy. This supports not only cost effectiveness of the portfolio and the CA Loading order, but also customer requirements. It also advances significantly the Strategic Plan's goals. On a broader scale, IDSM also includes the integration of third party programs and Local Government Partnerships (LGP) delivery channel with the statewide agricultural~~ale~~ program.

**f) Integration Across Resource Types (energy, water, air quality, etc.)**

California's agricultural~~ale~~ sector faces a multitude of environmental and regulatory challenges that threaten its survival and competitiveness. New regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual. Both these are impacting energy use and compliance.

Formatted: Font: 14 pt, Not Bold, No underline

To help deal with these challenges, the agricultural program will coordinate with the regulating agencies and their programs to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities.

Utilities IOUs will continue to offer targeted trainings to customers who share common regulatory challenges to educate customers on impending regulatory requirements for their business operations, and the most efficient solution options for their compliance. Future workshops may look at ~~small- and--medium sized water and~~ wastewater treatment options, steam system upgrades, and energy efficiency to meet AB32 targets.

Utilities IOUs will pursue opportunities to partner with water agencies to offer joint energy and water conservation incentives to support projects that would reduce both resources. Partnering with other utilities IOUs will help reduce administrative cost and has a greater impact on societal benefits. ~~Currently the utilities are participating in the Commission water/energy pilots with several water agencies. The results from this pilot may spur more partnerships among the utilities.~~

Formatted: Fontcolor: A uto

The Program will integrate applicable topics (for example, GHG reduction and water conservation) into targeted customer workshops, and marketing communications, based on work done in the earlier program cycle.

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

#### g) Pilots

~~N/A Not applicable.~~

#### h) EM&V

~~The IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader IOU and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the IOUs and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.~~

~~Refer to the overarching PIP section~~

## 4. Program Description

### a) Describe program

The purpose of the Statewide AgricultureAgricultural Continuous Energy Improvement (CEI) Program is to help agriculturalale customers engage in long-term, strategic energy planning. Target agriculturalale customers will be identified and approached selectively.

The program features:

- Management assessment of energy priorities;
- Integrated comprehensive energy audits with recommendations on energy efficiency, demand response, and self-generation;
- Benchmarking of energy usage and other resources;
- Development of a strategic plan with actions for implementation;
- Implementation including incentives from SCE each Utility-IOU; and
- Evaluation of performance leading to modifications for continuous improvement

The CEI Program is part of a suite of programs within the Statewide AgricultureAgricultural Energy Efficiency Program. The CEI will be designed to complement statewide agriculturalale energy audit and incentive programs, namely:

- Statewide AgricultureAgricultural Energy Efficiency Program;
- AgricultureAgricultural Deemed Energy Efficiency Program;
- AgricultureAgricultural Calculated Energy Efficiency Program; and
- Pump-Testing AgricultureAgricultural Customer Services Energy Advisor Program;

The audit and planning services of SCE the Utility-IOUs will be provided at no charge to the participating customer. Costs for capital investments by the customer will be shared by SCE the Utility-IOUs to the extent they are tied to measures installed under the agriculturalale programs.

Formatted: Fontcolor: A uto

The program seeks to help transform energy markets and reduce energy intensity. The program represents a comprehensive approach that addresses both technical and management opportunities. Background information on continuous improvement and details on implementation are provided below.

A CEI approach applies the six principals of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management: Commit, Assess, Plan, Implement, Evaluate, and Modify.

At each stage of customer engagement, there are a variety of utility IOU and non-utility IOU products and services that can be offered to fit different customer profiles and optimize the cost effectiveness of each utility IOU's portfolios.

Formatted: Font: 14 pt, Not Bold, No underline

In implementation, ~~utilities~~IOUs will screen customers for certain CEI services based on factors such as customer energy use, complexity, number of facilities, energy decision making structure, environmental commitment or demonstrated motivation to take action. Screening criteria and specific product offerings will be ~~utility~~IOU-specific.

In 2013-2014, CEI will be expanded to include select group of mid-sized non-residential customers. Available options to help target these customers may include an individualized, a small group, or a mass-market, remote deployment approach.

CEI will ~~offer~~coordinate its services ~~through~~ with the ~~Agriculture~~Agricultural Customer Services Energy Advisor ~~subprograms~~sub-program offerings. CEI offers customers what can be considered the pinnacle of audit offerings guiding senior management to instill energy considerations in all management/business operational decisions and in long-term energy planning.

Formatted: Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

### CEI Commitment

CEI begins with a high level management commitment by the customer to improving energy performance, combined with other environmental and regulatory commitments being developed by ~~large~~ energy users in response to market and political pressures. A corporate commitment sends the top-down message to employees, partners, shareholders and vendors that energy is a priority issue requiring attention. The message also paves the way for establishing the company resources required to implement the steps of CEI. These resources can include capital, personnel, i.e., energy champions or teams, or technical systems and software required for energy management.

Gaining true customer commitment can take time, but is critical. In implementation, ~~utilities~~IOUs will formalize the Commitment phase with ~~larger~~ or more intensive customers through a CEI participation agreement, which outlines the ~~utility~~IOU CEI services being offered as well as minimum customer expectations.

### CEI Assessment

After the CEI Commitment, a comprehensive assessment identifies not only technical opportunities, but also systemic energy management practices and cultural shifts. This can improve overall facility management practices and sustain continuous improvements towards long-term company targets. A component to the assessment will also include tools to help identify Energy Efficiency (EE), Distributed Generation (DG), and Demand Response (DR) opportunities.

There are many tools and resources, both ~~utility~~IOU and non-~~utility~~IOU, free and licensed, available to support comprehensive customer energy assessment. They include ENERGY STAR®'s *Guidelines for Energy Management*, customer energy management assessment software products like those developed by Envinta, benchmarking tools, Integrated ~~Comprehensive~~ Energy Audits through the ~~Agriculture~~Agricultural Customer

~~Services~~ Energy Advisor sub-~~Program~~, and/or local and statewide third parties who can offer specialized technical expertise and assessment.

Based on screening criteria, ~~utilities~~ IOUs will offer comprehensive energy assessment services utilizing, but not limited to, vetted sources like those described below, to develop a customer specific strategic energy plan.

### ENERGY STAR®'s Guidelines for Energy Management

ENERGY STAR®'s Guidelines for Energy Management is housed on the ENERGY STAR® website and provides step by step guidelines to customers to support CEI, and also guides customers to ENERGY STAR®'s numerous assessment tools. This option is a low cost resource for smaller and medium customers interested in CEI, with details available at [http://www.energystar.gov/index.cfm?c=guidelines.guidelines\\_index](http://www.energystar.gov/index.cfm?c=guidelines.guidelines_index).

### Energy Management Assessment Tools

*Envinta One-To-Five, Achiever, Challenger*: A professionally facilitated energy management assessment with company decision makers. The assessment explores management practices and company priorities to develop a CEI roadmap for energy goals and actions. Available tools are:

- Each IOU's website tools
- EPA website tools
- DOE website tools

### Integrated Comprehensive Energy Audits

Integrated Comprehensive Energy Audits provide an inventory of technical facility end-uses and energy efficiency, demand response and self-generation investment opportunities. For a full description, see ~~the Statewide Integrated Energy Audits Program~~ the Customer Services Agricultural Energy Advisor sub-program description plan.

### Benchmarking

Benchmarking can measure energy performance of a company, building, process, or piece of equipment to industry standards or comparable groupings. Benchmarking is a natural first step for the CEI process. Customers with multiple facilities find benchmarking useful to prioritize efficiency projects, track progress toward energy or green house gas improvement goals, or drive competition among similar benchmarked facilities. Units of measurement vary widely. For commercial buildings, the unit is energy used/square foot for a unit of time. For agriculture or agricultural ale facilities, however, benchmarking utilizes energy/unit of production for a unit of time.

Benchmarking can also be applied to other resources and environmental issues, such as water use and CO2 emissions.

The statewide ~~utilities~~ IOUs can currently utilize a variety of benchmarking tools and resources including those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab with CEC funding:

- ENERGY STAR® Portfolio Manager *Commercial* Benchmarking: Benchmarks customer facility against a national database of similar NAICS codes for an ENERGY STAR® score (0-100), kBTU/sq ft-yr, lbs CO2/yr;
- ENERGY STAR® *Cement Plant* Energy Performance Indicator;
- ENERGY STAR® *Auto Assembly Plant* Energy Performance Indicator; and
- LBNL BEST *Winery*: Benchmarks a winery’s energy and water use against a theoretical best practice winery and allows user to model efficiency improvements.

Other benchmarking tools are under development including:

- ENERGY STAR® *Food Processing* Energy Performance Indicator;
- ENERGY STAR® *Glass Manufacturing* Energy Performance Indicator;
- ENERGY STAR® *Pharmaceutical Manufacturing* Energy Performance Indicator;
- LBNL BEST *Dairy Processing*: Benchmarks a dairy processors energy and water use against a theoretical best practice facility allows modeling of improvements;
- Management Standard for Energy SME 2000-2008;
- DOE sponsored ISO Plant Certification; and
- LBNL Superior Energy Performance.

In implementation, the statewide agricultural program teams will continue to partner with energy industry peers, industry associations and DOE/Commission sponsored labs and consultants, to enhance the use of existing tools, and develop new tools for key California industries. Benchmarking will be coordinated with the Agriculture Agricultural Customer Services Energy Advisor sub-program.

### CEI Planning

Strategic energy planning involves setting energy goals and action plans around energy efficiency, demand response, and generation as appropriate. Implementation of the Planning stage of CEI can be undertaken independently by the customer, or with utility support. Planning for larger complex customers will typically involve Account Representatives and/or consultants. As is discussed in the Strategic Plan and in the PIP Integration Section, strategic planning can also include complementary non-energy considerations as well, such as greenhouse gas reductions, water efficiency, and waste-stream minimization, all which have embedded energy components.

Data and findings from a comprehensive customer assessment are critical in developing any comprehensive energy plan, including the results from technical audits or assessments, facility benchmarks, energy management assessments, and assessments of company priorities. This information is analyzed and used to develop realistic and achievable company goals and prioritized shorter-term tactics needed to achieve them. Energy plans should be living documents revisited and revised regularly.

Energy goals can vary widely and include elements such as resource utilization (“Company X will reduce it’s overall energy intensity by 3% over the ~~2010-2012~~2013-2014 program cycle”), carbon reduction goals (“Company X will be carbon neutral by 2014<sup>2</sup>”), or management oriented goals (“Company X will implement energy teams by 2013<sup>0</sup>”). Goals

Formatted: Font: 14 pt, Not Bold, No underline

can be internal documents or can be made public through press releases as part of larger sustainability plans, which is increasingly important for large and public companies.

CEI will assist customers in developing and implementing action plans to execute the prioritized near-term activities in support of their company’s energy goals, as well as assistance with planning for the resources, staff and schedule for tracking. Action plans typically includes activities such as prioritizing process systems or facilities based on benchmarking or company drivers, identifying internal resources required to implement plans, develop project justification and incentive application documentation lists and detailed schedules.

**CEI Implementation**

In the implementation stage, ~~utilities~~ IOUs partner with customers to identify technical support and ~~utility~~ IOU and non-~~utility~~ IOU resources available to support implementation of projects, such as rebates, incentives, third party and government partnership programs, and state and national resources, including:

- Statewide Deemed rebates;
- Statewide Calculated incentives for new construction/tenant improvement, ~~and~~ retrofit ~~and retrocommissioning/repair~~;
- Third Party and Government Partnership programs (described in the statewide and local third party filings);
- ~~Utility~~ IOU and Non-~~utility~~ IOU financing options and owners engineer support; ~~and~~
- External and internal engineer support.

**CEI Evaluation and Modification**

In any continuous improvement program, evaluation is an ongoing process of evaluating actual performance against company goals, targets and action plans. It may include repeating the benchmarking and system or facility baseline process annually, assessing advancements in organizational and management practices that facilitate energy management improvements, or evaluating cost savings per unit of product. Regular evaluation will inform changes to goals and action plans moving forward.

CEI ~~shall~~ will be available to all Non-Residential customers meeting certain eligibility criteria to justify the cost of the offering. Criteria will include but not be limited to customer energy use, complexity, number of facilities, energy decision making structure, environmental commitment and demonstrated motivation. Marketing and outreach plans include training of the IOU in-house staff and customer groups. Collateral materials such as fact sheets, how-to documents, and Power Point slides will be produced and distributed during sales calls, public events or trade shows.

**b) List measures**

Integrated energy audits under the CEI program will include the full range of applicable end-uses and measures for those end-uses. This will include process changes. The energy audit

provides a tool that will lead customers to the measures and incentives offered in the other agricultural programs. However, depending on the outcome of the 2012 process evaluation, customer incentives may be offered.

c) **List non-incentive customer services Agricultural Energy Advisor**

Activities conducted under the CEI Program are non-resource activities with no associated incentives. These activities include: marketing and outreach, savings calculation assistance, retrofit project scoping, technical assistance, and incentive application assistance.

5. **Program Rationale and Expected Outcome**

a) **Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 3** – Refer to the overarching program for quantitative baseline metrics

b) **Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

c) **Program Design to Overcome Barriers**

CEI is intended to address several market barriers that prevent wider adoption of energy efficiency practices. These barriers include:

- Lack of information – The CEI evaluation and modification process provides data that customers can use to reevaluate their commitment and/or modify their energy goals.
- Performance uncertainties – Through CEI’s comprehensive baselining and benchmarking assistance, customers will have access to real-time data that demonstrates how their facility is performing relative to their established goals.
- Organizational customs – The high-level customer commitment that is at the core of CEI increases the likelihood that corporate cultures that prevent successful implementation of comprehensive energy policies will be changed.

d) **Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

<b>Program Name</b>	Program Target by 2013 <del>0</del>	Program Target by 2014 <del>1</del>
<b>Square Footage Benchmarked Number</b>	TBD <del>864,000</del> <b>xx</b>	TBD <del>1,192,000</del> <b>xx</b>

Formatted: Font: 14 pt, Not Bold, No underline

of Engagements

e) **Advancing Strategic Plan Goals and Objectives**

The AgricultureAgricultural Energy Efficiency Program supports all three goals in the Strategic Plan for the AgricultureAgricultural Sector. General advancement of the goals is presented in the program implementation plan for the AgricultureAgricultural Energy Efficiency Program. More specific support of the goals in the AgricultureAgricultural Deemed Energy Efficiency Program is presented here.

*Goal 1:* Establish and maintain a knowledge base sufficient to support development of all available, cost-effective, reliable, and feasible energy efficiency, demand reduction (and renewable) energy resources.

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

Formatted: Font: TimesNewRoman

The AgricultureAgricultural CEI Program supports strategies to develop a knowledge base of efficiency solutions, foster workforce education and training, and encourage applications of new technologies.

*Goal 2:* California regulations, financing mechanisms, and incentives programs affecting the management of energy, air and water resources, solid waste, and climate change will be coordinated to mutual advantage.

Formatted: Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

The program supports strategies to attain multi-resource management goals and to coordinate technical assistance, funding and incentive mechanisms.

*Goal 3:* Achieve significant increases in the efficiency of electricity and natural gas use and on-site renewable energy utilization, including setting a specific target for irrigation efficiency.

Formatted: Fontcolor: A uto

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

The program supports strategies to make information on efficiency solutions readily available as well as conduct marketing and outreach to stimulate efficiency actions.

6. **Program Implementation**

a) **Statewide IOU coordination**

i. **Program name:** AgricultureAgricultural ~~Comprehensive-Continuous~~ Energy Improvement Program

ii. **Program delivery mechanisms**

The AgricultureAgricultural CEI Program will be coordinated on a statewide level to unify the implementation of program aspects such as program name, program delivery mechanisms, marketing and outreach plans, and ~~utility-IOU~~ program interactions. The AgricultureAgricultural CEI Program will coordinate with the core AgricultureAgricultural Energy Efficiency Program to provide mutual support.

Formatted: Font: 14 pt, Not Bold, No underline

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the ~~three~~two-year implementation cycle will be assured.

**iii. Incentive levels** ~~N/A. (CEI This is a non-resource program).~~

~~Not applicable. (CEI is a non-resource program.)~~

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

As with other information and education programs, CEI will be primarily delivered by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing and outreach efforts. Other channels of delivery may be developed.

The IOUs are currently developing an in-depth segmentation of the agricultural market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers, based on their needs and preferences. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs.

Formatted: No underline, Fontcolor: Auto

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with agricultural le customers.

**vi. Similar IOU and POU programs**

Over the next ~~three~~two years, the IOUs will seek to increase their interactions with the POU s, as applicable, to promote the CEI concept throughout the state. This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the STRATEGIC PLAN and how programs could/should be designed to help meet its aggressive targets.

**b) Program Delivery and Coordination**

**i. Emerging Technologies (ET) Program**

The audit program management team will stay abreast of and incorporate relevant emerging technologies into audit recommendations. In addition, IOU field engineers, who deliver IEAs, are active contributors to the Emerging Technology process by their participation in ET Roundtable/Information meetings and continually seek to offer new technologies to customers.

**ii. Codes and Standards Program**

The program will work with the Codes and Standards Program to maintain an updated and relevant list of measures that will support savings. As Codes and Standards impact measures, the program will act to align itself with appropriate offerings. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 24 will be reflected recommended measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) made available as these technologies transition from 1) R&D to 2) Emerging technologies to 3) Incubation to 4) Mainstream. CEI implementation will include information about pending new Ccodes and Sstandards program that may affect planning or prioritization of retrofit or new construction projects.

### iii. WE&T efforts

CEI can support Statewide Workforce Education & Training efforts by including educational information about Certified Energy Manager (CEM) programs and requirements in the audit reports. Such materials could suggest to customers that passing the CEM exam will allow them to conduct facility audits at other facilities that they may have. In addition, increased retrocommissioning activities will create opportunities for third party providers who deliver commissioning services such as project scoping, investigations and assessments, air balancing, HVAC quality maintenance, etc. CEI implementation will integrate with WE&T efforts by providing CEI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches. Program costs will be shared with WE&T.

### iv. Program-specific marketing and outreach efforts

A broad range of marketing activities will be used to promote audits and elevate customer engagement. The Agriculture/Agricultural CEI program will be promoted via direct communication between customers and Account Executives with support of Project Managers from individual programs, as well as through traditional advertising activities, such as internet, bill inserts, brochures, trade shows, etc. Marketing activities will be coordinated between IOUs, Demand Response and Distributed Generation departments within SCE each Utility IOU.

Integrated and program-specific marketing efforts will complement and work in coordination with SW Marketing, Education and Outreach (ME&O) Program to increase awareness, provide education, and drive ongoing engagement and participation in DSM

~~programs and services among nonresidential customers. The statewide effort will provide the first level with IOU specific programs providing reinforcement at a local level.~~

~~Third Party activities will be expanded, when feasible, to improve awareness of non-incentive utility services, such as CEI.~~

**v. Non-energy activities of program**

Integrated Comprehensive Energy Audits are a key tool for identifying non-energy opportunities for specific customers. The energy audits can identify non-energy benefits associated with recommended measures, such as improved safety, productivity, indoor air quality, comfort and appearance.

**vi. Non-IOU programs**

The program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs.

**vii. CEC work on PIER**

~~CEI will include the CEC's PIER EPIC and Green Building Initiative programs, DOE's "ISO plant certification" programs, EPA ENERGY STAR Portfolio Manager benchmarking and other programs, USGBC LEED certification, local and other government incentive programs as applicable. Not applicable.~~ As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC.

**viii. CEC work on C&S**

The program will not be implemented with a direct linkage to codes and standards efforts

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-~~utility~~IOU information and guidance that CEI will provide customers. In addition, the IOUs will participate in national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

**c) Best Practices**

A CEI approach applies the principals of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management: Commit, Assess, Plan, Implement, Evaluate, and Modify.

**d) Innovation**

The program seeks to help transform energy markets and reduce energy intensity. The program represents a comprehensive approach that addresses both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may pilot consider customer incentives to accelerate project implementation (including IDSMS projects), and reward customer for implementing strategic energy management.

#### **e) Integrated/Coordinated Demand Side Management**

The IOUs have identified integrated Demand Side Management (IDSMS) as an important priority. As a result they have proposed the establishment of a Statewide Integration Task Force (Task Force). The program plans to work closely with the Task Force to identify comprehensive integration approaches that feed into the overall statewide strategy and to implement best practices as rapidly as practical. CEI includes project analysis and implementation support of recommendations of Statewide Integrated Comprehensive Energy Audits, which provide customers with an inventory of facility end-use breakdown and energy efficiency, demand response and self-generation investment opportunities. Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other, similar programs, but because of siloing – thinking of programs as separate, unrelated efforts – this has proved difficult. To overcome this, the CEI sub-program will leverage lessons learned from IDSMS efforts by offering comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that the two programs are at financial odds with one another, as both programs often reduce the potential for each other's financial incentives. For example, energy efficiency may reduce the overall baseline by which the demand response program's incentives are based upon. Since benefits from long-term energy savings derived from technological measures outweigh the temporary demand reduction benefits derived from behavioral actions, the CEI sub-program will offer additional support and services for energy efficiency measures that enable demand response when customers enroll, or are already enrolled, in demand response programs. In so doing, the program seeks to maximize the potential for both types of programs.

A secondary issue when integrating energy efficiency and demand response programs is that communications of both types of DSM program are often non-coordinated, since energy efficiency is typically technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer "event season" and wane throughout the remainder of the year. To overcome these differences, the Program will offer integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable.

Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response programs in addition to energy efficiency programs.

To support the integration of energy efficiency and demand response programs, the sub-program will focus on several tactics:

- Promotion and incentives for demand response in such a way as to stimulate energy efficiency first;
- Integrated and coordinated year-round marketing (e.g. applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g. customer size);
- Provide unified technical assistance through enhanced EE/DR Audits through the TA Program to allow for cross-harvesting opportunities;
- Integrated presence on ~~utility~~IOU websites; and
- Regular coordination meetings between energy efficiency and demand response program management

CEI is recognized as an “integrated pilot” element of strategy to advance by supporting the statewide IDSM program’s goals and objectives geared towards IDSM. T, and the IOUs will increase IDSM messaging and coordination with in CEI.

**f) Integration Across Resource Types (energy, water, air quality, etc)**

CEI implementation ~~shall~~will include information on non-IOU Programs to expose customers to available funding, such as from air or water agencies to support efforts. IOU CEI sub-program managers will partner, as appropriate, with CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information, marketing collateral and financial incentive analysis with customers. Conventionally, each government agency and utilityIOU has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will inform the customer about the mutual benefit of combining complementary resource programs.

To promote the CEI, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. Concerning water conservation, utilityIOU program managers will partner with the local water districts to produce co-branded marketing collateral, attend trade shows, and co-release notices for programs with interactive water and energy effects.

**g) Pilots**

N/A Not applicable. Depending on the outcome of the 2012 process evaluation, CEI may pilot customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

~~Based on Energy Division feedback, a potential pilot that will be explored in the 2010-20122013-2014 program cycle is that of a Resource Energy Manager (REM). REMs are essentially energy managers who are placed at the customer’s facility to be a project champion and shepherd energy efficiency projects through to completion. Their salary is typically paid for through the energy savings they generate. REMs have been successfully used by IOUs in the government sector (typically military bases) in past program cycles. A~~

Formatted: Font: 14 pt, Not Bold, No underline

~~similar program has been available for commercial customers in the Pacific Northwest. The concept of using REMs in the commercial segment will be explored to determine the viability and cost effectiveness of such an approach. An appropriate EM&V plan will also be required prior to launching an REM pilot such that the affects of the pilot on achieving higher levels of energy efficiency can easily be determined.~~

#### **h) EM&V**

~~Refer to the overarching PIP section. The utilities IOUs are proposing to work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 after the program implementation plans are filed. This may include process evaluations and other program-specific studies within the context of broader utility IOU and Energy Division studies.~~

~~More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.~~

Formatted: No underline, Fontcolor: A uto

Formatted: Fontcolor: A uto

~~Once results of the 2010-2012 evaluations are ready, recommendations will be reviewed for modifying the CEI PIP accordingly.~~

### **8. Program Logic Model**

Please see the Commercial Continuous Energy Improvement program logic model ~~presented earlier for the core program.~~

## 2013-2014 PIP Addendum

<b>Program Name</b>	Codes and Standards	<b>Date Submitted</b>	July 2, 2012
<b>Subprogram Name</b>	Various	<b>Utility Name</b>	SoCalGas
<b>Program ID</b>	SCG 3724, SCG 3725, SCG 3726, SCG 3727, SCG 3728	<b>IOU Program Contact</b>	Ron Gorman
		<b>Program Cycle</b>	2013-2014

This form is to be used to document any required changes to the Program Implementation Plans (PIPs). The following are triggers that will require a PIP change:

1. Changes to eligibiity rules
2. Changes affecting incentive levels (indicate advice letter approval below if required)
3. Fund shifts (indicate advice letter approval below if required)
4. **Portfolio Budget and Other Commission-Directed Changes**
5. Changes to Program Theory/Logic Models
6. Addition or elimination of programs and/or sub-programs (indicate advice letter approval below)
7. Changes in program targets
8. Change in sub-program approach - unless the IOUs submit logic models for the sub-programs (to be defined) with IOUs
9. Changes in incented measures
10. Changes in adopted PPMs/MTIs (indicate advice letter approval below if required)

**Identify Specific Trigger (above) requiring the PIP change:**

6. Addition or elimination of programs and/or sub-programs (indicate approved advice letter) <span style="float: right;">▼</span>
---

**Driver of Change:**

Decision 12-05-015 May 10, 2012. DECISION PROVIDING GUIDANCE ON 2013-2014 ENERGY EFFICIENCY PORTFOLIOS AND 2012 MARKETING, EDUCATION, AND OUTREACH.
---

**Description of Change (if advice letter approval required, indicate Commission resolution or approval and provide hyperlink to advice letter):**

<ol style="list-style-type: none"> <li>a) Consolidation of all compliance improvement activities into one subprogram.</li> <li>b) Addition of statewide planning and coordination subprogram.</li> <li>c) Responses to ordering paragraphs.</li> </ol>

<b>Reach Codes</b>	0.2
<b>Total</b>	<b>11.2</b>

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Tables 2 and 3 include savings from the following California Energy Commission (CEC) proceedings.

- 2003 Title 24 (Building regulations adopted in 2003 and effective in 2005, we have previously referred to these as 2005 Title-24.)
- 2004 Title 20 (Appliance regulations adopted in 2004 and effective in 2006, 2007 or 2008, we have previously referred to these as 2005 Title 20.)
- 2006 Title 20 Tier II Lighting (Adopted in 2006, effective in 2008.)
- 2008 Title 24 (Adopted in 2008, effective in 2010.)
- 2008 Title 20 (Lighting standards adopted in 2008, effective in 2010, 2011, 2012, and 2013.)
- 2009 Title 20 (Television standards adopted in 2009, effective 2011 and 2013.)
- 2011 Title 20 (Battery charger standards adopted 2012, effective 2014.)
- Various Federal appliance standards (motors, vending machines, commercial refrigeration, ASHRAE products, etc.)
- 2013 Title 24 (Building regulations adopted in 2012, effective 2014.)

Table 2 and 3 savings are calculated from the sum of first-year gross savings from each CEC proceeding in 2009, 2010, and 2011. Gross savings are calculated from projected statewide installations, compliance, energy use baseline, and unit energy savings, prior to correcting for naturally occurring market adoption and attribution.

Savings in Table 2 and Table 3 are based on actual installation of measures, consistent with the rest of the portfolio that savings are real and in existence; therefore, 100% credit is assumed for savings from all proceedings, including those from pre-2006 adoptions.

**Table 4: Total Projected Program Savings by Subprogram (Net)**

	Building Codes Advocacy			Appliance Standards Advocacy			Compliance Improvement			Reach Codes		
	GWh	MW	MTherms	GWh	MW	MTherms	GWh	MW	MTherms	GWh	MW	MTherms
<b>SCG</b>	0	0	3.5	0	0	1.5	0	0	0.2	0	0	0.2

**Table 5: Total Projected Program Savings by IOU (Net)**

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

	<b>SCG (Therms)</b>
<b>Building Codes Advocacy</b>	3.5
<b>Appliance Standards Advocacy</b>	1.5
<b>Compliance Improvement</b>	0.2
<b>Reach Codes</b>	0.2
<b>Total</b>	<b>5.4</b>

Table 4 and Table 5 savings are calculated from the sum of first-year net savings from CEC proceeding that produces savings in 2013 and 2014.

#### **4. Program Mission**

The Codes and Standards (C&S) program saves energy on behalf of ratepayers by influencing continuous improvements in energy efficiency regulations, improving compliance with existing codes and standards, and working with local governments to develop ordinances that exceed statewide minimum requirements. Both the C&S program advocacy and compliance improvement activities extend to virtually all buildings and potentially any appliance in California.

The C&S program conducts advocacy activities to improve building and appliance efficiency regulations. The principal audience is the California Energy Commission (CEC) which conducts periodic rulemakings, usually on a three-year cycle (for building regulations), to update building and appliance energy efficiency regulations. C&S also seeks to influence the United States Department of Energy (DOE) in setting national energy policy that impacts California.

In some cases we may seek to influence the state legislature and other state agencies like California Air Resources Board (CARB) to influence policy regarding buildings and appliances. We may explore ways to influence the US Congress outside the traditional means of negotiating through Federal partners such as American Council for an Energy Efficient Economy (ACEEE) or Appliance Standards Awareness Project (ASAP).

Codes And Standards Enhancement (CASE) studies, focused on energy efficiency improvements, are developed for promising design practices and technologies and presented to standards- and code-setting bodies. Advocacy also includes affirmative expert testimony at public workshops and hearings, participation in stakeholder meetings, ongoing communications with industry, and a variety of other support activities.

The program participates in DOE proceedings and legislative negotiations leading to federal regulations that are passed through to California; in particular, Title 20 appliance efficiency regulations that are the same as Federal regulations.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Following adoption, C&S supports compliance improvement with both Title 24 building codes and Title 20 appliance standards. Compliance improvement activities complement the advocacy work by maximizing verified savings from codes and standards that are realized and persist over time. The Compliance Improvement subprogram targets market actors throughout the entire compliance chain, providing education, outreach, and technical support and resources to improve compliance with both the building and appliance energy standards. Compliance improvement responds to the CPUC's interest in robust implementation of existing standards and support for the California Long Term Energy Efficiency Strategic Plan's HVAC Big Bold strategies.

The program carries out strategic activities that support or shape future codes and standards. In addition to mandatory minimum-level codes, the C&S program advocates for the development and implementation of "reach codes" that exceed minimum state code requirements and may be adopted by local jurisdictions or agencies. The program monitors and/or participates in a wide range of activities or proceedings that have direct or indirect impacts on California regulations including, but not limited to American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE), international activities involving Europe, Asia, Canada, and Australia, voluntary standards such as green building codes, and ratings organizations such as the Cool Roof Rating Council (CRRC), National Fenestration Rating Council (NFRC), and the United States Green Building Council (USGBC). Additionally, the program intervenes in Energy Star and other voluntary activities, as necessary, to shape future regulations or support coordination with voluntary programs.

The new Planning and Coordination subprogram expands the coordination role of the C&S program in the market adoption cycle for energy efficiency technologies and practices. As many of the measures offered through voluntary programs are adopted into the standards, C&S will coordinate both internally and externally to support a dynamic approach to portfolio planning with the objective of accelerating market acceptance and ultimately the adoption of successful, cost-effective technologies or practices into code. C&S will directly support the goals and objectives of both the CA Long Term Energy Efficiency Strategic Plan and the Codes and Standards Action Plan currently under development, subject to budget constraints.

A glossary of acronyms used in this document is provided at the end of the document.

## **5. Program Rationale and Expected Outcome**

### **a) Quantitative Baseline and Market Transformation Information**

#### Program Performance Metrics (PPMs)

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Codes and Standards Statewide Program (Resolution E-4385, Appendix A):

<b>SW PROGRAM/ Sub-program</b>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>
<b>CODES AND STANDARDS</b>		
<i><b>Building Standards Advocacy</b></i>	1. Number of Residential and Commercial CASE studies, as defined in Building Standards Objectives 1 & 2 for which adoption by the CEC is anticipated by the IOUs, targeting efficient technologies practices and design in each of the following areas: lighting; HVAC; envelope; water heating; and cross-cutting measures in support of the following : (a) Integrated Design, including data management and automated diagnostic systems, with emphasis on HVAC aspects of Whole Building, (b) ZNE technologies, practices, and design in Residential Sector, (c) Peak efficient technologies including plug loads and HVAC technologies, (d) Advanced Lighting Technologies	2b
<i><b>Appliance Standards Advocacy</b></i>	1. Number of draft CASE Studies, as defined in Appliance Standards Objective 1, developed as mutually agreed upon by the CEC and IOUs in support of plug loads, refrigeration, advanced lighting, and/or other technologies that are adopted by the CEC, within authorized budget.	2b
<i><b>Compliance Enhancement</b></i>	1. Number of role-based, Title 24, training sessions delivered.	2a
<i><b>Reach Codes (RC)</b></i>	1. Number of jurisdictions in IOU Service territories with CEC approved Reach Codes in residential and/or commercial sectors as a result of the RC sub-program activities.	2b

**b) Market Transformation Information**

Market Transformation Indicators (MTIs)

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

**c) Program Design to Overcome Barriers**

The statewide Codes and Standards Program has five subprograms including:

- i.** Building Energy Codes Advocacy
- ii.** Appliance Standards Advocacy
- iii.** Compliance Improvement
- iv.** Reach Codes
- v.** Planning and Coordination

**Building Code and Appliance Standards Advocacy Subprograms**

Codes and standards advocacy comprises a portfolio level strategy that complements incentive and information offerings in several ways. Since IOU incentive and rebate programs typically capture only a small percentage of the market, a transition to regulatory intervention is essential to maximize portfolio energy savings. This transition to code causes a once high-margin product to become an industry standard; thereby reducing the overall cost to society for energy efficiency. This commoditization effect, in turn, spurs innovation for new high-margin products since most manufacturers and other industry practitioners seek to compete in part on high-margin differentiated products.

As involuntary interventions, codes and standards are effective at breaking down market barriers such as split incentives between building owners and tenants that are difficult to overcome through incentive and information programs. Minimum code requirements direct consumers’, builder’s and renovation contractor’s choices of materials and appliances to higher efficiency products, thereby reducing monthly energy bills to tenants. Regulations also improve equity in benefits from IOU customer investments in energy efficiency through rates. Through codes and standards, positive changes initiated through voluntary programs targeting early adopters are extended to all customers. Hence, hard-to-reach groups that do not participate in voluntary offerings benefit through codes and standards.

Baselines for building and appliance advocacy activities are developed in two ways. If the objective of a code proposal is to update an existing standard, the baseline is simply the existing standard. If the objective is a new standard, which expands the scope of building or appliance efficiency regulations, the baseline is established through market characterization studies prior to or during the development of the CASE study unless a recent preexisting market characterization study can be found. Hence, baselines for new standards often do not exist until a draft CASE study is complete.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

IOU support for recent CEC code upgrade cycles – in particular, the 2003, 2004, 2006, and 2008 CEC proceedings – for new building codes and appliance standards has significantly increased the rate of change in regulations compared to previous code cycles. Moreover, the scope of regulations has grown to include Title 24 alterations for measures such as duct sealing when replacing HVAC system components, and numerous appliances have been added to Title 20. These changes have created a significant need to support the successful implementation of the standards by improving industry awareness and understanding of California regulations.

As compliance improvement efforts are carried out to improve the rate-of-compliance -- with building codes or appliance standards, the benefits of the increase in compliance are captured in the Advocacy subprogram savings, as part of the verified C&S program energy savings. Determination of compliance improvement savings requires that program savings be recalculated periodically based on recurring CPUC evaluations of compliance rates.

**Compliance Improvement (CI) Subprogram**

Compliance improvement is increasingly important to the energy efficiency industry in California. Having supported the commercialization of efficient technologies and practices through IOU incentive and rebate programs, achieving satisfactory compliance is a crucial requirement for capturing market change for the long-term benefit of society. Broad compliance is necessary to level the playing field for well-intentioned suppliers and contractors who are otherwise faced with a competitive disadvantage when complying with regulations. Greater compliance strengthens voluntary program baselines, provides a solid foundation for future robust advocacy efforts, and improves throughput of California's energy efficiency industry by removing an industry bottleneck.

The primary barriers to compliance with the building standards include the complexity of the standards and limited resources available for enforcement by local governments and the CEC. Although education and training are not substitutes for enforcement, they increase compliance rates by generating awareness and improving understanding of regulations, and by equipping key market actors in the compliance supply chain with the tools and knowledge necessary for compliance. The CI subprogram will offer training and resources to market actors throughout the compliance delivery chain, which may include, but is not limited to energy consultants, building department staff, contractors, and design professionals.

In addition, the CI subprogram will work with local government and other industry partners to provide technical support and other resources, such as process improvement tools. The CI subprogram will document best practices and lessons learned from the Best Practices study completed in 2012, and will work with California Building Officials (CALBO), CEC, and local government partners to encourage other jurisdictions to adopt successful practices and tools identified during the pilot project. By encouraging more jurisdictions to use the same or similar processes, tools and forms where possible, compliance will be simpler for market actors, as enforcement will become more consistent.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

The CI subprogram supports proactive building departments that seek general improvements to operations and compliance improvement processes. The rationale is based on the recognition that building departments are facing increased economic pressures and resource constraints, with no reduction in the required workloads. Given that this trend is unlikely to change in the near future, utility assistance in improving the efficiency of building department enforcement processes will effectively provide the jurisdiction with more resources to increase compliance rates. The CI subprogram will identify and create tools to help optimize existing processes and simplify enforcement and work with staff to test and modify the tools as necessary. Tools might include, but are not limited to, electronic forms, tracking software, or implementing online permitting and payment methods.

In addition to supporting the CPUC's impact evaluation, which will involve establishing pre- and post-program compliance rates per participating jurisdiction, the IOUs will document training and other efforts employed, administer pre- and post-tests to gauge training participants' knowledge swing, and gather and measure implementation of action plans from participating building departments.

**Reach Codes (RC) Subprogram**

The RC subprogram will focus primarily on developing and/or supporting the development of reach codes, or locally adopted ordinances, that exceed statewide minimum requirements. Reach codes are typically codes adopted by local governments and provide a means to test new codes as well as testing the efficacy of increasing the stringency of existing codes at a local level prior to disseminating the code on a statewide basis. Each jurisdiction's experience with local codes can be used to inform the state's process by documenting both the successes and barriers faced for both adoption and implementation. The RC subprogram will encourage local governments to first optimize compliance with existing codes, and will provide training and resources where applicable.

The IOUs have worked with local jurisdictions (cities, counties, school districts, colleges and universities, etc.) to implement a more coordinated approach to development and implementation of local ordinances to minimize market actor confusion. In addition, IOUs have and will continue to promote regionally consistent ordinances where possible to reduce the duplication of efforts that results when individual government entities develop the language and technical supporting documentation independently. This duplication can even occur in regional government organizations whose geographical boundaries aren't consistent with the CEC's climate zone designations. Lastly, coordinated development provides better staging for statewide adoption, leverage for local jurisdictions to encourage adoption, and increases the likelihood of adoption and compliance.

Working with local jurisdictions and other market actors, the IOUs will develop a package of climate-zone based reach codes for new construction as well as some existing buildings. The IOUs will continue to work closely with the CEC to expedite the CEC review and approval process and to drastically reduce local government development costs and

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

facilitate subsequent adoption of the code(s). Reach codes may also include codes targeting government-owned buildings or particular activities such as commissioning.

The main enabling assumption for the RC subprogram is a continuation of the CPUC policy directive that allows constituents in jurisdictions with local ordinances to participate in voluntary programs without being classified as free riders. The CPUC, along with utilities and local governments recognize that this policy is necessary, especially in light of the long-term strategic policies that must be implemented to reduce California's Green House Gas (GHG) emissions sufficiently to meet statewide reduction goals as set forth by AB32. Otherwise, the effective result "punishes" innovators and market leaders by eliminating access to incentive and rebate programs to assist these leaders in achieving additional energy savings. In most cases, reach codes are adopted based upon the expectation of continuing eligibility for incentives and rebates.

The program assumes that citizens of a jurisdiction or agency that passes a reach code continue to be deemed eligible participants in incentive and rebate programs administered under the auspices of the CPUC, consistent with the treatment of California-owned buildings responding to Governor's Executive Orders (S-20-04 and B-18-12) requiring state buildings to reduce energy usage by 20% by 2015. This interpretation can set up a positive energy efficiency feedback loop wherein participation in incentive and rebate programs increases because of the reach code, and the availability of incentives and rebates to assist code compliance encourages more local governments to adopt a reach code.

**Baselines:** For new construction (including renovations, additions, and replacements) reach codes, the IOUs assume Title 24 as the baseline. A Title 24 baseline provides a conservative savings estimate, is consistent with new construction incentive programs, and eliminates any potential overlap with the Compliance Improvement savings claims.

Time-of-Sale (TOS) reach codes for existing buildings assume that no energy actions are undertaken absent the code. There are currently only two TOS codes that the program is aware of in California. The scopes are both very limited, and in at least one case, the code is not routinely enforced. Therefore, assuming that building owners do not undertake any energy efficiency retrofits at TOS absent a specific requirement is a reasonable assumption consistent with the rationale for the proposed new construction reach code baseline.

Enabling assumptions include a "shared savings" claim mechanism for attributing savings impacts resulting from reach codes. In a jurisdiction with a reach code, savings resulting from participants in the relevant incentive or rebate program (new construction or retrofit) will be claimed by that program, consistent with current practice. Savings resulting from completed projects that do not participate in an incentive or rebate program will be claimed by either the Codes and Standards or Government Partnership programs if one is extant.

In addition to local governments, various agencies such as school districts, colleges, universities, and industry groups are adopting reach-code policies. Examples include:

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

- CHPS (Collaborative for High Performance Schools) as adopted by school districts
- Green building requirements adopted by the UC, CSU, and community college districts
- LEED and GreenPoint Rated as adopted by various agencies, builders and jurisdictions
- ASHRAE Standard 189: High Performance Green Buildings, is expected to be adopted by agencies and local jurisdictions

In many cases, the IOUs were involved in the development, adoption, and deployment of these reach code programs. The primary intent of the IOUs involvement was to increase participation in EE programs. The impact of these programs needs to be recognized in the evaluation process as they tend to raise the baseline for code compliance for program participants and non-participants. For example, the baseline for schools in a district with a CHPS policy resolution may have a much higher efficiency baseline as a result of the efforts of the IOU from participation in both the Savings By Design program and CHPS even though there was no legal requirement to exceed the code.

Going forward, the C&S program will be working on the development of new and updated reach code rating systems, standards, guidelines, most of which be based upon the new Title 24 standards. These reach codes are expected to be adopted and implemented with the support of the C&S program by various agencies, institutions, and building associations. Although there have been cases where the mere adoption of reach code programs have little to no impact, there have been a number of cases where significant savings have been verified.

Examples of where verification processes are in place include the CHPS Verified program and the CHPS deployment at Los Angeles Unified School District (LAUSD). The CHPS Verified program ([http://chps.net/chps\\_schools/Verified.htm](http://chps.net/chps_schools/Verified.htm)) provides project review, design review, and construction review of school projects to verify compliance with CHPS requirements. This is a fee-for-service program that provides a rigorous review of the project prior to Department of State Architect (DSA) plan review which generally results in the overall reduction in time and cost for the school design and construction process. In the case of LAUSD, the District worked with consultants (including Global Green) to integrate CHPS into their internal quality assurance process that involved the design teams and all LAUSD design, construction review, and maintenance and operations staff. The C&S program proposes to review these and similar compliance improvement programs and processes and will implement them accordingly to maximize the energy savings associated with the reach code programs.

To the extent that the C&S program is able to increase compliance with these reach code programs, the resulting savings should be reflected in buildings that result in above-code performance. In addition, to the extent that the IOUs were and will be involved with the development and deployment of these reach-code programs, the energy savings should be treated similarly to the reach code ordinances adopted by local government jurisdictions.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Based upon precedents that allow eligibility for above-code incentives for state and federal agencies with executive orders (e.g., Governor's Executive Order (S-20-04, recently replaced by B-18-12) requiring state buildings to reduce energy usage by 20% by 2015) for mandatory above code construction of their buildings, the IOUs propose continuing the policy of treating these reach code policies in a similar manner.

**Planning and Coordination Subprogram**

The ambitious goals set by the CPUC and CEC require the participation of many different entities. Without proactive coordination, it will be difficult if not impossible to fully realize the savings from the C&S program activities as well as other programs. The C&S program will facilitate coordination and develop and implement a strategic vision to promote and advance cost-effective technologies.

The Planning and Coordination subprogram will work with the CEC, CPUC, emerging technologies, as well as voluntary programs to create a strategic approach for key measures and technologies in support of the Zero Net Energy (ZNE) and other policy goals. For those key technologies, the C&S program will strive to work with other programs to commercialize them for adoption into a relevant code or standard.

The Planning and Coordination subprogram will also work with other programs and market actors to improve code compliance, conduct more outreach and solicit additional input on code enhancement proposals from impacted industries. As part of the expanded outreach and communications efforts, the C&S program will establish and maintain a codes and standards collaborative, and will continue to facilitate the Compliance Advisory Group. In addition, the C&S program will maintain regular contact with state and federal code-setting agencies to minimize duplication of efforts and coordinate activities.

**d) Advancing Strategic Plan Goals and Objectives**

Through the C&S program, SoCalGas, SDG&E, SCE and PG&E will combine advocacy, compliance improvement and reach code development efforts to meet the codes and standards goals defined in the Strategic Plan in Section 7. Please see Section 6 for the specific action strategies the IOUs will employ in order to meet the Strategic Plan's codes and standards goals.

Due to the long code upgrade cycle, the process of developing CASE and research studies may extend past the end of the program cycle; therefore, funding committed prior to the end of 2011 will be available for four years thereafter to fund these studies. This might entail moving the committed funds forward into subsequent program cycles until these studies are completed.

**6. Program Goals, Objectives and Action Strategies**

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

**a) Subprogram Descriptions**

The C&S program consists of five subprograms: Building Codes Advocacy; Appliance Standards Advocacy; Compliance Improvement; Reach Codes; and, Planning and Coordination.

**i. Building Codes Advocacy Subprogram**

The Building Energy Codes Advocacy subprogram primarily targets improvements to Title 24 Building Efficiency Regulations that are periodically updated by the California Energy Commission (CEC). The subprogram also seeks changes to national building codes that impact CA building codes. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in public rulemaking processes. The subprogram will coordinate or engage with ratings organizations that are referenced in Title 24; for example, the National Fenestration Rating Council, and the Cool Roof Rating Council.

**ii. Appliance Standards Advocacy Subprogram**

The Appliance Standards Advocacy subprogram targets both state and federal standards and test methods: improvements to Title 20 Appliance Efficiency Regulations by the CEC, and improvements to Federal appliance regulations by the US Department of Energy. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in the public rulemaking process (Title 20), and comment letters based on IOU research and analysis (USDOE), participation in direct negotiations with industry, and development of quasi-mandatory appliance standards reach codes. Additionally, the subprogram monitors state and federal legislation and intervenes, as appropriate.

**iii. Compliance Improvement**

The Compliance Improvement subprogram is a new subprogram that combines the previous Extension of Advocacy and Compliance Enhancement subprograms. It provides education, training, and other activities targeting building departments and other industry actors responsible for compliance with Building Energy Code and Appliance Standards requirements. Activities may include development of “best practices tools” and other infrastructure elements that serve multiple compliance improvement objectives.

**iv. Reach Codes**

The Reach Codes subprogram provides technical support to local governments that wish to adopt ordinances that exceed statewide Title 24 minimum energy efficiency requirements for new buildings, additions, or alterations. Support for local governments includes research and analysis for establishing performance levels relative to Title 24 and cost effectiveness per Climate Zone, drafting of model ordinance

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

templates for regional consistency, and assistance for completing and expediting the application process required for approval by the CEC. The subprogram also supports local governments that seek to establish residential or commercial energy conservation ordinances for existing buildings.

v. **Planning and Coordination**

The Planning and Coordination Subprogram supports planning activities that improve alignment across the IOU energy efficiency portfolio with respect to future C&S program activities. This subprogram supports efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving zero net energy.

b) **Program Goals and Activities**

In general, the goals of the C&S program are the same as the two C&S goals defined in the C&S section of the Strategic Plan. Through the Advocacy subprograms, the IOUs will strive to continually strengthen and expand building and appliance codes and standards as IOU efforts reveals greater efficiency opportunities and compelling economic benefits. Through the Compliance Improvement subprogram, the IOUs will strive to improve code compliance through education, outreach, and other technical resources. IOUs will also develop local ordinances and facilitate their adoption and implementation in motivated communities.

- Strategic Plan Codes and Standards Goal #1: Continually strengthen and expand building and appliance codes and standards as market experience reveals greater efficiency opportunities and compelling economic benefits. (Subprograms 1 and 2: Building Codes and Appliance Standards Advocacy).
- Strategic Plan Codes and Standards Goal #2: Improve code compliance and enforcement. (Subprograms 3 and 4: Compliance Improvement and Reach Codes).

The following sections provide a description of the proposed C&S subprogram activities which will lead to achieving the program goals.

**Building Codes Advocacy**

The Building Codes Advocacy program will continue conducting many of the same activities as were conducted in the 2010 – 2012 program cycle, but will focus on the upcoming 2016 Title 24 Energy Building Code cycle. In addition, the Building Energy Codes Advocacy subprogram will expand activities at the national level. Primary activities for 2013-2014 include the following:

2013 Title 24 Building Codes

- Support implementation of adopted 2013 Energy Building Code:
  - Complete revisions to compliance manuals and forms.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

2016 Title 24 Building Codes

- Prepare CASE studies in coordination with CEC:
  - Conduct research for 2016 building code advocacy to advance State policy goals.
  - Support activities to address Department of Finance review requirements.
  - Research residential ventilation / IAQ requirements to reduce and control infiltration while maintaining and improving indoor air quality.
  - Research and advocate methods to remove code barriers to the increased use of renewable energy in support of ZNE goals.
  - Support development of 2016 compliance software.

**Appliance Standards Advocacy**

The Appliance Standards Advocacy subprogram will continue conducting many of the same activities as were conducted in the 2010–2012 program cycle, but will focus on preparing new measures pursuant to CEC’s adopted Order Instituting Rulemaking (OIR) for Title 20 Appliance Standards and U.S. Department of Energy’s ongoing rulemaking for Federal Appliance Standards. Primary activities for 2013-2014 include the following:

Title 20 Appliance Standards Rulemaking

- Prepare CASE studies pursuant to CEC’s adopted OIR:
  - Advocate and provide public testimony in State public proceedings
  - Conduct research and testing and submit supporting market and technical data to the CEC
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which CEC eventually adopts)
  - Develop quasi-mandatory reach codes that are voluntary with respect to participation, but require CEC certification if a supplier chooses to participate.

Federal Appliance Standards Rulemaking

- Provide support to DOE rulemaking process:
  - Advocate and provide public testimony in Federal public proceedings.
  - Submit supporting market and technical data to the Department of Energy (DOE).
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which DOE eventually adopts).
  - Develop voluntary agreements or reach standards.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

## **Compliance Improvement**

For the 2013-2014 program cycle, the combines the former Extension of Advocacy and Compliance Enhancement Program activities into one Compliance Improvement subprogram to enhance understanding of program objectives and activities. The subprogram will strive to improve compliance with Title 24 and Title 20 standards while implementing an effective sector strategy with the Workforce Education and Training (WE&T) Program. Primary activities for 2013-2014 include the following:

### Title 24 Compliance

- Title 24 Standards Essentials Role-Based training for building inspectors:
  - Continue delivering training to plans examiners and energy consultants. Update curriculum to cover what is new in the 2013 code.
  - Expand role-based training curriculum to additional compliance improvement market actors such as the building trades and design professionals as guided by needs assessment.
  
- HVAC Quality Installation and Other Programs with Direct Code Requirements
  - Identify opportunities to insert code compliance modules in existing curriculum, such as training required for technicians.
  
- Online Compliance Training:
  - Explore training delivery mechanisms beyond the traditional classroom to include live webinars, activity-based online training, and in-field demonstrations.
  
- Tools and Process Improvements:
  - Implement tools and process improvements as identified through the building department best practices study and the Compliance Improvement Advisory Group (CIAG).
  
- Forms and Compliance Documents:
  - Support development of improved forms and compliance-related documentation for 2013 Title 24.
  
- Compliance Improvement Incentives:
  - Explore a pilot project designed to improve compliance by providing incentives to local governments, contractors, or other key market actors. The pilot will be based on the CIAG's guidance and may include nonmonetary incentives such as

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

training or provision of tools designed to streamline the permitting and inspection processes for building additions and alterations.

- Target Low Compliance Problem Areas:
  - Collaborate with the CEC to identify problem areas and potential compliance improvement solutions through white papers developed by CIAG members.
  - Consider pilot project to improve compliance for measures with known challenges, which may include providing incentives to contractors for pulling permits, or motivation for other market actors.
  
- Develop and Conduct Outreach Campaign to Improve Compliance:
  - Collaborate with the CEC to develop and implement an outreach campaign designed to improve compliance with Title 24 and Title 20 standards. The campaign will be based on the CIAG's guidance and may include activities such as developing flyers for contractors to provide to potential customers explaining the code requirements and benefits, mini measure-based code seminars for big box store employees, etc.
  
- CEA exam development, facilitation support, and maintenance
  - Collaborate with the California Association of Building Energy Consultants to improve the working knowledge, skills, analytic ability and accountability of individuals using energy compliance software and preparing the appropriate Title 24 documentation for permit submittal. The C&S program will support updating the beta Residential and Nonresidential CEA examinations developed in 2010-2012 to properly test applicant CEAs under the 2013 standards and facilitating the roll out of the new certification process.

Title 20 and Federal Standards Compliance

- Surveys and Technical Support:
  - Conduct surveys and provide technical support to CEC and industry to facilitate compliance.
  
- Education and Outreach:
  - Collaborate with CEC on implementing an education and outreach campaign targeted to distributors, retailers, contractors, and possibly consumers.

**Reach Codes**

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

For the 2013-2014 program cycle, the IOUs will continue to collaborate with the CEC and Local Government Partnership Program to identify, and provide technical assistance to, local jurisdictions interested in adopting reach codes. In addition, the IOUs will continue to collaborate with CEC to provide support for developing voluntary standards to encourage buildings to achieve exemplary performance in the areas of energy efficiency. Primary Reach Code subprogram activities for 2013-2014 include the following:

Reach Code Technical Assistance

- Cost Effectiveness Studies:
  - Prepare Cost Effectiveness studies for each of the California climate zones (to be updated for 2013 Energy Building Code) that have been vetted with the CEC, resulting in expedited CEC review of reach code application submittals.
- Policy Guidelines:
  - Provide a “Road Map” of Policy Guidelines for adopting Reach Code including an overview of some of the implications and important choices in writing and adopting these types of ordinances, and recommendations intended to improve implementation and compliance.
- Ordinance Template:
  - Provide a Reach Code Ordinance “template” that establishes clear definitions of when the ordinance is triggered, including CEC-required language which states that all buildings shall meet all applicable requirements of the Building Energy Code.
- Workshops & Presentations:
  - Facilitate public workshops and presentations to interested stakeholders including elected officials, city staff, industry organizations, and community groups that address the following:
    - Critical role that energy efficiency plays in reducing greenhouse gas emissions
    - Understand how Reach Codes and complementary new construction incentive programs such as the California Advanced Homes (CAHP) program help meet CalGreen’s voluntary Tier 1 and Tier 2 Energy requirements, accelerate advancement of zero net energy building practices, and mitigate project-level GHG impacts pursuant to CEQA requirements.
    - Explain the process for developing and adopting a legally enforceable reach code pursuant to CEC requirements
  - Work with industry organizations and other market actors to conduct outreach to local governments to inform them of available reach code assistance.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Local ordinances may be structured in several ways, and often vary in scope, requirements, and triggers. The C&S team will encourage local governments to adopt regionally consistent ordinances where feasible to reduce potential market confusion. However, differing circumstances in each jurisdiction may require them to pursue different avenues. For example, ordinances may be limited to energy issues only, or may be more comprehensive, also including other green building measures. Some examples of typical variations in ordinances include the following:

- **Scope and Triggers:** Local ordinances may include residential, nonresidential, or municipal buildings, or any combination of the above. Many local ordinance requirements apply to new construction only, while others also include remodels. Triggers may include project size, scope, or value.
- **Requirements:** Local ordinances typically specify a particular level of performance, allowing builders and designers to achieve the desired performance using a combination of measures and technologies that are appropriate for the project. Many local ordinances specify that covered projects exceed state requirements by a specific percentage (15% was the most common requirement relative to the 2008 Standards). In addition, local ordinances may require projects to meet CalGreen Tier 1 or Tier 2 advanced efficiency levels as well as the non-energy portions of CALGreen. Another common structure employed by many local governments is to require buildings to obtain certification from a relevant green building rating system such as LEED or Build It Green. This structure allows the jurisdiction to leverage the documentation and verification requirements inherent in these systems, thus reducing the verification burden on the building department.

**Planning and Coordination (Non-Resource Subprogram)**

The Planning and Coordination subprogram supports planning activities that improve alignment across the IOU energy efficiency portfolio with respect to future C&S program activities. The C&S staff will coordinate with IOU energy efficiency portfolio programs to support efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving zero net energy.

This subprogram will consist of four elements: 1) Strategic planning and coordination; 2) Outreach within each IOU to other program areas; 3) Statewide planning and coordination; and, 4) Workforce education and training. Primary activities for 2013-2014 include the following:

Strategic Planning

- **Codes and Standards Collaborative:**
  - Maintain a Codes and Standards Collaborative to conduct strategic planning.
- **Code Readiness:**

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

- Establish cross-functional teams, including representatives from voluntary programs (incentive, emerging technologies, and education and training), the CPUC, and the CEC, will be established to identify code readiness priorities relative to policy goals, for example: zero net energy, AB 1109, and other Action Plan objectives.

Internal Coordination and Communications

- Periodic Meetings:
  - Conduct a variety of internal coordination activities based on respective needs of each IOU, including periodic meetings with program leads in other areas as well as management teams.
- Ongoing Communication:
  - Inform planners and support groups regarding future code changes, collaboration on evaluation and regulatory matters.
  - Solicit input from other groups re advocacy efforts, aligning education and training activities with incentive programs.

Statewide Collaboration

- Integrated Dynamic Approach to Portfolio Planning:
  - To support the state's zero net energy objectives, the C&S team will work closely with new construction programs to develop an integrated approach to align new construction program offerings with base code requirements as well as reach codes where possible.
  - The C&S team will work with core retrofit programs as well as local government partnerships and third parties to coordinate offerings with anticipated code changes.
- CPUC Communication:
  - Conduct monthly calls with CPUC personnel to share progress and discuss issues.
- CEC Communication:
  - Maintain statewide weekly calls with CEC staff regarding building codes and appliance standards.
- National Stakeholders Communication:
  - Conduct regular conference calls with national stakeholders regarding appliance standards.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

- Compliance Advisory Group Communication:
  - Host quarterly meetings with Compliance Improvement Advisory Group regarding compliance improvement activities.
  
- Local Government Partnership Communication:
  - Provide quarterly updates to Local Government Partnership Program regarding reach code adoption progress and delivery of training to building departments.

Workforce Education and Training (WE&T)

- Sector Strategies for WE&T:

The C&S and WE&T teams will meet periodically to coordinate activities that will enhance support for the appropriate market actor roles responsible for new and emerging codes and standards implementation according to priorities established by needs assessments. The C&S program will collaborate with the WE&T Centergies subprogram to not only prepare contractors and technicians to implement current codes, but to also prepare them with technical training on advanced technologies that are projected to become part of reach codes and then the statewide code.

c) **Program objectives (more specific milestones to be achieved to accomplish the goals)**

See Codes and Standards Alignment with Strategic Plan narrative and table below.

d) **Program action strategies that will be used to implement the goals**

See Codes and Standards Alignment with Strategic Plan narrative and table below.

e) **Program outputs (measurable results of the program linked to the action strategies)**

See Codes and Standards Alignment with Strategic Plan narrative and table below.

**Codes and Standards Alignment with Strategic Plan**

The following narrative and table details the specific actions the C&S program will use to carry out the C&S goals defined in the Strategic Plan and the program outputs linked to each action strategy.

In addition to striving to meet the two C&S goals defined in the Strategic Plan, the IOUs will work in concert with other programs within the energy efficiency portfolio to help

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

meet associated goals such as those defined for HVAC, local governments and WE&T as described in Section 8 of this PIP.

Strategic Plan Codes and Standards Goal #1: Continually strengthen and expand building and appliance codes and standards as market experience reveals greater efficiency opportunities and compelling economic benefits. (Subprograms 1 and 2: Building Codes and Appliance Standards Advocacy)

The C&S program will provide a direct response to the CPUC's goal by specifically addressing each near-term strategy in the Strategic Plan. Through the advocacy activities, the program will:

- Continue to expand Title 24 Building and Title 20 Appliance Efficiency Regulations through improved research to identify current code and compliance shortcomings, new technologies and processes, and latest thinking on breadth (scope) and depth (stringency) of possible standards
- Develop aggressive proposals to accelerate regulations for both Title 20 appliance efficiency standards and Title 24 building standards
- Support leading activities such as statewide reach standards (e.g., codes that include California Green Building Standard) and the coordinated development and adoption of advanced local government ordinances.
- Coordinate with both internal and external organizations on an ongoing basis, including voluntary programs and national standards organizations

The Strategic Plan outlines five strategies to strengthen and expand building and appliance standards. The C&S program intends to address each strategy through the advocacy subprograms as follows.

*Strategy 1-1: Develop a phased and accelerated approach to more stringent codes and standards.*

The C&S program seeks to accelerate the adoption of increasingly stringent building and appliance standards. To this end the program will develop proposals to increase the scope and stringency of Title 20 and Title 24. The C&S program will also develop or support development of more stringent codes, such as the California Green Building Standard, ASHRAE Standard 189, and other model code ordinances, which would significantly exceed the current Title 24 requirements and could potentially become a model for local green building ordinances.

The use of discrete, above minimum code tiers of efficiency standards (e.g. reach codes) have been proven to be an effective way to promote energy efficiency, prepare the market for high efficiency equipment in an orderly way and smooth the transition for more stringent future standards. However, the proliferation of many standards for the same product renders confusion in the market place and hinders compliance. The C&S program

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

will work with local governments that currently have or are considering adopting advanced energy codes to identify common themes among their primary objectives and develop a set of model reach codes and standards that form the path for subsequent statewide adoption. The C&S program will help local governments improve compliance by developing compliance forms, modify performance software, and provide code compliance training to practitioners and building departments

Historically, approximately 100,000 single family (SF) homes and 50,000 multi-family (MF) dwelling units are constructed each year. Estimated construction for 2009 is projected to be much lower: SF 30,000 SF units and 33,400 MF units.<sup>18</sup> These buildings are within the scope of the Title 24 energy code. There are about 8 million existing single family homes and 4 million existing multi-family dwelling units in California.<sup>19</sup> Since homes are sold on average every seven years in California<sup>20</sup>, approximately 1.4 million existing homes and (assuming same turn-over for rental properties) 570,000 existing multi-family units are sold each year. Thus requirements for the most basic efficiency measures (attic insulation, weather sealing) installed at time of sale would have a huge impact – potentially impacting 10 times as many residential buildings as do the current residential standards. The C&S program will work with local governments to identify existing barriers and develop model time-of-sale (TOS) requirements such as Home Energy Rating System (HERS) audits, and commissioning for commercial buildings that do not unnecessarily hinder real estate transactions or financing. Ultimately, if the pilot program with local governments is successful, it will make the case for a statewide time-of-sale requirement.

**HVAC.** The efficiency of heating and cooling systems is central to building energy efficiency standards and has become an even more significant component of the standards through the adoption of time-dependent valuation. Energy losses from ducts can be a large fraction of heating and cooling loads. The Title 24 standards have mandatory requirements for duct sealing and prescriptive requirements for duct testing and verification by a HERS rater. Feedback from duct tests to HVAC contractors and home builders is a very important mechanism for transforming the market. Thus, the C&S program will be pursuing the concept of mandatory requirements for duct testing and self-certification of the test while still including the prescriptive requirement for a HERS rating. Similar to the acceptance tests in the nonresidential market, a self-certified duct pressurization test would be required for all residential duct systems in unconditioned spaces that are not obtaining a HERS verified duct test.

The systems not receiving HERS duct sealing verification would receive the same energy penalty in the performance approach and the systems would not be allowed in the

<sup>19</sup> <http://www.dof.ca.gov/HTML/DEMOGRAPH/ReportsPapers/Estimates/E8/E-8.php>

<sup>20</sup> Median duration at residence is 7 years for homeowners and 1 year for renters. Jason P. Schachter and Jeffrey J. Kuenzi. US Census. Seasonality of Moves and The Duration and Tenure of Residence: 1996, data extracted from Figure 4. Duration of Current Residence by Current Tenure: 1996.

<http://www.census.gov/population/www/documentation/twps0069/twps0069.html>

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

prescriptive method approach. This requirement would reduce enforcement uncertainty – every duct system would be required to be tested. Since all duct systems are required to be tested, this lowers the incremental cost barrier for a HERS verified duct test and assures that mechanical contractors and homebuilders receive the feedback from duct testing on every job. This same approach would be taken for relatively new requirements for measurements of airflow, fan power, duct pressure drop and refrigerant charge.

The C&S program will prepare CASE studies to evaluate the cost-effectiveness, market status and availability of the equipment to determine the potential for revising the building efficiency standards so they are based on enhanced efficiency HVAC systems such as: radiant cooling with a dedicated outside air system, evaporative condensing, direct/indirect evaporative cooling and ground coupled heat pumps. These and other cooling technologies have the potential to be significantly more efficient than the federal air conditioning regulation but may be exempt from federal pre-emption. For federally-regulated cooling equipment, the C&S program will continue working with the federal DOE to develop regional air conditioning standards that would be more appropriately suited to California's warmer and drier climate.

**Envelope performance testing.** Similar to the requirements for performance testing of HVAC installations, the performance testing of the envelope of homes and other residential dwelling units provides direct feedback on the level of infiltration. Thus, testing could transform the building industry. The C&S program will evaluate the feasibility of adding mandatory requirements for blower door tests for all new homes. Similar to the requirements for duct testing, the prescriptive baseline would retain the HERS verification requirements, but for those homes wishing to avoid the HERS requirements through a performance trade-off the blower door test would still have to be performed.

*Strategy 1-2: Expand Titles 24 and 20 to address all significant energy end uses*

The C&S program will pursue additional energy savings by broadening the scope of the Title 20 appliance standards and the Title 24 building efficiency standards. Title 20 proposals will be developed and supported through the public stakeholder process for both current and future proceedings. Current proposals include: battery chargers, portable lighting fixtures, set top boxes, televisions, computer monitors, game consoles. Future proposals will include office equipment and other miscellaneous and plug loads. Integration activity with voluntary codes and program activities will be increased to expand potential for new product categories to be added to the measure list. The C&S program will continue to support the Title 20 proposals after their adoption by providing ongoing technical assistance to the CEC to fend off post adoption maneuvering by oppositional stakeholders, which has increased in recent years. This will reduce post adoption exemption of product classes.

For the 2008 revisions to Title 24, the C&S program successfully proposed a bold increase in scope to include refrigerated warehouses. For 2013, the C&S program again advocated increasing the scope of the standards, this time to include the refrigeration plant small

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

walk-in refrigerated coolers and refrigerant plants serving display cases in supermarkets. The C&S program is also pursuing other opportunities with computer room cooling, and other process measures such as compressed air systems.

In the past, energy codes have focused only on the efficiency of the equipment installed and not on how that equipment functions, and recent field studies have found that a significant number of controls do not work correctly. Thus the C&S program will be reviewing the efficacy of fault detection and diagnostic (FDD) controls to determine their effect on operators taking subsequent action to correct the problem when notified. The C&S program will also investigate barriers to submetering tenant units and major building energy consuming systems such as lighting, chiller plants, and boiler plants. Pending approval from the CPUC that water savings are within the scope of IOU energy and resource conservation programs and should be pursued, the C&S program will research requirements for water meters on all new buildings.

With the current federal administration's focus on energy efficiency we can expect, at a minimum, more opportunities to increase the stringency of Title 20 standards through Federal proceedings. If the new administration increases the budget for DOE staff, we can expect an even greater acceleration in activities than the already rapidly increasing number of DOE proceedings. Increased DOE funding would provide the opportunity for states to petition DOE for new rulemakings and/or waiver petitions in support of California energy savings.

The C&S program will work in conjunction with national organizations to align California's reach goals with LEED, Green Globes, and CHPS. Ideally, satisfying California's Green Building Standard would become the minimum threshold to apply for a LEED rating. Likewise, the C&S program will work with ResNet and California HERS Providers on the development of further home rating system upgrades and rating techniques.

*Strategy 1-3: Improve code research and analysis.*

Research and analysis is the basis of upgrading energy codes. In some cases this research is forward-looking and identifies technologies that have sufficient market experience, cost-effectiveness and broad applicability to be deemed "code-ready." This research can also be retrospective for two major categories of energy savings opportunities:

1. Review of code proposals that were unsuccessful in past code cycles, but appear to have promise due to changes in the market, refinements in the technology or new information.
2. Evaluation of current standards for loopholes, inconsistencies, enforcement barriers. The savings from these issues can be substantial and must be actively researched.

More generally, the program will seek to improve C&S advocacy by developing new approaches to determining incremental costs, availability, and reliability. In particular, cost

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

information is considered confidential by industry representatives who generally oppose code upgrades, so the success or failure of a standards proposal often turns on the perceived accuracy of incremental costs.

Due to the increasing complexity of the targeted measures and increasing sophistication of oppositional stakeholder tactics during the public process under both Title 20 and 24, a greater emphasis on more thorough market research, product performance measurement and technical production data is necessary. Existing studies may be expanded, new studies may be designed and implemented, and additional market research may be purchased to facilitate future standards development. New or updated test methods are required to pursue significant savings opportunities left stranded by current incomplete test methods (e.g., high temperature performance metrics for cooling systems and variable speed capability of commercial refrigeration equipment).

Codes research also needs to consider more than just technologies but also design methods. A “big bold” research topic for Title 24 is a whole building approach to building design. This concept is in support of a requirement for compressorless or “hybrid” cooling systems in the homes in the more temperate California climate zones. Well-designed homes in the mild coastal regions of California do not need air conditioners. These homes often have thermal mass to dampen the diurnal temperature swings when it is hot outside, so the thermal comfort of the home isn't solely dependent on the air temperature of the home, but also the radiant temperature. The C&S program will pursue the potential of providing Title 24 compliance credit to homes that do not have air conditioners as long as it can be reasonably expected that occupants in these homes will be comfortable enough that these homes will not be retrofitted with air conditioners later on. This approach would likely require an enhancement of the existing performance method simulation tools, or require newer simulation tools such as Energy Plus, that has a thermal comfort model. This would require a significant investment in resources. However, if this concept were implemented, it would move new homes in coastal regions significantly closer to the 2020 zero net energy goal.

This same concept can also be applied to commercial buildings with greater attention given to comfort due to tasks being conducted in fixed positions and locations, and greater attention to internal heat gains resulting from plug loads and lighting loads. However, better thermal mass and comfort models will advance low energy commercial buildings as this would also benefit the characterization and ultimately the design of passive solar commercial buildings assisted with radiant heating and cooling. Energy Plus also promises the capability of modeling airflow which should provide improved confidence in specifying two other low energy HVAC systems: positive displacement ventilation and natural convection.

Initially, advanced tools require advanced users. Thus training in low energy design principles and methods of predicting building performance training is needed for the next generation of architects and engineers starting out in practice and currently attending California architecture and engineering schools. Training is needed in a number of

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

different venues: for existing practitioners, training opportunities at utility training centers, and at professional conferences. Student training would be most efficiently conducted as part of their normal curriculum. Sponsored curriculum development and sponsored research in the design of efficient buildings results in career long impacts when combined with other broader society-wide incentives for low energy design.

Even more advanced interfaces to these tools expand the scope of potential users by simplifying the user's inputs, but requiring sufficient detail in the nomenclature used by designers so these tools can predict the energy impact of design choices with reasonable levels of accuracy. These program interfaces must have enough flexibility so the breath of applications is wide enough to affect a sizable portion of the possible building applications and the scope of measures is sufficiently broad. Training is still needed for these simplified tools but is accomplished in less time and is given to more people as there are more people likely to use the tool. Easier to use tools expands likely users to sales people, manufacturer representatives and facility managers.

In addition to the fairly sophisticated tools to support these advanced designs, a segment of the market will be drawn to design approaches that are formulaic. These approaches may not optimize energy savings, but if the prescriptive cookbook method is well designed, they can yield significant levels of reliable savings. This requires a significant effort in exercising the design tools, comparing the simulated results to actuals and synthesizing the results into design standards. These design patterns then must be transmitted in a number of ways including resource documents, training materials and presentations.

The energy consumption of buildings is not purely a function of their components but is impacted by occupant behavior and actual equipment installation and performance. Field studies are an important method of feedback on how much energy is really saved by a measure. In some cases this research can leverage information from CPUC EM&V studies and CEC load forecasting studies.

Another significant source of market and technology data is the utility energy efficiency programs. The C&S program will periodically poll the program managers for information concerning market share, technology cost and verified energy savings. The energy efficiency programs will likely identify technologies that may be ripe for code adoption and can help develop the market experience that differentiates those products that are truly code ready.

The importance of the statewide utility Emerging Technology (ET) program will increase as source of information and potential measures for voluntary reach-code tiers. Although available in the market, the measures that are assessed in the ET program may be neither cost-effective nor fully applicable for mandatory standards. In some cases, it may be appropriate to have measures simultaneously included in utility energy efficiency programs as well as a reach code tiers.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Also related to field studies are process evaluations of how the code is administered from the designer and specifier, to Title 24 analyst, to plan check, to bidding, through construction to inspection to occupancy. The delivery of efficient buildings relies on each step of this process. Transferring this information to the CEC and code proposal developers increases the likelihood that compliance will increase with the next energy code.

*Strategy 1-4: Improve coordination of State energy codes and standards with other state and Federal regulations.*

The development of the California energy efficiency standards does not occur in a vacuum. Much of the technical basis of Title 24 rests on consensus standards developed by ASHRAE (American Society of Heating, Refrigerating and Air-conditioning Engineers) and IESNA (Illuminating Engineering Society of North America.). The measurements of product properties rely on test standards developed by DOE; American Society for Testing and Materials now referred to as ASTM International (ASTM); Air-Conditioning, Heating and Refrigeration Institute (AHRI); National Fenestration and Rating Council (NFRC); Cool Roof Rating Council (CRRC). Although the C&S program works most closely with the CEC, other California state agencies are also involved with the development of efficiency standards. Examples of coordination with other state agencies may include, but are not limited to, the California Air Resources Board (CARB) as codes relate to greenhouse gas (AB 32) and other emissions, Department of Toxic Substance Control (DTSC) as codes relate to toxic waste from lamps, and California Department of Water Resources (DWR) as codes relate to the water use in HVAC systems. In addition, there is much to be learned and many benefits derived from coordinating with ASHRAE and other states that are developing their own energy codes. Thus, the C&S program will be coordinating with other entities in the development of test standards and other consensus standards.

The C&S program will also participate in the development of other standards that can then be applied in California. The most notable of these is the Federal appliance efficiency regulations and international standards, which are likely to have bigger impacts on Federal and state appliance standards in the future. If the C&S program continues to influence the outcome of these regulations, nominal savings in California will be achieved. Since the Federal regulations apply to all sales in the US, compliance enforcement is easier. The program will continue to take a leadership role in advocating for new legislated standards (often based on Title 20 standards in the past) and in both negotiated and contested DOE appliance standards rulemakings. In view of the increasing international coordination in the codes and standards arena, the program will take a more influential role in influencing international test methods and standards framework developments where there is significant opportunity to affect federal and CA appliance standards. We fully expect the need to travel to other countries to conduct effective collaboration and coordination of standards activities that potentially affect California. Increased coordination with national voluntary program frameworks including CEE and ENERGY STAR are also likely to increase codes and standards efficacy.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Federal appliance efficiency standards limitations have been a hindrance to more stringent codes in California. These Federal standards preempt the state from requiring additional labeling, higher appliance efficiency standards, and prevent building efficiency standards from requiring higher efficient equipment than equipment that are minimally compliant with the Federal appliance standards. Given that the Federal regulations cover the largest energy consuming devices (lighting, air conditioners, and water heaters), this has seriously constrained the effectiveness of California's appliance and building efficiency standards in California. The C&S program will be developing a research plan to address Federal pre-emption including, but not limited to, waiver petitions, federally legislated standards, and development of new coalitions.

The CARB's proposal in response to SB 97, which requires rules be developed to address the California Environmental Quality Act (CEQA) requirements for greenhouse gas emissions, expands the possible scope of energy consumption that could be regulated. Well-defined efficiency measures and performance trade-off options would be in the interest both of CARB and the entity submitting a new industrial, commercial or residential project.

In addition to the coordination with the DWR for the water use in HVAC systems noted above, there is an ongoing CPUC proceeding to determine the amount of energy embedded in water use. Therefore, the C&S program will further coordinate with the DWR as studies are initiated to examine potential reductions in water use. Since the CEC was given jurisdiction over water use starting in 2008, it is anticipated there will be new sections in Title 24 regulating the use of water.

Also as mentioned earlier, the C&S program will pursue developing reach codes in coordination with the California Green Building Standards. To do this the C&S program will coordinate with the BSC (Building Standards Commission), the CEC (California Energy Commission), HCD (Housing and Community Development), OSHPD (Office of Statewide Health Planning and Development), Local Governments, and others.

*Strategy 1-5: Improve coordination of energy codes and standards with utility programs*

Coordination between C&S and other utility programs may occur in various ways: existing or newly adopted standards, future standards, direct linkages between incentive programs and a specific standard, and long-term integrated planning. This is a rapidly evolving area, so planning is necessarily at an objectives level for now. The C&S team will periodically meet with other utility program staff to facilitate ongoing coordination.

**Newly adopted standards.** On an ongoing basis, C&S team communicates with IOU incentive program managers regarding potential adoptions of new standards. Depending on the opportunity, program managers may decide to provide incentives for measures in advance of the effective date to prepare the market.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Education and training between adoption and effective dates of a particular standard represents another way to prepare industry. The C&S program will provide Title 24 training to both market actors and internal program staff in advance of the effective date for the Title 24 Standards. The training will help identify opportunities for ongoing coordination between incentive programs and C&S activities. Another activity under development is to require program participants to complete and submit the applicable acceptance tests required by Title 24 to receive an incentive for HVAC and lighting controls equipment. This will increase compliance with the acceptance tests and help assure the incented equipment is installed according to code intent.

Although all utility programs are impacted by codes and standards, particular focus will be placed on coordinating with the Local Government, HVAC, and WE&T programs. Please refer to Section 8 for how the C&S program will coordinate efforts to help meet shared goals defined in the Strategic Plan.

**Future standards.** Having selected topics for potential CASE study proposals for the next code cycle, for example, 2011 building and appliance standards, energy efficiency program managers may be able to include measures in programs to improve code readiness. The C&S program may also work with statewide ET program staff to identify new technologies for which to develop alternative calculation methods (ACM). CASE studies can be developed for new technologies to propose Title 24 credit towards achieving compliance, thereby reducing one barrier to market acceptance. Moreover, a Title 24 ACM provides an approved method for calculating energy savings for incentive programs.

The C&S program will continue to improve coordination with the statewide new construction programs. Since the success of these programs are dependent on exceeding the current Title 24 codes, they serve as a useful “test-bed” to inform the development of future Title 24 proposals by highlighting the more cost effective measures, flagging problem areas with compliance, and demonstrating the extent to which the current code can be exceeded.

On a longer term basis, it is sometimes possible to identify code objectives two code cycles into the future. This will be particularly critical for developing an appropriate trajectory for reaching the Strategic Plan’s zero net energy goals, AB 1109 Huffman Bill goals<sup>21</sup>, and state policy initiatives indicated in the previous section. For these opportunities, the C&S program will complete a gap analysis to identify distance between code readiness attributes and the current market status of the technology, which will inform the creation of an integrated long-term coordination plan. Long term information repositories may be developed to collect information that will support adoption in a future code cycle.

**Direct linkages.** The C&S program seeks to directly link, as has been done for the current Title 20 television proposal before the CEC, code proposals with incentive programs. When faced with industry resistance, this linkage constitutes a stronger argument before the

---

<sup>21</sup> AB 1109 Huffman directs the CEC to implement strategies to reduce residential lighting by 50% and commercial and outdoor lighting by 25% by the year 2018.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

commission. Moreover, linking a standard with an incentive program creates a synergy in which the push of a widely recognized future standard reinforces the pull of near term incentive programs, thereby increasing participation in a complementary incentive program.

Albeit weaker compared to direct linkages, the synergy between standards and incentive programs exists more generally through indirect linkages.

Strategic Plan Codes and Standards Goal #2: Improve code compliance and enforcement. (Subprograms 3 and 4: Compliance Improvement and Reach Codes)

The C&S program is committed to improving code compliance and enforcement. To demonstrate this commitment, C&S is expanding the CI subprogram. The program will leverage existing, and develop new education and outreach activities to equip both building and appliance industry market actors with the knowledge and tools needed to comply with Title 24 building energy efficiency standards and Title 20 appliance efficiency regulations. Expanding the program to include compliance improvement will help ensure that the full potential of the state's codes and standards efforts are realized, and results in a comprehensive C&S program.

The C&S strategies and activities listed in the Strategic Plan are focused primarily on Title 24 building energy efficiency standards, noting that appliances are principally regulated at the federal level rather than the state level. As the CPUC Strategic Plan also notes, there remains huge potential savings at the state level for appliances and equipment not regulated by the federal government. With this in mind, the C&S program has added activities to capture Title 20 compliance savings as well and added a sixth implementation item for this program cycle in the Strategic Plan Table below to document planned Title 20 efforts.

*Strategy 2-1: Improve code compliance and enforcement.*

The Strategic Plan identifies one strategy and five activities targeted to improve compliance and enforcement with Title 24 building energy efficiency standards. Each activity is addressed in order below.

Activity 2-1 a): Conduct research to determine high-priority tactical solutions for code compliance and focus efforts accordingly.

As a first step in launching compliance improvement efforts, the C&S team will interview the building industry market actors included in the compliance supply chain to determine how their current performance compares to the desired performance, the reasons for the gap, and which performance improvement solutions the C&S program may employ to improve code compliance. Additionally, the team will interview experts who have been providing training, software and regulatory support to industry practitioners over the years to identify best practices, possible points of collaboration and gaps the C&S program can help fill. Furthermore, the C&S program will conduct a process pilot with several local

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

governments to investigate code enforcement processes in detail, identify opportunities to streamline enforcement practices and improve consistency across jurisdictions. Results of these research efforts will inform the total package of performance improvement solutions the program will implement to help improve code compliance rates. In addition, the results of the compliance improvement process study that included a stakeholder roundtable discussion will be compared with the interviews.

Activity 2-1 b): Increase training and support for local building code officials.

Building code officials are the primary key to improving compliance with Title 24 standards and certain Title 20 regulations such as residential air conditioning equipment. Building department personnel must enforce several different building codes simultaneously, with limited resources. Given the limited time available, officials correctly prioritize those codes related to life-safety, which often results in extremely limited time and resources dedicated to enforcing energy-related codes. In addition to resource limitations, energy codes have undergone much more significant changes in each of the recent code updates than most other codes, thus creating a challenge for officials to maintain their expertise.

The CI subprogram will focus a significant percentage of the code education resources on providing training and support to building code officials. Based on research results, the CI subprogram will develop role-based training courses and abbreviated code guidelines for plan checkers, inspectors and counter staff specifically targeting only those sections of the code related to each particular position. This work will be closely coordinated with the CEC and third party efforts to ensure that it supports and is in alignment with the CEC's compliance improvement efforts.

In addition, in response to the needs assessment to be conducted as part of the local government process pilot, the CI subprogram will develop and test process improvement tools, and will work with CALBO, the International Code Council (ICC), and CEC to conduct outreach to other jurisdictions to encourage adoption of those tools. The CI subprogram will conduct outreach and encourage other jurisdictions to adopt tools and processes that help building officials increase compliance. The CI subprogram will support more consistency across jurisdictions, in processes, documentation requirements and enforcement practices, and will encourage the expansion of submitting online permitting paperwork for HVAC replacements as well as other measures. These online submittals allow for the creation of customized inspection checklists that also simplify enforcement.

The CI subprogram will also work with the CEC and HERS providers to ensure the new HERS documentation and data management systems are consistent and serve to streamline the compliance process.

Activity 2-1 c): Investigate regulatory tools such as licensing/ registration enforcement.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Currently, although Title 24 documentation must be signed by a licensed professional, the actual calculations can be prepared by anyone. Anecdotal evidence from rebate programs and building departments indicates that the lack of training and/or professional certification requirements results in sub-par documentation being submitted to building officials, thus requiring more time to review documents and determine compliance. The CI subprogram will work with the California Association of Building Energy Consultants (CABEC), CEC and CALBO to increase the stringency of the Title 24 Certified Energy Analyst test, initiate a certification process for Title 24 consultants, and begin requiring energy education for building officials as part of CALBO's existing continuing education requirements.

The CI subprogram will also work with the CSLB (California State License Board) and the DCA (California Department of Consumer Affairs) to conduct outreach to members regarding the importance of the standards to the state and to their customers, and to encourage the CSLB to enforce the HVAC permitting requirements with their members.

Activity 2-1 d): Evaluate proposed changes to the code and compliance approaches to simplify and expedite compliance.

Feedback from building officials indicates that they are overwhelmed by the volume, complexity, and rapid changes to the energy codes. As a complement to the role-based training, the CI subprogram will work with industry experts, CEC, and building officials to develop and test role-based and context-sensitive code guidelines. The guidelines will target specific compliance items and common measures that must be addressed at each stage in the permitting and inspection processes.

The CI subprogram will conduct research to identify specific areas of the code that can be simplified by reducing the number of trade-offs and compliance options and/or transitioning to a greater number of mandatory measures.

In addition, the CI subprogram will work to increase the availability of online permitting resources and the consistency of requirements and documentation across all jurisdictions, with an initial focus on geographically contiguous regions. Online permitting makes obtaining permits more convenient and less costly, and geographic consistency provides a more stable and easier-to-understand process for building designers and contractors, as well as building officials.

Activity 2-1 e): Work with local governments to improve code compliance, adopt above code ordinances, and provide training/education.

The primary goal of the compliance improvement subprogram elements is to improve code compliance. As discussed in activities a) through d) above, CI subprogram will be dramatically expanding and enhancing efforts in support of this goal, launching several different outreach and training offerings and activities.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

The C&S RC subprogram has adopted a demand-side philosophy to local code adoption, consistent with the general philosophy of energy efficiency. California has a very robust energy efficiency code that can, if fully enforced, result in a tremendous amount of savings and reduction in both energy usage and peak demand. The RC subprogram will conduct outreach to local governments and green communities through Government Partnerships Programs, Build It Green, and others industry partners to educate interested participants about the potential savings that could be realized through optimizing compliance with existing codes prior to adopting a new code. The RC subprogram will inform local governments that optimizing compliance with existing codes is one of the most immediate and significant steps a city or county can take toward reducing the jurisdiction's carbon footprint, and will request a commitment from each participant to take documentable steps toward that end.

Many local governments, in their eagerness to take action in the absence of federal leadership, have individually developed and adopted unique local codes to reduce the climate change impacts of the building activities in their jurisdictions. Unfortunately, codes are developed and adopted without any real overall coordination with other jurisdictions, resulting in a plethora of local ordinances and code requirements throughout the state that are changing frequently, making it impossible to easily track what code applies in which jurisdiction at any given time. The RC subprogram will encourage local governments to work with neighboring jurisdictions to adopt consistent requirements and to remain consistent with current Title 24 climate designations to reduce potential market confusion.

One of the RC subprogram goals for local codes is to promote consistency with the current Title 24 climate zone structure, with which market actors are used to working. The RC subprogram will work with local government partners to identify and document their objectives for a local code and also with the CEC and Building Standards Commission (BSC) to make the next generation of the State's Green Building Standards meet those objectives for most, if not all local governments. First, the RC subprogram will work with local governments to support development of a package of cost-effective local energy codes that exceed Title 24 minimum requirements for residential and nonresidential new construction. The RC subprogram will support efforts to obtain CEC pre-approval to simplify the approval and adoption process at the local level. In addition, to begin harnessing the tremendous savings potential from existing homes, the RC subprogram will support development of a package of standards that are applicable at time-of-sale or major remodels. Local ordinances will serve as an opportunity to test the efficacy of the codes and inform regulators as to the readiness of the codes for statewide adoption.

Activity 2-1 f): Conduct outreach and education efforts to improve compliance with Title 20 Appliance Standards.

The IOUs' experience working with industry actors on Title 20 advocacy indicates that there are two primary paths for equipment covered by Title 20 to move through the supply chain from manufacturers to consumers. The first is via manufacturers, distributors and

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

contractors, while the second is via retailers directly to consumers. Similar to the Title 24 outreach, the IOUs plan to target each actor in the supply chain for selected measures with significant savings potential and for which compliance rates are relatively low.

Given the wide range of industries and the organization of their distribution channels, compliance improvement activities for appliances will be conducted on an industry-specific basis. For example, compliance improvement outreach for manufacturer-dominated industries logically begins with manufacturers since top down efforts will affect most product sales in California. If major manufacturers are located overseas, as is the case of consumer electronics for example, we fully expect the need to travel to other countries to conduct effective outreach and training.

Different approaches will be used to educate and train retailer-dominated and contractor-dominated industries. In the retailer-dominated case, for example, compliance efforts must target the stocking practices of these retailers. In the contractor dominated case, where contractors are largely responsible for the purchase and installation of the product, compliance efforts must focus on outreach to contractors.

The C&S program will coordinate with the CEC to conduct outreach to equipment manufacturers to inform them of existing code requirements, and to facilitate their compliance from both a technical and administrative perspective. Assistance will be provided to manufacturers to support their efforts to ensure equipment sold in California meets the minimum technical requirements, and to successfully complete the certification process with the CEC.

For measures such as pool pumps, where most are sold through distributors and installed by contractors, in addition to working with the pump manufacturers, the program will work directly with distributors to educate their representatives. The IOUs will also conduct outreach to contractors directly, and will work with trade organizations to leverage their existing communications networks. Outreach activities may include attending trade conferences and regional meetings, authoring articles for industry newsletters or publications, or direct contact via email or printed materials.

Other measures, such as incandescent lamps and consumer electronics are often purchased directly by consumers through retail establishments. Though the market actors are different for these measures, the C&S program will use similar methods to reach as many market actors as possible. Trade associations are expected to be important stakeholders in this effort and will be leveraged as much as feasible. The IOUs will coordinate with regulators and other providers to identify gaps and opportunities to collaborate.

## **7. List of Measures & CASE Studies**

Following are tables of possible IOU CASE study topics. For a number of reasons, these lists are not static. After further planning, IOUs may decide to swap leads, co-fund, or make other

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

changes, as appropriate. During the CASE study development process, it is sometimes found that there is insufficient market data or economic information to justify a standard. During rulemakings, industry representatives may inject sufficient uncertainty to derail a proposal. The CEC may indicate that they are more interested in some proposals and delay others. Sometimes new ideas occur that were overlooked during the planning process.

The CASE study projects develop feasibility and cost-effectiveness evaluation for a variety of code improvement opportunities. These CASE projects are not a purely technical exercise, advocacy is an important part of moving an idea into energy codes and this requires a significant amount of consensus building and negotiation.

Table 6 includes a preliminary list of measures from the CEC to be evaluated for the 2016 Title 24 Building Efficiency Standards cycle. These will inform IOU planning.

**Table 6: 2016 Title 24 Building Codes - Preliminary Measures**

<b>2016 Title 24 Preliminary Measures</b>	
<b>Preliminary Nonresidential Measures</b>	
Measure	Description
Flicker specification for all dimming systems	Flicker is a function of the lighting source (ballast, driver) and the dimming control
Task/ambient lighting for offices	
Low W/sf HVAC systems	Prescriptive performance-based requirement, cap on total installed watts.
Optimized Window Area, Update Window VT's	Reduce WWR from 40% to 30% while maintaining visual comfort. Estimate that 0.11/WWR reduced VT reduced daylighting savings by 25%. See ASHRAE ECB reduced WWR by building type.
Nat ventilation, dedicated O/A, + chilled beam or radiant system	Drive down fan energy. Window sensors interlocked with fan system
Dual path approach PV vs High Eff HVAC	Base case has 1W/sf of roof area, alternate has high eff HVAC
Eliminate reheat	Through zoning of systems or designs such as dual duct design, reheat can be mostly eliminated.
Daylighting control dimming plus off.	Ballasts can use 20% of power when fully dimmed. In primary zone no light can be needed much of the day. Added savings.
Opaque envelope U-factors	ASHRAE roof values are significantly lower
Retail lighting including occupancy controls	Fix general lighting in tailored method. Further LPD reductions, trade-offs with occupancy sensing controls
Skylighting in lower ceiling heights	Skylighting required in spaces > 15 ft, related to cost of lighting well and spacing of skylights. Technologies to reduce cost of light wells and to spread light so skylights can be further apart.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Egress lighting	Turn all the way off when space is unoccupied. Effort involves working with state fire marshal and perhaps NFPA.
Economizers	Catch up to IECC - required down to 33 kBtu/h, FDD updates
Façade and landscape lighting	ASHRAE has lower LPDs
Parking lot lighting (tall pole motion sensing?)	Motion controlled bi-level expanded to above 24 ft if technology ready. Consider expanding to other applications.
Solar pool heating for hotel/motels	Scoped out as cost-effective application of solar pool heating (year round operation)
Lab fume hoods, Occupancy sensing control of sash	Sash can be closed when no one is in front of fume hood. Saves energy and increases IAQ
Streamline and remove exceptions	Simplify and expand scope when possible
Plug-in hybrid and EV charging circuit	Reduces transportation costs and emissions, coincident with PV output
Plug for trucks at refrigerated warehouses	
<b>Nonresidential ACM</b>	
Refrigeration model in ACM	Allow trade-offs
Whole building (BEARS) model including deemed plug loads.	Software also generates BEARS rating and ZNE rating
Improved Natural Ventilation simulation	
PV model offsets consumption	Also useful; for ZNE rating
Radiant model including comfort	Provides accurate estimate of benefit of radiant cooling methods
Improved VRF simulation	Current model may be inaccurate. May require added manufacturer data for credit
Base case WWR by building type	ASHRAE 90.1 has reduced WWR for dome building types (i.e. 22% for schools, 11% for retail, 7% for grocery store, 19% for small office etc.)
Solar absorption air conditioning	
Combined heat and power	
<b>Process Loads</b>	
Evap fan speed control for walk-ins	Saves fan energy and compressor energy
Pipe sizing for compressed air systems	Pressure drop losses reduced
Specific efficiency requirements for refrigeration equipment	
Air dryer efficiency for compressed air	Modulating systems versus on/off systems
Capacity controls for centrifugal compressors	Remove exception from compressed air system requirements

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

<b>Preliminary Residential Measures</b>	
Low-rise multi-family prescriptive package	
QII - Quality Insulation Installation inspection	
All high efficacy lighting	Show availability of high quality high efficacy products for all sockets. Trade-off with PV
Ducts in conditioned space or ductless HVAC	Variety of methods, cathedral ceilings, scissor truss, mini-splits etc.
Tested Infiltration < 3 ACH 50	Catch up with IECC, have to show IAQ is OK, may be done in conjunction with mandatory CALGreen to reduce source pollutants
Compact water distribution	Measured length of pipe between water heater and fixture
Controlled supply mech ventilation	Better air quality, cleaner house
Dual path PV with high efficiency HVAC and DHW	
Coastal compressorless comfort	White paper for 2013 standards
Walls - R-21 + R5 in all CZs	Also consider R-15+ R-8 exterior insulation
Windows 16% of floor area	Highly controversial, should be based on survey
Heat recovery ventilator	Heat recovery in very hot or very cold climates
Simplify and remove exceptions	
Plug-in hybrid and EV charging circuit (MF)	
High efficiency white goods	Credit in model perhaps prescriptive trade-off
<b>Residential ACM</b>	
Multi-family modeling	
Evaporative cooling modeling	
Ductless AC system modeling	
Sealed attic modeling	
Whole building (HERS) model including deemed plug loads.	Basis of HERS rating and ZNE
PV model offsets consumption	Supports ZNE goal
Locational efficiency credit when solar access is low	Prepare for ZNE or equivalent

Table 7 includes a preliminary list of Title 20 measures under consideration by the CEC for the 2012-2015 Title 2- cycle. These will inform IOU advocacy work .

**Table 7: Title 20 Appliance Standards – Preliminary Measures.**

<b>Title 20 Measure</b>	<b>Description (all subject to change)</b>
-------------------------	--

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

<i>Lighting</i>	
Dimming ballasts	Minimum efficiency standards for dimming ballasts, and possible limits on standby wattage. Standard would likely use the Relative System Efficacy (RSE) or the Ballast Luminous Efficiency (BLE) metric, with minimum performance requirements at full light output only or at several light levels.
Multifaceted-Reflector lamps	Minimum efficiency standards for multifaceted-reflector lamps, possibly with tiered standards. May also require minimum light quality/lamp performance standards.
LED lamps	Require LED lamps to meet minimum performance requirements (e.g. dimming and lamp life), minimum light quality standards (e.g. CRI), and modest efficiency (lpw) requirements.
EISA exempt lamps	Apply existing T20 general purpose light bulb standards to EISA exempt bulb types, including: 3-way, 2,601 – 3,000 lumen, shatter-resistant, candelabra base, intermediate base. All can accommodate halogen capsules for reduced power. Consider coverage at similar stringency as non-exempt bulbs (approx. 30% lower power)
Lighting Accessories	Maximum energy use and standby power for nightlights (NL), maximum power/bulb requirements for decorative string lights (DSL), and maximum power requirements for illuminated house numbers (IHN).
Outdoor Lighting	Sets minimum performance requirements for pole-mounted outdoor lighting, including street, highway, parking, and area fixtures with “controls-ready” requirements in some cases.
Linear fluorescent fixtures	Propose test and list requirement for Energy Effectiveness Factor (EFF) and listing on product documentation resulting Target Efficacy Rating (TER) values from a combination of lamp lumens and ballast factors.
Illuminated street number signs	Set an efficacy standard (active power limit) to effectively require LEDs. Recommend requiring that all illuminated address numbers utilize photo-switches. Finally, recommend a standby power limit of 0.75 W.
Plug-in luminous signs	Set a standard establishing maximum power per square foot of illuminated area, and additional control requirements (required integral on/off switch, supplemental control for signs with face area(s) greater than 4 sqft).
Computers	Propose maximum energy requirements and power management enablement upon shipment for desktops and laptops; minimum power supply unit efficiencies for desktops. Exploring energy use limits or power limits in different operating modes.
Servers	Propose minimum power supply unit efficiencies and power proportionality for servers.
Game consoles	Set standard to require an auto power down feature and establish a maximum allowable standby power level.
Computer/video displays	Set maximum On Mode and Sleep Mode power consumption levels, as a function of screen size. Consider luminance and automatic brightness

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

	control requirements.
Set top boxes (terrestrial, cable and satellite)	Propose an energy use limit for new STBs. May include prescriptive requirements such as auto-off feature and performance-based maximum power demand per defined feature set (e.g., per tuner). Develop test and list requirements for small networking equipment.
Imaging Equipment	Propose maximum total energy consumption (TEC) levels for imaging equipment, which includes copiers, fax machines, printers, scanners, and all-in-one devices.
Low power modes	May propose required low-power modes, with maximum power levels, for various equipment. Low power modes include sleep, standby, idle, off.
Power Factor Interactive Effects	Appliance energy efficiency performance is influenced by power factor, such that losses in distribution circuits can be reduced by improving poor power factor. This is currently being studied in PIER research. This proposal would bring PIER findings into code as a consistent policy for appliances where merited
<b><i>Water and Miscellaneous</i></b>	
Toilets and Urinals	This standard proposal revises the current standards in Title 20 regulations to conform to the legislatively enacted performance standards of AB715, by having toilets have 1.28 gallons per flush and urinals have 0.5 gallons per flush effective January 1, 2014.
Air Filter Labeling	Require a label for air filters (a consumer version of the existing AHRI 680 label) so that consumers and designers can select the appropriate filter for the system.
Pool and Spa Equipment	Update current regulations to better align with APSP 15. Add performance efficiency requirements for new and replacement motors and pool heater hydraulic performance. Require labeling of efficiency performance and compliance information on portable electric spas to better inform consumers.
Faucets	This standard proposal sets the maximum flow rate for lavatory faucets and lavatory replacement aerators at 1.5 gpm at 60 psi, effective January 1, 2014. It also expands the definition of lavatory replacement aerator to include all flow restricting accessories, to encourage design best practices.
Water Meters	Propose requiring testing for accuracy of residential water meters at levels indicative of household leaks, to better identify and prevent leaks.
Landscape Irrigation Equipment	Set performance standards and labeling requirements for landscape irrigation controls and sensors; require a rain shut-off device and a test and list for landscape irrigation controllers (and add-on devices) for standby mode power.
Commercial Clothes Dryer	Commercial gas dryers are regulated by neither federal nor California regulations; there exists the opportunity to establish new Title 20 standards for commercial gas dryers to be sold in California. The C&S program will develop the testing procedure for Energy Factor of

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

	commercial clothes dryers, and establish a minimum performance requirement.
Refrigeration Condensing Units	Develop test procedure for EER for fixed output refrigeration condensing units and part load EER for variable output refrigeration condensing units. Establish a minimum performance requirement. Require either floating head control; require systems operate at 70°F or lower min. condensing temp.

Table 8 shows a preliminary list of federal appliance standards rulemaking events. IOUs will respond to rulemaking events carried out by USDOE, and possibly others, that impact California.

## 8. Coordination & Integration

At the CPUC's direction, the C&S program is adding a non-resource Planning and Coordination Subprogram to improve the integration of portfolio program offerings. The C&S team will coordinate with both internal and external entities to establish a dynamic and integrated planning and implementation process to methodically and purposefully accelerate the movement of successful, cost-effective measures from the ET program through voluntary offerings and ultimately to adoption into standards. The three primary functions of the planning and

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

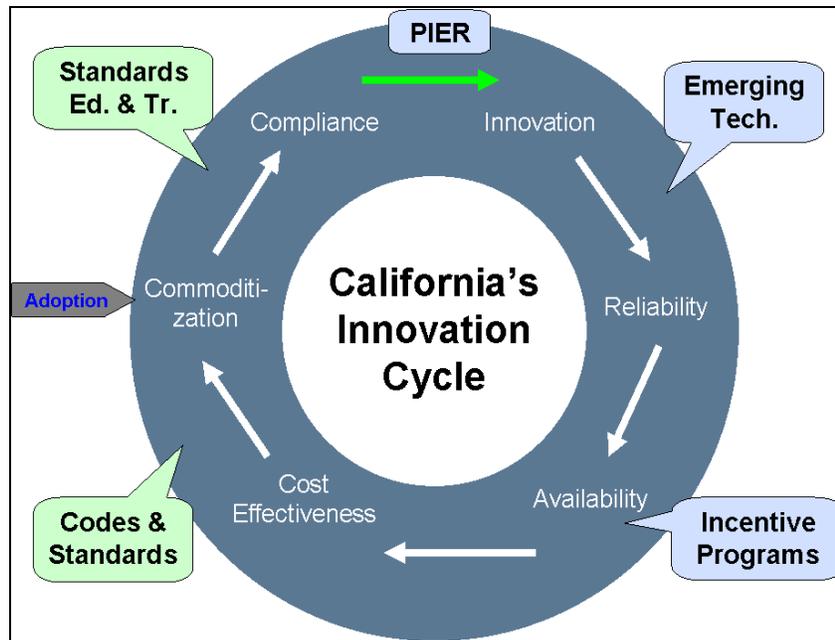

coordination subprogram include strategic planning, internal coordination and communication, and statewide collaboration.

**a) C&S State wide Coordination**

Many requirements for C&S coordination are derived from the CPUC’s objective to mitigate climate change through regulatory objectives, including Title 20 and Title 24. While the C&S program comprises the primary intervention to achieve these objectives, it must be considered within the context of California’s innovation cycle:

- Adoption causes commoditization in the sense that a once high margin product becomes the industry standard.
- Commoditization spurs companies to innovate.
- Innovation creates new, differentiated, high-margin products for the competitive market.
- Voluntary programs commercialize new innovations.
- Commercialization creates code readiness leading to adoption.

**Innovation Cycle**

Since the primary purpose of the C&S program is to propose and support adoption of code enhancements, it is essential that IOUs collectively respond to all significant energy savings opportunities identified for a future code update cycle. For example, IOUs are now planning how best to coordinate efforts to address a long list of potential Title 24 code

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

enhancements for the 2011 code cycle. In general, planning is conducted on an as needed basis.

Codes and standards operations are conducted relative to a multi-year time horizon, so statewide meetings organized on a quarterly basis are sufficiently frequent to coordinate activities. Some CASE studies are developed through co-funding agreements when multiple IOUs are interested in or have specific value-added knowledge, perhaps through previous research. More typically, however, code proposals are developed by one IOU on behalf of the statewide since each proposal is a fraction of the program budget. During these meetings, the primary objectives are to discuss CASE study objectives and develop mutual support for public proceedings.

The C&S program will enhance coordination and integration of codes and standards with other energy efficiency programs to maximize energy savings and demand reducing by coordinating training programs and utilizing the experience gained in resource programs to inform the development and advocacy of new codes. The C&S program will work with the Government Partnerships to improve code compliance, adopt above code ordinances, and provide training and education. The C&S compliance improvement subprogram will focus efforts on HVAC new installations and replacements in coordination with the HVAC program. The C&S program will also meet periodically with HVAC program staff to discuss compliance improvement strategies, training, and other program needs.

Coordination between C&S and other parts of the portfolio falls into one of two categories: existing standards and future standards. Compliance with code is essential to completing the commoditization process and capturing the benefit of commercialization efforts for the benefit of society, so the CI subprogram leads efforts to implement existing standards through development of core activities that can be delivered either through, or in coordination with, other programs. Opportunities are identified through small group meetings between C&S and each target group such as workforce education and training, local government partnerships, new construction programs. In addition, the IOUs will coordinate program efforts with the local utility integration teams and the Statewide Integration Task Force to identify successful integration approaches and offerings, potential pilot programs and metrics.

Small group meetings mentioned above, are particularly useful, as they serve to identify incentive program opportunities to leverage the pull of existing standards that have effective dates far enough in the future to accommodate program changes. For example, an appliance standard adopted with an effective date two years hence would provide an opportunity to develop an incentive program pull that complements the C&S push.

Coordination activities around future standards are, likewise, developed through individual targeted meetings. Once the C&S team has identified potential code enhancement opportunities for a future code proceeding, the team meets with Mass Market, Targeted Market, Emerging Technologies, HVAC, demand response, or general education and training leads to discuss gaps between adoption needs and current code readiness. As

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

appropriate, new measures may be added to incentive programs, new projects may be added to the ET portfolio. Sometimes, when ongoing CEC proceedings coincide with incentive program planning, incentive offerings can be integrated with code enhancement proposals to increase influence on proceedings.

Coordination with external organizations falls into a few broad categories. A particular code proposal typically attracts directly affected industry stakeholders. If an industry employs associations organized to oppose energy efficiency standards – which is usually the case – IOUs will seek support from other advocates and share information that enables their advocacy, as well as ours. Sometimes IOUs are able to work directly with industries that are not, in principal, opposed to all regulations.

**b) C&S Coordination with External Organizations & Entities**

As Federal preemption continues to grow, and as DOE continues to increase federal proceedings activities, it is necessary for California IOUs to increasingly engage with national organizations such as ACEEE, ASAP, and the NNRDC. In particular, since the innovation engine, as pictured above, turns over once every three years in California and once every eight to ten years at DOE, the C&S program needs to work with national organizations to relax federal preemption policies to better help California meet AB 32 energy efficiency targets. California IOUs have ramped up operations to contribute materially DOE proceedings through analysis, letters, and negotiations.

At a statewide and local level, the C&S program will develop training and compliance improvement activities with entities that include, but are not limited to, California Building Industry Association, local chapters of the Building Industry Association, Build it Green, Institute of Heating and Air Conditioning Industries, International Brotherhood of Electrical Workers, National Electrical Contractors Association, California League of Cities. Additionally, outreach and communications for Title 20 will include industry associations such National Electric Manufacturers Association, American Lighting Association, California Retailers Association, and the International Pool and Spa Association.

**How the Codes & Standards Program will Coordinate with  
Other Energy Efficiency Programs**

<b>Program With Which C&amp;S Will Coordinate</b>	<b>Coordination with Advocacy Subprograms</b>	<b>Coordination with CI or RC Subprograms</b>
HVAC	<ul style="list-style-type: none"> <li>➤ Research possible scenarios to help improve HVAC quality construction</li> <li>➤ Develop a whole</li> </ul>	<ul style="list-style-type: none"> <li>➤ Research the HVAC permitting tools available on the market, select permitting tools to test during the local government</li> </ul>

Program Implementation Plan**

<b>Program With Which C&amp;S Will Coordinate</b>	<b>Coordination with Advocacy Subprograms</b>	<b>Coordination with CI or RC Subprograms</b>
		<ul style="list-style-type: none"> <li>➤ Investigate the feasibility of an HVAC serial number tracking process to increase compliance. Various HVAC industry groups and HVAC distributors have expressed an interest in pursuing this as a way to increase the quality of installations and better ensure Title 24 compliance.</li> </ul>
Government Partnerships		<ul style="list-style-type: none"> <li>➤ CI subprogram personnel will conduct a holistic process pilot in select building departments in addition to developing and delivering role-based tools and training to building department personnel.</li> <li>➤ RC subprogram personnel will encourage local governments to lead by example, and to adopt codes for government buildings that match or exceed the requirements for the private sector within their jurisdiction. Those local governments that do not wish to adopt reach codes for the private sector will be encouraged to at least adopt more stringent codes for their own buildings.</li> <li>➤ Initial C&amp;S efforts will focus on encouraging and supporting local governments, designers, and builders/contractors to implement and enforce existing acceptance testing requirements. CI will work with the CEC, CA Commissioning Collaborative, and industry organizations such as SMACNA to conduct outreach and provide acceptance testing education at all levels of the supply chain.</li> </ul>
Workforce		<ul style="list-style-type: none"> <li>➤ CI will work with Workforce</li> </ul>

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

<b>Program With Which C&amp;S Will Coordinate</b>	<b>Coordination with Advocacy Subprograms</b>	<b>Coordination with CI or RC Subprograms</b>
Education and Training		<p>Education and Training program managers, CABEC, Sonoma State University, CalPoly San Luis Obispo and others throughout the state to develop a curriculum that can be implemented at the state and community college level to expand current energy-related offerings and train building energy analysts in the theory and concepts of energy-efficient building design, simulation and construction.</p> <p>➤ CI is working with IBEW, NECA, California Community Colleges, and others to develop and implement an electrical contractor’s training program for advanced lighting controls. This is a critical step in facilitating the installation of the sophisticated lighting controls that are essential to meeting the AB1109 Huffman Bill and zero net energy goals.</p>
Targeted Markets/Mass Market/Emerging Technologies	<p>➤ Through small group meetings, C&amp;S will work with the Mass Market, Targeted Market and Emerging Technologies programs to identify incentive program opportunities to leverage the pull of existing standards that have effective dates far enough in the future to accommodate program changes. For example, an appliance standard adopted with an effective date two years hence would provide an opportunity to develop an incentive program pull that</p>	<p>➤ CI will work with fellow energy efficiency program managers to identify and fulfill code-related training needs in order to keep program managers up to date on current and future codes, and to help prepare IOU sales reps with the knowledge they need to effectively market incentive programs.</p>

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

<b>Program With Which C&amp;S Will Coordinate</b>	<b>Coordination with Advocacy Subprograms</b>	<b>Coordination with CI or RC Subprograms</b>
	<p>complements the C&amp;S push. For promising measures that are evaluated by the ETP, the C&amp;S program may propose that they are included in reach codes in parallel with EE incentive programs.</p> <ul style="list-style-type: none"> <li>➤ C&amp;S will work with the targeted and mass market program managers to require program participants to complete and submit the applicable acceptance tests required by Title 24 to receive an incentive for HVAC and lighting controls equipment. This will increase compliance with the acceptance tests and help assure the incented equipment is installed according to code intent.</li> </ul>	

**9. Marketing & Outreach/Education & Training**

Outreach for advocacy activities occurs through telephone calls and e-mails to industry stakeholders throughout the CASE study development process, leading up to commencement of a CEC rulemaking. After commencement of CEC rulemaking proceedings, CASE studies are presented during public workshops and hearings conducted by the CEC that are typically attended by building or appliance industry representatives, environmental groups, compliance industry representatives including local government officials, advocates from other states. In response to industry issues and concerns, the IOUs and their consultants will contact specific representatives or conduct stakeholder meetings to address specific issues more broadly. Following adoption hearings, the IOUs participate in developing compliance manuals.

Compliance improvement encompasses numerous industries engaged in supplying buildings and appliances to California; hence, outreach and marketing activities will be conducted through a variety of channels. IOU's training centers will conduct direct outreach to industry associations such as the Contractor State Licensing Board, California Building Officials Association, California Association of Building Energy Consultants, Consumer Electronics Association, and National Electrical Manufacturers Association. E-mail solicitations and paper

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

calendars are sent to individuals notifying them of upcoming classes. Local governments will also be contacted through local government partnerships and circuit riders assigned to provide consulting services.

## **10. Quality Assurance & Evaluation Activities**

To help ensure quality assurance and effective evaluation, the IOUs will continue their ongoing efforts to track and assess the effectiveness of the C&S Program in advocating for new codes, and for increasing compliance with existing codes.

The C&S program will continue to support the impact evaluation efforts of the CPUC and its contractors by documenting code advocacy efforts, and documenting compliance improvement efforts and education and training efforts and their effects on participant behavior. The IOUs will coordinate with the CPUC and their impact evaluation contractors to ensure that the sufficient type and level of data are being collected at the appropriate level of detail to enable an estimation of energy savings related to codes and standards activities. This includes supporting the CPUC in their research effort to establish Title 20 and Title 24 baselines, and track changes in adoption and compliance over time. This includes providing appropriate program data, as well as encouraging the participation of vendors, contractors, building officials and others, as appropriate, in providing information for establishing baselines and changes in penetration over time.

For the purpose of quality assurance in carrying out and improving the C&S program, the IOUs will be conducting various qualitative evaluation activities to establish IOU effectiveness in various market transformation activities. These include but are not limited to:

- Code adoption - Research with participants in the code adoption process to assess the level and quality of participation by the IOUs and other stakeholders. This includes interview-based research, as well as review of documentation of participation.
- Compliance Improvement – Effectiveness of various education and training activities, based on pre- and post- participation assessment of ‘knowledge swing’ of participants, and commitments to action made by participants and participant organization that stem from compliance improvement activity. Initial assessments will be succeeded by assessments in the post period to identify changes in code-related activity resulting from the CI subprogram.
- Reach Code Assistance – Effectiveness of IOU efforts to assist local governments in establishing, implementing and enhancing compliance with reach codes. Initial assessments of energy codes and code compliance, local code support capability and other factors will be followed by an ongoing assessment of the effects of IOU reach code assistance.

For compliance improvement, the IOUs will be using this assessment process to identify changes in awareness, capability and behavior change among individual CI participants, and participant organizations, resulting for the various compliance improvement activities. The

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

IOUs will also look into calibrating our assessment of compliance improvement through evaluations of non-participant awareness, capability and behavior changes. For example, if there is a compliance improvement effort focused on building officials, the research could include an assessment of awareness, capability and behavior of building officials who did not participate in the training.

Additional, formative research will be conducted to provide insight into emerging issues related to current and pending codes and standards. Specifically, research will be carried out to identify issues and trends appearing along the delivery chain for appliances as well as for building practices.

**11. Program Theory & Logic Model and Performance Indicators**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below are the approved logic models for the C&S program.

- a) Building Codes
- b) California Appliance Standards
- c) Federal Appliance Standards
- d) Compliance Improvement
- e) Reach Codes
- f) Planning and Coordination

Logic models will be improved based on experience and finalized based on application to specific industries, local governments.

Logic Models and the accompanying Program Theory and Program Indicators are tools designed to illustrate program structure and operation for the purpose of program management. This logic model is a schematic of the program as planned.

A program theory is the basis of a logic model. Effective program management applies program theory, and related performance indicators are used to determine whether program theory is correct. Indicators enable informed management responses that improve programs.

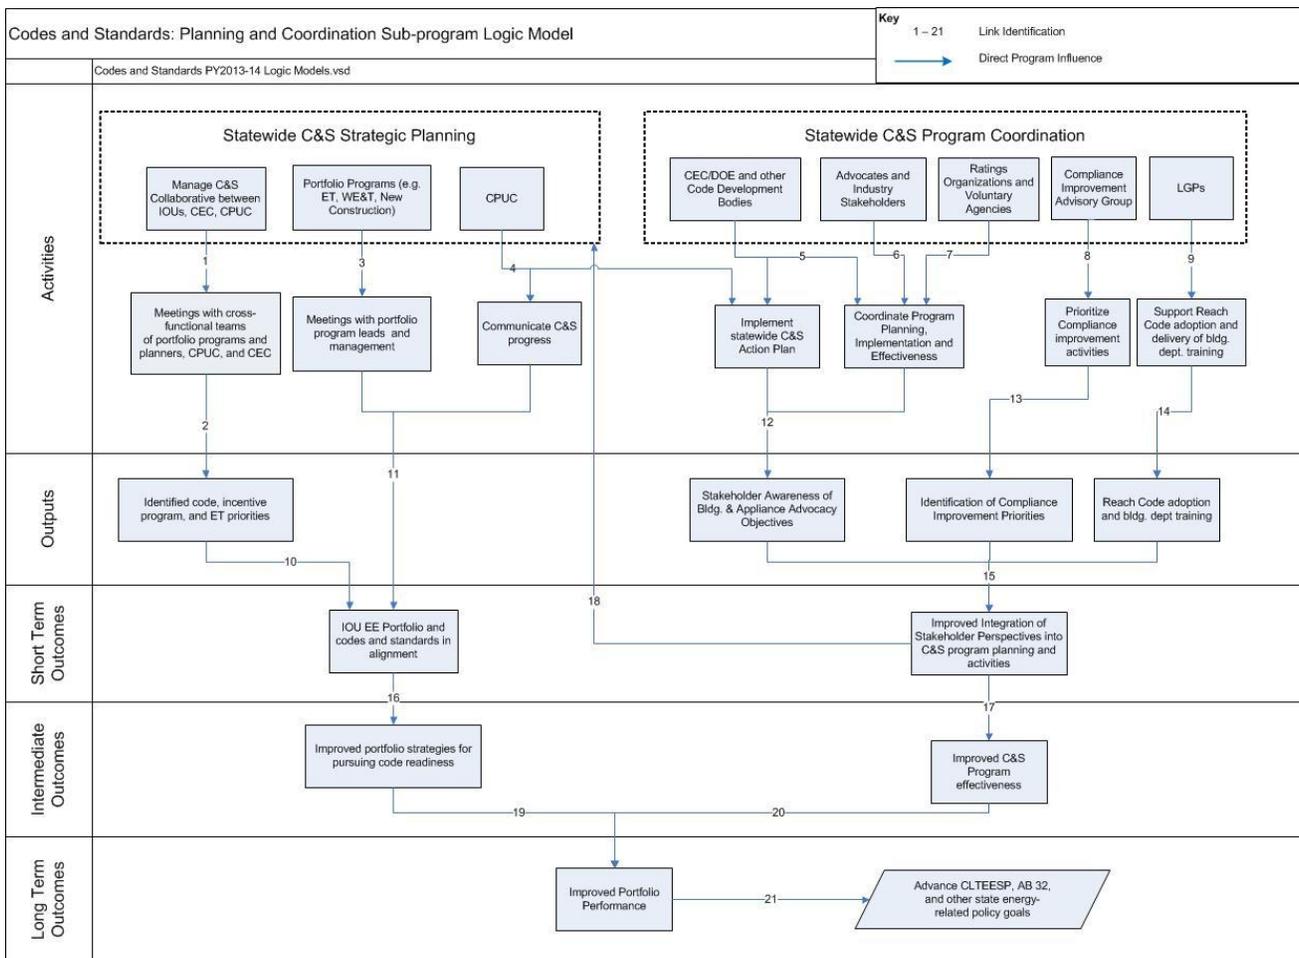

Performance indicators are intended to serve as a program's 'dashboard'; displaying information necessary for effective program operation. As with automobile dashboards; indications are neither good nor bad, but enable appropriate management responses that maintain and/or improve program performance.

Logic models, program theories, and performance indicators can provide evaluators an understanding of program activities, outputs and outcomes. However, they are not intended as

# 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

the basis for estimating, valuing, or attributing program savings as they focus on program operation rather than program results. Revised logic models and program theory tables will be included in a future addendum to the PIP.

Revised logic models and program theory tables will be included in a future addendum to the program implementation plan.

Statewide Codes and Standards Program  
Program Implementation Plan**

5	IOU proposed code change language is included in CEC adopted reach code standards	<ul style="list-style-type: none"> <li>Adoption of CEC-approved reach codes by BSC includes IOU proposed code change language</li> </ul>
6	C&S Program efforts support the development of energy efficiency reach standards by CEC and BSC	<ul style="list-style-type: none"> <li>Adoption of CEC-approved reach codes by BSC</li> <li>Support and contributions to CEC/BSC reach codes efforts, in particular CALGreen</li> </ul>
7	C&S Program advocacy to BSC and HCD to support adoption of energy efficient standards into CALGreen	<ul style="list-style-type: none"> <li>Advocacy for industry energy efficiency standards, such as ASHRAE Std 189, influence the CEC-approved reach codes adopted by BSC</li> </ul>
8	BSC adopted reach code (CALGreen) is used for the basis of local reach code development	<ul style="list-style-type: none"> <li>Local ordinance development begins with consideration of BSC adopted reach code (e.g. CalGreen Tier 1 or 2)</li> <li>Increase in regional code consistency (countywide or geographically contiguous jurisdictions)</li> </ul>
9	C&S Program conducts full range of advocacy efforts to support to rulemaking processes and ensure successful reach code development, completed in collaboration with the local government, CEC, BSC, and others	<ul style="list-style-type: none"> <li>9a. Stakeholder meetings, outreach and on-going communication</li> <li>9b. “Road Map” of policy guidelines for adopting reach code</li> <li>9c. Reach code ordinance “template” that establishes clear definitions of when the ordinance is triggered</li> <li>9d. Reach code cost-effectiveness documentation</li> </ul>
10	Stakeholder outreach by C&S Programs and LGP increase reach code awareness and knowledge	<ul style="list-style-type: none"> <li>Responses to requests for technical assistance from local government officials and stakeholders</li> <li>Input to stakeholder comments and questions on proposed code changes</li> </ul>
11	C&S Program supports local government officials in the reach code application process by responding to requests for technical assistance and support materials	<ul style="list-style-type: none"> <li>Technical support material and reach code policy and adoption guidance to local governments upon request</li> </ul>
12	Local governments conduct rulemaking process, develop ordinance with technical support from C&S Program	<ul style="list-style-type: none"> <li>Local ordinance adoption proceedings</li> <li>Reach code application developed with support from C&amp;S Program</li> </ul>

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

13	C&S Program support leads to adopted local reach code ordinances	<ul style="list-style-type: none"> <li>• Reach code ordinance adoption published by local jurisdictions</li> </ul>
14	CEC/BSC model reach code, with C&S Program proposed code change language, is adopted by local ordinances	<ul style="list-style-type: none"> <li>• Reach code ordinance adoption published by local jurisdictions</li> </ul>
15	Development of locally adopted reach code ordinances leads to integration of more efficient building practices into future CEC rulemaking	<ul style="list-style-type: none"> <li>• Increased acceptance and experience of reach code measures by builders, designers, and contractors prepares the market for future CEC reach codes</li> </ul>
16	Stakeholder outreach and technical support by LGP and C&S Programs increase awareness and knowledge of reach code and EE incentive program benefits, resulting in greater utilization of efficient appliances and technologies	<ul style="list-style-type: none"> <li>• Increased utilization of efficient appliances and technologies</li> <li>• Reduction of noncompliant practices and appliances</li> </ul>
17	Adoption of reach code ordinances leads to more efficient buildings and equipment	<ul style="list-style-type: none"> <li>• Increased market acceptance of reach code requirements and practices throughout the state</li> </ul>
18	More efficient buildings result in electric and gas energy savings, demand reduction, and water savings	<ul style="list-style-type: none"> <li>• Energy savings calculations or building energy and water usage</li> </ul>
19	Adopted and implemented codes lead to advancement towards long term strategic goals	<ul style="list-style-type: none"> <li>• State policy objectives are met to achieve environmental, macroeconomic, and other non-energy benefits</li> </ul>
20	Increased market acceptance of building practices resulting from reach codes leads to advancement towards long term strategic goals	<ul style="list-style-type: none"> <li>• Accelerated completion of state policy objectives to achieve environmental, macroeconomic, and other non-energy benefits</li> </ul>

## Appendix 1 Glossary of Acronyms

Acronym/Term	Description
AB 32	California Assembly Bill AB 32, California Global Warming Solutions Act of 2006
ACM	Alternate Component Method, The CEC's Public Domain Computer Programs, one of the CEC's Simplified Calculation Methods, or any other calculation method approved by the CEC.
AHRI	Air-Conditioning, Heating and Refrigeration Institute
ASHRAE	American Society of Heating, Refrigerating, and Air-Conditioning Engineers
ASHRAE 90.1	Energy Standard for Buildings Except Low-Rise Residential Buildings
ASHRAE 189	Standard for the Design of High-Performance, Green Buildings Except Low-Rise Residential Buildings
ASTM	American Society for Testing and Materials Now referred to as ASTM International
BSC	California Building Standards Commission
C&S	Codes and Standards program
CA	California
CABEC	California Association of Building Energy Consultants
CALBO	California Building Officials
CARB	California Air Resources Board
CASE	Codes and Standards Enhancement
CEC	California Energy Commission
CEE	Consortium for Energy Efficiency
CEPs	Compliance Enhancement Programs
CEQA	California Environmental Quality Act
CHPS	Collaborative for High Performance Schools
CPUC	California Public Utilities Commission
CRRC	Cool Roof Rating Council
CSLB	California State License Board
CSU	California State University
DOE	United States Department of Energy
DCA	California Department of Consumer Affairs
DR	Demand Response
DTSC	California Department of Toxic Substance Control
DSA	California Division of State Architect
DWR	California Department of Water Resources
EE	Energy Efficiency
EISA 2007	United States Energy Independence and Security Act of 2007
EOA	Extension of Advocacy
EPA	United States Environmental Protection Agency
ET (ETP)	Emerging Technologies (Emerging Technologies Program)
FDD	Fault Detection and Diagnostics
GHG	Greenhouse Gas
Green Globes	Green building rating system as administered by the Green Building Initiative

Acronym/Term	Description
HCD	California Department of Housing and Community Development
HERS	Home Energy Rating System
HID	High Intensity Discharge
Huffman Bill (AB1109)	California Assembly Bill AB 1109, Lighting Efficiency and Toxics Reduction Act
HVAC	Heating, Ventilating and Air Conditioning
IBEW	International Brotherhood of Electrical Workers
ICC	International Code Council
IESNA	Illuminating Engineering Society of North America
IOU	California Investor Owned Utility (PG&E, SCE, SDG&E, SCG)
LAUSD	Los Angeles Unified School District
LEED	Leadership in Energy and Environmental Design Green building rating system as administered by the USBGC
LG	Local Government
LGC	Local Government Commission
M&V	Measurement and Verification
NECA	National Electrical Contractors Association
NFRC	National Fenestration Rating Council
NRDC	National Resources Defense Council
OSHPD	California Office of Statewide Health Planning and Development
PG&E	Pacific Gas and Electric
RC	Reach Code
Reach Code	Codes, standards, regulations, policies and programs that exceed minimum energy codes such as Title 24, Title 20, ASHRAE Standard 90.1
ResNet	Residential Energy Services Network
SCE	Southern California Edison
SCG	Southern California Gas
SDG&E	San Diego Gas and Electric
SMACNA	Sheet Metal and Air Conditioning Contractors' National Association
SMUD	Sacramento Municipal Utility District
Title 20	Title 20, California Appliance Efficiency Regulations, Section 1601 et seq. of the California Code of Regulations.
Title 24	Title 24, California Building Energy Efficiency Standards, as set forth in the California Code of Regulations, Title 24, Part 6. Also known as the <i>California Energy Code</i> .
TDV	Time Dependent Valuation is the time varying energy caused to be used at by the building to provide space conditioning and water heating and for specified buildings lighting, accounting for the energy used at the building site and consumed in producing and in delivering energy to a site, including, but not limited to, power generation, transmission and distribution losses.
TOS	Time of Sale
UC	University of California
USGBC	United States Green Building Council
WE&T	Workforce, Education and Training

## Appendix 2 - 2013 – 2014 Codes and Standards PIP Addendum

### *Codes and Standards Program Overview*

The Codes and Standards (C&S) Program saves energy on behalf of ratepayers by influencing continuous improvements in energy efficiency regulations, improving compliance with existing codes and standards, and working with local governments to develop ordinances that exceed statewide minimum requirements. C&S program activities extend to all buildings and potentially any appliance in California, for both advocacy and compliance improvement.

The C&S Program consists of five subprograms: Building Codes Advocacy; Appliance Standards Advocacy; Compliance Improvement; Reach Codes; and, Planning and Coordination.

#### 1. Building Codes Advocacy Subprogram

The Building Codes Advocacy subprogram primarily targets improvements to Title 24 Building Efficiency Regulations that are periodically updated by the California Energy Commission. The subprogram also seeks changes to national building codes that impact CA building codes. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in public rulemaking processes. The program may coordinate with or intervene in ratings organizations that are referenced in Title 24; for example, the National Fenestration Rating Council, and the Cool Roof Rating Council.

#### 2. Appliance Standards Advocacy Subprogram

The Appliance Standards Advocacy subprogram targets both state and federal standards and test methods: improvements to Title 20 Appliance Efficiency Regulations by the California Energy Commission, and improvements to Federal appliance regulations by the US Department of Energy. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in the public rulemaking process (Title 20), and comment letters based on IOU research and analysis (USDOE), and participation in direct negotiations with industry. Additionally, the program monitors state and federal legislation and intervenes, as appropriate.

#### 3. Compliance Improvement

The Compliance Improvement subprogram is a new subprogram that combines the previous Extension of Advocacy and Compliance Enhancement subprograms. It provides education, training, and other activities targeting building departments and other industry actors responsible for compliance with Building Energy Code and Appliance Standards requirements. Activities may include development of “best practices tools” and other infrastructure elements that serve multiple compliance improvement objectives.

#### 4. Reach Codes Subprogram

The Reach Codes subprogram provides technical support to local governments that wish to adopt ordinances that exceed statewide Title 24 minimum energy efficiency requirements for new buildings, additions, or alterations. Support for local governments includes research and analysis for establishing performance levels relative to T-24 and cost effectiveness per Climate Zone, drafting of model ordinance templates for regional consistency, and assistance for completing and expediting the application process required for approval by the CEC. The subprogram also supports local governments that seek to establish residential or commercial energy conservation ordinances for existing buildings.

## 5. Planning and Coordination

The Planning and Coordination Subprogram provides a formal process that aligns planning activities across the IOU energy efficiency portfolio within the Codes and Standards program activities. This subprogram supports efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving Zero Net Energy.

### *Codes and Standards 2013-2104 Activities by Sub-Programs*

#### **Building Energy Codes Advocacy**

The Building Codes Advocacy program will continue conducting many of the same activities as were conducted in the 2010 – 2012 program cycle, but will focus on the upcoming 2016 Title 24 Energy Building Code cycle. In addition, the Building Codes Advocacy sub-program will expand activities at the national level. Primary activities for 2013-2014 include the following:

##### 2013 Title 24 Energy Building Code

- Support implementation of adopted 2013 Energy Building Code:
  - Complete revisions to compliance manuals and forms

##### 2016 Title 24 Energy Building Code

- Prepare CASE studies in coordination with CEC:
  - Conduct research for 2016 building code advocacy to advance State policy goals
  - Support activities to address Department of Finance review requirements
  - Research residential ventilation / IAQ requirements to reduce and control infiltration while maintaining and improving indoor air quality
  - Research and advocate methods to remove code barriers to the increased use of renewable energy in support of ZNE goals
  - Support development of 2016 compliance software

#### **Appliance Standards Advocacy**

The Appliance Standards Advocacy program will continue conducting many of the same activities as were conducted in the 2010–2012 program cycle, but will focus on preparing new measures pursuant to CEC’s adopted Order Instituting Rulemaking (“OIR”) for Title 20 Appliance Standards and U.S. Department of Energy’s ongoing rulemaking for Federal Appliance Standards. Primary activities for 2013-2014 include the following:

##### Title 20 Appliance Standards Rulemaking

- Prepare CASE studies pursuant to CEC's adopted OIR:
  - Advocate and provide public testimony in State public proceedings
  - Conduct research and testing and submit supporting market and technical data to the CEC
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which CEC eventually adopts)
  - Develop voluntary agreements or reach standards

### Federal Appliance Standards Rulemaking

- Provide support to DOE rulemaking process:
  - Advocate and provide public testimony in Federal public proceedings
  - Submit supporting market and technical data to the Department of Energy
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which DOE eventually adopts)
  - Develop voluntary agreements or reach standards

### Compliance Improvement

For the 2013-2014 program cycle, the C&S team will combine the former Extension of Advocacy and Compliance Enhancement Program activities into one Compliance Improvement subprogram to enhance understanding of program objectives and activities. The subprogram will strive to improve compliance with the Title 24 and Title 20 efficiency standards while implementing an effective sector strategy with the Workforce Education and Training Program. Primary activities for 2013-2014 include the following:

#### Title 24 Compliance

- Title 24 Standards Essentials Role-Based training for building inspectors:
  - Continue delivering training to plans examiners and energy consultants. Update curriculum to cover what's new in the 2013 code. *(per OP 93)*
  - Expand role-based training curriculum to additional compliance improvement market actors such as the building trades and design professionals as guided by needs assessment
- HVAC Quality Installation and Other Programs with Direct Code Requirements
  - Identify opportunities to insert code compliance modules in existing curriculum, such as training required for technicians
- On-line Compliance Training:
  - Explore training delivery mechanisms beyond the traditional classroom to include live webinars, activity-based online training, and in-field demonstrations

- Tools and Process Improvements:
  - Implement tools and process improvements as identified through the building department best practices study and the Compliance Improvement Advisory Group (CIAG)
- Forms and Compliance Documents:
  - Support development of improved forms and compliance-related documentation for 2013 Title 24
- Nonmonetary Compliance Improvement Incentives:
  - Explore a pilot project designed to improve compliance by providing incentives to local governments, contractors, or other key market actors. The pilot will be based on the CIAG's guidance and may include nonmonetary incentives such as training or provision of tools designed to streamline the permitting and inspection processes for additions and alterations (*per OP 94*)
- Target Low Compliance Problem Areas:
  - Collaborate with the CEC to identify problem areas and potential compliance improvement solutions through white papers developed by CIAG members (*per OP 95*)
  - Consider pilot project to improve compliance for measures with known challenges, which may include providing incentives to contractors for pulling permits, or motivation for other market actors. (*per OP 95*)
- Develop and Conduct Outreach Campaign to Improve Compliance:
  - Collaborate with the CEC to develop and implement an outreach campaign designed to improve compliance with Title 24 and Title 20 standards. The campaign will be based on the CIAG's guidance and may include activities such as developing flyers for contractors to provide to potential customers explaining the code requirements and benefits, mini measure-based code seminars for big box store employees, etc. (*per OP 93*)
- CEA exam development, facilitation support, and maintenance
  - Collaborate with the California Association of Building Energy Consultants to improve the working knowledge, skills, analytic ability and accountability of individuals using energy compliance software and preparing the appropriate Title 24 documentation for permit submittal. C&S will support updating the beta Residential and Nonresidential CEA examinations developed in 2010-2012 to properly test applicant CEAs under the 2013 standards and facilitating the roll out of the new certification process.

#### Title 20 and Federal Standards Compliance

- Surveys and Technical Support:

- Conduct surveys and provide technical support to CEC and industry to facilitate compliance.
- Education and Outreach:
  - Collaborate with CEC on implementing an education and outreach campaign targeted to distributors, retailers, contractors, and possibly consumers. (*OP 93*)

## **Reach Codes**

For the 2013-2014 program cycle, the IOUs will continue to collaborate with the CEC and Local Government Partnership Program to identify, and provide technical assistance to, local jurisdictions interested in adopting Reach Codes. In addition, the IOUs will continue to collaborate with CEC to provide support for developing voluntary standards to encourage buildings to achieve exemplary performance in the areas of energy efficiency. Primary Reach Code activities for 2013-2014 include the following:

### **Reach Code Technical Assistance**

- Cost Effectiveness Studies:
  - Prepare Cost Effectiveness studies for each of the California climate zones (to be updated for 2013 Energy Building Code) that have been vetted with the CEC, resulting in expedited CEC review of reach code application submittals.
- Policy Guidelines:
  - Provide a “Road Map” of Policy Guidelines for adopting Reach Code including an overview of some of the implications and important choices in writing and adopting these types of ordinances, and recommendations intended to improve implementation and compliance.
- Ordinance Template:
  - Provide a Reach Code Ordinance “template” that establishes clear definitions of when the ordinance is triggered, including CEC-required language which states that all buildings shall meet all applicable requirements of the Building Energy Code.
- Workshops & Presentations:
  - Facilitate public workshops and presentations to interested stakeholders including elected officials, city staff, industry organizations, and community groups that address the following:
    - Critical role that energy efficiency plays in reducing greenhouse gas emissions
    - Understand how Reach Codes and complementary new construction incentive programs such as California Advanced Homes help meet CalGreen’s voluntary Tier 1 and Tier 2 Energy requirements, accelerate

advancement of zero net energy building practices, and mitigate project-level GHG impacts pursuant to CEQA requirements.

- Explain the process for developing and adopting a legally enforceable Reach Code pursuant to CEC requirements
- Work with industry organizations and other market actors to conduct outreach to local governments to inform them of available Reach Code assistance.

### **Planning and Coordination (Non-Resource Subprogram)**

The Planning and Coordination Subprogram supports planning activities that improve alignment across the IOU energy efficiency portfolio with respect to future C&S program activities. C&S staff will coordinate with IOU energy efficiency portfolio programs to support efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving Zero Net Energy.

This subprogram will consist of four elements: 1) Strategic planning and coordination; 2) Outreach within each IOU to other program areas; 3) Statewide planning and coordination; and, 4) Workforce education and training. Primary activities for 2013-2014 include the following:

#### Strategic Planning (per OP 91)

- Codes and Standards Collaborative:
  - Maintain a Codes and Standards Collaborative to conduct strategic planning
- Code Readiness:
  - Establish cross-functional teams, including representatives from voluntary programs (incentive, emerging technologies, and education and training), the CPUC, and the CEC, will be established to identify code readiness priorities relative to policy goals, for example: zero net energy, AB 1109, and other Action Plan objectives.

#### Internal Coordination and Communications

- Periodic Meetings:
  - Conduct a variety of internal coordination activities based on respective needs of each IOU, including periodic meetings with program leads in other areas as well as management teams.
- Ongoing Communication:
  - Inform planners and support groups regarding future code changes, collaboration on evaluation and regulatory matters.
  - Solicit input from other groups re advocacy efforts, aligning education and training activities with incentive programs.

## Statewide Collaboration

- Integrated Dynamic Approach to Portfolio Planning:
  - To support the state's Zero Net Energy objectives, the C&S team, will work closely with new construction programs to develop an integrated approach to align new construction program offerings with base code requirements as well as reach codes where possible.
  - The C&S team will work with core retrofit programs as well as local government partnerships and third parties to coordinate offerings with anticipated code changes. *(per OP 91, 152)*
  
- CPUC Communication:
  - Conduct monthly calls with CPUC personnel to share progress and discuss issues *(per OP 91)*
  
- CEC Communication:
  - Maintain statewide weekly calls with CEC staff regarding building codes and appliance standards *(per OP 91)*
  
- National Stakeholders Communication:
  - Conduct regular conference calls with national stakeholders regarding appliances *(per OP 91)*
  
- Compliance Advisory Group Communication:
  - Host quarterly meetings with Compliance Improvement Advisory Group regarding compliance improvement activities *(per OP 91, 152)*
  
- Local Government Partnership Communication:
  - Provide quarterly updates to Local Government Partnership Program regarding reach code adoption progress and delivery of training to building departments *(per OP 91)*

## Workforce Education and Training (WE&T)

- Sector Strategies for WE&T:
  - C&S and WE&T personnel will meet periodically to coordinate activities that will enhance support for the appropriate market actor roles responsible for new and emerging codes and standards implementation according to priorities established by needs assessments. C&S will collaborate with the WE&T Centergies sub-program to not only prepare contractors and technicians to implement current codes, but to also prepare them with technical training on advanced technologies that are projected to become part of reach codes and then the statewide code. *(per OP 92 and OP 152)*

Table 54 and Table 65 savings are calculated from the sum of first-year net savings from CEC proceeding that produces savings in 2013 and 2014.

**4. Program Mission**

The Codes and Standards (C&S) Program-program saves energy on behalf of ratepayers by directly influencing standards and code setting bodies to strengthen continuous improvements in energy efficiency regulations, by improving compliance with existing codes and standards, and working with local governments to develop ordinances that exceed statewide minimum requirements. Both the C&S program advocacy and compliance improvement activities extend to virtually all buildings and potentially any appliance in California.

The C&S Program-program conducts advocacy activities to improve building and appliance efficiency regulations. The principal audience is the California Energy Commission (CEC) which conducts periodic rulemakings, usually on a three-year cycle (for building regulations), to update building and appliance energy efficiency regulations. C&S also seeks to influence the United States Department of Energy (DOE) in setting national energy policy that impacts California.

In some cases we may seek to influence the state legislature and other state agencies like California Air Resources Board (CARB) to influence policy regarding buildings and appliances. We may explore ways to influence the US Congress outside the traditional means of negotiating through Federal partners such as American Council for an Energy Efficient Economy (ACEEE) or Appliance Standards Awareness Project (ASAP).

Codes And Standards Enhancement (CASE) studies, focused on energy efficiency improvements, are developed for promising design practices and technologies and presented to standards- and code-setting bodies. Advocacy also includes affirmative expert testimony at

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

public workshops and hearings, participation in stakeholder meetings, ongoing communications with industry, and a variety of other support activities.

The program participates in DOE proceedings and legislative negotiations leading to federal regulations that are passed through to California; in particular, Title 20 appliance efficiency regulations that are the same as Federal regulations.

~~Extension of advocacy activities, in particular, include compliance improvement efforts carried out as continuing advocacy for codes or standards adopted as a result of the Program.~~

Formatted: Font: TimesNewRoman

Following adoption, C&S supports compliance improvement with both Title 24 building codes and Title 20 appliance standards.

~~Compliance Enhancement (CE) subprogram improvement activities — in that, these are not carried out as extension of complement the advocacy — include two elements based on the CPUC’s Evaluator’s Protocol for Code Compliance Enhancement Programs: 1) work by maximizing verified savings, ensuring that the measure-based element is aimed at full savings from codes and standards not adopted as a result of that are realized and persist over time. The Compliance Improvement subprogram targets market actors throughout the Program, similar to extension of advocacy efforts, and 2) the holistic entire compliance enhancement subprogram seeks chain, providing education, outreach, and technical support and resources to improve compliance with both the building department and appliance energy code enforcement processes from beginning to end standards. Compliance improvement responds to the CPUC’s interest in robust implementation of existing standards and support for the California Long Term Energy Efficiency Strategic Plan’s HVAC Big Bold strategies.~~

- Formatted: Font: (Default)TimesNewRoman

The Program program carries out strategic activities that support or shape future codes and standards. In addition to mandatory minimum-level codes, the C&S Program program advocates for the development and implementation of “reach codes” that exceed minimum state code requirements and may be adopted by local jurisdictions or agencies. The Program program monitors and/or participates in a wide range of activities or proceedings that have direct or indirect impacts on California regulations including, but not limited to American Society of Heating, Refrigerating, and Air-Conditioning Engineers (ASHRAE), international activities including involving Europe, Asia, Canada, and Australia, voluntary standards such as green building codes, and ratings organizations such as the Cool Roof Rating Council (CRRC), National Fenestration Rating Council (NFRC), and the United States Green Building Council (USGBC). Additionally, the program intervenes in Energy Star and other voluntary activities, as necessary, to shape future regulations or support coordination with voluntary programs.

The new Planning and Coordination subprogram expands the coordination role of the C&S program in the market adoption cycle for energy efficiency technologies and practices. As many of the measures offered through voluntary programs are adopted into the standards, C&S will coordinate both internally and externally to support a dynamic approach to portfolio planning with the objective of accelerating market acceptance and ultimately the adoption of successful, cost-effective technologies or practices into code. C&S will directly support the

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Formatted: Indent: Firstline: 0.25"

Below are the approved PPMs and metric types for the [Lighting Market Transformation Codes and Standards](#) Statewide Program (Resolution E-4385, Appendix A):

**b) Market Transformation Information**

Formatted: Font: TimesNewRoman, 12 pt

Formatted: Font: 12 pt

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the

<sup>2</sup> California Public Utilities Commission Decision, D.98-04-063, Appendix A.

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

continuous transformation of markets around successive generations of new technologies.<sup>3</sup>

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures.<sup>4</sup> Markets are social institutions,<sup>5</sup> and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress.<sup>7</sup> According to York,<sup>8</sup> “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate—particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as

Formatted: Centered

on the degree of successful market transformation<sup>9</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

Formatted: Font: 12 pt

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>13</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

Center of Wisconsin's guide for MT program developers<sup>16</sup> suggests that the first step is not to set end point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

As stated above, market transformation draws heavily upon diffusion of innovation theory, with the state of a market characterized by adoption rate plotted against time on the well known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects. Therefore it is problematic, if not impractical, to offer internal annual milestones towards market transformation sectors and specific program activities.

### Market Transformation Indicators (MTIs)

Formatted: Font: (Default)TimesNew Roman

Formatted: Heading3, Indent: Left: 0.75",  
Space After: 12 pt

Formatted: Indent: Left: 0.75"

Resolution E 4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment "H" are approved for this sub-program as applicable.

<sup>16</sup> Palouza & York, (1999).

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

**c) Program Design to Overcome Barriers**

The statewide Codes and Standards Program has ~~four~~<sup>five</sup> subprograms including:

- ~~i. 1) Building Energy Codes; Advocacy, Extension of Advocacy (EOA) and CASE Studies~~
- ~~ii. 2) Appliance Standards; Advocacy, Extension of Advocacy and CASE Studies~~
- ~~iii. 3) Compliance Enhancement (CE); Measure Based and Holistic Improvement~~
- ~~iv. 4) Reach Codes (RC); Local Government Ordinances and Green Building Standards~~
- ~~v. 5) Planning and Coordination~~

**Building Code and Appliance Standards Advocacy Subprograms**

Codes and standards & S advocacy comprises a portfolio level strategy that complements incentive and information offerings in several ways. Since IOU incentive and rebate programs typically capture only a small percentage of the market, a transition to regulatory intervention is essential to maximize portfolio energy savings. This transition to code causes a once high-margin product to become an industry standard; thereby reducing the overall cost to society for energy efficiency. This commoditization effect, in turn, spurs innovation for new high-margin products since most manufacturers and other industry practitioners seek to compete in part on high-margin differentiated products.

As involuntary interventions, codes and standards are effective at breaking down market barriers such as split incentives between building owners and tenants that are difficult to overcome through incentive and information programs. Minimum code requirements direct consumers', builder's and renovation contractor's choices of materials and appliances to higher efficiency products, thereby reducing monthly energy bills to tenants. Regulations also improve equity in benefits from IOU customer investments in energy efficiency through rates. Through codes and standards, positive changes initiated through voluntary programs targeting early adopters are extended to all customers. Hence, hard-to-reach groups that do not participate in voluntary offerings benefit through C&S codes and standards.

Baselines for building and appliance advocacy activities are developed in two ways. If the objective of a code proposal is to update an existing standard, the baseline is simply the existing standard. If the objective is a new standard, which expands the scope of building or appliance efficiency regulations, the baseline is established through market characterization studies prior to or during the development of the CASE study unless a recent preexisting market characterization study can be found. Hence, baselines for new standards often do not exist until a draft CASE study is complete.

IOU support for recent CEC code upgrade cycles – in particular, the 2003, 2004, 2006, and 2008 CEC proceedings – for new building codes and appliance standards has significantly

increased the rate of change in regulations compared to previous code cycles. Moreover, the scope of regulations has grown to include Title 24 alterations for measures such as duct sealing when replacing HVAC system components, and numerous appliances have been added to Title 20. These changes have created a significant need to extend advocacy efforts to improve support the successful implementation of the standards by improving industry awareness and understanding of California regulations.

~~Extension of advocacy (EOA) As compliance improvement efforts are carried out to improve the rate-of-compliance -- with building codes or appliance standards Title 24 and Title 20 -- as inputs to savings calculations for standards adopted as a result of the C&S Program. Hence, the benefits of EOA activities, the increase in compliance are captured in the Advocacy subprogram savings, as part of the verified C&S Program program energy savings. Determination of compliance improvement savings requires that P programs savings must be recalculated periodically based on recurring CPUC evaluations that include rate-of compliance rates. ; however, since program attribution is based on attribution factors for code adoption that extends to compliance improvement, evaluation of changes in rates of compliance excludes additional attribution factors.~~

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: 12 pt

Formatted: Font: TimesNewRoman

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNewRoman

~~The enabling assumptions for EOA efforts are as follows. CPUC compliance evaluations will be conducted at least once during each program cycle and the IOU's will receive full credit for savings. Evaluators must sample at technology level for T 20, mandatory T 24 measures, and prescriptive measures when a prescriptive compliance approach is used. Evaluators sample at the whole building level when performance approach is used, with mandatory measures evaluated in sufficient detail to capture energy impacts. Evaluation must be sensitive to variations across state and in time.~~

Formatted: Font: 12 pt

~~In May 2007, Quantec and the Benningfield Group published an evaluation of C&S advocacy efforts, the "Statewide Codes and Standards Market Adoption and Noncompliance Rates," in part to refine estimates of noncompliance rates assumed for 2003 and 2004 C&S advocacy measures adopted as a result of the Program; however, at the time of this writing, The Cadmus Group is reevaluating compliance rates. Baseline metrics will be established based on The Cadmus Group's reevaluation and target improvement metrics will be determined from new baseline metrics and additional evaluation. The CPUC is expected to conduct another evaluation at or shortly after the end of the 2010-2012 program cycle to, once again, adjust savings for 2005 advocacy measures.~~

### ~~Compliance Enhancement (CE) Improvement (CI) Subprogram~~

Compliance improvement is increasingly important to the energy efficiency industry in California. Having supported the commercialization of efficient technologies and practices through IOU incentive and rebate programs, achieving satisfactory compliance is a crucial requirement for capturing market change for the long-term benefit of society. Broad compliance is necessary to level the playing field for well-intentioned suppliers and

Formatted: Font: TimesNewRoman

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNewRoman

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

contractors who are otherwise faced with a competitive disadvantage when complying with regulations. Greater compliance strengthens voluntary program baselines, provides a solid foundation for future robust advocacy efforts, and improves throughput of California's energy efficiency industry by removing an industry bottleneck.

The primary barriers to compliance improvement with the building standards include the complexity of the standards and limited resources available for enforcement by local governments and the CEC. Although education and training are not substitutes for enforcement, they increase compliance rates by generating awareness and improving understanding of regulations, and by equipping key market actors in the compliance supply chain with the tools and knowledge necessary for compliance. The CI subprogram will offer training and resources to market actors throughout the compliance delivery chain, which may include, but is not limited to energy consultants, building department staff, contractors, and design professionals.

Formatted: Font: 12 pt

Formatted: Font: (Default) Times New Roman

Formatted: Font: 12 pt

In addition, the CI subprogram will work with local government and other industry partners to provide technical support and other resources, such as process improvement tools. The CI subprogram will document best practices and lessons learned from the Best Practices study completed in 2012, and will work with California Building Officials (CALBO), CEC, and local government partners to encourage other jurisdictions to adopt successful practices and tools identified during the pilot project. By encouraging more jurisdictions to use the same or similar processes, tools and forms where possible, compliance will be simpler for market actors, as enforcement will become more consistent.

Formatted: Font: (Default) Times New Roman

Formatted: Font: 12 pt

The CE subprogram, whose primary purpose is to increase the number of customers complying with code,<sup>42</sup> is based on the Code Compliance Enhancement Programs Protocol featured on pages 100-103 of *California Energy Efficiency Evaluation Protocols: Technical, Methodological, and Reporting Requirements for Evaluation Professionals*. Per the evaluator's protocols, Compliance Enhancement Programs require a separate program theory and logic model, and before and after measurements of compliance rates. Hence, a separate logic model for the CE subprogram is included at the end of this document. This subprogram has two elements including measure specific and holistic.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

The measure specific element of the Compliance Enhancement Subprogram includes measures for existing regulations not adopted as a result of the program; for example, these include pre-2005 Title 24 or Federal standards for which no credit for advocacy is expected. IOUs propose that this element be similar to measure specific extension of advocacy efforts with respect to evaluation.

Enabling assumptions include the following. CPUC evaluators will conduct an ex ante evaluation in 2009 and an ex post study in 2012 of measures included in this subprogram. Evaluations will include sampling at technology level for T-20, mandatory T-24 measures, and prescriptive measures when a prescriptive compliance approach is used. Evaluators

<sup>42</sup> [CPUC] California Public Utilities Commission, April 2006. *California Energy Efficiency Evaluation Protocols: Technical, Methodological, and Reporting Requirements for Evaluation Professionals*.

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

~~sample at the whole building level when performance approach is used; however, mandatory measures are evaluated in sufficient detail to capture energy impacts. Evaluation accounts for variations across the state and in time. Verified energy savings are calculated based on the difference in measure compliance rates before and after implementation. Following the initial ex post evaluation, recurring CPUC evaluations must be conducted at least once each program cycle for measures included in future work.~~

~~The Code Compliance Enhancement Programs Protocol, used to evaluate compliance enhancement programs, also includes a correction for naturally occurring compliance (the compliance that occurs without program intervention) that IOUs recommend be deleted. This recommendation stems from the belief that the savings at risk are small since the rate of change in compliance “flattens out” soon after a code or standard becomes effective. Defining “natural” may be subjective and attribution parameters may be complex and costly to evaluate. Parsing out attribution gets in the way of a more important objective to work cooperatively with all California stakeholders.~~

~~The holistic element of the CE~~~~The CI~~ subprogram supports proactive building departments that seek general improvements to operations and compliance improvement processes; ~~as such, this element complements measure-based activities. The holistic element will be implemented initially as a pilot program. The rationale behind the holistic element. The rationale~~ is based on the recognition that building departments are facing increased economic pressures and resource constraints, with no reduction in the required workloads. Given that this trend is unlikely to change in the near future, utility assistance in improving the efficiency of building department enforcement processes will effectively provide the jurisdiction with more resources to increase compliance rates. ~~The IOUs anticipate working with approximately twelve building departments collectively to develop process improvement interventions including, but not limited to, role-based training and tools customized in accordance with program theory by market actor type and jurisdiction.~~

Formatted: Font: (Default)TimesNew Roman

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNew Roman

Formatted: Font: 12 pt

~~The holistic element will identify and screen potential partners based on several criteria. One of the primary characteristics of process pilot partners is jurisdictions that have building stock characteristics that meet the program objectives. For example, one jurisdiction might have a high growth rate, thus a high volume of both residential and nonresidential new construction. Another example might include a jurisdiction with a high cooling load and a high volume of HVAC related activity and/or contractors. Still another might be mostly built-out, with a majority of the building activity devoted to remodels or renovations. Any criteria used will be established by the program in collaboration with the CPUC, with provisions for clarity and consistency in application, and documentation of these criteria.~~

~~The holistic element also requires support from the partners at multiple levels including the Chief Building Official and the mayor or city council. At a minimum, the building department staff must be interested in and have the ability to test new tools or processes. The support might take many different forms, including allowing access to building~~

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

department staff, and permit and inspection records, or officially setting optimizing compliance as a high priority for the jurisdiction.

The holistic element process improvement activities include conducting a comprehensive needs assessment/gap analysis by interviewing staff, reviewing permitting and inspection processes, tracking and documentation, internal communications as projects move toward completion, and available tools and resources and how they are currently used. The Program CI subprogram will identify and create tools to help optimize existing processes and simplify enforcement and work with staff to test and modify the tools as necessary. Tools might include, but are not limited to, electronic forms, tracking software, or implementing online permitting and payment methods.

The holistic element will also offer staff and local market actor training and resources, and will document best practices and lessons learned in each jurisdiction. The Program will work with California Building Officials (CALBO), CEC, and local government partners to encourage other jurisdictions to adopt successful practices and tools identified during the pilot. By encouraging more jurisdictions to use the same or similar processes, tools and forms where possible, compliance will be simpler for market actors, as enforcement will become more consistent.

In addition to supporting the CPUC's impact evaluation, which will involve establishing pre- and post-program compliance rates per participating jurisdiction, the IOUs will document training and process improvement to other efforts employed per jurisdiction, administer pre- and post-tests to gauge training participants' knowledge swing, and gather and measure implementation of action plans from participating building departments.

### Reach Codes (RC) Subprogram

The Reach Codes RC subprogram will develop focus primarily on developing and/or supporting the development of reach codes, or locally adopted ordinances, that exceed statewide minimum requirements. Reach codes are typically codes adopted by local governments and provide a means to test new codes as well as testing the efficacy of increasing the stringency of existing codes at a local level prior to disseminating the code on a statewide basis. Each jurisdiction's experience with local codes can be used to inform the state's process by documenting both the successes and barriers faced for both adoption and implementation. The RC subprogram will encourage local governments to first optimize compliance with existing codes, and will provide training and resources where applicable.

The Reach Codes subprogram relies on a demand-side philosophy, similar to the general philosophy guiding all other energy efficiency activities. Rather than looking first to supply-side options (new codes), the program asks two standard DSM questions to frame the discussion. The answer to the first question, "What do we want?" is the easiest—more energy savings. However, the answer to the second question, "How do we get it most efficiently?" is less obvious. In response, many local governments IOUs have adopted reach codes to directly increase the efficiency of new buildings within their jurisdiction, or

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

in some cases just the buildings owned by the local government. However, based upon the most recent Codes and Standards EM&V report, (Quantee study performed in May 2007), the non-compliance rate worked with the existing 2003 code is approximately 25-30%, leaving a tremendous amount of savings on the table. What many local governments are not aware of is that there are significant savings available from optimizing compliance with the existing code that likely exceeds the potential savings available through adopting a reach code. The most immediate, cost-effective way to obtain more energy savings and reduce the carbon footprint of each jurisdiction is to optimize compliance with the existing code.

The Program will encourage all local governments to first optimize compliance with existing codes. In addition to the biggest savings opportunity, sub-optimal compliance with the existing code will erode potential savings from a new code. The reach code subprogram is designed to facilitate mutual support from the utilities and local governments to realize the full savings potential from codes, both statewide, and at a local level. The IOUs will request that prior to adopting any new codes, building department staff attend role-based training as well as relevant measure-specific training (HVAC replacements, controls under skylights), and to identify, implement and document two actions designed to increase compliance. Examples might include: conducting outreach to market actors in the community, adding or expanding on-line services, providing a financial incentive to those who submit required compliance documents, or offering rewards such as expedited plan check services for contractors with high compliance rates. Incentive programs may also require acceptance testing to improve energy savings from installed equipment and provide incentives to contractors to participate in advanced hands on training. Observations of contractor performance at the hands on training can in turn be used to improve the acceptance test methods or materials for the next round of standards.

Many local governments, eager to act in the absence of federal leadership, have passed local jurisdictions (cities, counties, school districts, colleges and universities, etc.) to implement a more coordinated approach to development and implementation of local ordinances that are more stringent than minimum state requirements. While the intention is honorable, the volume and variety of codes has resulted in an extremely inconsistent structure that changes frequently, making it nearly impossible to track or learn. A contractor, designer or builder working within a single county might have to comply with ten different energy or green building codes, depending on which city a project is in, and whether it's in or outside of city limits. This kind of fragmentation causes to minimize market actor confusion and even contempt for the code, resulting in resistance from both the market actors and enforcement personnel, and ultimately lower compliance rates. The IOUs propose a coordinated development approach and will continue to promote regionally consistent ordinances where possible to reduce the wasted energy and cost resulting from duplication of efforts. In addition that results when individual government entities develop the language and technical supporting documentation independently. This duplication can even occur in regional government organizations whose geographical boundaries aren't consistent with the CEC's climate zone designations. Lastly, coordinated development provides better staging for statewide adoption, leverage

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

for local ~~governments jurisdictions~~ to encourage adoption, and increases the likelihood of adoption and compliance.

~~The program will work with interested local governments as well as others including, but not limited to, IOU voluntary rebate programs, CEC, Building Standards Commission, the Local Government Commission (LGC), IOU green or sustainable communities programs, regional local government associations, and organizations that promote green building rating systems, to identify characteristics of reach codes that meet the needs of the majority of jurisdictions. The Working with local jurisdictions and other market actors, the IOUs will then develop a package of climate-zone based reach codes for both new construction and as well as some existing buildings (at time of sale). The IOUs will submit continue to work closely with the package CEC to expedite the CEC to obtain pre-review and approval as required process and to eliminated drastically reduce local government development costs and facilitate subsequent adoption of the code(s). At present, there are approximately a dozen local jurisdictions with reach code ordinances surpassing Title 24 2005 approved by the CEC, all of which are different. Going forward, there is an opportunity to develop a pre approved reach code based upon surpassing Title 24 2008. Reach codes may also include codes targeting government-owned buildings or particular activities such as commissioning.~~

The main enabling assumption for the ~~Reach Code RC~~ subprogram is ~~a continuation of the resolution of an outstanding CPUC policy issue related to efficiency activities undertaken as a result of legislative or other policies. Current thinking on this topic presumes directive that any action required to meet a code or standard is not eligible for incentives and rebates. Thus, the allows constituents of ain jurisdictions with local government that passed a reach code could not obtain financial assistance from utility incentive and rebate ord in ances to participate in voluntary programs to help meet that code, as they would be without being classified as free riders.~~

~~The CPUC, along with utilities and local governments recognize that this policy may have unintended consequences is necessary, especially in light of the long-term strategic policies that must be implemented to reduce California's Green House Gas (GHG) emissions sufficiently to meet statewide reduction goals as set forth by AB32. The Otherwise, the effective result, of the current interpretation of the policy, "punishes" innovators and market leaders by eliminating access to incentive and rebate programs to assist these leaders in achieving additional energy savings. In most cases, reach codes were are adopted based upon the expectation of continuing eligibility for incentives and rebates.~~

The program assumes that citizens of a jurisdiction or agency that passes a reach code ~~continue to~~ be deemed eligible participants in incentive and rebate programs administered under the auspices of the CPUC, consistent with the treatment of California-owned buildings responding to ~~the Governor's Governor's Executive Order Orders (S-20-04 and B-18-12)~~ requiring state buildings to reduce energy usage by 20% by 2015. This interpretation can set up a positive energy efficiency feedback loop wherein participation in incentive and rebate programs increases because of the reach code, and the availability of

Formatted: Centered

Formatted

Formatted

Formatted

Formatted

Formatted

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

incentives and rebates to assist code compliance encourages more local governments to adopt a reach code.

**Baselines:** For new construction (including renovations, additions, and replacements) reach codes, the IOUs assume Title 24 as the baseline. A Title 24 baseline provides a conservative savings estimate, is consistent with new construction incentive programs, and eliminates any potential overlap with the [Extension of Advocacy Compliance Improvement](#) savings claims.

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNewRoman

Time-of-Sale (TOS) reach codes for existing buildings assume that no energy actions are undertaken absent the code. There are currently only two TOS codes that the program is aware of in California. The scopes are both very limited, and in at least one case, the code is not routinely enforced. Therefore, assuming that building owners do not undertake any energy efficiency retrofits at TOS absent a specific requirement is a reasonable assumption consistent with the rationale for the proposed new construction reach code baseline.

Enabling assumptions include a "shared savings" claim mechanism for attributing savings impacts resulting from reach codes. In a jurisdiction with a reach code, savings resulting from participants in the relevant incentive or rebate program (new construction or retrofit) will be claimed by that program, consistent with current practice. Savings resulting from completed projects that do not participate in an incentive or rebate program will be claimed by either the Codes and Standards or Government Partnership programs if one is extant.

In addition to local governments, various agencies such as school districts, colleges, universities, and industry groups are adopting reach-code policies. Examples include:

- CHPS (Collaborative for High Performance Schools) as adopted by school districts
- Green building requirements adopted by the UC, CSU, and community college districts
- LEED and GreenPoint Rated as adopted by various agencies, builders and jurisdictions
- ASHRAE Standard 189: High Performance Green Buildings, is expected to be adopted by agencies and local jurisdictions

In many cases, the IOUs were involved in the development, adoption, and deployment of these reach code programs. The primary intent of the IOUs involvement was to increase participation in EE programs. The impact of these programs needs to be recognized in the evaluation process as they tend to raise the baseline for code compliance for program participants and non-participants. For example, the baseline for schools in a district with a CHPS policy resolution may have a much higher efficiency baseline as a result of the efforts of the IOU from participation in both the Savings By Design program and CHPS even though there was no legal requirement to exceed the code.

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

Going forward, the C&S [Program-program](#) will be working on the development of new and updated reach code rating systems, standards, guidelines, most of which be based upon the new Title 24 [2008 standards](#). These reach codes [programs](#) are expected to be adopted and implemented with the support of the [IOU-C&S Program-program](#) by various agencies, institutions, and building associations. Although there have been cases where the mere adoption of reach code programs have little to no impact, there have been a number of cases where significant savings have been verified.

Formatted: Font: (Default)TimesNewRoman

Examples of where verification processes are in place include the CHPS Verified program and the CHPS deployment at Los Angeles Unified School District (LAUSD). The CHPS Verified program ([http://chps.net/chps\\_schools/Verified.htm](http://chps.net/chps_schools/Verified.htm)) provides project review, design review, and construction review of school projects to verify compliance with CHPS requirements. This is a fee-for-service program that provides a rigorous review of the project prior to Department of State Architect (DSA) plan review which generally results in the overall reduction in time and cost for the school design and construction process. In the case of LAUSD, the District worked with consultants (including Global Green) to integrate CHPS into their internal quality assurance process that involved the design teams and all LAUSD design, construction review, and maintenance and operations staff. The C&S [Program-program](#) proposes to review these and similar compliance improvement programs and processes and will implement them accordingly to maximize the energy savings associated with the reach code programs.

To the extent that the C&S [Program-program](#) is able to increase compliance with these reach code programs, the resulting savings should be reflected in buildings that result in above-code performance. In addition, to the extent that the IOUs were and will be involved with the development and deployment of these reach-code programs, the energy savings should be treated similarly to the reach code ordinances adopted by local government jurisdictions.

Based upon precedents that allow eligibility for above-code incentives for state and federal agencies with executive orders (e.g., Governor's Executive Order (S-20-04, [recently replaced by B-18-12](#)) requiring state buildings to reduce energy usage by 20% by 2015) for mandatory above code construction of their buildings, the IOUs propose [similar treatment continuing the policy](#) of [treating](#) these reach code policies [in a similar manner](#).

Formatted: Font: (Default)TimesNewRoman

### Planning and Coordination Subprogram

Formatted: Font: TimesNewRoman,Bold

[The ambitious goals set by the CPUC and CEC require the participation of many different entities. Without proactive coordination, it will be difficult if not impossible to fully realize the savings from the C&S program activities as well as other programs. The C&S program will facilitate coordination and develop and implement a strategic vision to promote and advance cost-effective technologies.](#)

Formatted: Font: TimesNewRoman

[The Planning and Coordination subprogram will work with the CEC, CPUC, emerging technologies, as well as voluntary programs to create a strategic approach for key measures](#)

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

and technologies in support of the Zero Net Energy (ZNE) and other policy goals. For those key technologies, the C&S program will strive to work with other programs to commercialize them for adoption into a relevant code or standard.

The Planning and Coordination subprogram will also work with other programs and market actors to improve code compliance, conduct more outreach and solicit additional input on code enhancement proposals from impacted industries. As part of the expanded outreach and communications efforts, the C&S program will establish and maintain a codes and standards collaborative, and will continue to facilitate the Compliance Advisory Group. In addition, the C&S program will maintain regular contact with state and federal code-setting agencies to minimize duplication of efforts and coordinate activities.

**d) Advancing Strategic Plan Goals and Objectives**

Through the C&S ~~Program program~~, SoCalGas, SDG&E, SCE and PG&E will combine advocacy, compliance ~~enhancement; improvement~~ and reach code development efforts to meet the codes and standards goals defined in the Strategic Plan in ~~section Section 7seven~~. Please see ~~s~~Section 6 for the specific action strategies the IOUs will employ in order to meet the Strategic Plan's codes and standards goals.

Due to the long code upgrade cycle, the process of developing CASE and research studies may extend past the end of the program cycle; therefore, funding committed prior to the end of 2011 will be available for four years thereafter to fund these studies. This might entail moving the committed funds forward into subsequent program cycles until these studies are completed.

**6. Program Goals, Objectives and Action Strategies**

**a) ~~a)~~ Subprogram Descriptions**

The ~~statewide Codes and Standards~~C&S Program program has ~~four~~consists of five subprograms ~~including:~~

~~1)~~ Building Codes; Advocacy; Extension of Advocacy and CASE Studies; Appliance Standards Advocacy; Compliance Improvement; Reach Codes; and, Planning and Coordination.

**i. ~~1.~~ Building Codes Advocacy Subprogram**

The Building Energy Codes Advocacy subprogram primarily targets improvements to Title 24 Building Efficiency Regulations that are periodically updated by the California Energy Commission (CEC). The subprogram also seeks changes to national building codes that impact CA building codes. Advocacy activities include, but are not limited

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

to, development of code enhancement proposals and participation in public rulemaking processes. The subprogram ~~may will~~ coordinate ~~with or engage with~~ ~~intervene in~~ ratings organizations that are referenced in Title 24; for example, the National Fenestration Rating Council, and the Cool Roof Rating Council.

**ii. ~~2.~~ — Appliance Standards; Advocacy; Subprogram**

The Appliance Standards Advocacy subprogram targets both state and federal standards and test methods: improvements to Title 20 Appliance Efficiency Regulations by the CEC, and improvements to Federal appliance regulations by the US Department of Energy. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in the public rulemaking process (Title 20), and comment letters based on IOU research and analysis (USDOE), participation in direct negotiations with industry, and development of quasi-mandatory appliance standards reach codes. Additionally, the subprogram monitors state and federal legislation and intervenes, as appropriate.

**iii. ~~3.~~ — Compliance Improvement**

The Compliance Improvement subprogram is a new subprogram that combines the previous Extension of Advocacy and ~~CASE Studies~~ Compliance Enhancement subprograms. It provides education, training, and other activities targeting building departments and other industry actors responsible for compliance with Building Energy Code and Appliance Standards requirements. Activities may include development of “best practices tools” and other infrastructure elements that serve multiple compliance improvement objectives.

**3) — Compliance Enhancement: Measure-Based and Holistic**

**4) — Reach Codes; ~~v.~~ — Local Government Ordinances and Green Building Standards**  
~~Reach Codes~~

The Reach Codes subprogram provides technical support to local governments that wish to adopt ordinances that exceed statewide Title 24 minimum energy efficiency requirements for new buildings, additions, or alterations. Support for local governments includes research and analysis for establishing performance levels relative to Title 24 and cost effectiveness per Climate Zone, drafting of model ordinance templates for regional consistency, and assistance for completing and expediting the application process required for approval by the CEC. The subprogram also supports local governments that seek to establish residential or commercial energy conservation ordinances for existing buildings.

**5v. — Planning and Coordination**

The Planning and Coordination Subprogram ~~provides a formal process that aligns~~ supports planning activities that improve alignment across the IOU energy efficiency portfolio with respect to future ~~within the~~ C&S program activities. This subprogram supports efforts to prepare the market for future code adoption (i.e.,

In general, the goals of the C&S Program-program are the same as the two C&S goals defined in the C&S section of the Strategic Plan. Through the Advocacy subprograms, the IOUs will strive to continually strengthen and expand building and appliance codes and standards as IOU efforts reveals greater efficiency opportunities and compelling economic benefits. Through the Compliance EnhancementImprovement subprogram, the IOUs will strive to improve code compliance using through education and outreach, and other technical resources. IOUs will also develop reach codes local ordinances and facilitate their adoption and implementation in motivated communities.

- Strategic Plan Codes and Standards Goal #1: Continually strengthen and expand building and appliance codes and standards as market experience reveals greater efficiency opportunities and compelling economic benefits. (Subprograms 1 and 2: Building Codes and Appliance Standards Advocacy).
- Strategic Plan Codes and Standards Goal #2: Improve code compliance and enforcement. (Subprograms 3 and 4: Compliance Improvement and Reach Codes).

Formatted: Font: (Default)TimesNewRoman

The following sections provide a description of the proposed C&S subprogram activities which will lead to achieving the program goals.

**Building Codes Advocacy**

The Building Codes Advocacy program will continue conducting many of the same activities as were conducted in the 2010 – 2012 program cycle, but will focus on the upcoming 2016 Title 24 Energy Building Code cycle. In addition, the Building Energy Codes Advocacy subprogram will expand activities at the national level. Primary activities for 2013-2014 include the following:

2013 Title 24 Building Codes

- Support implementation of adopted 2013 Energy Building Code:
  - Complete revisions to compliance manuals and forms.

2016 Title 24 Building Codes

- Prepare CASE studies in coordination with CEC:
  - Conduct research for 2016 building code advocacy to advance State policy goals.
  - Support activities to address Department of Finance review requirements.
  - Research residential ventilation / IAQ requirements to reduce and control infiltration while maintaining and improving indoor air quality.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

- Research and advocate methods to remove code barriers to the increased use of renewable energy in support of ZNE goals.
- Support development of 2016 compliance software.

### **Appliance Standards Advocacy**

The Appliance Standards Advocacy subprogram will continue conducting many of the same activities as were conducted in the 2010–2012 program cycle, but will focus on preparing new measures pursuant to CEC’s adopted Order Instituting Rulemaking (OIR) for Title 20 Appliance Standards and U.S. Department of Energy’s ongoing rulemaking for Federal Appliance Standards. Primary activities for 2013-2014 include the following:

#### Title 20 Appliance Standards Rulemaking

- Prepare CASE studies pursuant to CEC’s adopted OIR:
  - Advocate and provide public testimony in State public proceedings
  - Conduct research and testing and submit supporting market and technical data to the CEC
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which CEC eventually adopts)
  - Develop ~~voluntary agreements or reach standards~~ quasi-mandatory reach codes that are voluntary with respect to participation, but require CEC certification if a supplier chooses to participate.

#### Federal Appliance Standards Rulemaking

- Provide support to DOE rulemaking process:
  - Advocate and provide public testimony in Federal public proceedings.
  - Submit supporting market and technical data to the Department of Energy (DOE).
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which DOE eventually adopts).
  - Develop voluntary agreements or reach standards.

### **Compliance Improvement**

For the 2013-2014 program cycle, the combines the former Extension of Advocacy and Compliance Enhancement Program activities into one Compliance Improvement subprogram to enhance understanding of program objectives and activities. The subprogram will strive to improve compliance with Title 24 and Title 20 standards while

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

implementing an effective sector strategy with the Workforce Education and Training (WE&T) Program. Primary activities for 2013-2014 include the following:

Title 24 Compliance

- Title 24 Standards Essentials Role-Based training for building inspectors:
  - Continue delivering training to plans examiners and energy consultants. Update curriculum to cover what is new in the 2013 code. *(per OP 93)*
  - Expand role-based training curriculum to additional compliance improvement market actors such as the building trades and design professionals as guided by needs assessment.
  
- HVAC Quality Installation and Other Programs with Direct Code Requirements
  - Identify opportunities to insert code compliance modules in existing curriculum, such as training required for technicians.
  
- Online Compliance Training:
  - Explore training delivery mechanisms beyond the traditional classroom to include live webinars, activity-based online training, and in-field demonstrations.
  
- Tools and Process Improvements:
  - Implement tools and process improvements as identified through the building department best practices study and the Compliance Improvement Advisory Group (CIAG).
  
- Forms and Compliance Documents:
  - Support development of improved forms and compliance-related documentation for 2013 Title 24.
  
- Compliance Improvement Incentives:
  - Explore a pilot project designed to improve compliance by providing incentives to local governments, contractors, or other key market actors. The pilot will be based on the CIAG's guidance and may include nonmonetary incentives such as training or provision of tools designed to streamline the permitting and inspection processes for building additions and alterations. *(per OP 94)*
  
- Target Low Compliance Problem Areas:

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

- Collaborate with the CEC to identify problem areas and potential compliance improvement solutions through white papers developed by CIAG members. ~~(per OP 95)~~
- Consider pilot project to improve compliance for measures with known challenges, which may include providing incentives to contractors for pulling permits, or motivation for other market actors. ~~(per OP 95)~~
- Develop and Conduct Outreach Campaign to Improve Compliance:
  - Collaborate with the CEC to develop and implement an outreach campaign designed to improve compliance with Title 24 and Title 20 standards. The campaign will be based on the CIAG's guidance and may include activities such as developing flyers for contractors to provide to potential customers explaining the code requirements and benefits, mini measure-based code seminars for big box store employees, etc. ~~(per OP 93)~~
- CEA exam development, facilitation support, and maintenance
  - Collaborate with the California Association of Building Energy Consultants to improve the working knowledge, skills, analytic ability and accountability of individuals using energy compliance software and preparing the appropriate Title 24 documentation for permit submittal. The C&S program will support updating the beta Residential and Nonresidential CEA examinations developed in 2010-2012 to properly test applicant CEAs under the 2013 standards and facilitating the roll out of the new certification process.

### Title 20 and Federal Standards Compliance

- Surveys and Technical Support:
  - Conduct surveys and provide technical support to CEC and industry to facilitate compliance.
- Education and Outreach:
  - Collaborate with CEC on implementing an education and outreach campaign targeted to distributors, retailers, contractors, and possibly consumers. ~~(OP 93)~~

### Reach Codes

For the 2013-2014 program cycle, the IOUs will continue to collaborate with the CEC and Local Government Partnership Program to identify, and provide technical assistance to, local jurisdictions interested in adopting reach codes. In addition, the IOUs will continue

Formatted: Centered

Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

to collaborate with CEC to provide support for developing voluntary standards to encourage buildings to achieve exemplary performance in the areas of energy efficiency. Primary Reach Code subprogram activities for 2013-2014 include the following:

Reach Code Technical Assistance

- Cost Effectiveness Studies:
  - Prepare Cost Effectiveness studies for each of the California climate zones (to be updated for 2013 Energy Building Code) that have been vetted with the CEC, resulting in expedited CEC review of reach code application submittals.
- Policy Guidelines:
  - Provide a “Road Map” of Policy Guidelines for adopting Reach Code including an overview of some of the implications and important choices in writing and adopting these types of ordinances, and recommendations intended to improve implementation and compliance.
- Ordinance Template:
  - Provide a Reach Code Ordinance “template” that establishes clear definitions of when the ordinance is triggered, including CEC-required language which states that all buildings shall meet all applicable requirements of the Building Energy Code.
- Workshops & Presentations:
  - Facilitate public workshops and presentations to interested stakeholders including elected officials, city staff, industry organizations, and community groups that address the following:
    - Critical role that energy efficiency plays in reducing greenhouse gas emissions
    - Understand how Reach Codes and complementary new construction incentive programs such as the California Advanced Homes (CAHP) program help meet CalGreen’s voluntary Tier 1 and Tier 2 Energy requirements, accelerate advancement of zero net energy building practices, and mitigate project-level GHG impacts pursuant to CEQA requirements.
    - Explain the process for developing and adopting a legally enforceable reach code pursuant to CEC requirements
  - Work with industry organizations and other market actors to conduct outreach to local governments to inform them of available reach code assistance.

Local ordinances may be structured in several ways, and often vary in scope, requirements, and triggers. The C&S team will encourage local governments to adopt regionally consistent ordinances where feasible to reduce potential market confusion. However, differing circumstances in each jurisdiction may require them to pursue different avenues.

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

For example, ordinances may be limited to energy issues only, or may be more comprehensive, also including other green building measures. Some examples of typical variations in ordinances include the following:

- Scope and Triggers: Local ordinances may include residential, nonresidential, or municipal buildings, or any combination of the above. Many local ordinance requirements apply to new construction only, while others also include remodels. Triggers may include project size, scope, or value.
- Requirements: Local ordinances typically specify a particular level of performance, allowing builders and designers to achieve the desired performance using a combination of measures and technologies that are appropriate for the project. Many local ordinances specify that covered projects exceed state requirements by a specific percentage (15% was the most common requirement relative to the 2008 Standards). In addition, local ordinances may require projects to meet CalGreen Tier 1 or Tier 2 advanced efficiency levels as well as the non-energy portions of CALGreen. Another common structure employed by many local governments is to require buildings to obtain certification from a relevant green building rating system such as LEED or Build It Green. This structure allows the jurisdiction to leverage the documentation and verification requirements inherent in these systems, thus reducing the verification burden on the building department.

### Planning and Coordination (Non-Resource Subprogram)

The Planning and Coordination subprogram establishes a formal process that dynamically aligns planning activities across the IOU energy efficiency portfolio within the C&S program activities. The Planning and Coordination subprogram supports planning activities that improve alignment across the IOU energy efficiency portfolio with respect to future C&S program activities.

The C&S staff will coordinate with IOU energy efficiency portfolio programs to support efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving zero net energy.

This subprogram will consist of four elements: 1) Strategic planning and coordination; 2) Outreach within each IOU to other program areas; 3) Statewide planning and coordination; and, 4) Workforce education and training. Primary activities for 2013-2014 include the following:

#### Strategic Planning (per OP 91)

- Codes and Standards Collaborative:
  - Maintain a Codes and Standards Collaborative to conduct strategic planning.
- Code Readiness:

Formatted: Font: 12 pt, Fontcolor: Auto

Formatted: Font: (Default)TimesNew Roman, 12 pt

Formatted: Font: 12 pt, Fontcolor: Auto

Formatted: Font: (Default)TimesNew Roman

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

- Establish cross-functional teams, including representatives from voluntary programs (incentive, emerging technologies, and education and training), the CPUC, and the CEC, will be established to identify code readiness priorities relative to policy goals, for example: zero net energy, AB 1109, and other Action Plan objectives.

Internal Coordination and Communications

- Periodic Meetings:
  - Conduct a variety of internal coordination activities based on respective needs of each IOU, including periodic meetings with program leads in other areas as well as management teams.
- Ongoing Communication:
  - Inform planners and support groups regarding future code changes, collaboration on evaluation and regulatory matters.
  - Solicit input from other groups re advocacy efforts, aligning education and training activities with incentive programs.

Statewide Collaboration

- Integrated Dynamic Approach to Portfolio Planning:
  - To support the state's zero net energy objectives, the C&S team will work closely with new construction programs to develop an integrated approach to align new construction program offerings with base code requirements as well as reach codes where possible.
  - The C&S team will work with core retrofit programs as well as local government partnerships and third parties to coordinate offerings with anticipated code changes. *(per OP 91, 152)*
- CPUC Communication:
  - Conduct monthly calls with CPUC personnel to share progress and discuss issues. *(per OP 91)*
- CEC Communication:
  - Maintain statewide weekly calls with CEC staff regarding building codes and appliance standards. *(per OP 91)*
- National Stakeholders Communication:

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

- [Conduct regular conference calls with national stakeholders regarding appliance standards. \(per OP 91\)](#)
- [Compliance Advisory Group Communication:](#)
  - [Host quarterly meetings with Compliance Improvement Advisory Group regarding compliance improvement activities. \(per OP 91, 152\)](#)
- [Local Government Partnership Communication:](#)
  - [Provide quarterly updates to Local Government Partnership Program regarding reach code adoption progress and delivery of training to building departments.](#)

[Workforce Education and Training \(WE&T\)](#)

- [Sector Strategies for WE&T:](#)

The C&S and WE&T teams will meet periodically to coordinate activities that will enhance support for the appropriate market actor roles responsible for new and emerging codes and standards implementation according to priorities established by needs assessments. The C&S program will collaborate with the WE&T Centergies subprogram to not only prepare contractors and technicians to implement current codes, but to also prepare them with technical training on advanced technologies that are projected to become part of reach codes and then the statewide code. (per OP 92 and OP 152)

Formatted: Font: Times New Roman

Formatted: Font: Times New Roman

Strategic Plan Codes and Standards Goal #1: Continually strengthen and expand building and appliance codes and standards as market experience reveals greater efficiency opportunities and compelling economic benefits. (Subprograms 1 and 2: Building Codes and Appliance Standards Advocacy)

The C&S Program will provide a direct response to the CPUC's goal by specifically addressing each near-term strategy in the Strategic Plan. Through the advocacy activities, the program will:

Formatted: Font: Times New Roman

- Continue to expand Title 24 Building and Title 20 Appliance Efficiency Regulations through improved research to identify current code and compliance shortcomings, new technologies and processes, and latest thinking on breadth (scope) and depth (stringency) of possible standards
- Develop aggressive proposals to accelerate regulations for both Title 20 appliance efficiency standards and Title 24 building standards
- Support leading activities such as statewide reach standards (e.g., codes that include California Green Building Standard) and the coordinated development and adoption of advanced local government ordinances.
- Coordinate with both internal and external organizations on an ongoing basis, including voluntary programs and national standards organizations

The Strategic Plan outlines five strategies to strengthen and expand building and appliance standards. The C&S Program intends to address each strategy through the advocacy subprograms as follows.

Formatted: Font: Times New Roman

Strategy 1-1: Develop a phased and accelerated approach to more stringent codes and standards.

The C&S Program seeks to accelerate the adoption of increasingly stringent building and appliance standards. To this end the program will develop proposals to increase the scope and stringency of Title 20 and Title 24. The C&S Program will also develop or support development of more stringent codes, such as the California Green Building Standard,

Formatted: Font: Times New Roman

Formatted: Font: Times New Roman

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

ASHRAE Standard 189, and other model code ordinances, which would significantly exceed the current Title 24 requirements and could potentially become a model for local green building ordinances.

The use of discrete, above minimum code tiers of efficiency standards (e.g. reach codes) have been proven to be an effective way to promote energy efficiency, prepare the market for high efficiency equipment in an orderly way and smooth the transition for more stringent future standards. However, the proliferation of many standards for the same product renders confusion in the market place and hinders compliance. The C&S Program program will work with local governments that currently have or are considering adopting advanced energy codes to identify common themes among their primary objectives and develop a set of model reach codes and standards that form the path for subsequent statewide adoption. The C&S Program program will help local governments improve compliance by developing compliance forms, modify performance software, and provide code compliance training to practitioners and building departments

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Historically, approximately 100,000 single family (SF) homes and 50,000 multi-family (MF) dwelling units are constructed each year. Estimated construction for 2009 is projected to be much lower: SF 30,000 SF units and 33,400 MF units.<sup>18</sup> These buildings are within the scope of the Title 24 energy code. There are about 8 million existing single family homes and 4 million existing multi-family dwelling units in California.<sup>19</sup> Since homes are sold on average every seven years in California<sup>20</sup>, approximately 1.4 million existing homes and (assuming same turn-over for rental properties) 570,000 existing multi-family units are sold each year. Thus requirements for the most basic efficiency measures (attic insulation, weather sealing) installed at time of sale would have a huge impact – potentially impacting 10 times as many residential buildings as do the current residential standards. The C&S Program program will work with local governments to identify existing barriers and develop model time-of-sale (TOS) requirements such as Home Energy Rating System (HERS) audits, and commissioning for commercial buildings that do not unnecessarily hinder real estate transactions or financing. Ultimately, if the pilot program with local governments is successful, it will make the case for a statewide time-of-sale requirement.

Formatted: Font: TimesNewRoman

**HVAC.** The efficiency of heating and cooling systems is central to building energy efficiency standards and has become an even more significant component of the standards through the adoption of time-dependent valuation. Energy losses from ducts can be a large fraction of heating and cooling loads. The Title 24 standards have mandatory requirements for duct sealing and prescriptive requirements for duct testing and verification by a HERS rater. Feedback from duct tests to HVAC contractors and home builders is a very

<sup>18</sup> Construction Industry Research Board, California Construction Review, Private Building Construction, January 22, 2009.

<sup>19</sup> <http://www.dof.ca.gov/HTML/DEMOGRAP/ReportsPapers/Estimates/E8/E-8.php>

<sup>20</sup> Median duration at residence is 7 years for homeowners and 1 year for renters. Jason P. Schachter and Jeffrey J. Kuenzi. US Census. **2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

important mechanism for transforming the market. Thus, the C&S ~~Program~~ program will be pursuing the concept of mandatory requirements for duct testing and self-certification of the test while still including the prescriptive requirement for a HERS rating. Similar to the acceptance tests in the nonresidential market, a self-certified duct pressurization test would be required for all residential duct systems in unconditioned spaces that are not obtaining a HERS verified duct test.

Formatted: Font: TimesNewRoman

The systems not receiving HERS duct sealing verification would receive the same energy penalty in the performance approach and the systems would not be allowed in the prescriptive method approach. This requirement would reduce enforcement uncertainty – every duct system would be required to be tested. Since all duct systems are required to be tested, this lowers the incremental cost barrier for a HERS verified duct test and assures that mechanical contractors and homebuilders receive the feedback from duct testing on every job. This same approach would be taken for relatively new requirements for measurements of airflow, fan power, duct pressure drop and refrigerant charge.

The C&S program will prepare CASE studies to evaluate the cost-effectiveness, market status and availability of the equipment to determine the potential for revising the building efficiency standards so they are based on enhanced efficiency HVAC systems such as: radiant cooling with a dedicated outside air system, evaporative condensing, direct/indirect evaporative cooling and ground coupled heat pumps. These and other cooling technologies have the potential to be significantly more efficient than the federal air conditioning regulation but may be exempt from federal pre-emption. For federally-regulated cooling equipment, the C&S program will continue working with the federal DOE to develop regional air conditioning standards that would be more appropriately suited to California's warmer and drier climate.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

**Envelope performance testing.** Similar to the requirements for performance testing of HVAC installations, the performance testing of the envelope of homes and other residential dwelling units provides direct feedback on the level of infiltration. Thus, testing could transform the building industry. The C&S program will evaluate the feasibility of adding mandatory requirements for blower door tests for all new homes. Similar to the requirements for duct testing, the prescriptive baseline would retain the HERS verification requirements, but for those homes wishing to avoid the HERS requirements through a performance trade-off the blower door test would still have to be performed.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

*Strategy 1-2: Expand Titles 24 and 20 to address all significant energy end uses*

The ~~codes and standards~~ C&S program will pursue additional energy savings by broadening the scope of the Title 20 appliance standards and the Title 24 building efficiency standards. Title 20 proposals will be developed and supported through the public stakeholder process for both current and future proceedings. Current proposals include: battery chargers, portable lighting fixtures, set top boxes, televisions, computer monitors, game consoles. Future proposals will include office equipment and other miscellaneous and plug loads. Integration activity with voluntary codes and program activities will be increased to expand

Formatted: Font: TimesNewRoman

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

potential for new product categories to be added to the measure list. The C&S program will continue to support the Title 20 proposals after their adoption by providing ongoing technical assistance to the CEC to fend off post adoption maneuvering by oppositional stakeholders, which has increased in recent years. This will reduce post adoption exemption of product classes.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

For the 2008 revisions to Title 24, the C&S Program successfully proposed a bold increase in scope to include refrigerated warehouses. For 2011-2013, the C&S Program program will consider increasing again advocated increasing the scope of the standards, this time to include the refrigeration plant small walk-in refrigerated coolers and refrigerant plants serving display cases in supermarkets. The C&S Program is also pursuing other opportunities with computer room cooling, and other process measures such as compressed air systems.

Formatted: Font: TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

In the past, energy codes have focused only on the efficiency of the equipment installed and not on how that equipment functions, and recent field studies have found that a significant number of controls do not work correctly. Thus the C&S Program will be reviewing the efficacy of fault detection and diagnostic (FDD) controls to determine their effect on operators taking subsequent action to correct the problem when notified. The C&S Program will also investigate barriers to sub-metering tenant units and major building energy consuming systems such as lighting, chiller plants, and boiler plants. Pending approval from the CPUC that water savings are within the scope of IOU energy and resource conservation programs and should be pursued, the C&S Program will research requirements for water meters on all new buildings.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

With the current new federal administration's focus on energy efficiency we can expect, at a minimum, more opportunities to increase the stringency of Title 20 standards through Federal proceedings. If the new administration increases the budget for DOE staff, we can expect an even greater acceleration in activities than the already rapidly increasing number of DOE proceedings. Increased DOE funding would provide the opportunity for states to petition DOE for new rulemakings and/or waiver petitions in support of California energy savings.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

The C&S Program will work in conjunction with national organizations to align California's reach goals with LEED, Green Globes, and CHPS. Ideally, satisfying California's Green Building Standard would become the minimum threshold to apply for a LEED rating. Likewise, the C&S Program will work with ResNet and California HERS Providers on the development of further home rating system upgrades and rating techniques.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

### Strategy 1-3: Improve code research and analysis.

Research and analysis is the basis of upgrading energy codes. In some cases this research is forward-looking and identifies technologies that have sufficient market experience, cost-

Formatted: Font: TimesNewRoman

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

effectiveness and broad applicability to be deemed “code-ready.” This research can also be retrospective for two major categories of energy savings opportunities:

1. Review of code proposals that were unsuccessful in past code cycles, but appear to have promise due to changes in the market, refinements in the technology or new information.
2. Evaluation of current standards for loopholes, inconsistencies, enforcement barriers. The savings from these issues can be substantial and must be actively researched.

More generally, the Program will seek to improve C&S advocacy by developing new approaches to determining incremental costs, availability, and reliability. In particular, cost information is considered confidential by industry representatives who generally oppose code upgrades, so the success or failure of a standards proposal often turns on the perceived accuracy of incremental costs.

Formatted: Font: TimesNewRoman

Due to the increasing complexity of the targeted measures and increasing sophistication of oppositional stakeholder tactics during the public process under both Title 20 and 24, a greater emphasis on more thorough market research, product performance measurement and technical production data is necessary. Existing studies may be expanded, new studies may be designed and implemented, and additional market research may be purchased to facilitate future standards development. New or updated test methods are required to pursue significant savings opportunities left stranded by current incomplete test methods (e.g., high temperature performance metrics for cooling systems and variable speed capability of commercial refrigeration equipment).

Formatted: Font: TimesNewRoman

Codes research also needs to consider more than just technologies but also design methods. A “big bold” research topic for Title 24 is a whole building approach to building design. This concept is in support of a requirement for compressorless- or “hybrid” cooling systems in the homes in the more temperate California climate zones. Well-designed homes in the mild coastal regions of California do not need air conditioners. These homes often have thermal mass to dampen the diurnal temperature swings when it is hot outside, so the thermal comfort of the home isn't solely dependent on the air temperature of the home, but also the radiant temperature. The C&S program will pursue the potential of providing Title 24 compliance credit to homes that do not have air conditioners as long as it can be reasonably expected that occupants in these homes will be comfortable enough that these homes will not be retrofitted with air conditioners later on. This approach would likely require an enhancement of the existing performance method simulation tools, or require newer simulation tools such as Energy Plus, that has a thermal comfort model. This would require a significant investment in resources. However, if this concept were implemented, it would move new homes in coastal regions significantly closer to the 2020 net-zero net energy homes goal.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

This same concept can also be applied to commercial buildings with greater attention given to comfort due to tasks being conducted in fixed positions and locations, and greater attention to internal heat gains resulting from plug loads and lighting loads. However,

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

better thermal mass and comfort models will advance low energy commercial buildings as this would also benefit the characterization and ultimately the design of passive solar commercial buildings assisted with radiant heating and cooling. Energy Plus also promises the capability of modeling airflow which should provide improved confidence in specifying two other low energy HVAC systems: positive displacement ventilation and natural convection.

Initially, advanced tools require advanced users. Thus training in low energy design principles and methods of predicting building performance training is needed for the next generation of architects and engineers starting out in practice and currently attending California architecture and engineering schools. Thus, Training is needed in a number of different venues: for existing practitioners, training opportunities at utility training centers, and at professional conferences. Student training would be most efficiently conducted as part of their normal curriculum. Sponsored curriculum development and sponsored research in the design of efficient buildings results in career long impacts when combined with other broader society-wide incentives for low energy design.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Even more advanced interfaces to these tools expand the scope of potential users by simplifying the user's inputs, but requiring sufficient detail in the nomenclature used by designers so these tools can predict the energy impact of design choices with reasonable levels of accuracy. These program interfaces must have enough flexibility so the breath of applications is wide enough to affect a sizable portion of the possible building applications and the scope of measures is sufficiently broad. Training is still needed for these simplified tools but is accomplished in less time and is given to more people as there are more people likely to use the tool. Easier to use tools expands likely users to sales people, manufacturer representatives and facility managers.

In addition to the fairly sophisticated tools to support these advanced designs, a segment of the market will be drawn to design approaches that are formulaic. These approaches may not optimize energy savings, but if the prescriptive cookbook method is well designed, they can yield significant levels of reliable savings. This requires a significant effort in exercising the design tools, comparing the simulated results to actuals and synthesizing the results into design standards. These design patterns then must be transmitted in a number of ways including resource documents, training materials and presentations.

The energy consumption of buildings is not purely a function of their components but is impacted by occupant behavior and actual equipment installation and performance. Field studies are an important method of feedback on how much energy is really saved by a measure. In some cases this research can leverage information from CPUC EM&V studies and CEC load forecasting studies.

Another significant source of market and technology data is the utility energy efficiency programs. The C&S P program will periodically poll the program managers for information concerning market share, technology cost and verified energy savings. The energy efficiency programs will likely identify technologies that may be ripe for code adoption and

Formatted: Font: TimesNewRoman

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

can help develop the market experience that differentiates those products that are truly code ready.

The importance of the statewide utility Emerging Technology (ET) Program will increase as source of information and potential measures for voluntary reach-code tiers. Although available in the market, the measures that are assessed in the ET Program may be neither cost-effective nor fully applicable for mandatory standards. In some cases, it may be appropriate to have measures simultaneously included in utility energy efficiency programs as well as a reach code tiers.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Also related to field studies are process evaluations of how the code is administered from the designer and specifier, to Title-24 analyst, to plan check, to bidding, through construction to inspection to occupancy. The delivery of efficient buildings relies on each step of this process. Transferring this information to the CEC and code proposal developers increases the likelihood that compliance will increase with the next energy code.

Formatted: Font: TimesNewRoman

### Strategy 1-4: Improve coordination of State energy codes and standards with other state and Federal regulations.

The development of the California energy efficiency standards does not occur in a vacuum. Much of the technical basis of Title 24 rests on consensus standards developed by ASHRAE (American Society of Heating, Refrigerating and Air-conditioning Engineers) and IESNA (Illuminating Engineering Society of North America.). The measurements of product properties rely on test standards developed by DOE; American Society for Testing and Materials now referred to as ASTM International (ASTM); Air-Conditioning, Heating and Refrigeration Institute (AHRI); National Fenestration and Rating Council (NFRC); Cool Roof Rating Council (CRRC). Although the C&S Program works most closely with the CEC, other California state agencies are also involved with the development of efficiency standards. Examples of coordination with other state agencies may include, but are not limited to, the California Air Resources Board (CARB) as codes relate to greenhouse gas (AB 32) and other emissions, Department of Toxic Substance Control (DTSC) as codes relate to toxic waste from lamps, and California Department of Water Resources (DWR) as codes relate to the water use in HVAC systems. In addition, there is much to be learned and many benefits derived from coordinating with ASHRAE and other states that are developing their own energy codes. Thus, the C&S Program will be coordinating with other entities in the development of test standards and other consensus standards.

Formatted: Font: 12 pt

Formatted: Font: TimesNewRoman

Formatted: Font: 12 pt

Formatted: Font: TimesNewRoman

Formatted: Font: 12 pt

The C&S Program will also participate in the development of other standards that can then be applied in California. The most notable of these is the Federal appliance efficiency regulations and international standards, which are likely to have bigger impacts on Federal and state appliance standards in the future. If the C&S Program continues to influence the outcome of these regulations, nominal savings in California will be achieved. Since the Federal regulations apply to all sales in the US, compliance enforcement is easier. The

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

The program will continue to take a leadership role in advocating for new legislated standards (often based on Title 20 standards in the past) and in both negotiated and contested DOE appliance standards rulemakings. In view of the increasing international coordination in the codes and standards arena, the program will take a more influential role in influencing international test methods and standards framework developments where there is significant opportunity to affect federal and CA appliance standards. We fully expect the need to travel to other countries to conduct effective collaboration and coordination of standards activities that potentially affect California. Increased coordination with national voluntary program frameworks including CEE and ENERGY STAR are also likely to increase C&S codes and standards efficacy.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Federal appliance efficiency standards limitations have been a hindrance to more stringent codes in California. These Federal standards preempt the state from requiring additional labeling, higher appliance efficiency standards, and prevent building efficiency standards from requiring higher efficient equipment than equipment that are minimally compliant with the Federal appliance standards. Given that the Federal regulations cover the largest energy consuming devices (lighting, air conditioners, and water heaters), this has seriously constrained the effectiveness of California's appliance and building efficiency standards in California. The C&S program will be developing a research plan to address Federal preemption including, but not limited to, waiver petitions, federally legislated standards, and development of new coalitions.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

The CARB's proposal in response to SB 97, which requires rules be developed to address the California Environmental Quality Act (CEQA) requirements for greenhouse gas emissions, expands the possible scope of energy consumption that could be regulated. Well-defined efficiency measures and performance trade-off options would be in the interest both of CARB and the entity submitting a new industrial, commercial or residential project.

In addition to the coordination with the DWR for the water use in HVAC systems noted above, there is an ongoing CPUC proceeding to determine the amount of energy embedded in water use. Therefore, the C&S program will further coordinate with the DWR as studies are initiated to examine potential reductions in water use. Since the CEC was given jurisdiction over water use starting in 2008, it is anticipated there will be new sections in Title 24 regulating the use of water.

Formatted: Font: TimesNewRoman

Also as mentioned earlier, the C&S program will pursue developing reach codes in coordination with the California Green Building Standards. To do this the C&S program will coordinate with the BSC (Building Standards Commission), the CEC (California Energy Commission), HCD (Housing and Community Development), OSHPD (Office of Statewide Health Planning and Development), Local Governments, and others.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

*Strategy 1-5: Improve coordination of energy codes and standards with utility programs*

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

Coordination between C&S and other utility programs may occur in various ways: existing or newly adopted standards, future standards, direct linkages between incentive programs and a specific standard, and long-term integrated planning. This is a rapidly evolving area, so planning is necessarily at an objectives level for now. [The C&S program staff team](#) will periodically meet with other utility program staff to facilitate ongoing coordination.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

**Newly adopted standards.** On an ongoing basis, C&S [staff team](#) communicates with IOU incentive program managers regarding potential adoptions of new standards. Depending on the opportunity, program managers may decide to provide incentives for measures in advance of the effective date to prepare the market.

Formatted: Font: TimesNewRoman

Education and training between adoption and effective dates of a particular standard represents another way to prepare industry. [The C&S program](#) will provide ~~2008~~ Title 24 training to both market actors and internal program staff in advance of the ~~August 1, 2009~~ effective date for the ~~2008~~ Title 24 Standards. The training will help identify opportunities for ongoing coordination between incentive programs and C&S activities. Another activity under development is to require program participants to complete and submit the applicable acceptance tests required by Title 24 to receive an incentive for HVAC and lighting controls equipment. This will increase compliance with the acceptance tests and help assure the incented equipment is installed according to code intent.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Although all utility programs are impacted by codes and standards, particular focus will be placed on coordinating with the Local Government, HVAC, and [Workforce, Education and Training \(WE&T\)](#) programs. Please refer to Section 8 for how the [Program C&S program](#) will coordinate efforts to help meet shared goals defined in the Strategic Plan.

Formatted: Font: TimesNewRoman

**Future standards.** Having selected topics for potential CASE study proposals for the next code cycle, for example, 2011 building and appliance standards, energy efficiency program managers may be able to include measures in programs to improve code readiness. The C&S ~~Pp~~ program may also work with statewide [Emerging TechnologiesET](#) program staff to identify new technologies for which to develop alternative calculation methods (ACM). CASE studies can be developed for new technologies to propose Title 24 credit towards achieving compliance, thereby reducing one barrier to market acceptance. Moreover, a Title 24 ACM provides an approved method for calculating energy savings for incentive programs.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

The C&S ~~Pp~~ program will continue to improve coordination with the statewide new construction programs. Since the success of these programs are dependent on exceeding the current Title 24 codes, they serve as a useful “test-bed” to inform the development of future Title 24 proposals by highlighting the more cost effective measures, flagging problem areas with compliance, and demonstrating the extent to which the current code can be exceeded.

Formatted: Font: TimesNewRoman

On a longer term basis, it is sometimes possible to identify code objectives two code cycles into the future. This will be particularly critical for developing an appropriate trajectory for

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

reaching the Strategic Plan’s zero net energy goals, AB 1109 Huffman Bill goals<sup>21</sup>, and state policy initiatives indicated in the previous section. For these opportunities, the C&S program will complete a gap analysis to identify distance between code readiness attributes and the current market status of the technology, which will inform the creation of an integrated long-term coordination plan. Long term information repositories may be developed to collect information that will support adoption in a future code cycle.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

**Direct linkages.** The C&S program seeks to directly link, as has been done for the current Title 20 television proposal before the CEC, code proposals with incentive programs. When faced with industry resistance, this linkage constitutes a stronger argument before the commission. Moreover, linking a standard with an incentive program creates a synergy in which the push of a widely recognized future standard reinforces the pull of near term incentive programs, thereby increasing participation in a complementary incentive program.

Formatted: Font: TimesNewRoman

Albeit weaker compared to direct linkages, the synergy between standards and incentive programs exists more generally through indirect linkages.

Strategic Plan Codes and Standards Goal #2: Improve code compliance and enforcement.  
Strategic Plan Codes and Standards Goal #2: Improve code compliance and enforcement.  
(Subprograms 3 and 4: Compliance Enhancement/Improvement and Reach Codes)

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

The C&S program is committed to improving code compliance and enforcement. To demonstrate this commitment, C&S will expand Extension of Advocacy activities and launch expanding the new Compliance Enhancement (CECI) subprogram. The program will leverage existing, and develop new education and outreach activities to equip both building and appliance industry market actors with the knowledge and tools needed to comply with Title 24 building energy efficiency standards and Title 20 appliance efficiency regulations. Expanding the program to include Compliance improvement will help ensure that the full potential of the state’s codes and standards efforts are realized, and results in a comprehensive C&S program.

Formatted: Font: TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

The C&S strategies and activities listed in the Strategic Plan are focused primarily on Title 24 building energy efficiency standards, noting that appliances are principally regulated at the federal level rather than the state level. As the CPUC Strategic Plan also notes, there remains huge potential savings at the state level for appliances and equipment not regulated by the federal government. With this in mind, the C&S program has added activities to capture Title 20 compliance savings as well and added a sixth implementation item for this program cycle in the Strategic Plan Table below to document planned Title 20 efforts.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Strategy 2-1: Improve code compliance and enforcement.

<sup>21</sup> AB 1109 Huffman directs the CEC to implement strategies to reduce residential lighting by 50% and commercial and outdoor lighting by 25% by the year 2018.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

The Strategic Plan identifies one strategy and five activities targeted to improve compliance and enforcement with Title 24 building energy efficiency standards. Each activity is addressed in order below.

Activity 2-1 a): Conduct research to determine high-priority tactical solutions for code compliance and focus efforts accordingly.

As a first step in launching compliance improvement efforts, ~~Program staff~~ the C&S team will interview the building industry market actors included in the compliance supply chain to determine how their current performance compares to the desired performance, the reasons for the gap, and which performance improvement solutions the C&S ~~P~~ program may employ to improve code compliance. Additionally, ~~the team~~ C&S staff will interview experts who have been providing training, software and regulatory support to industry practitioners over the years to identify best practices, possible points of collaboration and gaps the C&S ~~P~~ program can help fill. Furthermore, ~~the~~ C&S program will conduct a process pilot with several local governments to investigate code enforcement processes in detail, identify opportunities to streamline enforcement practices and improve consistency across jurisdictions. Results of these research efforts will inform the total package of performance improvement solutions the ~~p~~ program will implement to help improve code compliance rates. In addition, the results of the compliance improvement process study that included a stakeholder roundtable discussion will be compared with the interviews.

Formatted: Font: TimesNewRoman

Activity 2-1 b): Increase training and support for local building code officials.

Building code officials are the primary key to improving compliance with Title 24 standards and certain Title 20 regulations such as residential air conditioning equipment. Building department personnel must enforce several different building codes simultaneously, with limited resources. Given the limited time available, officials correctly prioritize those codes related to life-safety, which often results in extremely limited time and resources dedicated to enforcing energy-related codes. In addition to resource limitations, energy codes have undergone much more significant changes in each of the recent code updates than most other codes, thus creating a challenge for officials to maintain their expertise.

~~EOA and CE~~ The CI subprogram will focus a significant percentage of the code education resources on providing training and support to building code officials. Based on research results, ~~EOA and CE~~ the CI subprogram will develop role-based training courses and abbreviated code guidelines for plan checkers, inspectors and counter staff specifically targeting only those sections of the code related to each particular position. This work will be closely coordinated with the CEC and third party efforts to ensure that it supports and is in alignment with the CEC's compliance improvement efforts.

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

In addition, in response to the needs assessment to be conducted as part of the local government process pilot, ~~CE~~ the CI subprogram will develop and test process improvement tools, and will work with CALBO, the International Code Council (ICC), and

Formatted: Font: (Default)TimesNewRoman

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

CEC to conduct outreach to other jurisdictions to encourage adoption of those tools.

CEThe CI subprogram will conduct outreach and encourage other jurisdictions to adopt tools and processes that help building officials increase compliance. CEThe CI subprogram will support more consistency across jurisdictions, in processes, documentation requirements and enforcement practices, and will encourage the expansion of submitting online permitting paperwork for HVAC replacements as well as other measures. These on-line submittals allow for the creation of customized inspection checklists that also simplify enforcement.

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: (Default)TimesNewRoman

CEThe CI subprogram will also work with the CEC and HERS providers to ensure the new HERS documentation and data management systems are consistent and serve to streamline the compliance process.

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Activity 2-1 c): Investigate regulatory tools such as licensing/ registration enforcement.

Currently, although Title 24 documentation must be signed by a licensed professional, the actual calculations can be prepared by anyone. Anecdotal evidence from rebate programs and building departments indicates that the lack of training and/or professional certification requirements results in sub-par documentation being submitted to building officials, thus requiring more time to review documents and determine compliance. CEThe CI subprogram will work with the California Association of Building Energy Consultants (CABEC), CEC and CALBO to increase the stringency of the Title 24 Certified Energy Analyst test, initiate a certification process for Title 24 consultants, and begin requiring energy education for building officials as part of CALBO's existing continuing education requirements.

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

CEThe CI subprogram will also work with the CSLB (California State License Board) and the DCA (California Department of Consumer Affairs) to conduct outreach to members regarding the importance of the standards to the state and to their customers, and to encourage the CSLB to enforce the HVAC permitting requirements with their members.

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Activity 2-1 d): Evaluate proposed changes to the code and compliance approaches to simplify and expedite compliance.

Feedback from building officials indicates that they are overwhelmed by the volume, complexity, and rapid changes to the energy codes. As a complement to the role-based training, CEthe CI subprogram will work with industry experts, CEC, and building officials to develop and test role-based and context-sensitive code guidelines. The guidelines will target specific compliance items and common measures that must be addressed at each stage in the permitting and inspection processes.

Formatted: Font: TimesNewRoman

CEThe CI subprogram will conduct research to identify specific areas of the code that can be simplified by reducing the number of trade-offs and compliance options and/or transitioning to a greater number of mandatory measures.

Formatted: Font: (Default)TimesNewRoman

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

In addition, ~~CE~~the CI subprogram will work to increase the availability of online permitting resources and the consistency of requirements and documentation across all jurisdictions, with an initial focus on geographically contiguous regions. Online permitting makes obtaining permits more convenient and less costly, and geographic consistency provides a more stable and easier-to-understand process for building designers and contractors, as well as building officials.

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: TimesNewRoman

Activity 2-1 e): Work with local governments to improve code compliance, adopt above code ordinances, and provide training/education.

The primary goal of the ~~CE measure-based and holistic compliance improvement~~ subprogram elements is to improve code compliance. As discussed in activities a) through d) above, ~~CI subprogram~~E will be dramatically expanding and enhancing efforts in support of this goal, launching several different outreach and training offerings and activities.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

The C&S ~~Reach Code~~ (RC) subprogram has adopted a demand-side philosophy to local code adoption, consistent with the general philosophy of energy efficiency. California has a very robust energy efficiency code that can, if fully enforced, result in a tremendous amount of savings and reduction in both energy usage and peak demand. ~~The RC subprogram~~E will conduct outreach to local governments and green communities through Government Partnerships Programs, Build It Green, and others industry partners to educate interested participants about the potential savings that could be realized through optimizing compliance with existing codes prior to adopting a new code. ~~The RC subprogram~~E will inform local government<sup>s</sup> that optimizing compliance with existing codes is one of the most immediate and significant steps a city or county can take toward reducing the jurisdiction's carbon footprint, and will request a commitment from each participant to take documentable steps toward that end.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

Many local governments, in their eagerness to take action in the absence of federal leadership, have individually developed and adopted unique local codes to reduce the climate change impacts of the building activities in their jurisdictions. Unfortunately, codes are developed and adopted without any real overall coordination with other jurisdictions, resulting in a plethora of local ordinances and code requirements throughout the state that are changing frequently, making it impossible to easily track what code applies in which jurisdiction at any given time. ~~In Sonoma County alone, there are ten different local energy and green building ordinances.~~ ~~The RC subprogram~~E will encourage local governments to work with neighboring jurisdictions to adopt consistent requirements and to remain consistent with current Title 24 climate designations to reduce potential market confusion.

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman

One of ~~the RC subprogram's~~ goals for local codes is to promote consistency with the current Title 24 climate zone structure, with which market actors are used to working. ~~The RC subprogram~~E will work with local government partners to identify and document their objectives for a local code and also with the CEC and Building Standards Commission (BSC) to make the next generation of the State's Green Building Standards meet those

Formatted: Font: TimesNewRoman

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

objectives for most, if not all local governments. First, [the RC subprogram](#) will work with local governments to support development of a package of cost-effective local energy codes that exceed [2008](#) Title 24 minimum requirements for residential and nonresidential new construction. [The RC subprogram](#) will support efforts to obtain CEC pre-approval to simplify the approval and adoption process at the local level. In addition, to begin harnessing the tremendous savings potential from existing homes, [the RC subprogram](#) will support development of a package of standards that are applicable at time-of-sale or major remodels. Local ordinances will serve as an opportunity to test the efficacy of the codes and inform regulators as to the readiness of the codes for statewide adoption.

Formatted: Font: TimesNewRoman

### Activity 2-1 f): Conduct outreach and education efforts to improve compliance with Title 20 Appliance Standards.

The IOUs' experience working with industry actors on Title 20 advocacy indicates that there are two primary paths for equipment covered by Title 20 to move through the supply chain from manufacturers to consumers. The first is via manufacturers, distributors and contractors, while the second is via retailers directly to consumers. Similar to the Title 24 outreach, the IOUs plan to target each actor in the supply chain for selected measures with significant savings potential and for which compliance rates are relatively low.

Given the wide range of industries and the organization of their distribution channels, compliance improvement activities for appliances will be conducted on an industry-specific basis. For example, compliance improvement outreach for manufacturer-dominated industries logically begins with manufacturers since top down efforts will affect most product sales in California. If major manufacturers are located overseas, as is the case of consumer electronics for example, we fully expect the need to travel to other countries to conduct effective outreach and training.

Different approaches will be used to educate and train retailer-dominated and contractor-dominated industries. In the retailer-dominated case, for example, compliance efforts must target the stocking practices of these retailers. In the contractor dominated case, where contractors are largely responsible for the purchase and installation of the product, compliance efforts must focus on outreach to contractors.

The C&S [P](#)rogram will coordinate with the CEC to conduct outreach to equipment manufacturers to inform them of existing code requirements, and to facilitate their compliance from both a technical and administrative perspective. Assistance will be provided to manufacturers to support their efforts to ensure equipment sold in California meets the minimum technical requirements, and to successfully complete the certification process with the CEC.

Formatted: Font: TimesNewRoman

For measures such as pool pumps, where most are sold through distributors and installed by contractors, in addition to working with the pump manufacturers, the [P](#)rogram will work directly with distributors to educate their representatives. The IOUs will also conduct outreach to contractors directly, and will work with trade organizations to leverage their

Formatted: Font: TimesNewRoman

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

existing communications networks. Outreach activities may include attending trade conferences and regional meetings, authoring articles for industry newsletters or publications, or direct contact via email or printed materials.

Other measures, such as incandescent lamps and consumer electronics are often purchased directly by consumers through retail establishments. Though the market actors are different for these measures, the C&S Program will use similar methods to reach as many market actors as possible. Trade associations are expected to be important stakeholders in this effort and will be leveraged as much as feasible. The IOUs will coordinate with regulators and other providers to identify gaps and opportunities to collaborate.

**f) Market Transformation Information**

Formatted: Default, Indent: Left: 0.5", Don't keep with next

Regulation through building codes and appliance standards comprises an exit strategy for traditional portfolio activities and creates a continuous improvement cycle in California. While voluntary programs are essential to establishing market acceptance, adoption into code is required to complete the market transformation process.

Formatted: Default

Adoption into code is a commoditization process which converts a once high margin differentiated product into an industry commodity or baseline product. Greater economies of scale for the once premium product reduce the cost of the regulated product which, in turn, drives innovation for new products that can be sold at high margins.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

Formatted: Centered

In California, the CEC is responsible for conducting rulemakings, including setting the scope of proceedings, determining the schedule and either adopting (with or without modifications) or rejecting a code proposal. Hence, the CEC largely determines the success or failure of the CPUC's IOU administered C&S program. For various reasons, the CEC sometimes fails to adopt IOU code enhancement proposals for reasons other than code readiness; examples include lack of resources to conduct a robust rulemaking or vigorous industry resistance.

So too does the CPUC's decisions impact success; for example, the delay in program approval and associated funding has delayed preparation for the 2011 code cycle. Since the emphasis on C&S program opportunities is still comparatively new, some C&S program-related CPUC policies are not fully developed, which creates uncertainty for C&S program implementation. Additionally, if CPUC is unable to conduct timely baselines and evaluations, the delay may constrain or delay C&S program activities.

From a C&S Program perspective, the IOU's role is somewhat limited, including developing code proposals through the building codes and appliance standards advocacy subprograms and supporting the public process through adoption. Following adoption, IOU's provide other assistance such as writing drafts of the compliance manuals and assisting CEC staff in clarifying standards.

Since the CEC controls the timing of all aspects of the adoption process, advocacy entries in Table 4 are general and subject to change.

Through the extension of advocacy components of the building codes and appliance standards advocacy subprograms, IOUs will strive to improve compliance rates with the measures as noted below.

In 2009, the IOUs will develop a detailed statewide compliance enhancement plan and goals based on the Program's compliance enhancement scoping study results. This plan will include program targets for compliance based, in part, on the CADMUS evaluation ongoing at the time of this writing. In 2010, the IOUs will assess the Program's progress relative to the compliance enhancement plan goals, revise the plan and improve CE subprogram implementation as necessary. Again in 2011, the IOUs will assess the Program's progress relative to the plan goals, revise the plan and improve Program implementation as necessary.

**7. List of Measures & CASE Studies**

Formatted: Font: 12 pt

Formatted: Font: TimesNewRoman, 12 pt

Formatted: Heading2

Following are tables of ~~current and future~~ possible IOU CASE study topics. For a number of reasons, these lists are not static. After further planning, IOUs may decide to swap leads, co-fund, or make other changes, as appropriate. During the CASE study development process, it is sometimes found that there is insufficient market data or economic information to justify a standard. During rulemakings, industry representatives may inject sufficient uncertainty to derail a proposal. The CEC may indicate that they are more interested in some proposals and delay others. Sometimes new ideas occur that were overlooked during the planning process.

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNewRoman

The CASE study projects develop feasibility and cost-effectiveness evaluation for a variety of code improvement opportunities. These CASE projects are not a purely technical exercise, advocacy is an important part of moving an idea into energy codes and this requires a significant amount of consensus building and negotiation.

Formatted: Font: 12 pt

~~Table 6 includes measures to be evaluated for the 2011 Title 24 Building Efficiency Standards. The IOU lead provides funding, is the project manager for the CASE report, is responsible for tracking project progress, and is involved with some of the policy questions that arise in the development and advocacy of the CASE measure. Co-funding typically indicates another IOU which is interested in the topic and will likely provide in-kind support as well as financial support of the CASE report but is not managing the consultant working on the CASE report. Research support often comes in the form of utility test labs, or field data collected by ET or other programs. The status indicates whether a contract has been let ("initiated"), research has commenced ("ongoing"), or in the case when this field is blank, the measure is in an RFP that has not yet been issued.~~

~~Table 6 includes a preliminary list of measures from the CEC to be evaluated for the 2016 Title 24 Building Efficiency Standards cycle. These will inform IOU planning.~~

Formatted: Font: (Default)TimesNewRoman

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

**Formatted:** Centered

<a href="#">Task/ambient lighting for offices</a>	
<a href="#">Low W/sf HVAC systems</a>	<a href="#">Prescriptive performance-based requirement, cap on total installed watts.</a>
<a href="#">Optimized Window Area, Update Window VT's</a>	<a href="#">Reduce WWR from 40% to 30% while maintaining visual comfort. Estimate that 0.11/WWR reduced VT reduced daylighting savings by 25%. See ASHRAE ECB reduced WWR by building type.</a>
<a href="#">Nat ventilation, dedicated O/A, + chilled beam or radiant system</a>	<a href="#">Drive down fan energy. Window sensors interlocked with fan system</a>
<a href="#">Dual path approach PV vs High Eff HVAC</a>	<a href="#">Base case has 1W/sf of roof area, alternate has high eff HVAC</a>
<a href="#">Eliminate reheat</a>	<a href="#">Through zoning of systems or designs such as dual duct design, reheat can be mostly eliminated.</a>
<a href="#">Daylighting control dimming plus off.</a>	<a href="#">Ballasts can use 20% of power when fully dimmed. In primary zone no light can be needed much of the day. Added savings.</a>
<a href="#">Opaque envelope U-factors</a>	<a href="#">ASHRAE roof values are significantly lower</a>
<a href="#">Retail lighting including occupancy controls</a>	<a href="#">Fix general lighting in tailored method. Further LPD reductions, trade-offs with occupancy sensing controls</a>
<a href="#">Skylighting in lower ceiling heights</a>	<a href="#">Skylighting required in spaces &gt; 15 ft, related to cost of lighting well and spacing of skylights. Technologies to reduce cost of light wells and to spread light so skylights can be further apart.</a>
<a href="#">Egress lighting</a>	<a href="#">Turn all the way off when space is unoccupied. Effort involves working with state fire marshal and perhaps NFPA.</a>
<a href="#">Economizers</a>	<a href="#">Catch up to IECC - required down to 33 kBtu/h, FDD updates</a>
<a href="#">Façade and landscape lighting</a>	<a href="#">ASHRAE has lower LPDs</a>
<a href="#">Parking lot lighting (tall pole motion sensing?)</a>	<a href="#">Motion controlled bi-level expanded to above 24 ft if technology ready. Consider expanding to other applications.</a>
<a href="#">Solar pool heating for hotel/motels</a>	<a href="#">Scoped out as cost-effective application of solar pool heating (year round operation)</a>
<a href="#">Lab fume hoods, Occupancy sensing control of sash</a>	<a href="#">Sash can be closed when no one is in front of fume hood. Saves energy and increases IAQ</a>
<a href="#">Streamline and remove exceptions</a>	<a href="#">Simplify and expand scope when possible</a>
<a href="#">Plug-in hybrid and EV charging circuit</a>	<a href="#">Reduces transportation costs and emissions, coincident with PV output</a>
<a href="#">Plug for trucks at refrigerated warehouses</a>	
<b>Nonresidential ACM</b>	
<a href="#">Refrigeration model in ACM</a>	<a href="#">Allow trade-offs</a>

**Formatted:** Font: (Default)TimesNew Roman, 12 pt

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

**Formatted:** Centered

<a href="#">Whole building (BEARS) model including deemed plug loads.</a>	<a href="#">Software also generates BEARS rating and ZNE rating</a>
<a href="#">Improved Natural Ventilation simulation</a>	
<a href="#">PV model offsets consumption</a>	<a href="#">Also useful; for ZNE rating</a>
<a href="#">Radiant model including comfort</a>	<a href="#">Provides accurate estimate of benefit of radiant cooling methods</a>
<a href="#">Improved VRF simulation</a>	<a href="#">Current model may be inaccurate. May require added manufacturer data for credit</a>
<a href="#">Base case WWR by building type</a>	<a href="#">ASHRAE 90.1 has reduced WWR for dome building types (i.e. 22% for schools, 11% for retail, 7% for grocery store, 19% for small office etc.)</a>
<a href="#">Solar absorption air conditioning</a>	
<a href="#">Combined heat and power</a>	
<b><u>Process Loads</u></b>	
<a href="#">Evap fan speed control for walk-ins</a>	<a href="#">Saves fan energy and compressor energy</a>
<a href="#">Pipe sizing for compressed air systems</a>	<a href="#">Pressure drop losses reduced</a>
<a href="#">Specific efficiency requirements for refrigeration equipment</a>	
<a href="#">Air dryer efficiency for compressed air</a>	<a href="#">Modulating systems versus on/off systems</a>
<a href="#">Capacity controls for centrifugal compressors</a>	<a href="#">Remove exception from compressed air system requirements</a>
<b><u>Preliminary Residential Measures</u></b>	
<a href="#">Low-rise multi-family prescriptive package</a>	
<a href="#">QII - Quality Insulation Installation inspection</a>	
<a href="#">All high efficacy lighting</a>	<a href="#">Show availability of high quality high efficacy products for all sockets. Trade-off with PV</a>
<a href="#">Ducts in conditioned space or ductless HVAC</a>	<a href="#">Variety of methods, cathedral ceilings, scissor truss, mini-splits etc.</a>
<a href="#">Tested Infiltration &lt; 3 ACH 50</a>	<a href="#">Catch up with IECC, have to show IAQ is OK, may be done in conjunction with mandatory CALGreen to reduce source pollutants</a>
<a href="#">Compact water distribution</a>	<a href="#">Measured length of pipe between water heater and fixture</a>
<a href="#">Controlled supply mech ventilation</a>	<a href="#">Better air quality, cleaner house</a>
<a href="#">Dual path PV with high efficiency HVAC and DHW</a>	
<a href="#">Coastal compressorless comfort</a>	<a href="#">White paper for 2013 standards</a>
<a href="#">Walls - R-21 + R5 in all CZs</a>	<a href="#">Also consider R-15+ R-8 exterior insulation</a>
<a href="#">Windows 16% of floor area</a>	<a href="#">Highly controversial, should be based on survey</a>

<a href="#">Heat recovery ventilator</a>	<a href="#">Heat recovery in very hot or very cold climates</a>
<a href="#">Simplify and remove exceptions</a>	
<a href="#">Plug-in hybrid and EV charging circuit (ME)</a>	
<a href="#">High efficiency white goods</a>	<a href="#">Credit in model perhaps prescriptive trade-off</a>
<b><a href="#">Residential ACM</a></b>	
<a href="#">Multi-family modeling</a>	
<a href="#">Evaporative cooling modeling</a>	
<a href="#">Ductless AC system modeling</a>	
<a href="#">Sealed attic modeling</a>	
<a href="#">Whole building (HERS) model including deemed plug loads.</a>	<a href="#">Basis of HERS rating and ZNE</a>
<a href="#">PV model offsets consumption</a>	<a href="#">Supports ZNE goal</a>
<a href="#">Locational efficiency credit when solar access is low</a>	<a href="#">Prepare for ZNE or equivalent</a>

**Formatted:** Font: (Default)TimesNew Roman, 12 pt

[Table 7 includes a preliminary list of Title 20 measures under consideration by the CEC for the 2012-2015 Title 2- cycle. These will inform IOU advocacy work.](#)

**Table 7: Title 20 Appliance Standards.** ~~Ongoing advocacy efforts will extend into the 2009-2011 program cycle.~~ **Preliminary Measures.**

<u>Title 20 Measure</u>	<u>Description (all subject to change)</u>
<b><u>Lighting</u></b>	
<a href="#">Dimming ballasts</a>	<a href="#">Minimum efficiency standards for dimming ballasts, and possible limits on standby wattage. Standard would likely use the Relative System Efficacy (RSE) or the Ballast Luminous Efficiency (BLE) metric, with minimum performance requirements at full light output only or at several light levels.</a>
<a href="#">Multifaceted-Reflector lamps</a>	<a href="#">Minimum efficiency standards for multifaceted-reflector lamps, possibly with tiered standards. May also require minimum light quality/lamp performance standards.</a>
<a href="#">LED lamps</a>	<a href="#">Require LED lamps to meet minimum performance requirements (e.g. dimming and lamp life), minimum light quality standards (e.g. CRI), and modest efficiency (lpw) requirements.</a>
<a href="#">EISA exempt lamps</a>	<a href="#">Apply existing T20 general purpose light bulb standards to EISA exempt bulb types, including: 3-way, 2,601 – 3,000 lumen, shatter-resistant, candelabra base, intermediate base. All can accommodate halogen capsules for reduced power. Consider coverage at similar stringency as non-exempt bulbs (approx. 30% lower power)</a>
<a href="#">Lighting Accessories</a>	<a href="#">Maximum energy use and standby power for nightlights (NL), maximum power/bulb requirements for decorative string lights (DSL),</a>

	<a href="#">and maximum power requirements for illuminated house numbers (IHN).</a>
<a href="#">Outdoor Lighting</a>	<a href="#">Sets minimum performance requirements for pole-mounted outdoor lighting, including street, highway, parking, and area fixtures with “controls-ready” requirements in some cases.</a>
<a href="#">Linear fluorescent fixtures</a>	<a href="#">Propose test and list requirement for Energy Effectiveness Factor (EFF) and listing on product documentation resulting Target Efficacy Rating (TER) values from a combination of lamp lumens and ballast factors.</a>
<a href="#">Illuminated street number signs</a>	<a href="#">Set an efficacy standard (active power limit) to effectively require LEDs. Recommend requiring that all illuminated address numbers utilize photo-switches. Finally, recommend a standby power limit of 0.75 W.</a>
<a href="#">Plug-in luminous signs</a>	<a href="#">Set a standard establishing maximum power per square foot of illuminated area, and additional control requirements (required integral on/off switch, supplemental control for signs with face area(s) greater than 4 sqft).</a>
<a href="#">Computers</a>	<a href="#">Propose maximum energy requirements and power management enablement upon shipment for desktops and laptops; minimum power supply unit efficiencies for desktops. Exploring energy use limits or power limits in different operating modes.</a>
<a href="#">Servers</a>	<a href="#">Propose minimum power supply unit efficiencies and power proportionality for servers.</a>
<a href="#">Game consoles</a>	<a href="#">Set standard to require an auto power down feature and establish a maximum allowable standby power level.</a>
<a href="#">Computer/video displays</a>	<a href="#">Set maximum On Mode and Sleep Mode power consumption levels, as a function of screen size. Consider luminance and automatic brightness control requirements.</a>
<a href="#">Set top boxes (terrestrial, cable and satellite)</a>	<a href="#">Propose an energy use limit for new STBs. May include prescriptive requirements such as auto-off feature and performance-based maximum power demand per defined feature set (e.g., per tuner). Develop test and list requirements for small networking equipment.</a>
<a href="#">Imaging Equipment</a>	<a href="#">Propose maximum total energy consumption (TEC) levels for imaging equipment, which includes copiers, fax machines, printers, scanners, and all-in-one devices.</a>
<a href="#">Low power modes</a>	<a href="#">May propose required low-power modes, with maximum power levels, for various equipment. Low power modes include sleep, standby, idle, off.</a>
<a href="#">Power Factor Interactive Effects</a>	<a href="#">Appliance energy efficiency performance is influenced by power factor, such that losses in distribution circuits can be reduced by improving poor power factor. This is currently being studied in PIER research. This proposal would bring PIER findings into code as a consistent policy for appliances where merited</a>
<b><u>Water and Miscellaneous</u></b>	
<a href="#">Toilets and Urinals</a>	<a href="#">This standard proposal revises the current standards in Title 20 regulations to conform to the legislatively enacted performance</a>

**Formatted:** Font: (Default)TimesNew Roman,12 pt

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

	<a href="#">standards of AB715, by having toilets have 1.28 gallons per flush and urinals have 0.5 gallons per flush effective January 1, 2014.</a>	
<a href="#">Air Filter Labeling</a>	<a href="#">Require a label for air filters (a consumer version of the existing AHRI 680 label) so that consumers and designers can select the appropriate filter for the system.</a>	
<a href="#">Pool and Spa Equipment</a>	<a href="#">Update current regulations to better align with APSP 15. Add performance efficiency requirements for new and replacement motors and pool heater hydraulic performance. Require labeling of efficiency performance and compliance information on portable electric spas to better inform consumers.</a>	
<a href="#">Faucets</a>	<a href="#">This standard proposal sets the maximum flow rate for lavatory faucets and lavatory replacement aerators at 1.5 gpm at 60 psi, effective January 1, 2014. It also expands the definition of lavatory replacement aerator to include all flow restricting accessories, to encourage design best practices.</a>	
<a href="#">Water Meters</a>	<a href="#">Propose requiring testing for accuracy of residential water meters at levels indicative of household leaks, to better identify and prevent leaks.</a>	
<a href="#">Landscape Irrigation Equipment</a>	<a href="#">Set performance standards and labeling requirements for landscape irrigation controls and sensors; require a rain shut-off device and a test and list for landscape irrigation controllers (and add-on devices) for standby mode power.</a>	
<a href="#">Commercial Clothes Dryer</a>	<a href="#">Commercial gas dryers are regulated by neither federal nor California regulations; there exists the opportunity to establish new Title 20 standards for commercial gas dryers to be sold in California. The C&amp;S program will develop the testing procedure for Energy Factor of commercial clothes dryers, and establish a minimum performance requirement.</a>	
<a href="#">Refrigeration Condensing Units</a>	<a href="#">Develop test procedure for EER for fixed output refrigeration condensing units and part load EER for variable output refrigeration condensing units. Establish a minimum performance requirement. Require either floating head control; require systems operate at 70°F or lower min. condensing temp.</a>

**8. Coordination & Integration**

At the CPUC's direction, the C&S program is adding a non-resource Planning and Coordination Subprogram to improve the integration of portfolio program offerings. The C&S team will coordinate with both internal and external entities to establish a dynamic and integrated planning and implementation process to methodically and purposefully accelerate the movement of successful, cost-effective measures from the ET program through voluntary offerings and ultimately to adoption into standards. The three primary functions of the planning and coordination subprogram include strategic planning, internal coordination and communication, and statewide collaboration.

**a) C&S Statewide Coordination**

Many requirements for C&S coordination are derived from the CPUC's objective to mitigate climate change through regulatory objectives, including Title 20 and Title 24. While the Statewide C&S Program comprises the primary intervention to achieve these objectives, it must be considered within the context of California's innovation cycle:

- Adoption causes commoditization in the sense that a once high margin product becomes the industry standard.
- Commoditization spurs companies to innovate.

**2013-2014 Energy Efficiency Programs  
Statewide Codes and Standards Program  
Program Implementation Plan**

- Innovation creates new, differentiated, high-margin products for the competitive market.
- Voluntary programs commercialize new innovations.
- Commercialization creates code readiness leading to adoption.

**Innovation Cycle**

Since the primary purpose of the [Statewide C&S Program](#) is to propose and support adoption of code enhancements, it is essential that IOUs collectively respond to all significant energy savings opportunities identified for a future code update cycle. For example, IOUs are now planning how best to coordinate efforts to address a long list of potential [Title 24](#) code enhancements for the 2011 code cycle. In general, planning is conducted on an as needed basis.

Codes and standards operations are conducted relative to a multi-year time horizon, so statewide meetings organized on a quarterly basis are sufficiently frequent to coordinate activities. Some CASE studies are developed through co-funding agreements when multiple IOUs are interested in or have specific value-added knowledge, perhaps through previous research. More typically, however, code proposals are developed by one IOU on behalf of the statewide since each proposal is a fraction of the program budget. During these meetings, ~~the our~~ primary objectives are to discuss CASE study objectives and develop mutual support for public proceedings.

The [C&S Program](#) will enhance coordination and integration of [Codes](#) and [Standards](#) with other [IOU](#) energy efficiency programs to maximize energy savings and demand reducing by coordinating training programs and utilizing the experience gained in resource

Formatted: Centered

programs to inform the development and advocacy of new codes. The C&S program will work with the Government Partnerships to improve code compliance, adopt above code ordinances, and provide training and education. The C&S compliance improvement subprogram will focus compliance improvement efforts on HVAC new installations and replacements in coordination with the HVAC program. The C&S program will also meet periodically with HVAC program staff to discuss compliance improvement strategies, training, and other program needs.

Coordination between the C&S and other parts of the IOU portfolio falls into one of two categories: existing standards and future standards. Compliance with code is essential to completing the commoditization process and capturing the benefit of commercialization efforts for the benefit of society, so the CEI subprogram leads efforts to implement existing standards through development of core activities that can be delivered either through, or in coordination with, other programs. Opportunities are identified through small group meetings between C&S and each target group such as workforce education and training, local government partnerships, new construction programs. In addition, the IOUs will coordinate program efforts with the local utility integration teams and the Statewide Integration Task Force to identify successful integration approaches and offerings, potential pilot programs and metrics.

Small group meetings mentioned above, are particularly useful, as they serve to identify incentive program opportunities to leverage the pull of existing standards that have effective dates far enough in the future to accommodate program changes. For example, an appliance standard adopted with an effective date two years hence would provide an opportunity to develop an incentive program pull that complements the C&S push.

Coordination activities around future standards are, likewise, developed through individual targeted meetings. Once the C&S team has identified potential code enhancement opportunities for a future code proceeding, the team meets with Mass Market, Targeted Market, Emerging Technologies, HVAC, demand response, or general education and training leads to discuss gaps between adoption needs and current code readiness. As appropriate, new measures may be added to incentive programs, new projects may be added to the ET portfolio. Sometimes, when ongoing CEC proceedings coincide with incentive program planning, incentive offerings can be integrated with code enhancement proposals to increase influence on proceedings.

Coordination with external organizations falls into a few broad categories. A particular code proposal typically attracts directly affected industry stakeholders. If an industry employs associations organized to oppose energy efficiency standards – which is usually the case – IOUs will seek support from other advocates and share information that enables their advocacy, as well as ours. Sometimes IOUs are able to work directly with industries that are not, in principal, opposed to all regulations.

Program Implementation Plan**

Formatted: Centered

**b) C&S Coordination with External Organizations & Entities**

As Federal preemption continues to grow, and as DOE continues to increase federal proceedings activities, it is necessary for California IOUs to increasingly engage with national organizations such as [American Council for an Energy Efficient Economy \(ACEEE\)](#), [Appliance Standards Awareness Project \(ASAP\)](#), and the [Natural Resources Defense Council \(NRDC\)](#). In particular, since the innovation engine, as pictured above, turns over once every three years in California and once every eight to ten years at DOE, the C&S Program needs to work with national organizations to relax federal preemption policies to better help California meet AB 32 energy efficiency targets. California IOUs have ramped up operations to contribute materially DOE proceedings through analysis, letters, and negotiations.

At a statewide and local level, the C&S program will develop training and compliance improvement activities with entities that include, but are not limited to, California Building Industry Association, local chapters of the Building Industry Association, Build it Green, Institute of Heating and Air Conditioning Industries, International Brotherhood of Electrical Workers, National Electrical Contractors Association, California League of Cities. Additionally, outreach and communications for Title 20 will include industry associations such National Electric Manufacturers Association, American Lighting Association, California Retailers Association, and the International Pool and Spa Association.

**9. Marketing & Outreach/Education & Training**

Formatted: Font: TimesNewRoman

Formatted: Font: TimesNewRoman, 12 pt

Formatted: Heading2

Formatted: Font: TimesNewRoman

Outreach for advocacy activities occurs through telephone calls and e-mails to industry stakeholders throughout the CASE study development process, leading up to commencement of a CEC rulemaking. After commencement of CEC rulemaking proceedings, CASE studies are presented during public workshops and hearings conducted by the CEC that are typically attended by building or appliance industry representatives, environmental groups, compliance industry representatives including local government officials, advocates from other states. In response to industry issues and concerns, the IOUs and their consultants will contact specific representatives or conduct stakeholder meetings to address specific issues more broadly. Following adoption hearings, the IOUs participate in developing compliance manuals.

Compliance improvement encompasses numerous industries engaged in supplying buildings and appliances to California; hence, outreach and marketing activities will be conducted through a variety of channels. IOU's training centers will conduct direct outreach to industry associations such as the Contractor State Licensing Board, California Building Officials Association, California Association of Building Energy Consultants, Consumer Electronics Association, and National Electrical Manufacturers Association. E-mail solicitations and paper calendars are sent to individuals notifying them of upcoming classes. Local governments will also be contacted through local government partnerships and circuit riders assigned to provide consulting services.

**10. Quality Assurance & Evaluation Activities**

Formatted: Font: 12 pt

Formatted: Font: TimesNewRoman, 12 pt

Formatted: Heading2, Keep with next

Formatted: Font: TimesNewRoman

To help ensure quality assurance and effective evaluation, the IOUs will continue their ongoing efforts to track and assess the effectiveness of the [Codes and Standards C&S](#) Program in advocating for new codes, and for increasing compliance with existing codes.

## 2013-2014 Energy Efficiency Programs Statewide Codes and Standards Program Program Implementation Plan

Formatted: Centered

The [C&S P](#) program will continue to support the impact evaluation efforts of the CPUC and its contractors by documenting code advocacy efforts, and documenting compliance improvement efforts and education and training efforts and their effects on participant behavior. The IOUs will coordinate with the CPUC and their impact evaluation contractors to ensure that the sufficient type and level of data are being collected at the appropriate level of detail to enable an estimation of energy savings related to codes and standards activities. This includes supporting the CPUC in their research effort to establish Title 20 and Title 24 baselines, and track changes in adoption and compliance over time. This includes providing appropriate program data, as well as encouraging the participation of vendors, contractors, building officials and others, as appropriate, in providing information for establishing baselines and changes in penetration over time.

For the purpose of quality assurance in carrying out and improving the [Codes and Standards PC&S p](#) program, the IOUs will be conducting various qualitative evaluation activities to establish IOU effectiveness in various market transformation activities. These include but are not limited to:

- Code adoption - Research with participants in the code adoption process to assess the level and quality of participation by the IOUs and other stakeholders. This includes interview-based research, as well as review of documentation of participation.
- Compliance [EnhancementImprovement](#) – Effectiveness of various education and training activities, based on pre- and post- participation assessment of ‘knowledge swing’ of participants, and commitments to action made by participants and participant organization that stem from [CEcompliance improvement](#) activity. Initial assessments will be succeeded by assessments in the post period to identify changes in code-related activity resulting from [CEthe CI subprogram](#).
- Reach Code Assistance – Effectiveness of IOU efforts to assist local governments in establishing, implementing and enhancing compliance with reach codes. Initial assessments of energy codes and code compliance, local code support capability and other factors will be followed by an ongoing assessment of the effects of IOU reach code assistance.

Formatted: Font: (Default)TimesNewRoman

For [CEcompliance improvement](#), the IOUs will be using this assessment process to identify changes in awareness, capability and behavior change among individual [CECI](#) participants, and participant organizations, resulting for the various [CE-compliance improvement](#) activities. The IOUs will also look into calibrating our assessment of [CE-compliance improvement](#) through evaluations of non-participant awareness, capability and behavior changes. For example, if there is a [CE-compliance improvement](#) effort focused on building officials, the research could include an assessment of awareness, capability and behavior of building officials who did not participate in the training.

b)d) Compliance Enhancement/Improvement

Formatted: Indent: Left: 0.5", A llowhanging punctuation, A djustspace betw eenLatin and A siantext, A djustspace betw eenA siantext and numbers, FontA lignment: A uto

e) Reach Codes

f) Planning and Coordination

Formatted: Font: 12 pt

Logic models will be improved based on experience and finalized based on application to specific industries, local governments.

Formatted: Font: (Default)TimesNewRoman

Logic Models and the accompanying Program Theory and Program Indicators are tools designed to illustrate program structure and operation for the purpose of program management. This logic model is a schematic of the program as planned.

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: 12 pt

Formatted: Font: (Default)TimesNewRoman

Formatted: Font: 12 pt

Formatted: Font: TimesNewRoman

Formatted: Font: 12 pt

A program theory is the basis of a logic model. Effective program management applies program theory, and related performance indicators are used to determine whether program theory is correct. Indicators enable informed management responses that improve programs.

Performance indicators are intended to serve as a program's 'dashboard'; displaying information necessary for effective program operation. As with automobile dashboards; indications are neither good nor bad, but enable appropriate management responses that maintain and/or improve program performance.

Logic models, program theories, and performance indicators can provide evaluators an understanding of program activities, outputs and outcomes. However, they are not intended as the basis for estimating, valuing, or attributing program savings as they focus on program operation rather than program results. Revised logic models and program theory tables will be included in a future addendum to the PIP.

Formatted: Font: TimesNewRoman

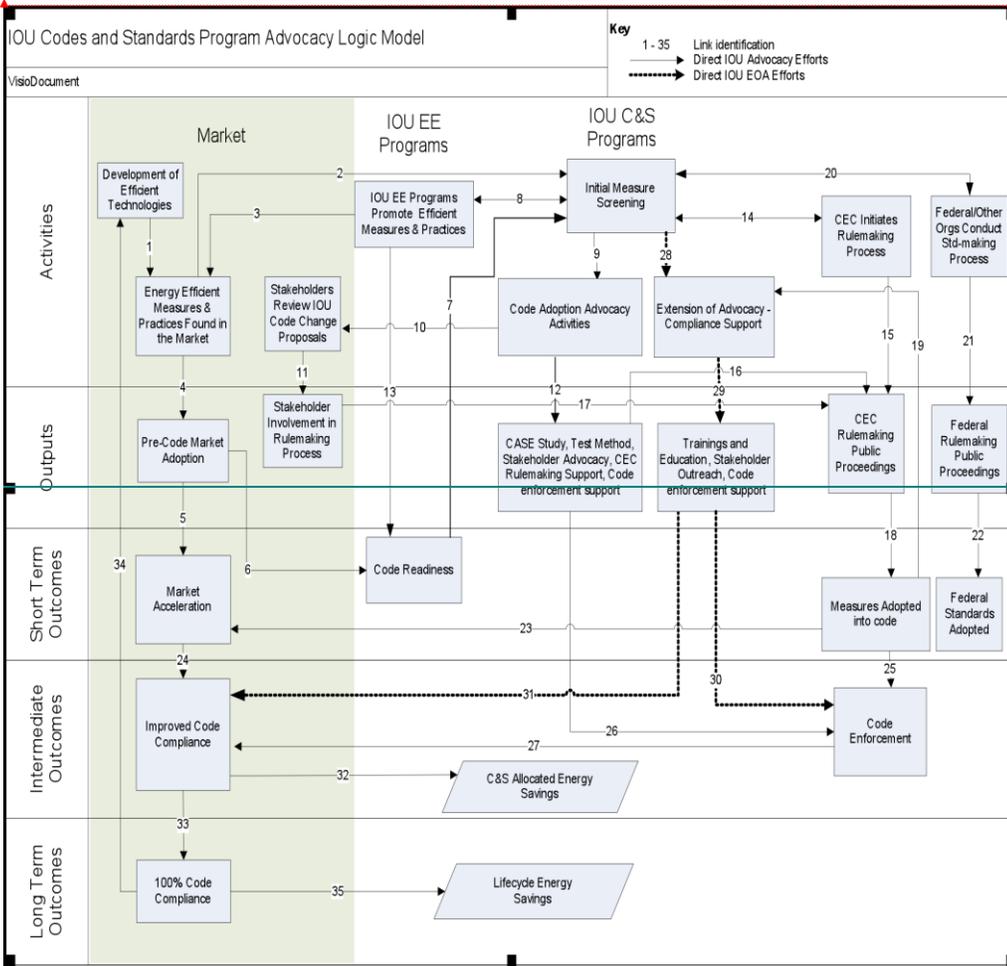

Formatted: Font: 12 pt

Revised logic models and program theory tables will be included in a future addendum to the program implementation plan.

**Formatted:** Font: TimesNewRoman, 12 pt

**Formatted:** Font: TimesNewRoman

**Formatted:** Font: TimesNewRoman, 12 pt

### Codes and Standards Program Overview

The Codes and Standards (C&S) Program saves energy on behalf of ratepayers by influencing continuous improvements in energy efficiency regulations, improving compliance with existing codes and standards, and working with local governments to develop ordinances that exceed statewide minimum requirements. C&S program activities extend to all buildings and potentially any appliance in California, for both advocacy and compliance improvement.

**Formatted:** Font: (Default)TimesNew Roman, 12 pt

The C&S Program consists of five subprograms: Building Codes Advocacy; Appliance Standards Advocacy; Compliance Improvement; Reach Codes; and, Planning and Coordination.

#### 1. Building Codes Advocacy Subprogram

The Building Codes Advocacy subprogram primarily targets improvements to Title 24 Building Efficiency Regulations that are periodically updated by the California Energy Commission. The subprogram also seeks changes to national building codes that impact CA building codes. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in public rulemaking processes. The program may coordinate with or intervene in ratings organizations that are referenced in Title 24; for example, the National Fenestration Rating Council, and the Cool Roof Rating Council.

#### 2. Appliance Standards Advocacy Subprogram

The Appliance Standards Advocacy subprogram targets both state and federal standards and test methods: improvements to Title 20 Appliance Efficiency Regulations by the California Energy Commission, and improvements to Federal appliance regulations by the US Department of Energy. Advocacy activities include, but are not limited to, development of code enhancement proposals and participation in the public rulemaking process (Title 20), and comment letters based on IOU research and analysis (USDOE), and participation in direct negotiations with industry. Additionally, the program monitors state and federal legislation and intervenes, as appropriate.

#### 3. Compliance Improvement

The Compliance Improvement subprogram is a new subprogram that combines the previous Extension of Advocacy and Compliance Enhancement subprograms. It provides education, training, and other activities targeting building departments and other industry actors responsible for compliance with Building Energy Code and Appliance Standards requirements. Activities may include development of “best practices tools” and other infrastructure elements that serve multiple compliance improvement objectives.

#### 4. Reach Codes Subprogram

The Reach Codes subprogram provides technical support to local governments that wish to adopt ordinances that exceed statewide Title 24 minimum energy efficiency requirements for new buildings, additions, or alterations. Support for local governments includes research and analysis for establishing performance levels relative to T-24 and cost effectiveness per Climate Zone, drafting of model ordinance templates for regional consistency, and assistance for completing and expediting the application process required for approval by the CEC. The subprogram also supports local governments that seek to establish residential or commercial energy conservation ordinances for existing buildings.

**Formatted:** DefaultParagraphFont, Font color: White

**Formatted:** Right, Border: Top: (No border), Tab stops: 3", Centered+ 6", Right + Not at 3.25" + 6.5"

## 5. Planning and Coordination

The Planning and Coordination Subprogram provides a formal process that aligns planning activities across the IOU energy efficiency portfolio within the Codes and Standards program activities. This subprogram supports efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving Zero Net Energy.

### Codes and Standards 2013-2104 Activities by Sub-Programs

#### Building Energy Codes Advocacy

The Building Codes Advocacy program will continue conducting many of the same activities as were conducted in the 2010– 2012 program cycle, but will focus on the upcoming 2016 Title 24 Energy Building Code cycle. In addition, the Building Codes Advocacy sub-program will expand activities at the national level. Primary activities for 2013-2014 include the following:

##### 2013 Title 24 Energy Building Code

- Support implementation of adopted 2013 Energy Building Code:
  - Complete revisions to compliance manuals and forms

##### 2016 Title 24 Energy Building Code

- Prepare CASE studies in coordination with CEC:
  - Conduct research for 2016 building code advocacy to advance State policy goals
  - Support activities to address Department of Finance review requirements
  - Research residential ventilation / IAQ requirements to reduce and control infiltration while maintaining and improving indoor air quality
  - Research and advocate methods to remove code barriers to the increased use of renewable energy in support of ZNE goals
  - Support development of 2016 compliance software

#### Appliance Standards Advocacy

The Appliance Standards Advocacy program will continue conducting many of the same activities as were conducted in the 2010–2012 program cycle, but will focus on preparing new measures pursuant to CEC’s adopted Order Instituting Rulemaking (“OIR”) for Title 20 Appliance Standards and U.S. Department of Energy’s ongoing rulemaking for Federal Appliance Standards. Primary activities for 2013-2014 include the following:

##### Title 20 Appliance Standards Rulemaking

**Formatted:** DefaultParagraphFont,Font color: White

**Formatted:** Right, Border: Top: (No border), Tab stops: 3", Centered+ 6", Right + Not at 3.25" + 6.5"

- Prepare CASE studies pursuant to CEC's adopted OIR:
  - Advocate and provide public testimony in State public proceedings
  - Conduct research and testing and submit supporting market and technical data to the CEC
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which CEC eventually adopts)
  - Develop voluntary agreements or reach standards

#### Federal Appliance Standards Rulemaking

- Provide support to DOE rulemaking process:
  - Advocate and provide public testimony in Federal public proceedings
  - Submit supporting market and technical data to the Department of Energy
  - Participate in consensus negotiations with industry and energy advocacy groups (which typically develop standards levels which DOE eventually adopts)
  - Develop voluntary agreements or reach standards

#### Compliance Improvement

For the 2013-2014 program cycle, the C&S team will combine the former Extension of Advocacy and Compliance Enhancement Program activities into one Compliance Improvement subprogram to enhance understanding of program objectives and activities. The subprogram will strive to improve compliance with the Title 24 and Title 20 efficiency standards while implementing an effective sector strategy with the Workforce Education and Training Program. Primary activities for 2013-2014 include the following:

#### Title 24 Compliance

- Title 24 Standards Essentials Role-Based training for building inspectors:
  - Continue delivering training to plans examiners and energy consultants. Update curriculum to cover what's new in the 2013 code. (per OP 93)
  - Expand role-based training curriculum to additional compliance improvement market actors such as the building trades and design professionals as guided by needs assessment
- HVAC Quality Installation and Other Programs with Direct Code Requirements
  - Identify opportunities to insert code compliance modules in existing curriculum, such as training required for technicians
- On-line Compliance Training:
  - Explore training delivery mechanisms beyond the traditional classroom to include live webinars, activity-based on line training, and in-field demonstrations

**Formatted:** DefaultParagraphFont,Font color: White

**Formatted:** Right, Border: Top: (No border), Tab stops: 3", Centered+ 6", Right + Not at 3.25" + 6.5"

- Tools and Process Improvements:
  - Implement tools and process improvements as identified through the building department best practices study and the Compliance Improvement Advisory Group (CIAG)
- Forms and Compliance Documents:
  - Support development of improved forms and compliance-related documentation for 2013 Title 24
- Nonmonetary Compliance Improvement Incentives:
  - Explore a pilot project designed to improve compliance by providing incentives to local governments, contractors, or other key market actors. The pilot will be based on the CIAG's guidance and may include nonmonetary incentives such as training or provision of tools designed to streamline the permitting and inspection processes for additions and alterations (per OP 94)
- Target Low Compliance Problem Areas:
  - Collaborate with the CEC to identify problem areas and potential compliance improvement solutions through white papers developed by CIAG members (per OP 95)
  - Consider pilot project to improve compliance for measures with known challenges, which may include providing incentives to contractors for pulling permits, or motivation for other market actors. (per OP 95)
- Develop and Conduct Outreach Campaign to Improve Compliance:
  - Collaborate with the CEC to develop and implement an outreach campaign designed to improve compliance with Title 24 and Title 20 standards. The campaign will be based on the CIAG's guidance and may include activities such as developing flyers for contractors to provide to potential customers explaining the code requirements and benefits, mini measure-based code seminars for big box store employees, etc. (per OP 93)
- CEA exam development, facilitation support, and maintenance
  - Collaborate with the California Association of Building Energy Consultants to improve the working knowledge, skills, analytic ability and accountability of individuals using energy compliance software and preparing the appropriate Title 24 documentation for permit submittal. C&S will support updating the beta Residential and Nonresidential CEA examinations developed in 2010-2012 to properly test applicant CEAs under the 2013 standards and facilitating the roll out of the new certification process.

Title 20 and Federal Standards Compliance

- Surveys and Technical Support:

**Formatted:** Font: (Default)TimesNewRoman

**Formatted:** Font: (Default)TimesNewRoman, 12 pt

**Formatted:** DefaultParagraphFont, Font color: White

**Formatted:** Right, Border: Top: (No border), Tab stops: 3", Centered+ 6", Right + Not at 3.25" + 6.5"

- Conduct surveys and provide technical support to CEC and industry to facilitate compliance.

- Education and Outreach:

- Collaborate with CEC on implementing an education and outreach campaign targeted to distributors, retailers, contractors, and possibly consumers. (OP 93)

### Reach Codes

For the 2013-2014 program cycle, the IOUs will continue to collaborate with the CEC and Local Government Partnership Program to identify, and provide technical assistance to, local jurisdictions interested in adopting Reach Codes. In addition, the IOUs will continue to collaborate with CEC to provide support for developing voluntary standards to encourage buildings to achieve exemplary performance in the areas of energy efficiency. Primary Reach Code activities for 2013-2014 include the following:

#### Reach Code Technical Assistance

- Cost Effectiveness Studies:

- Prepare Cost Effectiveness studies for each of the California climate zones (to be updated for 2013 Energy Building Code) that have been vetted with the CEC, resulting in expedited CEC review of reach code application submittals.

- Policy Guidelines:

- Provide a “Road Map” of Policy Guidelines for adopting Reach Code including an overview of some of the implications and important choices in writing and adopting these types of ordinances, and recommendations intended to improve implementation and compliance.

- Ordinance Template:

- Provide a Reach Code Ordinance “template” that establishes clear definitions of when the ordinance is triggered, including CEC-required language which states that all buildings shall meet all applicable requirements of the Building Energy Code.

- Workshops & Presentations:

- Facilitate public workshops and presentations to interested stakeholders including elected officials, city staff, industry organizations, and community groups that address the following:
  - Critical role that energy efficiency plays in reducing greenhouse gas emissions
  - Understand how Reach Codes and complementary new construction incentive programs such as California Advanced Homes help meet CalGreen’s voluntary Tier 1 and Tier 2 Energy requirements, accelerate

**Formatted:** DefaultParagraphFont, Font color: White

**Formatted:** Right, Border: Top: (No border), Tab stops: 3", Centered+ 6", Right + Not at 3.25" + 6.5"

advancement of zero net energy building practices, and mitigate project-level GHG impacts pursuant to CEQA requirements.

- Explain the process for developing and adopting a legally enforceable Reach Code pursuant to CEC requirements

- Work with industry organizations and other market actors to conduct outreach to local governments to inform them of available Reach Code assistance.

### Planning and Coordination (Non-Resource Subprogram)

The Planning and Coordination Subprogram establishes a formal process that dynamically aligns planning activities across the IOU energy efficiency portfolio within the Codes and Standards program activities.

The Planning and Coordination Subprogram supports planning activities that improve alignment across the IOU energy efficiency portfolio with respect to future C&S program activities. C&S staff will coordinate with IOU energy efficiency portfolio programs to support efforts to prepare the market for future code adoption (i.e., improve code readiness), to ensure higher code compliance rates and advance the CPUC Strategic Plan goals for achieving Zero Net Energy.

This subprogram will consist of four elements: 1) Strategic planning and coordination; 2) Outreach within each IOU to other program areas; 3) Statewide planning and coordination; and, 4) Workforce education and training. Primary activities for 2013-2014 include the following:

#### Strategic Planning (per OP 91)

- Codes and Standards Collaborative:
  - Maintain a Codes and Standards Collaborative to conduct strategic planning
- Code Readiness:
  - Establish cross-functional teams, including representatives from voluntary programs (incentive, emerging technologies, and education and training), the CPUC, and the CEC, will be established to identify code readiness priorities relative to policy goals, for example: zero net energy, AB 1109, and other Action Plan objectives.

#### Internal Coordination and Communications

- Periodic Meetings:
  - Conduct a variety of internal coordination activities based on respective needs of each IOU, including periodic meetings with program leads in other areas as well as management teams.
- Ongoing Communication:
  - Inform planners and support groups regarding future code changes, collaboration on evaluation and regulatory matters.

**Formatted:** Font: 12 pt, Fontcolor: A auto

**Formatted:** Font: (Default)TimesNew Roman, 12 pt

**Formatted:** Font: 12 pt

- Solicit input from other groups re advocacy efforts, aligning education and training activities with incentive programs.

#### Statewide Collaboration

- Integrated Dynamic Approach to Portfolio Planning:
  - To support the state's Zero Net Energy objectives, the C&S team will work closely with new construction programs to develop an integrated approach to align new construction program offerings with base code requirements as well as reach codes where possible.
  - The C&S team will work with core retrofit programs as well as local government partnerships and third parties to coordinate offerings with anticipated code changes. (per OP 91, 152)
- CPUC Communication:
  - Conduct monthly calls with CPUC personnel to share progress and discuss issues (per OP 91)
- CEC Communication:
  - Maintain statewide weekly calls with CEC staff regarding building codes and appliance standards (per OP 91)
- National Stakeholders Communication:
  - Conduct regular conference calls with national stakeholders regarding appliances (per OP 91)
- Compliance Advisory Group Communication:
  - Host quarterly meetings with Compliance Improvement Advisory Group regarding compliance improvement activities (per OP 91, 152)
- Local Government Partnership Communication:
  - Provide quarterly updates to Local Government Partnership Program regarding reach code adoption progress and delivery of training to building departments (per OP 91)

#### Workforce Education and Training (WE&T)

- Sector Strategies for WE&T:
  - C&S and WE&T personnel will meet periodically to coordinate activities that will enhance support for the appropriate market actor roles responsible for new and emerging codes and standards implementation according to priorities established by needs assessments. C&S will collaborate with the WE&T Centergies sub-program to not only prepare contractors and technicians to implement current codes, but to also

## 2013-2014 PIP Addendum

<b>Program Name</b>	Workforce Education and Training	<b>Date Submitted</b>	July 2, 2012
<b>Subprogram Name</b>	SW-WE&T-Centergies SW-WE&T-Connections SW-WE&T-Strategic Planning	<b>Utility Name</b>	SoCalGas
<b>Program ID</b>	SCG-3729, SCG-3730, SCG-3731	<b>IOU Program Contact</b>	Rodney Davis
		<b>Program Cycle</b>	2013 - 2014

This form is to be used to document any required changes to the Program Implementation Plans (PIPs). The following are triggers that will require a PIP change:

1. Changes to eligibiity rules
2. Changes affecting incentive levels (indicate advice letter approval below if required)
3. Fund shifts (indicate advice letter approval below if required)
4. Portfolio Budget and Other Commission-Directed Changes
5. Changes to Program Theory/Logic Models
6. Addition or elimination of programs and/or sub-programs (indicate advice letter approval below)
7. Changes in program targets
8. Change in sub-program approach - unless the IOUs submit logic models for the sub-programs (to be defined) with IOUs
9. Changes in incented measures
10. Changes in adopted PPMs/MTIs (indicate advice letter approval below if required)

**Identify Specific Trigger (above) requiring the PIP change**

4. Portfolio Budget and Other Commission-Directed Changes	▼
---	---

**Driver of Change:**

Revisions made to the WE&T Centergies and WE&T Planning PIPs as directed in Commission Decision 12-05-015. Revisions made to the Connections PIP to reflect program implementation changes for 2013-2014 bridge period. Revised logic models provided for Centergies and Connections subprograms.

**Description of Change (if advice letter approval required, indicate Commission resolution or approval and provide hyperlink to advice letter):**

**WE&T CENTERGIES:**  
 Updates and new information as directed in the Guidance Decision are reflected in the attached documents:  
 \* 2013-2014 Workforce Education and Training Program Implmentation Plan in redline and clean versions  
 \* Attachment F – Statewide response to additional information as requested by Staff  
 \* Attachment 2 - List of SCG’s courses

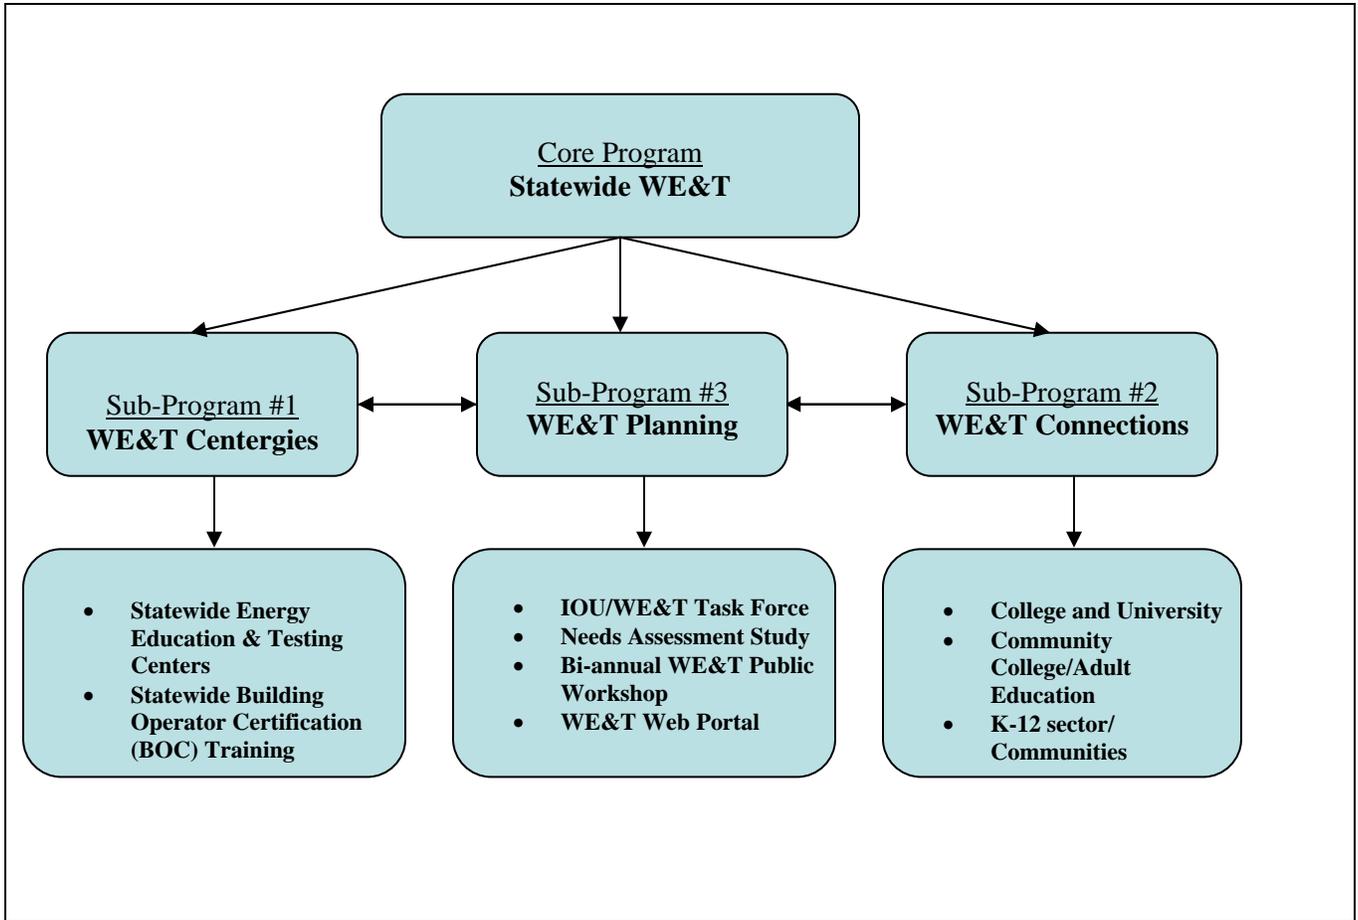

**WE&T CONNECTIONS:**  
 The statewide Connections Program is continuing with the updated information reflected in the redlined changes attached, including a revised logic model.  
 New information for PG&E’s programs for 2013-2014 include:  
**Green Pathways:**  
 The innovative PG&E pilot exceeded the deliverables outlined in the 1/21/2010 Green Pathways Advice Letter (PG&E Advice 3080-G/3596-E), and is transitioning into a P&GE local program that will scale throughout the PG&E service territory in 2013-2014. Research findings from the pilot phase resulted in modifications to the scope, design and delivery to address the needs of the target market and to incorporate best practices.

	<b>TOTAL:</b>	<b>\$504,380</b>	<b>\$258,206</b>	<b>\$5,391,967</b>	<b>\$0</b>	<b>\$6,154,553</b>

**3. Projected Program Gross Impacts Table**

WE&T is considered a non-resource program and thus is not expected to provide energy savings impacts for the IOU Energy Efficiency portfolio for the 2013-2014 program years. However, as part of the ongoing efforts of the IOUs and recommendations taken from future study results, the IOU WE&T programs are continually seeking methodologies that can support energy savings contributions for WE&T activities.

**Table 2**

Program #	Main/Sub Program Name	2013-2014 Gross kW Savings	2013-2014 Gross kWh Savings	2013-2014 Gross Therm Savings

3730	SW-WE&T-Connections	0	0	0
3731	SW-WE&T-Strategic Planning	0	0	0
	<b>TOTAL:</b>	<b>0</b>	<b>0</b>	<b>0</b>

**4. Program Description**

a) Program description

The Statewide IOU Workforce Education and Training (WE&T) Program represents a portfolio of education, training, and workforce development planning and implementation funded by or coordinated with the Investor-Owned Utilities (IOUs): Pacific Gas and Electric (PG&E), Southern California Edison (SCE), San Diego Gas & Electric (SDG&E), and Southern California Gas (SOCALGAS). Education and training are vital components of each of the IOU's energy efficiency portfolio filings for 2013-2014 and are integral in supporting the achievement of IOU energy savings targets and the workforce objectives set forth in the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan). Workforce Education and Training has become an important crosscutting activity for the IOUs in an effort to not only educate and train current workers, but to prepare future workers to be better able to successfully perform the jobs needed to help achieve increased energy savings targets for the IOUs and California's clean energy goals.

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

WE&T relies on statewide coordination to collaboratively create a comprehensive training platform that leverages the potential of key stakeholders with the resources, knowledge, and commitments to implement an education and training strategy that focuses on integrating existing workforce skills with new workforce needs, as well as expand outreach efforts to increase awareness of and demand for green careers.

California wants to expeditiously increase statewide workforce development and training relying on strategically coordinated planning and administration to deliver energy efficiency and demand side energy management in the public and private sectors. This effort will require concerted planning among secondary and post-secondary educational leaders, technical and professional organizations, state agencies, economic and labor development organizations, utilities, construction and manufacturing businesses that deliver energy management and efficiency solutions.

The Strategic Plan's vision for WE&T is that "[b]y 2020, California's workforce will be trained and engaged to provide the human capital necessary to achieve California's economic energy efficiency and demand-side management potential."<sup>2</sup> To do this, the Statewide IOU WE&T Program must be constructed in an implementable form to: 1) initiate and drive long-term WE&T development and strategic planning, including identification of funding streams and market sector specific needs; 2) support community college and adult education efforts to develop education based on visible career paths in energy efficiency and related fields; 3) incorporate energy efficiency and integrated demand side energy management into traditional contractor and technician training; 4) support the creation or expansion of energy management and efficiency focused curriculum by college and university programs and foster this knowledge in clear view of students and faculty; 5) support development of K-12 curriculum to include a basic understanding of energy fundamentals, including environmental and greenhouse gas impacts as well as solutions to mitigate energy use impacts such as EE, DSM, and associated behavioral changes, identify how career education in energy-related fields can be incorporated across the grades, and bolster high school career counseling to improve community college enrollment in green job training programs; and 6) achieve the fullest participation by minority, low income and disadvantaged communities in training and education at all levels of DSM and the energy/resource efficiency industry. Diagram I illustrates the proposed program implementation structure for the Statewide IOU WE&T Program to best deliver the strategies outlined by the Strategic Plan.

Throughout the approved IOU Program Implementation period, the WE&T Program will strive to continuously initiate and facilitate ongoing dialogue with a broad group of market and education sector stakeholders to define, introduce and drive long-term WE&T development and solutions to establish EE and DSM education and training at all levels of California's educational system and accommodate the dramatic increase in EE activities envisioned by the Strategic Plan. The IOUs will modify curriculum and delivery methods to incorporate feedback and guidance from sources, including the

<sup>2</sup> California Long Term Energy Efficiency Strategic Plan, p. 74.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

California WE&T Needs Assessment, customer feedback from the 2010-2012 Process Evaluation, and the Guidance Decision for 2013-2014. Such modifications include, but are not limited to, approaching curriculum development with the sector strategy approach.

The Statewide IOU WE&T Program includes three pivotal Sub-Programs that form an integrated and cohesive structure for implementing WE&T curriculum and related activities in support of IOU energy savings targets and the long-term strategic goals for the state of California as prioritized and outlined by the Strategic Plan and Big Bold Energy Efficiency Strategies (BBEES). These three Sub-Programs include:

- i. The **WE&T Centergies Sub-Program** is generally organized around market sectors and cross-cutting segments to facilitate workforce education and training appropriate for achieving the energy savings, demand reductions and related energy initiatives required of the IOUs. The Energy Centers, which have many years of experience in creating and disseminating high-quality programs, represent the largest component of this Sub-Program and provide WE&T curriculum and related deliverables—training courses, seminars, workshops, clean energy technology demonstration, equipment efficiency testing, interactive training exhibits and lectures—to promote industry trends and developments for advancing energy efficiency as a professional discipline. For many years, they have served as the IOU’s primary delivery channels for mid- and upstream workforce education and training, information dissemination, and education/outreach coordination. IOU-administered Third Party, Local Government and Emerging Technology, Codes and Standards, Heating, Ventilation and Air Conditioning (HVAC), and Energy Savings Assistance (ESA) programs, as well as other community-based training efforts, are supported by the Energy Centers to sponsor workforce training courses. (Refer to WE&T Centergies Sub-Program Section 6.1 for a more detailed discussion of 2013-2014 program implementation.)

The Statewide Building Operator Certification (BOC) Training Partnership, the second component of this Sub-Program, will continue to play a major role in improving and maintaining California’s green collar building workforce stock of building engineers, stationary engineers, maintenance supervisors, maintenance workers, facility coordinators, HVAC technicians, electricians, , and others in the facility operation and maintenance field. The IOUs have been collaborating with BOC to offer California building operators competency-based training and certification, resulting in improved job skills and more comfortable, efficient facilities. Operators earn certification by attending training and completing project assignments in their facilities. Training topics include facility electrical, HVAC, and lighting systems; indoor air quality; environmental health and safety; and energy conservation. The IOUs will work with BOC to shape and realign the BOC certification program to be consistent with the Strategy Plan.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- ii. The **WE&T Connections Sub-Program** is organized around downstream and upstream relationships between the IOUs and the educational sector, entry and intro-level community-based training efforts that support workforce development in energy efficiency, energy management, and new emerging green careers. This Sub-Program emphasizes education curriculum and related activities that inspire interest in energy careers, new and emerging technology, and future skills development to advance the energy initiatives and goals of the state. This Sub-Program involves expanded relationship-building to foster curriculum development and related training that result from existing and expanding industry needs. IOUs will work with education institutions, labor and communities to nurture interest in green careers by K-12, community college, occupational, vocational, and major university students, as well as assist in the growth of low-income and transitional workforce targeted clean energy training programs. (Refer to WE&T Connections Sub-Program Section 6.2 for a more detailed discussion of 2013-2014 program implementation.)
  
- iii. The **WE&T Planning Sub-Program** involves the management and execution of several strategic statewide planning tasks and resulting project implementation actions initiated by the Strategic Plan. The tasks and projects are seen as instrumental in delivering mechanisms and protocols that facilitate ongoing momentum and focus on the achievement of workforce, education and training long-term goals. The WE&T Planning Sub-Program facilitates implementation and completion of the four key strategic tasks identified in the Strategic Plan to drive long-term WE&T development:
  - 1) Form an IOU/CPUC WE&T Task Force
  - 2) Conduct a Needs Assessment
  - 3) Create a WE&T Specific Web Portal
  - 4) Facilitate annual WE&T Public Workshops

(Refer to WE&T Planning Sub-Program Section 6.3 for a more detailed discussion of 2013-2014 program implementation.)

b) List of current measures/curriculum

Refer to WE&T Sub-Program Sections 6.1 and 6.2 for specific detail.

- i. WE&T Centergies
  - a. Statewide Energy Education and Testing Centers (Centers)  
The Centers will continue to offer and expand their curricula to current and new audiences that make up California's energy efficiency workforce. The primary target audience for each of the Center's activities and that audience's significance to California's energy efficiency future are delineated in Attachment 2. Attachment 2 also includes a more comprehensive list of

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

existing and new educational seminars that the Centers will offer at the local and statewide level. The list reflects classes that are developed around specific technologies or installation methods as well as classes that present integration among DSM programs, including distributed generation and demand response. NOTE: The course topics listed in Attachment 2 will be modified during the program cycle, as new technologies are introduced into the marketplace and revised codes and standards are implemented.

- b. Statewide Building Operator Certification (BOC) Training Partnership  
BOC will continue to be a WE&T partner with the IOUs. The IOUs will expand and improve the BOC partnership. The “measures” to be provided in the BOC program include delivery of the Level I (7-class series) and Level II (4-class series) certification courses. BOC will also track certification statistics.
- ii. WE&T Connections
- a. College and University sector: The Statewide University program that operates at UC/CSU campuses offers the following as well as advances the Strategic Plan goals:
    - IOU and /or program staff will work with the UC Office of the President of Academic Affairs and the CSU Office of Degree Programs and Educational Opportunities to 1) promote energy minor or major degree programs, 2) collaborate and/or provide expertise in the development of complementary new and revised courses that will form a comprehensive integrated approach to energy education, and 3) consult with campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields.
    - Student interns will work with many campus groups and organizations to promote energy efficiency and green careers to the student body.
    - Student interns will work with campus EOP Programs to ensure that minority, low income, and disadvantaged students are fully engaged in our energy efficiency and green career path programs. Many students do not apply for admission to college because no one in their family has ever attended college or because college seems too expensive. EOP aims to improve the access, retention, and graduation of students who have been historically disadvantaged, either socially or economically.
    - Student Interns promote energy efficiency throughout the campus by performing energy assessments and providing recommended actions to operate more efficiently.
    - The program provides a pathway to green jobs through professional development, training, mentoring, integrated academic curricula, internships, project based learning, and a broad-based professional networks.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Students are offered job shadowing and internships with IOUs, universities, other entities, and government agencies.
- b. Community College sector: The Community College program will better position California's workforce to meet the growing need for energy professionals as well as advance Strategic Plan goals:
- The California Community College training and education program currently provides energy efficiency courses for CCC facilities, operations, and maintenance staff in an effort to create an energy efficient environment, help in the development energy efficient policies, take advantage of DSM programs, and implement distributed generation programs,
  - IOUs are in the early stages of discussion with the Community Colleges to develop a Utility Workforce Education and Training program. The first step is to gather labor market information from employers in the energy sector and use this information to develop new certificate and degree programs that focus on energy efficiency and demand side management.
  - IOUs will work with campus EOP Programs to ensure that minority, low income, and disadvantaged students are fully engaged in our energy efficiency and green career path programs. Traditionally, minority, low income and disadvantaged students heavily favor community colleges because they are economically more feasible or because students' GPA or standardized test scores were not high enough to get into a university. EOP provides support and helps students transition to universities if that is the goal of the student. EOP aims to improve the access, retention, and graduation of students who have been historically disadvantaged, either socially or economically.
- c. K-12 sector: The various K-12 educational components all offer the following as well as advance Strategic Plan goals:
- Ensure that minority, low income, and disadvantaged communities fully participate in training and education programs: At least 50% of each program is offered in minority, low income, and disadvantaged communities, determined by school lunch program data.
  - Designed to promote green careers to K-12 students through energy and environmental curriculum and highlight green careers/jobs: Students will learn about a range of green jobs and participate in shadowing and training program and classroom instruction to help them consider and prepare for future green employment. A focus will be on experimental learning models, including contacts with both blue and white collar workers now working in the green economy.
  - Designed to educate students on energy, water, renewable energy, demand response, distributed generation, and greenhouse gases and

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

impacts to the environment, with the goal of influencing the day-to-day energy efficiency decisions of students and their households (customer awareness focused).

- Designed to educate schools on the benefits of implementing energy efficiency policies and demand response programs at their sites to impact energy use in schools.
- The IOUs and/or our third party vendors will work with the State's Department of Education (Curriculum Commission) as well as Counties' Departments of Education to be included in curriculum development advisory boards so that we can contribute to tailored K-12 curriculum that includes the science of energy, energy efficiency, and some discussion about green careers.

c) List non-incentive customer services

i. WE&T Centergies

Common Center elements include:

- Educational seminars
- Technical consultations
- Outreach efforts
- Food Service Test Protocols
- Tool Lending Libraries
- Educational Partnerships
- HVAC sector strategy
- Energy Design Resources integration and collaboration

These non-incentive customer services will be used to direct the Centers' customers to the IOU's incentive programs through inclusion of program materials in class course books, through information integration on Centers' class websites, and literature displays in Centers' exhibits. (Refer to WE&T Centergies Sub-Program section 6.1 for specific details.)

## **5. Program Rationale and Expected Outcome**

a) Quantitative Baseline and Market Transformation Information

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as "Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

market.”<sup>3</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>4</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>5</sup>. Markets are social institutions<sup>6</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>7</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>8</sup>. According to York<sup>9</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

successful market transformation<sup>10</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>11</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>12</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>13</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>14</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>15</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>16</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>17</sup> suggests that the first step is

Statewide Workforce, Education and Training Program  
Program Implementation Plan**

not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

**Program Performance Metrics (PPMs)**

Below are the approved PPMs and metric types for the Workforce Education & Training Statewide Program (Resolution E-4385, Appendix A). These PPMs will be extended into the 2013-2014 portfolio, with the clarifying definitions shown below:

<b>WORKFORCE EDUCATION AND TRAINING (WE&amp;T)</b>		
<i>Centergies</i>	Percent increase in educational collaboration with partners from 2011 baseline. <u>(Tracked and reported by educational level, and by number of partners operating in Title-1 communities.)</u> * Educational “collaboration” is defined as: seminars, outreach events and consultations as needed. These collaborations include exchanges of monetary or in-kind support and services (i.e., sharing meeting facilities, marketing/promotional services, etc.).	2b
	2. Percent increase in educational collaboration with organizations serving disadvantaged communities * Educational “collaboration” is defined as: seminars, outreach events and consultations as needed. These collaborations include exchanges of monetary or in-kind support and services (i.e., sharing meeting facilities, marketing/promotional services, etc.).	2b
	3. Number of IDSM educational classes with substantial IDSM (EE, DR, and DG) content. * “Substantial” is defined as approximately 50% or more of class content must address IDSM subject matter. The WE&T Program staff have been in conversation with Energy Division to refine the definition of these metrics, which may change for the 2013-2014 reporting period.	2b
<i>Connections</i>	1. Percent increase in educational collaboration with partners. <u>(Tracked and</u>	2b

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

	<u>reported by educational level, and by number of partners operating in Title-1 communities.)</u>  * Educational “collaboration” is defined as: seminars, outreach events and consultations as needed. These collaborations include exchanges of monetary or in-kind support and services (i.e., sharing meeting facilities, marketing/promotional services, etc.).	
	2. Percent of K-12 WET Connection program participants that are from Title-1 schools	2a
	3a. Complete <u>baseline study to determine the current number of partnerships.</u> (Y/N) 3b: Number of high school continuing education outreach partnerships** in WET Connection	2a*  * Starting 2011.

b) Market Transformation Information

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms was presented at a public workshop on November 7, 2011 to allow for public comments and further discussion before being finalized. No MTIs were identified for the WE&T Program.

c) Program Design to Overcome Barriers

The Statewide IOU WE&T Program structure illustrated by this document is intended to address several new and recent challenges and existing barriers in order to implement a sustainable long-term education and training strategy, while leveraging the resources of the CA-IOUs to help influence energy efficiency curriculum and training content among education, labor and community sectors in a way that incorporates best practices and coordinates investment throughout the state.

The national, statewide and local economic downturn poses a real barrier to change, creating the risk of distracted focus and resistance to invest in projects. The IOUs currently represent a long and stable commitment to energy efficiency and demand-side management education and training. The IOUs have demonstrated the ability to offer a targeted breadth of education and training program, but market transformation toward a new green workforce will require an urgent commitment to change by educational sector stakeholders.

The challenge of introducing new technology into the marketplace has historically relied on coordination between technology development, research and technology commercialization. IOUs have demonstrated flexibility in identifying new and emerging technology training needs and introducing workforce training courses to both private and public sectors. However, market transformation to meet target dates associated with net zero new construction and code adoptions will require a rebound in the economy and interest in new investment.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The IOUs offer a broad statewide contiguous view on workforce, education and training which few other parties have. The proposed implementation plan leverages the statewide IOU assets and resources to the extent possible to address gaps in the workforce landscape, and IOUs can act as conduits to identify new or successful local and regional workforce training models that can be migrated across the state into underserved areas via IOU implementation or IOU administration of third-party sponsored implementation. Such an effort cannot occur solely from IOU funding, so there will need to be additional financial stimulus from alternative resources.

WE&T Connections

Energy education is critical to assuring a stable and reliable supply of energy in California. Educating students will create a new generation of Californians who understand the significance of energy in their lives, their role in its efficient use and the importance of managing our limited resources for the future. This knowledge and information can also lead to life-long energy savings habits and a concern for the environment and its limited resources for not only the students but, for their family and friends. This knowledge and education can also lead the interest in a future green career path. However, given the budget cuts at schools, cuts to curriculum and longer work hours for teachers, getting this message across may not be possible without the assistance of these IOU sponsored programs.

WE&T Connections program components are designed to be both flexible and effective across diverse learning environments. All program components promote the science of energy, energy efficiency, demand response, distributed generation, and empower K-12 and college students to become advocates of smart energy management in their homes, schools, and communities. The program effectively combines classroom learning with hands-on activities such as:

The program will address lost opportunities in the schools market by implementing a comprehensive, innovative approach that involves incorporating:

- Some of the nation's leading energy education programs. These programs are 1) designed to promote green careers through energy and environmental curriculum, 2) designed to educate students on energy, water, renewable energy, demand response, distributed generation as well as green house gases and impact to the environment, with the goal of influencing day-to-day decisions of students and their households, 3) also designed to educate schools/facilities on the benefits of implementing energy efficiency policies and demand response programs at their sites so as to impact energy use in schools and, universities and to project energy and environmental leadership by example
- The program is developed in collaboration with natural gas, electricity and water agencies to promote and encourage the adoption of energy efficiency, demand response, distributed generation and water conservation options.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Collaboration and integration with residential and business incentive programs that result in firm energy savings for homes and schools.

The WE&T Connections program will address the needs of schools through a combination of student, teacher, and school administrator education programs that increase their awareness and knowledge as well as provide support in developing curriculum and/or lesson plans that support these objectives. Additionally, once school-aged children learn something new like energy efficiency, they become advocates by taking that knowledge home and teaching/motivating their parents and siblings to take actions to reduce energy and water consumption. University students can conduct valuable research and effectively educate their peers and campus administrators about energy efficiency:

- Educational campaigns can result in significant energy savings on campus facilities and dorms by changing behaviors and purchasing decisions;
- Students are effective advocates, able to reach their peers, communities and high-level decision makers in promoting green jobs on campus.
- IOUs will coordinate with the Department of Education Curriculum Frameworks and Instructional Resources Division to discuss how curricula on energy efficiency fundamentals, GHG issues and global climate change can be included in the Science Framework (PG&E has submitted an application to be on the Science Curriculum Framework and Evaluation Criteria Committee for the revision of Science Framework, adoption in 2012). Additionally, coordinate with the Dept. of Ed for inclusion of curricula of green career options in energy-related fields in the Career Technical Education Framework for 7-12.
- IOUs will update the “Resource Guide for Teachers” developed by PG&E that provides an annotated listing of sites and curricula for teachers and students covering issues related to energy, energy efficiency and the environment.
- IOUs will coordinate with partners to expand outreach into K-12 schools that have curricula on energy, water, and environmental issues (e.g., California Department of Education of Education, Water Districts, California Department of Energy, California Energy Commission, Air Quality Management Districts).
- As an outcome of the collaboration of partners representing curricula mentioned above suggestions on how to integrate career options in energy-related fields will be explored. In the interim the IOU’s will review the existing curriculum programs that they support and work together to see where career options can be incorporated into their curricula.
- The IOUs and/or our third party vendors will work with the appropriate (as described in program description) K-12, Community College and University agencies responsible for developing curriculum, courses and programs needed to educate students about energy, energy efficiency and prepare them for a green career path.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

d) Quantitative Program Targets

Refer to WE&T Sub-Program sections for specific details.

e) Advancing Strategic Plan goals and objectives

The proposed Statewide IOU WE&T program implementation structure, integrating WE&T Planning as a Sub-Program in parallel with the two other major statewide IOU Sub-Programs, WE&T Centergies and WE&T Connections is intended to better integrate long-term planning with WE&T implementation. As stated in the Strategic Plan, “This cross-cutting sector demands a truly statewide coordination effort that integrates energy efficiency training into a wide range of public and private programs. This effort will include the California Department of Education, the Department of Employment Development, industry and labor associations, educational institutions at all levels, technical and vocational training organizations, community based nonprofit organizations and the business community.”<sup>18</sup>

California today is faced with an unprecedented challenge: the generation of students graduating high school in 2009 will need to stabilize carbon emissions in the 30+ years of their work careers. Additionally, this generation will need to develop and train the next generation of energy technologies. Transforming California’s current building industry into one that exemplifies carbon neutrality by 2020 will require major changes in our existing market infrastructure and business models. This will result in many new jobs and industries.

One of the keys to success for future implementation of energy efficiency technologies is the need to train the next generation workforce in energy-related positions. The Statewide IOU WE&T Program, supported by the strategic activities of the WE&T Planning Sub-Program activities, establishes a connection among statewide implementers for increasing the knowledge and skills of the current generation - from local code officials, energy managers, and HVAC technicians to school teachers - to develop the muscle needed to achieve market transformation.

Achieving success in creating a workforce well educated in energy efficiency matters will require large-scale, ongoing, collaborative education, and training efforts to match evolving demands for both the type of jobs and number of workers needed to fully implement the Strategic Plan. Addressing human capital resource requirements will require collaborative efforts of federal, state, and local governments; financial institutions; community-based and non-profit organizations; industry and labor organizations and utilities. These entities present potential funding sources and opportunities for partnerships.

---

<sup>18</sup> California Long Term Energy Efficiency Strategic Plan, p. 75.

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

Students benefit from energy efficiency education and training opportunities with the ultimate goal of students entering careers in energy efficiency, advancing within their established career paths, and ultimately helping the state to meet very intense energy efficiency goals. A better trained workforce will advance the purpose of DSM implementation, policy, research and development, and education.

The educational components offered by the WE&T Connections program provide energy efficiency education and training at most levels of California's educational systems. The program also ensures that minority, low income and disadvantaged communities fully participate in training and education programs at all levels of the DSM and energy efficiency industry. The expected results are that:

1. Students develop careers, and existing workers develop skills and knowledge that advance DSM business, policy, research and development, and education; and
2. Individuals from the targeted communities take advantage of programs that specialize in energy disciplines at all levels of the educational system and successfully advance themselves into rewarding careers in the energy services fields.

The Statewide IOU WE&T Program is structured to implement workforce training and workforce curriculum development in cooperation with the California Community Colleges Chancellor's Office, the California Board of Education and Adult Education Leadership. WE&T Planning Taskforce and annual workshops will help to nurture technical training and education services that support community college and adult education within the first 12 months of the program cycle. Together, these relationships will be able to outline the foundational learning plan(s) needed to prepare students for career paths in energy efficiency and related fields. Based on experience, learning plan outlined through this collaborative effort could provide students with entry points for entering the field of energy efficiency and/or result in career development tracks within a traditional education system. IOUs would initially suggest learning plans be based on the "working backwards" exercise of asking what knowledge, skills, educational background and abilities are needed for particular sets of jobs and careers. Once these various attributes have been identified, learning plans shall be developed which will drive the development of curricula and training programs and support the knowledge and skills sets needed to prepare students for the "green collar" workforce. The Statewide IOU WE&T Program will build on existing training activities to address "gaps" in the learning plans as appropriate and diagnosed by the needs assessment.

The Statewide IOU WE&T Program is modeled to generate stronger linkages to K-12, advising on energy curriculum and coordination between K-12, Community Colleges Chancellor's Office and the adult education sector. The Statewide IOUs will exchange instruction and curricula with community colleges, industry and labor on HVAC, Energy Audits, Home Performance Retrofits and Building Operator Certification. The Statewide IOU WE&T Program will also advance consistency among the IOUs to use training

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

curricula through established partnerships with the community colleges, vocational / technical / trade schools and apprenticeship programs.

The Statewide IOU WE&T Program establishes a framework for cross-sectional expansion of training curricula and related workforce development programs to address HVAC quality installation and maintenance, building construction, home performance audit and retrofit services, building operator certification, facilities maintenance, and other technical fields. The Sub-Programs will build on the established partnerships with key actors to deliver technical information through a wide variety of training and education services for upstream stakeholders such as contractors, installers, inspectors, plan checkers, designers, architects, engineers, vendors, installers, and other technical skilled personnel to increase actions, awareness, and attitudes toward energy efficiency.

The Statewide IOU WE&T Program as structured supports the Big / Bold Strategies adopted by the CPUC in the Strategic Plan by continuing to offer training programs on quality installation and maintenance of HVAC systems and equipment selection based on whole building design, training and certification, compliance improvement and new technologies. Education and Training will continue its focus on the building envelope and overall home performance by providing HVAC quality installation, maintenance and service courses based on ACCA (Air Conditioning Contractors of America) and other appropriate standards. Education and Training will also continue to offer programs on new and emerging technologies in HVAC (e.g., variable refrigerant flow (VRF) systems) and will encourage HVAC participants to become certified under the North American Technician Excellence (NATE) certification program or other appropriate credentials as a means of demonstrating technicians and installers' ability to perform quality work.

The Statewide IOU WE&T Program will work with Marketing Education and Outreach implementers on effective marketing and outreach strategies that will be designed to maximize participation in green career paths. For example, to increase awareness of the availability of training and career development programs, WE&T will contribute to the Web portal project to ensure that "green education" opportunities are accessible through the Web portal.

During the first 24 months of the program cycle, the Statewide IOU WE&T Program will be a guide for collaboration among the Department of Employment Development, community colleges, technical and vocational schools, industry and labor associations specifically on building job training programs and internships for students and preparing them for energy efficiency careers and related career paths. Collaboration will be aided by recruitment of key resources to help in promoting to students and continuing education participants the types of employment prospects available in energy derived from the WE&T Assessment study and other market data.

Within the first 24 months of the program cycle approval, the Statewide IOU WE&T Program structure will demonstrate its effectiveness to drive statewide coordination among key stakeholders to expand continuing education and college extension programs

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

to include a greater focus on energy/resource efficiency, sustainability and green technologies. The Statewide IOU WE&T Program structure clearly shows the inclusion to collaborate with the UC/CSU system and California's community colleges to bring an expanded focus on energy/resource efficiency to students and faculty; utilize the extension programs available through the colleges and universities to incorporate a continuing education curriculum component; and work with these educational institutions to help them with expansion of their green degree programs. The Statewide IOU WE&T Program will seek ways of increasing awareness of the importance of energy efficiency, sustainability and green technologies to California, and the key partners will be able to positively impact participation and enrollment in educational programs and green careers.

The Statewide IOU WE&T Program enhances relationships with K-12 public and private educators to share best practices to attract students and facilitate interest in energy efficiency careers and the study of energy efficiency and GHG emissions. The WE&T Connections Sub-Program implementation, in collaboration with WE&T Planning activities, will engage industry experts and educational specialists including but not be limited to: the State Department of Education, educators working at County Offices of Education, leaders in teacher organizations [e.g., California Science Teachers Association (CSTA), California Regional Environmental Education Community (CREEC), Regional Occupational Centers and Programs (ROCP), California Integrated Waste Management Board (CIWMB), and the California Environmental Protection Agency for the K-12 market to determine the inventory of educational resources, funding mechanisms, and include a breakdown of workforce development and strategic planning needed to establish career training for energy-related fields.

The California EPA and the California Integrated Waste Management Board (CIWMB) are involved in the implementation of AB1548. This is the development of a "unified education strategy to bring education about the environment into California's primary and secondary schools."<sup>19</sup> Identified are fourteen specific environmental topics where curriculum is currently being developed. The WE&T will engage in the State Department of Education Science Framework revision to encourage incorporation of energy efficiency and renewable energy emphasis.

The Statewide IOU WE&T Program will help steer more training outreach and green careers education toward minority, low-income and disadvantaged communities. The IOU administered ESA program is expected to dramatically expand the number of units that will receive education and weatherization services during the 2013-2014 program cycle. To meet the significantly higher goals, more communication and joint WE&T coordination will be necessary and desirable. The Statewide IOU WE&T Program creates an implementation framework to focus on expanding behavior modification in existing training programs to increase emphasis on energy efficient practices, steps that will enable installers, weatherization crews and energy specialists to build on the

---

<sup>19</sup> [www.calepa.ca.gov/Education/EEI/workgroups/envirotopics](http://www.calepa.ca.gov/Education/EEI/workgroups/envirotopics)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

information they provide to minority, low-income and disadvantaged communities to achieve California’s economic energy efficiency potential.

**6. Program Implementation**

a) Statewide IOU Coordination

As part of the overall Program Implementation Strategy, the statewide IOU WE&T program plans to institute protocols and processes to identify and facilitate statewide migration of quality training models into each IOU service area, as well as into underserved communities within the respective IOU service areas, where appropriate.

Summary table of WE&T target sectors, program implementation and implementers:

Workforce Education and Training	Sub-Program	Sub-Program coordinated implementation
Schools	Green Campus; Energenius; PEAK	WE&T; IOU UC/CSU/CCC Partnerships
Commercial Market Segments	Tool Lending; Food Service; Building Design Training; Building Operations and Maintenance	WE&T (Energy Centers); Statewide Commercial Resource Programs; IOU Local Government Partnerships; BOMA; BOC; USGBC; New Construction; Codes and Standards
HVAC Industry	Tool Lending ;ACCA; IHACI - QI/QM (ACCA standards inclusive)	WE&T (Energy Centers) Community Colleges Statewide Residential and Commercial Resource Programs, including their HVAC Sub-Programs
Residential Market Segments	Building Design and Construction Training; Energy Partners (PG&E); CLEO (SOCALGAS/SDGE)	WE&T (Energy Centers) BIA – Remodelers; Statewide Residential Resource Programs; New Construction;

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

		BPI; ESAP
Industrial/Agriculture Market Segments	Tool Lending; Audits/Assessments	WE&T (Energy Centers) Statewide Residential Resource Programs; DOE

b) Program delivery and coordination

Three areas of focus for the IOUs to deliver training curriculum to expanded audiences are:

**Joint statewide training and seminars** – comprehensive energy efficiency and clean energy educational seminars and conferences jointly hosted, promoted and sponsored among the IOUs, municipalities, government agencies, non-profits and industry experts.

**Distance learning** – web-based platform for synchronous and asynchronous access to digitally transmitted and pre-recorded (catalogued) on-line education and training modules. Distance learning enables webcasting as a communication tool to reach larger workforce audiences with specific training topics in a low cost manner. IOUs can explore co-production and access to on-line training curriculum with other agencies (i.e., CARB, CAL-EPA) to provide more comprehensive energy solutions training.

**Outreach** – Assist community-based training programs that offer energy efficiency and hands-on training green job curriculum to trainees in minority and other disadvantaged communities. These types of relationships will be coordinated with Low-Income Energy Efficiency programs and likely piloted regionally by IOUs to develop best practices, determine cost effective designs and fine tune a model for turnkey statewide migration. IOUs can help community training programs implement best practices, measure impacts and revise programs, while helping to shape and form standardize integrated resource curriculum (i.e., water, air emissions) beyond what can be offered by IOUs.

i. Emerging Technologies Program

The Statewide WE&T Program will collaborate with the Emerging Technologies program in an improved manner to allow external participation in the ET process. Working closer with ET to increase knowledge and confidence in emerging technologies, the WE&T programs will help with implementation of these new technologies disseminating information and training to enhance market transformation and acceptance into the marketplace.

ii. Codes and Standards Program

The Statewide WE&T Program structure segregates Sub-Program curricula to make it easier to identify training opportunities that: 1) enhance interest in C&S career positions, 2) provide training on the codification process of energy

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

efficiency and green laws, 3) provide direct industry training on energy and green implementation strategies in response to current or impending codes and standards, and 4) prepare the workforce for code compliance improvement tasks.

WE&T Centergies will work closely with the Codes and Standards Program to support development of a sector strategy to support workforce development in an area with low compliance, for example, in HVAC. WE&T will maintain ongoing communications with the C&S staff to ensure coordinated development and inclusion of code-related content.

iii. WE&T Efforts

The Statewide WE&T Program will support the other IOU EE Programs as appropriate. Refer to Section 6.b.iii for each Sub-Program for additional plans, if applicable.

iv. Program-specific marketing and outreach efforts

Refer to Section 6.b.iv. for each Sub-Program, if applicable.

v. Rationale for selection of sub-contractors

Refer to Section 6.b.v. for each Sub-Program, if applicable.

vi. Non-energy activities of program

Refer to Section 6.b.vi. for each Sub-Program, if applicable.

vii. Non-IOU programs

The proposed Statewide IOU WE&T Program structure is very significant in that they represent a feasible and respected leader to help flesh out the common ground for delivering and coordinating statewide workforce training program among IOU and non-IOU sponsored trainers. WE&T as a strategic platform can help facilitate energy neutral training, coordination and funding among not only IOUs, but other stakeholders linked to California's energy plans. Refer to Section 6.b.vii for each Sub-Program for additional plans, if applicable.

viii. CEC work on Electric Program Investment Charge (EPIC)

Not applicable.

ix. CEC work on C&S

Please see Section 6.b.ix. for each Sub-Program, if applicable.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- x. Non-utility market incentives

Refer to Section 6.b.x. for each Sub-Program, if applicable.

- c) Best Practices

In addition to showing the relationship of the Statewide WE&T Program and Sub-Programs, Diagram I also illustrates the bi-directional interaction anticipated between the Sub-Programs under this structure. This represents IOU commitment to the WE&T strategic plan and its objectives, as well as IOU interests in facilitating stakeholder input in presenting, identifying and supporting IOUs efforts to create well-coordinated processes to connect and migrate local and regional WE&T models across the state based on best practices identified by a variety of stakeholders. The WE&T taskforce, with CPUC, IOU and statewide stakeholder roles can have a long-term impact on WE&T implementation plans of IOUs by maximizing the benefits of the structure presented. Regularly scheduled meetings among WE&T taskforce members will ensure that voices can be heard, IOUs implementation plans can be discussed and long-term WE&T strategic progress is addressed. As has been described in this section in some length, by layering the strategies outlined in the Strategic Plan on the Statewide IOU WE&T PIP, the IOUs see that as a sustainable framework for achieving the various goals sought by the CPUC from the IOUs.

- d) Innovation

Refer to Section 6.d. for each Sub-Program, if applicable.

- e) Integrated/coordinated Demand Side Management (IDSMD)

The statewide WE&T team will continue to coordinate IDSMD education and training efforts by working with IDSMD program staff and as a member of the IDSMD Task Force.

- f) Integration across resource types

Refer to Section 6.f. for each Sub-Program, if applicable.

- g) Pilots

No pilot programs are planned for WE&T in 2013-2014.

In 2012, the IOUs have started work to develop an HVAC sector strategy approach, to be implemented in 2013-2014. Details are provided in the Centergies Subprogram.

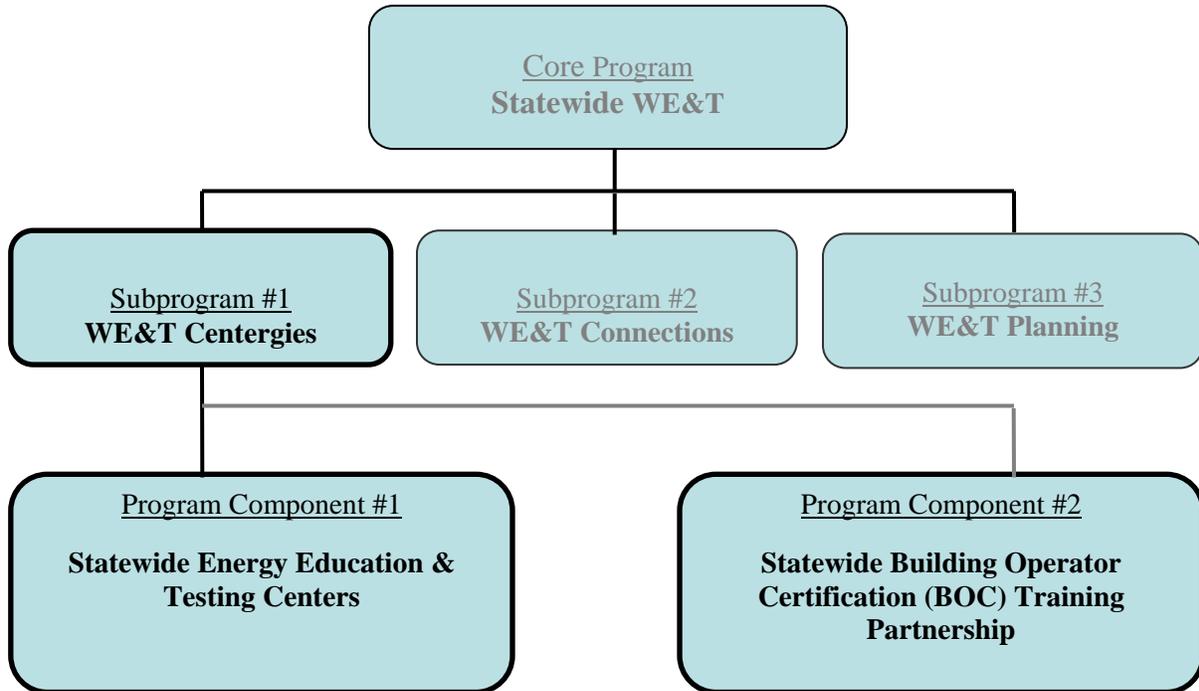

- h) EM&V

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

6.1) Sub-Program Implementation – WE&T Centergies – SCG3729

a) Statewide IOU Coordination

i. Program name

The Statewide WE&T “Centergies” is a Sub-Program within the Statewide WE&T Core Program. The “Centergies” Subprogram has two primary components which are diagrammed above and described in greater detail below. Parts to the “components” shall be referred to as “elements”.

ii. Program delivery mechanisms

The IOUs will continue to deliver workforce education and training through two delivery mechanisms: Statewide Energy Education and Testing Centers and through the Building Operator Certification (BOC) program.

**Statewide Energy Education and Testing Centers**

Through their energy education and testing centers (Centers), California’s IOUs have been supporting the energy efficiency workforce and partnering with 3<sup>rd</sup> Party and Local Government Partnerships, in some cases, for over 30 years. The Energy Training Center (ETC), Food Service Technology Center (FSTC), and

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Pacific Energy Center (PEC) will align with the statewide WE&T goals of the Strategic Plan by addressing the training needs of the midstream and upstream mass market, commercial, industrial, and agricultural actors through state-of-the-art classes designed to enable building professionals to reduce energy consumption in new and existing residential and small commercial buildings. As disseminators of information, the Centers are structured to deliver integrated energy efficiency, demand response, and renewable energy program information through their offerings described below. The Centers serve as a “public face” in interactions with the community and as a conduit to California’s local and statewide energy efficiency programs. Through the 2013-2014 transition period, the Energy Centers will partner with appropriate California industry and labor organizations, professional organizations, trade and vocational schools, community colleges, universities, third-party entities, government partners serving low-income or disadvantaged communities, and other IOU and POU education and training centers. By delivering technical information through a wide variety of courses and technical consultations, the Energy Centers will support and enhance programs which address demand side management (DSM), demand response (DR), distributed generation (DG), water and energy use, codes and standards, emerging technologies, renewables, and all incentive programs. The Energy Centers will ensure maximum effectiveness and impacts needed to achieve long-term energy savings goals for California. With some variation at the local level, the Centers have and will continue to evolve their elements to:

- Deliver high-quality integrated educational seminars to train members of the energy efficiency workforce, including entry-level contractors, disadvantaged community members, university and community college students, architects, food service facility designers and operators, HVAC engineers, equipment installers, manufacturers, developers, and commissioning agents. Based on factors, including changes in technology, changes in codes and standards, and feedback from seminar participants, seminars will be modified to more effectively integrate topics such as distributed generation, DR, and EE as described in section 6.2.e and 6.2.f. Seminars will continue to include transferring skills on energy audits to members of the EE workforce at various stages in their careers—novices to seasoned energy auditors.
- Provide technical consultations and equipment demonstrations through building design plan and equipment schedule reviews, technical advice on new equipment and system technologies, technical advice on best-practice methods, and site visits for identifying energy efficiency opportunities. Site visits shall not replicate the efforts of the energy audits program, but rather be conducted when necessary to provide technical advice.
- Where Outreach falls under the local Center, provide on- and off-site outreach programs for disseminating technical EE information, and promoting utility energy efficiency incentive programs to green- and white-collar building

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

professionals. Outreach programs will include, but not be limited to: on-site facility tours, off-site short presentations about Centers' offerings, participation in environmental fairs and events. Centers shall work with their IOU's marketing groups so as to collaborate, but not duplicate efforts.

- Design, certify, and maintain food service equipment test protocols that allow for unbiased measurement of energy efficiency and production capacity while engaging manufacturers and chain operators to test equipment and build user accessible performance results databases. This data provides the foundation for future training programs across the Food Service spectrum as well as the technical support for rebate and other programs provided by the IOUs.
- Expand and integrate tool lending library programs that provide building and system performance measuring instrumentation, instrument use information, and measurement protocols. Tool lending libraries will loan tools free of charge to people working on short-term EE projects in California. Patrons will include building operators, facility managers, designers and other professionals who use the tools for building diagnostics, site analysis, power and energy consumption studies, research projects, and educational efforts.
- Expand energy efficiency educational partnerships with institutions that include government, professional, and trade organizations that will help Centers deliver IOU programs and information to a broader audience. Examples of such groups include, but are not limited to the U.S. Green Building Council, Building Owners and Manufacturers Association, American Institute of Architects, American Society of Heating, Refrigerating, and Air-conditioning Engineers, the Association of Energy Engineers, the Illuminating Engineering Society, Institute of Heating and Air Conditioning Industries, Air Conditioning Contractors of America, Affordable Comfort Inc., Building Performance Institute, Residential Energy Services Network, Apprenticeship Training Programs, North American Technician Excellence, the National Restaurant Association, Foodservice Consultants Society International, North American Foodservice Equipment Manufacturers, National Environmental Balancing Bureau, Stationary Engineer Unions, U.S. Environmental Protection Agency / Department of ENERGY STAR, American Society for Testing and Materials, the California Energy Commission, California Division of Apprenticeship Standards, International Brotherhood of Electrical Workers, National Electrical Contractors Association, Sheet Metal and Air Conditioning Contractors' National Association, Counselors of Real Estate, Institute of Real Estate Management, and the International Facility Management Association. More detail on educational partnerships is available as part of the Statewide WE&T Connections Sub-Program.
- Support building energy efficiency by developing training sessions to prepare the marketplace for new HVAC codes (acceptance testing and HERS

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

verification), technologies, and innovative whole building approaches to new and existing buildings. Since the HVAC Big Bold initiative will expand training and education aimed at the HVAC industry, the WE&T program will coordinate carefully to complement HVAC industry training by providing educational support to related market actors such as energy consultants, Home Energy Raters, engineers, architects, and home performance contractors. It is anticipated that the robust HVAC industry training proposed by the HVAC program will create important collaboration opportunities to not only increase training opportunities, but to embellish energy center offerings and impacts.

- Increase statewide Energy Design Resources (EDR) Integration. (EDR) is an existing statewide energy efficiency resource website featuring design materials on how to effectively integrate energy efficient designs into nonresidential facilities. EDR has begun developing the structure to expand the materials and tool offerings to include residential design requirements. While EDR is not funded through WE&T, EDR content is very relevant to the Centers' WE&T direction and goals. Centers will integrate EDR content (online classes, case studies, materials, etc) as statewide resources that are relevant to specific classes, outreach efforts, and consultations. The table below summarizes common Center elements defined above.

<b>Centers' Elements</b>	<b>SCE AGTAC</b>	<b>SCE CTAC</b>	<b>PG&amp;E ETC</b>	<b>PG&amp;E PEC</b>	<b>PG&amp;E FSTC</b>	<b>SDGE SDERC</b>	<b>SoCal Gas ERC</b>	<b>SoCal Gas FSEC</b>

WE&T Food Service Test Protocols	15	15	30
Tool Lending Library	tbd*	tbd*	

\* SoCalGas has not developed a feasible way to manage tool lending. Continuing discussions with other Energy Efficiency program areas to identify potential opportunities.

**A. Changes for 2013-2014 Statewide Program Coordination through IOU Energy Centers:**

The IOUs will modify Centergies curriculum and delivery methods to incorporate feedback and guidance from sources, including the California WE&T Needs Assessment, customer feedback from the 2010-2012 Process Evaluation, and the Guidance Decision for 2013-2014. Such modifications include, but are not limited to, approaching curriculum development with the sector strategy approach.

**1. Heating Ventilation and Air Conditioning (HVAC)**

IOUs will incorporate and integrate HVAC education and training programs into its Workforce Education and Training Centergies sub-program to deliver a dedicated, industry-specific education and training opportunities targeted at all levels of the HVAC value chain. As part of this effort, IOUs will convene various stakeholders from, but not limited to, community colleges, trade organizations, professional organizations, employers, and apprenticeship/pre-apprenticeship programs including through the IOU-sponsored Western HVAC Performance Alliance stakeholder collaboration group, which has WE&T-specific committees already built into its structure. This will allow for identifying skill gaps and to identify opportunities for collaboration in a coordinated effort toward implementing recommendations needed to close gaps at all levels of the industry.

**HVAC Sector Strategy Plan:**

In response to the Guidance Decision, the IOUs began work in 2012 to develop a plan as described below to expand their educational efforts toward more

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

direct effect on trade organizations that have memberships involved with installation and maintenance of commercial HVAC systems. IOUs will tested a non-residential HVAC sector strategy. A core component will be the development of a multi-stakeholder partnership to develop a full implementation plan to apply the CALCTP sector strategy approach to the HVAC non-residential industry. The IOUs began with Quality Maintenance to provide the foundation, and then included a Quality Installation sub-strategy. Cornerstones of the Quality Maintenance implementation plan include identifying priority emerging technologies for improving EE related non-residential HVAC systems, identifying the knowledge, skills and abilities (KSAs) professionals need to install and maintain systems efficiently and safely as well as the linkage of these KSAs to ANSI or ISO certifications, and, developing a steering committee.

IOUs will collaborate on a statewide memorandum of understanding (MOU) with the California Division of Apprenticeship Standards. The MOU will provide a framework for partnering with labor, trade, and professional organizations that resembles the existing CALCTP program. Such an MOU will help to reinforce cooperation in achieving goals of the sector strategy test of having certified training modules, performance based principles to test and diagnose the HVAC system, site information for the contractor to design and implement real solutions for customer comfort and efficiency, training that takes good HVAC technicians to the next level and gives them the tools to maximize efficiency, comfort and safety of customers in the construction of new systems, and real-time analysis to track and maintain data from completed projects by trained participants.

Because of early activities with sector strategies, IOUs will be applying recent lessons learned from their related efforts within Commercial EE to the HVAC sector strategy, as it develops.

IOUs will work with qualified partners to institute a test that will enable HVAC workforce member to attend various HVAC classes and receive credit towards industry-recognized certifications or other appropriate credentials. The IOUs will also contact and extend partnership opportunities designed to improve installation and maintenance quality of Commercial HVAC units.

The IOUs have initiated discussions to determine the parameters of an HVAC sector strategy, to be deployed in 2013. The IOUs have identified a core group from across lines of business, and externally, the IOUs have begun to discuss pilot concepts with the other IOUs and external stakeholders such as the Western HVAC Performance Alliance and the Division of Apprenticeship Standards.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Based on best practices from CALCTP the IOUs recommend starting with a Needs Assessment to determine where gaps and opportunities exist, prior to determining the HVAC sector strategy's specific objectives and goals.

With Quality Maintenance as a test, the IOUs intend to glean lessons learned from that approach, to be subsequently extended into the quality installation approach to the HVAC sector strategy.

The IOUs will endeavor to have skills standards for HVAC installations established by the end of 2013. The IOUs will continue to provide necessary training as a component of the quality installation and quality maintenance programs. The current design is geared toward providing the highest possible level of installation and maintenance expertise for contractors and technicians working within the HVAC subprograms. The IOUs will continue to use the basic foundations of Title 24 acceptance testing regulations and the consensus HVAC industry standards as the basis of requirements for this training. The IOUs will continue necessary training as a component of HVAC programs. These programs will continue to evolve as needed to meet program changes as they develop.

**2. Support for California Advanced Lighting Controls Training Program (CALCTP)**

The IOUs will continue to partner with CALCTP to offer CALCTP trainings as part of their portfolio of classes to various sectors of the advanced lighting controls workforce, including electricians, contractors, business managers, installers, specifiers, marketing reps, and designers. Where appropriate, IOUs will serve as program advisors and instructors, and provide direct financial and in-kind support to help sustain the program. IOU contributions will augment funding and support from other stakeholders, including employers, unions, other training partners, and manufacturers. Where appropriate, IOUs will continue to provide letters of support to secure grants to help support CALCTP and will continue to serve on the CALCTP board of directors and advise CALCTP curriculum developers.

To assess mandatory or voluntary incentive-based approaches to promoting high-road skills standards as part of the HVAC sector strategy initiative or CALCTP training, IOUs will work with relevant resource program managers to identify opportunities to create or enhance incentive programs that are linked to the participation of members of the workforce who have specific qualifications and/or credentials. For example, IOUs will explore the opportunity to provide an additional incentive directly to the customer if the customer hires a CALCTP certified electrician, in order to help create demand for participation in IOU-supported training programs such as CALCTP. The same model can be applied to the HVAC industry as well as other sector strategy approaches.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

In response to the guidance decision (at p. 283), the IOUs provide the following information about the CALCTP program.

<b>Request</b>	<b>CALCTP Information</b>
(1) Data or estimation of the incremental customer cost, if any, of requiring skill standards;	(1)When the program requires CALCTP certified installers, the cost to the customer for the labor component of the project may be 10% - 15% more than prior when no certification was required.
(2) Data or estimation of the average and range of permitting/compliance costs across permitting jurisdictions in the IOUs' service territories;	(2) Compliance and permitting cost are directly associated to the cost of proper training programs for designers, installers, manufacturers, etc. which may be equivalent to an additionally 20% to the project cost. However, proper collaboration with industry associations and manufacturers may offset this cost.
(3) Data or estimation of impacts, if any, mandatory skill standards would have on program participation rates;	(3) With proper incentive levels and education of the segment, it is anticipated that adoption/participation would increase since the misperceptions of advanced lighting control systems, potential for demand response and how DR or ADR works will be corrected causing more demand for the control solution.
(4) Data or estimation of impacts, if any, mandatory skill standards would have on program participation rates;	(4) It has been proven with advanced lighting control system assessment projects at PG&E, SCE and SDG&E that the customer will achieve a minimum of an additional 30% savings over traditional lighting efficiency measures. And dependent upon the level of control allowed to individual employees, savings may increase an additional 5% - 10%. With the opportunity to participation in DR, the customer will achieve even greater cost savings due to the ability to shave or control peak loads. The actual dollar values will be determined as the program adoption occurs and customer site performance is monitored and data collected.
(5) Any other potential benefits associated	(5) Additional benefits include: a. systems

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

<p>with higher standards, such as fewer call-backs, lower frequency of customers over-riding control systems, lower life-cycle costs, and increased consumer uptake of measures based on higher quality and certainty.</p>	<p>do not get overridden due to better understanding as well as the system being designed and installed. Also, ease of proper training of customer personnel regardless of turnover with the local certified installer; b. IOU assessments have shown that fewer, if any, call backs will be experienced when the system is installed by a certified installer. In contrast, numerous call backs were experienced before the system was able to be commissioned when a non-certified installer was used. c) increased proper maintenance, d) higher visibility of actual energy use in lighting due to the potential of graphic interfaces and other reporting. e) ability to track GHG emission reductions. f) create market disruption as customers begin talking to others about how well their advanced lighting control system is working and saving them money due to proper design and installation.</p>
--	---

**3. Coordination with Energy Upgrade California’s Whole Home Upgrade (EUC - WHUP)**

The IOUs will continue to develop and produce a core set of offerings in 2013-2014 that will be geared to providing interested contractors and technicians with the program knowledge necessary to provide entry, as well as support for their continued participation into WHUP.

To increase emphasis on workforce training for WHUP, the utilities will work with various “trade organizations” to share existing and future course offerings for their membership. The sharing of these courses is intended to expand the relevant knowledge base of partnering organizations, with regards to WHUP, and thereby improve the quality of energy efficient products installed throughout California.

SoCalGas will continue its current efforts to offer “continuing education credits” for organizations such as NATE, BPI, AIA, NARI, and other certification programs to be approved.

In consultation with local governments, the utilities will expand their training networks to include specific contractor and technician training. In addition, the utilities will work with local governments to identify geographic listings

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

of contractors and technicians who will address community needs and comply with local codes and standards. In addition, the IOUs will conduct a gap assessment with local governments to identify additional needs not currently addressed.

SoCalGas will continue to work through our local government partnerships to ensure we have identified and marketed to contractors in areas served by those local jurisdictions, including multifamily programs.

- Coordination with Energy Savings Assistance Program (ESAP) Training and Certification

In 2012 the IOUs will engage with various Community Based Organizations, Local Training Facilities and Community Colleges to identify the most appropriate methods to partner with them to serve disadvantaged members of their communities. In 2013-2014, based on results of discussions with other relevant organizations, the IOUs will develop agreements to offer or share existing curricula with these partners to better serve their communities. These curricula will be designed to provide potential employment tracks within EE through entities such as trade organizations, IOU weatherization programs and weatherization programs offered through State agencies.

Partnership with the Energy Savings Assistance Program has provided low income utility customers with a variety of energy efficiency improvements for their homes for over 30 years.

The community colleges and the community based organizations have demonstrated that they can offer equivalent training for skills based training through their facilities which results in a reduced cost to contractors wishing to hire new assessors and installers for the program. The result of the articulation also reduces the initial cost of training for participating contractors (a key consideration in the hiring decision) making the individual more likely to be successful in their employment search. In addition, the contractors that have taken advantage of this symbiotic relationship have also found it has resulted in essentially these prescreened candidates are more likely to be long term employees of the program.

- Real Estate Agent Training

In 2012 the IOUs will make an initial introduction of courses designed to stimulate interest within the Real Estate community to expand their knowledge of benefits of EE in resale of residential and commercial properties as well as provide continuing education opportunities through

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

partnership with various local, state and national oversight entities. Consultations in 2012 with relevant stakeholders are planned to continue into 2013-2014, so that ongoing feedback can lead to continuous improvement of these efforts. In 2013-2014 these offerings will be restructured, if necessary, and expanded to meet increased needs of these groups.

The utilities in 2012 will make initial entries into partnerships with various real estate groups within their territories in an attempt to gauge possible obstacles to WHUP trainings to enhance knowledge of EE by their memberships. In addition, the first forays into workshop offerings will be targeted at areas likely to be receptive to the sessions. In 2013-2014 the partnerships and offerings will be increased to provide a better understanding of the value of WHUP in real estate transactions. Consultations in 2012 with relevant stakeholders are planned to continue into 2013-2014, so that ongoing feedback can lead to continuous improvement of these efforts.

**4. Additional information Required in Guidance Decision**

- **Serving Low Income and Disadvantaged Communities**

IOUs will build partnerships with community-based organizations to offer on-location joint utility workshops in disadvantaged communities. These workshops will promote IOU low income programs, training, and certification opportunities at IOU Energy Centers and community-based organization locations. IOUs will explore providing presentations and materials in languages other than English, as appropriate to each community and partnership, to overcome any barriers of communication to customers in the disadvantaged communities. Please see additional information regarding efforts to serve low income and disadvantaged communities in Attachment 1 to this addendum.

- **Other Program Coordination**

WE&T will work with the Continuous Energy Improvement Program to introduce the CEI process, lessons learned, and case study input to community colleges and universities. CEI has a goal of integrating into energy engineering curriculum. IOUs will also work with CEI to assess and determine specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges. IOUs will also continue with WE&T coordination and cost sharing to transition the linkages and integrate sector strategy approaches.

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

SoCalGas has begun implementing a sector strategy to accelerate the development of the Commercial demand-side management workforce needed by IOUs and larger EE industry. This implementation is the result of statewide research and cross-stakeholder collaboration, with a focus on deepening partnerships between education and industry. Moving forward, SoCalGas will be refining those programs, developing new programs and building an overall project plan for deliverables in 2012 as well as in 2013 and beyond. This strategy has already begun to provide key lessons for application towards similar strategies within other priority sectors.

In 2013-2014, WE&T will work with the Benchmarking and IDSM Programs in similar manner as proposed for the Continuous Energy Improvement Program to introduce the processes, lessons, and case studies curriculum to working energy management professionals, industry professionals, IOUs will consider a sector strategies approach in furthering development of these collaborative effort.

- **Safety Related Training**

The IOUs currently conduct Natural Gas Appliance Testing (NGAT) training where appropriate, and in particular when working with providers of low income weatherization programs. No lead or asbestos abatement certification is currently required as part of IOUs' low income weatherization training programs, only identification of potential conditions, because licensed contractors are expected to obtain such training as required.

SoCalGas through many of its contractor training programs currently provides training and consulting services for the appropriate combustion safety protocols (Natural Gas Appliance Testing (NGAT) or LIHEAP Combustion Appliance Safety (CAS) protocols for the Energy Savings Assistance Program's weatherization programs, and augmented Building Performance Institute (BPI) protocols for Whole Home Upgrade Program non-low income weatherization programs.

- **Attachments to Addendum**

Attached to this addendum in Attachment 2 is SoCalGas's list of courses and programs planned for 2013-2014, using the template provided in the Guidance Decision (Appendix C). Course offerings may be modified, based on market training demands and input from industry stakeholders. Per WE&T's Joint Advice Letter<sup>20</sup>, IOUs will redesign and structure select courses offered in 2013-2014 such that they become part of a series.

---

<sup>20</sup> SDG&E 2260-E-B/2041-G-B, SOCALGAS 4249-B, SCE 2588-E-B, and PG&E 3212-G-B/3852-E-B

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

**Statewide Building Operator Certification (BOC) Training Partnership**

In addition to IOU coordination of Energy Center activities, the IOUs will continue to offer Building Operator Certification training to the commercial building workforce in their territories.

Building operators are a sector of California’s green collar workforce that will continue to play a major role in improving and maintaining California’s energy efficient building stock.

Buildings at all scales—small commercial to high-rise commercial and universities—that are designed to operate at a high level of energy efficiency and comfort often fall short of design expectations for many reasons, including unexpected occupancy or use patterns, malfunctioning controls, incorrect installation, and equipment that falls out of calibration over time. Building operators and facility managers play major roles in ensuring buildings are performing at the level of efficiency and comfort they were designed to perform.

Building Operator Certification (BOC®) is a national program providing education and accreditation in the field of energy efficiency of commercial and institutional buildings. BOC has been recognized by the American Council for an Energy Efficient Economy (ACEEE) as one of the country’s “Exemplary Programs.” With more than 6,000 facility professionals earning the credential, BOC is widely recognized by key employers as a means to distinguish skill proficiency for energy management in buildings.

As an active national training program, BOC is well positioned to provide training for workers looking to establish or enhance their building energy efficiency skill sets as well as those who may need foundational building and energy efficiency training as an entry point to a growing clean energy career path. BOC’s target workforce audience includes building engineers, stationary engineers, maintenance supervisors, maintenance workers, facility coordinators, HVAC technicians, electricians, operations supervisors, operations technicians, and others in the facility operation and maintenance field.

The BOC curriculum supports a credential at two levels. The Level I certification provides a strong grounding in commercial building systems, the key energy using equipment within the building, and how improved energy management technology and practices can reduce operating costs, improve comfort and productivity, and reduce the building’s carbon footprint. The Level II certification builds on the Level I competencies with additional technical specificity in key building energy use areas such as HVAC, controls, and electrical equipment. In total, the BOC curriculum offers a comprehensive 130 hours of training. A list of class topics for Level I and II are provided in the Attachment 2.

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

### *BOC Beyond the Classroom*

BOC offers a classroom training component supplemented by both an exam process for credentialing and a practicum component. Participants utilize a set of project assignments which help ensure that energy management principles are well understood and can be actively applied in buildings. The program has had numerous third party evaluations over the past 10 years and has been rated very positively by participants and their employers. These evaluations have consistently reported significant energy savings for employers who utilize credentialed BOC employees. Utilities across the country are supporting BOC and many utilize the core training program as a means for professional development of their internal staff.

### *Employers and BOC*

BOC is being used by employers across the country for their energy management training needs. Public agencies, private employers, property managers, schools, universities, and healthcare institutions are all active BOC participants. Many companies and public institutions use BOC as a component of their professional development track for their employees. Examples of employers using BOC include California State University System, Irvine Company, Providence Health System, Raytheon, State Farm Insurance, and Washington State General Administration.

### *IOUs and BOC*

The IOUs have been collaborating with BOC to offer California building operators competency-based training and certification, resulting in improved job skills and more comfortable, efficient facilities. Through a coordinated effort, the four California IOUs offer BOC training to their commercial and institutional customers. The statewide program combines classroom training, exams and in-facility project assignments to train and certify building engineers and O&M technicians in the practice of energy efficient building operation and maintenance. NEEC has implemented the program for the IOUs since 2002.

The IOUs will work with BOC to shape and realign the BOC certification program to be consistent with the California Long Term Energy Efficiency Strategy Plan (Strategic Plan) as well as other guiding documents, including the California WE&T Needs assessment and the Guidance Decision. Changes to the BOC curriculum and program will include:

- Following up with program participants to assess content implementation into existing facilities;
- Expanding the number of and improving the dissemination of case studies of model energy efficiency projects conducted by program participants in combination with other demand side management (ex: onsite generation and demand response) improvements when applicable;

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Incorporating BOC materials and findings into broader IOU Centers’ curriculum and vice-versa;
- Better integration between BOC and other utility and utility-sponsored integrated EE, DR, and distributed generation programs;
- Better integration between BOC and other utility-sponsored energy efficiency education and other demand side management programs, including the BOMA Energy Efficiency Program (BEEP);
- Continuous updating of curriculum materials to include information about monitoring and operating zero-net energy buildings;
- Emphasizing diagnostic and troubleshooting strategies in BOC curriculum and including materials of the use of measurement equipment; and
- Developing an annual awards program for BOC program participants annual awards program to recognize graduates for their energy efficiency building operations implementation efforts, including improved building performance from measured energy savings, documented improvement in occupant satisfaction/comfort, or document tenant complaints.
  
- Per feedback received from the 2010-2012 Process Evaluation via Opinion Dynamics, offering the BOC four-part webinar series as a cost-effective way to address a growing demand for web-based learning, increasingly limited budgets among building operations staff, and for continuing education credits for maintaining certification.
  
- As resources allow, working with local workforce investment boards (WIBs) to develop specific programs to offer BOC trainings to experienced, but displaced building operators at a significant discount. Such programs will also include opportunities to implement course material into actual buildings as well as development of “soft skills,” including resume writing and interview techniques.

*Local BOC Program Variations among IOUs:*

IOUs will implement the BOC program statewide as described above throughout their territories.

**2013-2014 BOC Course and 4-Part Technical Webinar Series Targets**

	2013			2014		
	Level 1	Level 2	Webinar	Level 1	Level 2	Webinar
SCE	4	2	0	4	2	0
PG&E	4	4	2	4	2	2
SoCalGas	1	1	1	1	0	1
SDG&E	2	0	1	1	1	1

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

iii. Incentive levels

Not applicable.

iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms

Over the years, the Energy Centers have identified and cataloged these individuals as having the greatest capability of exerting significant influence on the energy efficiency decisions of customers based on the multiplier effect. Energy Centers will continue to expand their marketing efforts by incorporating innovative and creative approaches to reach new target audiences including industry and labor partners, colleges and universities, local governments, and third party partnerships, and will continue to cross-market their courses through its established relationships with various professional organizations. Energy Centers have and will continue to rely on email promotions to people in their combined database of potential students. The Centers will continually update their database to ensure accuracy and targeted marketing for seminars.

Training sessions and workshops will be marketed through SoCalGas's Internet Event Business Management System (IEBMS) training website ([www.SoCalGas.com/erc](http://www.SoCalGas.com/erc)), the Whole Home Upgrade Program web site, professional organizations' websites, HVAC distributors and vendors, California Community Colleges, energy fairs, trade shows, and energy efficiency / environmental events designed to increase awareness of the Energy Centers and their education programs to prospective participants.

Over the past several years, the Energy Centers have worked with labor and industry to qualify many of their courses for accreditation. Through these outreach efforts, the Energy Centers have been able to certify many of its for continuing education credits from the following organizations: Build It Green (BIG), North American Technical Excellence (NATE), American Institute of Architects (AIA), National Council for the Qualification of Lighting Professionals (NCQLP), and the National Association of the Remodeling Industry (NARI). The U.S. Green Building Council (USGBC) will soon begin a continuing education program for its LEED™ Accredited Professionals to maintain their accreditation, thus providing another target audience for the Energy Centers' courses. The Energy Centers will continue to reach out to these and other industry groups and labor organizations, and will expand their marketing to vocational training institutions and programs which serve low-income, disadvantaged communities.

The Energy Centers will leverage their long-standing partnerships with the California Community Colleges, UC/CSU system, State of California Community Services Department, USDOE Industrial Technology Program, the Building Operator Certification (BOC), and the California Energy Commission Industrial and Agricultural Programs during 2013-2014 as part of its overall marketing and

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

outreach efforts to attract and train the next generation of the green collar workforce. In addition, the Energy Centers will partner with the Energy Savings Assistance Program (ESA) to improve, expand, and extend training offerings to disadvantaged communities. The Energy Centers will also coordinate with the ESA Program to enhance recruitment of low-income workers.

FSTC works directly with SCE and SoCalGas on coordinating the seminars and events relating to food service. The statewide food service energy center team provides the technical support for the statewide Energy Wise Food Service Equipment rebate programs and for target market incentives for food service. The target audience for FSTC and the statewide energy center activities is to a significant extent; corporate or franchise customers whose decision makers are located outside of PG&E's service territory or, more likely, outside of California. FSTC maintains close communication with the other IOUs and the food service energy center teams in order to provide coordination of programs or information aimed at these customers.

- v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable

*Carbon neutrality* – Energy Centers will support AB32 compliance by incorporating waste and greenhouse gas (GHG) emissions reduction information into all appropriate training courses. Energy Centers will prioritize its training and DSM efforts based on the carbon content of sources used to meet building energy loads and by challenging people to eliminate carbon consumption. Technical expertise, educational programs and support for the Big Bold Zero Energy New Home goal and California's vision of achieving zero net energy residential buildings by 2020 and commercial buildings by 2030 will also be made, as well as training on methods needed to achieve deep energy savings retrofits for existing homes.

*Codes and Standards* – The Energy Centers will continue their long-standing partnership with the Codes and Standards team and the California Energy Commission (CEC) to offer training on the latest updates to the Title 24 Energy Standard through improved code compliance and design / installation methods for exceeding code requirements in residential new construction and HVAC retrofits.

FSTC and the statewide food service energy center team provide technical support to staff of the CEC as Title 20 appliance regulations are developed for commercial food service equipment. Efficiency regulations for commercial kitchen equipment tend to go hand-in-hand with the voluntary ENERGY STAR program. The ENERGY STAR database and criteria are used to qualify (through testing and labeling) the top quartile of equipment efficiency while CEC seeks to through regulation the bottom quartile of equipment on the same list.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

FSTC works with the Bay Area Air Quality Management District (based in San Francisco) directly or through ASHRAE on projects and technologies aimed at efficiently reducing food service effluents. For the major equipment categories and candidates for national energy and water savings, the FSTC and the statewide food service energy center team will provide technical support to establish efficiency criteria for EPA's ENERGY STAR program. On an appliance-by-appliance basis, FSTC and the statewide food service energy center team will work with EPA and leading manufacturers to implement ENERGY STAR for commercial food service equipment and to support the Federal Energy Management Program (FEMP) interagency program on energy-efficient federal purchasing.

FSTC and the statewide food service energy center team will continue to work with the LEED "Working Group" to finalize the list of recommended prescriptive measures and baselines for energy modeling of commercial food service facilities. This group provides insight and submits formal CIRs on EA Credit 1 to the Retail Core Committee to help mature the language to yield a clear guideline for all types of retailers, including restaurants.

vi. Similar IOU and POE programs

The food service (FS) programs offered by the three IOUs are coordinated through two levels, first at the FS program level through interactions between FSTC (PG&E), FSEC (SoCalGas), and the Energy Innovations Center (SDG&E) to develop program offerings, schedule combined outreach programs, and develop support programs such as Rebate Workpapers. Second, the FS programs are coordinated at the Energy Center level through the statewide Energy Center coordinating committee. The Food Service Coordination deals with the scheduling and logistics of cooperative events such as seminars and supporting outreach materials, workshops, Executive Planning Committee meetings, outreach events such as trade shows, joint energy efficiency program advertisements, and trade articles and general promotion of both the seminar and rebate programs.

b) Program delivery and coordination

Between 2013-2014, the Energy Centers will work closely with all programs to coordinate and conduct seminars and workshops that address the knowledge and skill gaps of builders, developers, contractors, designers, installers, plant engineers and operators, agricultural owners and managers, and city and county building department staffs. Additional services will include technical assistance and support, consultations and tool loans.

i. Emerging Technologies program

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The Energy Centers will continue to coordinate and collaborate with the Emerging Technologies program to introduce new equipment, installation practices, and whole building concepts to key market actors. Such support helps expand implementation of new energy efficiency products and services. For example, Energy Centers partner with Emerging Technology projects by: developing demonstration and testing facilities, jointly developing curricula, organizing product showcases, and incorporating new products into training sessions.

The ERC will collaborate with the Emerging Technologies (ET) program to coordinate training programs for training the trainer and training programs with information about technologies on the horizon for introduction to the marketplace. ET will also play a significant role in advising the PEC on fixed and portable displays and exhibits for its interactive lighting classroom.

The IOUs will coordinate efforts with the Codes and Standards program and with the California Energy Commission to identify critical early planning workforce training needs for advanced technologies.

IOUs will collaborate with their respective Emerging Technologies groups, the statewide Emerging Technologies Coordinating Council, State agencies, and IOU codes and standards groups to identify and deliver on opportunities for teaching targeted parts of the workforce about emerging technology products as they relate to energy savings opportunities through energy efficiency and demand response. WE&T programs will also include content on proper installation and commissioning of ET products/systems.

ii. Codes and Standards Program

The Centers will collaborate through their educational seminars with compliance improvement efforts planned by the Codes and Standards (C&S) Program. Typically, these efforts will focus on training of building department staff. Centers will focus on building standards training for architect, engineers, energy consultants, home performance contractors, home energy raters, and green building programs.

The Energy Centers will directly impact improved compliance with Title 24 energy standards through rigorous updates that go beyond new construction to include revolutionary impacts on the existing housing market. The ETC and PEC will work with HVAC contractors and building department officials to overcome information and training barriers to code compliance and enforcement. Since 1998, the Energy Centers have proactively offered training on Title 24 code updates and changes to residential / small commercial building standards. The ETC and PEC will continue to go “beyond code” by providing state-of-the-art,

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

building science-based information about the best available systems, technologies and techniques for minimizing building and operational energy consumption while optimizing whole building or system performance and occupant satisfaction or enhanced productivity. Additionally, the FSTC and the statewide food service energy center team provide technical support to C&S staff for Title 20 appliance and Title 24 building regulations as relating to commercial food service equipment, operations and facilities.

In collaboration with WE&T, C&S will enhance support for the appropriate market actor roles responsible for new and emerging codes and standards implementation according to priorities established by needs assessments. C&S will collaborate with the WE&T Centergies sub-program to not only prepare contractors and technicians to implement current codes, but to also prepare them with technical training on advanced technologies that are projected to become part of reach codes and then the statewide code.

In support of the Zero Net Energy goals, C&S will continue to build on existing training offerings and will expand activities to coordinate more closely with WE&T. In collaboration with WE&T, C&S will develop a sector strategy to support workforce development in an area with low compliance, for example, the Commercial Air Conditioning Quality Maintenance and Installation Program. C&S will maintain ongoing communications with WE&T staff to ensure coordinated development and inclusion of code-related content WE&T programs will offer market actor-specific training on Codes and Standards to address ongoing code changes and code compliance.

iii. WE&T efforts

*Energy Centers*

The Centers will collaborate and coordinate where possible to be in alignment with California's Strategic Plan. Statewide collaboration among Centers will increase sub-program consistency and information/cost sharing for what the Centers offer to their customers (seminars, tool lending library development assistance, portable exhibits).

*BOC Program*

In alignment with the goals of the Strategic Plan, BOC's curricula incorporate relevant information about the Emerging Technologies, Codes and Standards, and HVAC Quality Installers/Quality Maintenance programs. As appropriate, BOC instructors will enhance the depth of the learning experience by discussing new technologies and ways to meet and exceed the state's code and standards.

Through its two levels of training and certification, BOC offers supplemental training in existing technical positions by providing knowledge and skill building for technician-level facilities personnel including building engineers, stationary

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

engineers, maintenance supervisors, maintenance workers, facility coordinators, HVAC technicians, electricians, general repairers, and head custodians.

BOC has been recognized by several industry and labor organizations as one of value to its members. This recognition reflects the program's efforts to meet the needs of these organizations through solid, industry relevant curricula development. Among the organizations recognizing BOC's training program are the International Facility Management Association (IFMA), the Building Owners and Managers Institute (BOMI), the National School Plant Management Association (NSPMA), local chapters of the society of healthcare engineering, and the California State Employees Trades Council (SETC). NEEC also partners with California statewide partnerships including the UC/CSU/IOU Partnership and other Local Government Partnerships (e.g. Association of Monterey Bay Area Governments).

- iv. Program-specific marketing and outreach efforts (Budget provided in Table 1)

*Energy Centers*

Each of the Centers will distribute their own print calendars to a more focused target audience to ensure notifications of Centers' offerings reach key actors. Innovative and creative approaches will be applied to attract and retain new customers and market actors to the Centers. This will include aligning the Centers' activities with corporate and statewide direction. Centers will contribute content to the Statewide Web portal described above and below. Classes and other Center activities will be promoted through the following venues: the Centers' print calendars, collaboration with professional and trade organizations, Center's Web sites, Centers' email communications with students who have opted in to receiving email notifications, and other partnerships, including non-profit organizations and existing academic channels (community colleges, UC/CSU).

Centers will continue to promote and collaborate on marketing efforts with established and new partnerships involving other utility segments, across utilities, and with government, academic, research, professional/trade, and non-profit organizations focused on efforts supporting the Strategic Plan.

*BOC Program*

Northwest Energy Efficiency Council (NEEC) works closely with the IOUs to promote Building Operator Certification (BOC) seminars. IOU-sponsored BOC classes shall be mentioned in Energy Centers' calendars and email-marketing campaigns targeting commercial and institutional customers. NEEC will also target potential participants with direct marketing materials including informational brochures, case studies and bi-annual bulletins. The program's website also serves as a promotional channel. In 2013-2014, BOC will undertake promotional activities that build on customer interest in national initiatives such

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

as the ENERGY STAR® Challenge and LEED for Existing Buildings. It will also work with large employers to organize closed-enrollment sessions for facilities engineering departments at a single site. Where the IOUs offer the Building Owners and Managers Association (BOMA) Energy Efficiency Program seminars, BOC shall be cross-marketed.

BOC will continue to promote training and certification through its highly successful educational partnerships with professional associations representing the facilities engineers. These include the International Facility Management Association (IFMA), Building Owners and Managers Association (BOMA), Association of Physical Plant Administrators (APPA - higher education), National School Plant Management Association, and the American Society Healthcare Engineering (ASHE). BOC will participate in the annual events and program meetings of these associations to share information about opportunities to reduce operating costs through energy efficient building operations.

v. Non-energy activities of program

The Centers and BOC shall remain focused on delivering content centered around integrated DSM programs, including EE, DR and distributed generation. The Centers have and will continue to explore other program topics that do not have direct energy connections, but that do contribute to improving California's building stock. Such topics include indoor air quality, occupant comfort, recycling, and environmental stewardship and preservation. The LEED™ Green Building Rating System provides an outline for other topics that can help inform Centers' program managers and instructors about other resource types.

The Energy Centers provide low-cost centralized meeting space for the benefit of program implementers. Volume of activity for non-energy program participants lowers the average cost of energy efficiency training due to volume discounts. Non-energy participants are not subsidized by this program.

FSTC supports water conservation through its work on hot water heating and use in FS, hot water systems research, testing and rating of water using cooking and refrigeration equipment. Air Quality work is being coordinated with Air Quality Districts on reduction of kitchen effluents.

vi. Non-IOU Programs

IOU program will interact with CEC, ARB, Air Quality Management Districts, local government programs and other government programs as applicable. The Centers will interact with the CEC to develop and deliver training to support improved compliance with building and appliance standards. Compliance with retrofit HVAC requirements is a key strategy in the Big Bold Initiative that will rely on collaborative training efforts.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The Sacramento Municipal Utilities District (SMUD) operates its Energy Technology Center (ETC) that provides similar functions as the IOU's Centers. The IOUs will reach out to SMUD to collaborate on WE&T elements. The IOUs are active partners with Community Colleges to support and embellish green career technical education. This collaboration will provide professional development for instructors to aid in adjustments to curricula to support green job training. Such an endeavor may set the stage for expanded collaboration to support instructors and develop additional programs.

BOC has and will continue to support CEC adoption of minimum energy efficiency standards.

- vii. CEC work on Electric Program Investment California (EPIC)

Not Applicable

- viii. CEC work on codes and standards

The Centers will work with the CEC and the IOU C&S programs to improve code compliance through coordinated education and training delivery. For more details on these integration efforts, refer to the HVAC WE&T PIP.

- ix. Non-utility market initiatives

The Energy Centers collaborate with certification and training initiatives by the following organizations: North American Technician Excellence (NATE), Affordable Comfort, Inc. (ACI), Building Performance Institute (BPI), National Association of the Remodeling Industry (NARI), American Institute of Architects (AIA), BuildItGreen (BIG), and Home Energy Rating System (HERS) Providers [California Building Performance Contractors Association (CBPCA), U.S. Green Building Council (USGBC), American Society of Heating, Refrigerating, and Air-conditioning Engineers (ASHRAE), California Home Energy Efficiency Rating System(CHEERS) and CALCerts].

FSTC and the statewide food service energy center team utilize their relationships with ENERGY STAR and various restaurant and food service industry organizations to promote their programs and leverage these relationships to pursue efficiency objectives. (Refer to Section 6.2.b.v. above.)

c) Best Practices

Centers will develop classes, displays, and materials with current information that highlights and demonstrates best practices for efficient installation and equipment through field-experience and case studies from existing programs, including Savings by Design and Energy Design Resources. Centers' offerings will emphasize whole building

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

and system performance in conjunction with design intent. Implementation of hands-on learning methods that are applied in the field creates an opportunity for partnering with EM&V and/or 3rd party evaluators to follow up with course participants to assess impact upon practice and/or energy savings. A description of this pilot program appears in Section 6.1-g below. The Centers will continue to implement best practice methods as prescribed in prior statewide evaluation reports, including “Evaluation of the 2003 Statewide Education and Training Services Program” by Wirtshafter Associates, Inc., 2005 and “2004-2005 Statewide Education, Training and Services Program Evaluation” by KEMA, 2007.

Many of the training programs conducted through the Energy Centers incorporate adult learning theory by utilizing a “hands-on” approach that enables students to visualize and experience the impact proper system design, installation and maintenance can have on operation and energy efficiency.

Throughout the 2013-2014 transition period, the Energy Centers will develop additional training props and equipment for use in many of the courses offered to enhance learning and provide real-world experience in the classroom. In addition, both Energy Centers will expand their courses to include more “Train the Trainer” classes to expand the reach of their training efforts and materials.

FSTC, through its research, testing, and constant customer contact continually updates its technology and operational practices knowledge base. The Best Practice partner Program is a manifestation of this constant improvement.

The ETC also interacts with Affordable Comfort, Inc., in a leadership, planning and strategic mode to audition and recruit the best talent and state-of-the-art topics for delivery in California, capitalizing on long-term relationships that gain access to best practice providers.

BOC teaches commercial and institutional facility staff how to operate and maintain building systems for energy efficiency, optimal performance, and occupant comfort. BOC combines classroom training, exams, and in-facility project assignments to train and certify building engineers and operations and maintenance technicians in the practice of energy-efficient building operation and maintenance. The curriculum was developed to provide knowledge and skill building for technician-level facility personnel including HVAC technicians, electricians, general repairers, and head custodians. BOC curriculum is taught by practicing professionals who implement best practice building operations strategies toward improving building energy efficiency. The curriculum is updated on a regular basis. Trained instructors share best practices with one another as BOC curriculum is updated on an annual basis.

d) Innovation

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

In 2013-2014, the IOU Energy Education and Testing Centers will undertake three pilot projects that will serve to shape programs for future filings. These pilot projects are discussed in Section 6.1-g below. The Centers will also continue to keep their Centers and offerings up-to-date with current and upcoming technologies.

- *Increased use of the Internet to deliver education and training programs as real-time simulcasts, real-time Webinars, and archived on-demand classes:* While these applications have been implemented by some Centers in the past, all Centers will implement and progress this delivery method further to reach a wider audience and to increase program cost-effectiveness.
- *Expanded curriculum to support California Energy Efficiency Action Plan for 2020:* The IOU Centers will develop teaching material on topics such as climate change, energy neutral growth, effective mass transit and Plug-In Hybrid Vehicles, and effective implementation of green technologies. Centers will need to pilot, experiment and partner with local Universities, science museums and other parties with expertise to provide a balanced view on these complex topics.
- *Emphasis on Adult Learning Principles:* Centers will complete the revision of seminar content and curriculum based on adult learning principles to which they were exposed as part of the KEMA program evaluation effort “2004-2005 Statewide Education, Training and Services Program Evaluation”, submitted in 2007. Such learning principles emphasized hands-on “learn by doing” training. Some members of the Centers’ training staff at the centers have been trained on these principles and will integrate them with the goals of promoting energy efficient behavior participating in available EE programs. The expected benefit of utilizing Adult Learning Principles is an increase in participant retention of knowledge, awareness and comprehension leading to greater EE behavior and program impact.
- Centers will work together and collaboratively with other utility groups (i.e. Emerging Technologies) to develop new exhibits with up-to-date technology that can be either replicated and/or shared across utilities to maximize cost-effectiveness of new exhibit development.
- Centers will work together and collaboratively with other utility groups and stakeholders to create an educational series describing paths to zero net energy residential buildings by 2020 and commercial buildings by 2030. This is in support of CPUC and CEC commitments and directives.

*BOC Innovation*

As a credential program, BOC is uniquely positioned to maintain a long term relationship with graduates through its certification renewal program. Graduates must earn continuing education hours annually to maintain the BOC credential. This provides an opportunity to direct graduates to the utility education and training centers to earn continuing education hours towards renewal.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Energy efficiency project work also qualifies for continuing education. Graduates may earn continuing education hours through engagement of EE and DR projects at their facilities. In 2006, almost 20% of BOC graduates earned hours through completion of efficiency projects. Finally, BOC graduates and their supervisors are informed about energy efficiency and demand response program opportunities through the BOC Bulletin, a bi-annual newsletter mailed to 1,500 California IOU customers.

Continue, and even increase, utility presence at BOC trainings: Students expressed satisfaction with utility account representative presentations in BOC classes. This should be continued and even expanded on by involving account reps in promoting BOC to key accounts in advance of the course series start date.

e) Integrated/coordinated Demand Side Management

Centers will develop their programs to incorporate other DSM opportunities, including demand response (DR), and distributed generation. The Centers have taken the first steps toward integrating DG and energy efficiency into their exhibits and educational seminars. They have also developed seminars and exhibits focused on DG, EE, and DR. The next step is to work with the DG and DR groups to develop programs that integrate the three in a way that is consistent with other utility programs and with the long-term energy efficiency strategic plan towards zero net energy residential buildings by 2020 and commercial buildings by 2030. Centers will integrate training offerings with codes and standards programs as described in section 6-b above.

NEEC recognizes California's demand side management needs are not fully addressed through energy efficiency alone, but rather through a blend of multiple DSM options including rigorous building codes and standards, demand response, and on-site generation. The BOC curricula are structured to offer flexibility for the incorporation and promotion of relevant demand side management options (rebate and non-rebate) available through the IOUs. NEEC has and will continue to work with the IOU's to customize BOC curriculum to the California market to address technologies and practices associated with demand reduction and to stimulate uptake of utility programs in energy efficiency, demand response, and on-site generation. In 2005 and 2006, BOC curriculum modules were supplemented with material on the topics of enhanced automation strategies for demand reduction and operational best practices to ensure persistence of savings from building retro-commissioning. In 2008, BOC curriculum modules were supplemented with material on the topic of O&M practices for sustainable buildings covering a full range of resource conservation topics. The curricula are also flexible to include information pertaining changes and/or implications to support implementation of and compliance with the CEC's Title 24 to Title 24 2008 Building Energy Efficiency Standards, AB32 (Greenhouse Gas Reduction bill), and other initiatives.

In 2013-2014, WE&T will work with the Benchmarking and IDSMS Programs in similar manner as proposed for the Continuous Energy Improvement Program to introduce the processes, lessons, and case studies curriculum to working energy management

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

professionals, industry professionals, IOUs will consider a sector strategies approach in furthering development of these collaborative efforts.

f) Integration across resource types

IOU Centers recognize that energy efficiency can be achieved through programs that go beyond traditional energy efficiency education and training. The Centers have and will continue to offer seminars and build partnerships that remain focused on energy efficiency and go a step further to show the benefits of energy efficiency upon other areas (e.g., air quality). The Centers will also work together and collaboratively with other utility groups and stakeholders to incorporate the benefits of achieving efficiencies with other types of resources (e.g. water efficiency) upon whole building energy use. This integration can be achieved by developing courses on specific topics like water efficiency since any use of water requires energy consumption. The highest impact for water efficiency integration occurs when water is also heated on site. The LEED™ Green Building Rating System provides an outline for other topics that can help to inform Center program managers and instructors about other resource types.

BOC's Level II course structure offers unique flexibility to integrate the curricula from other resource management areas relevant to building operation and maintenance such as water, waste, and indoor air quality. Level II supplemental classes are offered in tandem with core classes to customize the course series to regional and topical interests in the California building operator market. Three one-day supplemental classes in the topics of water efficiency, O&M for sustainable buildings, indoor air quality, and demand response have been developed and successfully delivered to 500 building operators since the program's inception.

g) Pilots

No pilots are proposed for Centergies Subprogram. Several sector strategy initiatives will be pursued in coordination with IOU programs, as discussed in previous sections.

h) EM&V

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

**7. Program Diagram**

See above Section 6.2.

**8. Program Logic Model**

Below is the logic model for the WE&T Centergies Subprogram.

The activities specified in the logic model focus on several types of actions. One is to promote and market center services to target audiences. These activities involve gathering labor market information from employers in the energy sector and designing programs to meet their needs. They also include leveraging existing relationships with colleges, and professional and trade organizations to market courses and other energy center offerings.

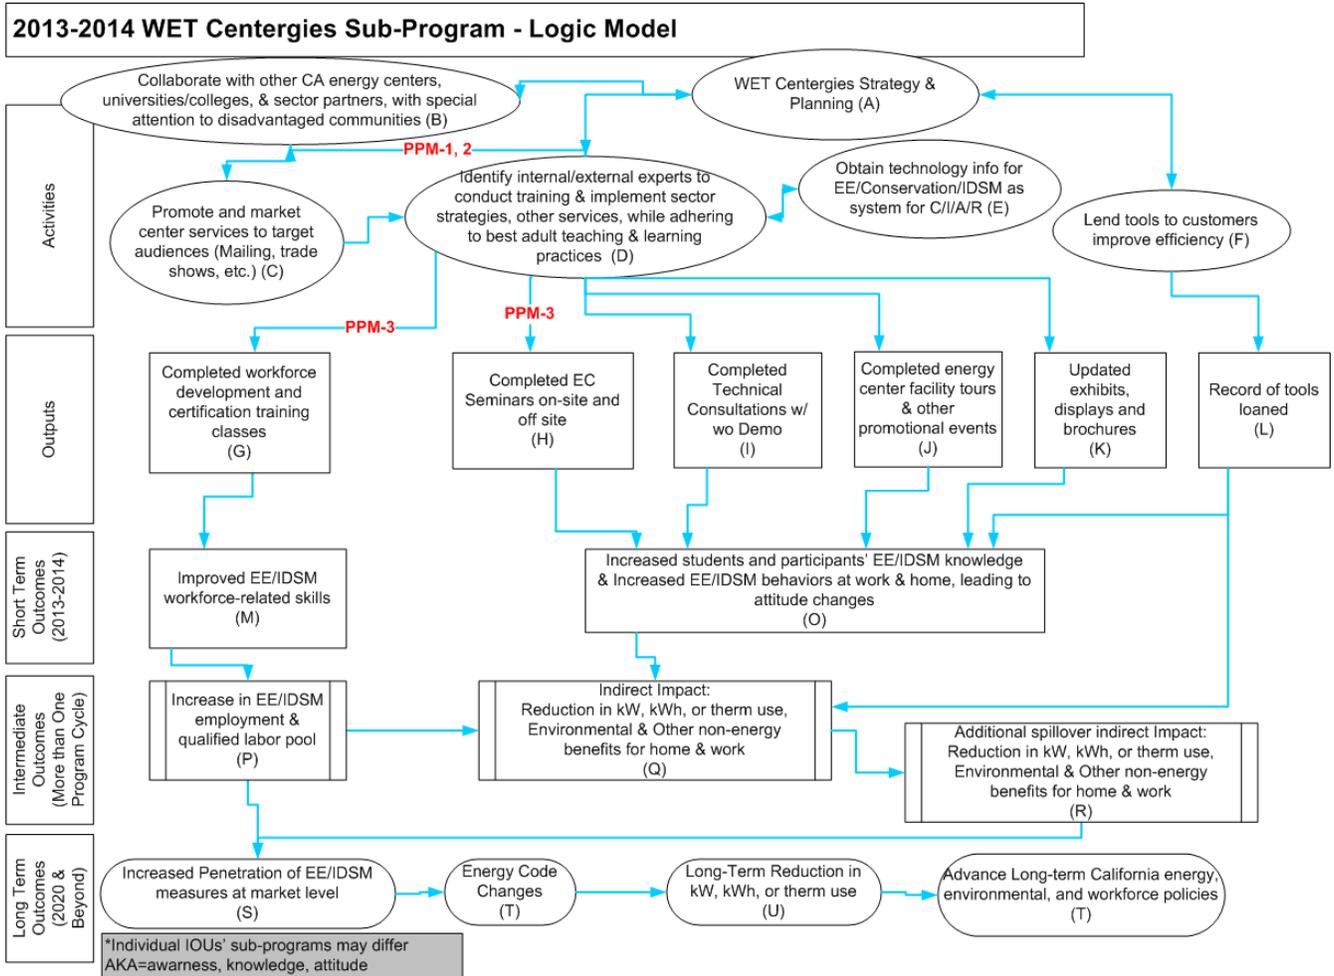

A second activity focus is marketing and reaching out to disadvantaged communities to facilitate energy-related job skills in those communities. This will be accomplished by partnering with industry and labor organizations, professional organizations, trade and vocational schools, community colleges, third-party entities, government organizations and other partners that service low-income or disadvantaged communities in order to reach members of these communities and bring them into energy center training programs.

A third activity focus is to identify internal and external experts to conduct training and other services, while adhering to best practices in adult learning. The centers are developing and using many new training props to give students first-hand experience with how energy-saving technologies and practices work and how they produce savings. They are also including energy modeling tools to teach students to estimate savings resulting from the technologies and practices they learn in the classes. In addition, the centers are reviewing seminar content to be sure the adult learning principles are being incorporated.

A fourth activity in the logic model is the lending of tools to customers that will allow them to judge the energy efficiency of their equipment and make changes and adjustments to increase efficiency.

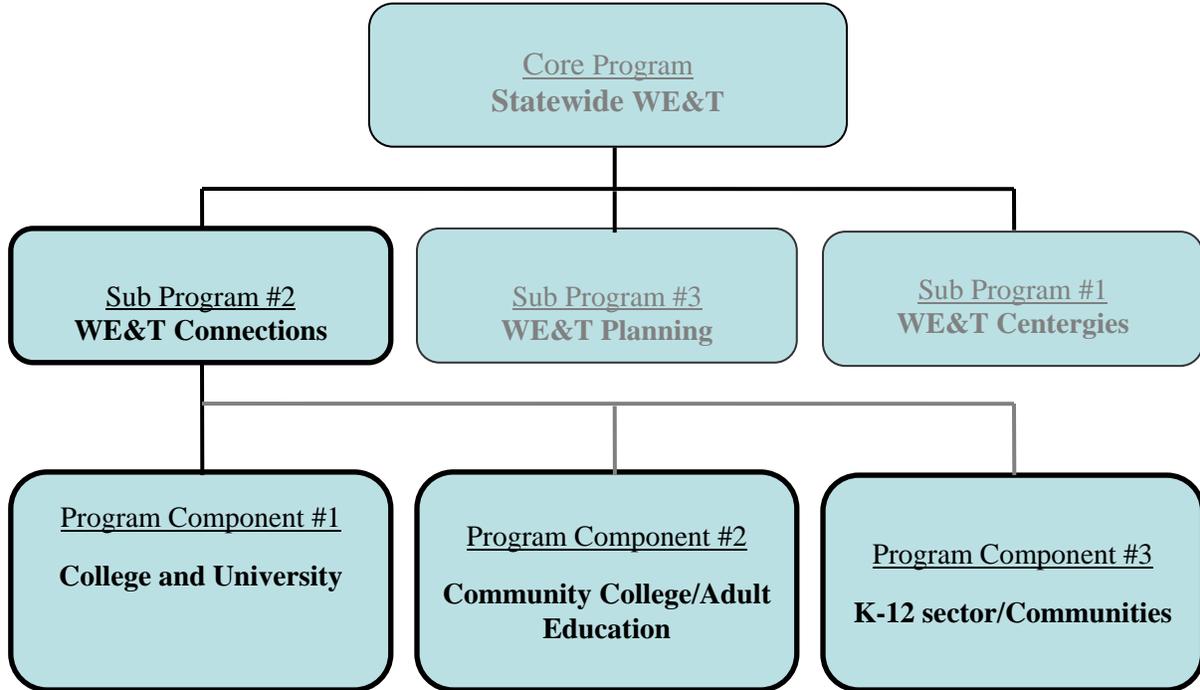

All of these activities are all expected to result in classes, consultations, promotional events, exhibits, and tool lending that increase participants' energy efficiency and IDSM knowledge and behaviors. Ultimately, these activities and outputs are expected to result in indirect energy savings.

# 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

6.2) Sub-Program Implementation – WE&T Connections SCG3730

**1. Program Description**

a) Describe program

WE&T Connections is a three-fold marketing, outreach and workforce education and training program. This Sub-Program offers K-12, Adult Education (post-high school), Technical Training, Community College and University level education programs that support the Strategic Plan’s vision for educating and training California’s workforce for “green” jobs.

- First, the programs promote green careers to K-12, Adult Education (post-high school), Technical Training, Community College and University students through energy and environmental curriculum, college credit courses at high schools, college degree programs, job shadowing and internships.

The IOUs and/or our third party vendors will continue to work with California Department of Education (Curriculum Commission) as well as curriculum coordinators from the County Offices of Education to be included in curriculum development advisory boards so that we can contribute to tailored K-12 curriculum that includes the science of energy, energy efficiency, Demand Response, Renewable Resources and some discussion about green careers. We will also work with the

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

California Community College Chancellor's office, UC Office of the President of Academic Affairs and the CSU Office of Degree Programs and Educational Opportunities to 1) promote energy minor or major degree programs, 2) collaborate and/or provide expertise in the development of complementary new and revised courses that will form a comprehensive integrated approach to energy education, and 3) consult with campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields. Throughout the process, we will also work to incorporate and promote a green career path.

- Second, the programs are intended to educate students on energy, water, renewable energy, demand response, distributed generation as well as greenhouse gases and the environmental impact, with the goal of influencing day-to-day decisions of students and their households.
- Third, the programs educate K-12/Community Colleges/Universities on the benefits of adopting energy efficiency and demand response policies at their facilities to help them save energy and money. Having these programs at schools and campuses serves to reinforce that schools practice what they preach. Some students truly pay close attention to see if the schools are just providing lip service or if they are leading by example.

b) List measures

WE&T Connections program offers five energy education program components— Green Campus, DEEP, PEAK, Energenius, LivingWise, Green Pathways and Green Schools— and effectively integrates specific content for the science of energy, energy efficiency, water conservation, renewable energy, demand response, distributed generation, greenhouse gases to address awareness in the communities, barriers faced by schools as well as growth and demand for green careers. These programs are designed to be both flexible and affective across diverse learning environments as well as to empower K-12/college students to become advocates of smart energy management in their homes, schools, and communities. Each program component will also leverage all other available energy efficiency, demand response, and distributed generation programs for consumers as well as existing business incentives for schools, all to achieve immediate and long-term energy savings and demand reduction in homes, communities, schools and universities.

c) List non-incentive customer services

WE&T Connections is a non-incentive based, education and training sub-program.

**2. Program Rationale and Expected Outcome**

a) Quantitative Baseline and Market Transformation Information

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

See core program Section 5.a. for program performance metrics (PPMs) and Section 5.b. market transformation information.

b) Market Transformation Indicators (MTIs)

There were no market transformation indicators (MTIs) identified for the WE&T program.

c) Program Design to Overcome Barriers

Energy education is critical to assuring a stable and reliable supply of electricity in California. Educating students will create a new generation of Californians who understand the significance of energy in their lives, their role in its efficient use and the importance of managing our limited resources for the future. This knowledge and information can also lead to life-long energy savings habits and a concern for the environment and its limited resources for not only the students but, for their family and friends. This knowledge and education can also lead the interest in a future green career path. However, given the budget cuts at schools, cuts to curriculum and longer work hours for teachers, getting this message across may not be possible without the assistance of these IOU-sponsored programs.

WE&T Connections program components are designed to be both flexible and effective across diverse learning environments. All program components promote the science of energy, energy efficiency, demand response, distributed generation, and empower K-12 and college students to become advocates of smart energy management in their homes, schools, and communities. The program effectively combines classroom learning with hands-on activities.

The program will address lost opportunities in the school market by implementing a comprehensive, innovative approach that involves incorporating:

- Some of the nation's leading energy education programs. These programs are 1) designed to promote green careers through energy and environmental curriculum, 2) designed to educate students on energy, water, renewable energy, demand response, distributed generation as well as greenhouse gases and their impact to the environment, with the goal of influencing day-to-day decisions of students and their households, and 3) also designed to educate schools/facilities on the benefits of implementing energy efficiency policies and demand response programs at their sites to impact energy use in schools and, universities and to project energy and environmental leadership by example.
- The program components are developed in collaboration with natural gas, electricity and water agencies to promote and encourage the adoption of energy efficiency, demand response, distributed generation and water conservation options.
- Collaboration and integration with residential and business incentive programs that result in firm energy savings for homes and schools.

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

Energy costs for schools can be an enormous expense and are often the second largest expense for schools after employee salaries. Declines in school funding over the last 20 years have left little to no room in budgets for incorporating high performance measures during major repairs or renovation in existing buildings. This is where our business incentives programs come into play when promoting these educational programs to schools. Not only are these educational components funded by the IOUs, but the schools can also see a measurable utility savings. Also, when the schools teach something that children can take home that helps parents save on their utility bills, the parents are more likely to be active in their students' education. Failure to take advantage of these educational and facility programs represents a significant missed opportunity.

The U.S. Department of Energy estimates that schools could save approximately 20% of their energy costs by incorporating energy efficiency measures<sup>21</sup>. To start, schools can begin with no cost behavioral and operational changes. Additional funds and/or incentives are needed before schools would seriously consider the more serious energy efficient options.

IOUs will continue to promote low-to-no-cost energy efficiency measures, as well as retrofits programs for their school facilities. In most cases, the benefit of the IOUs assisting school in ways to save on energy cost is the selling point to getting school district cooperation in implementing the educational components. Schools practicing what they teach with respect to energy efficiency, demand response, distributed generation and other helps reinforce the importance of practicing smart energy management with students, thus creating a new generation of energy smart citizens and potential future members of a green workforce.

The WE&T Connections program will address the needs of schools through a combination of student, teacher and school administrator education programs and increase their awareness and knowledge as well as provide curriculum and/or lesson plans that support these objectives. Also, once school-aged children learn something new like energy efficiency, they are great advocates for taking that knowledge home and teaching/motivating their parents and siblings to take actions to reduce energy and water consumption. University students can conduct valuable research and effectively educate their peers as well as campus administrators about energy efficiency:

- Students are effective advocates, able to reach their peers, communities and high-level decision makers in promoting green jobs on campus.
- Educational campaigns can result in significant energy savings on campus facilities and dorms by changing behaviors and purchasing decisions.
- The IOUs and/or our third-party vendors will develop curriculum and lesson plans for K-12 as well as work with the appropriate community college and university agencies responsible for, college courses and programs needed to educate students about energy, energy efficiency and prepare them for a green career path.

---

<sup>21</sup> Per DOE website. [<http://www.eere.energy.gov/buildings/info/schools/>]  
[[http://eere.energy.gov/buildings/energysmartschools/howto\\_operating.html](http://eere.energy.gov/buildings/energysmartschools/howto_operating.html)]

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Addressing the interaction between energy and water use is essential, as well as the link between energy conservation and the reduction in greenhouse gases. Water conservation lowers energy use and energy bills; particularly, when energy used to heat water can be reduced and energy conservation reduces emission and global warming. The utilities and water agencies will extend the reach of their programs and services and promote integrated solutions.

The primary goal of the program is to educate and create awareness among K-12 and college students about the importance of energy and water efficiency and how to apply at home and in their communities what is learned at school and to promote green careers to K-12 and college students to meet California’s need for green jobs, A secondary goal of the program is to improve public education facilities and inform facility operators and administrators about the benefits of energy efficient equipment and operation practices.

The basis of the program theory is that increased awareness will result in increased levels of energy and water efficiency in communities and at home where energy conservation starts, and increase conservation efforts at schools and universities. The combination of education and environmental awareness at schools and campuses are expected to motivate students not only to change their energy use behavior, but also to provide them with another very real and worthy option for a career path.

d) Program Targets

The proposed targets may be modified due to funding restrictions.

<b>Program Name</b>	<b>Program Target 2013</b>	<b>Program Target 2014</b>
<b>University Sector</b>		
Green Campus (Statewide)	16 campuses	16 campuses
<b>Community College Sector</b>		
DEEP (SCE only)	3 campuses	3 campuses
<b>K-12 Sector</b>		
PEAK (Statewide)	20,000 students	20,000 students
Energenius (PG&E)	60,000 students	60,000 students
Green Pathways* (PG&E)	1,000 Online Course/Community Participants	3,300 Online Course/Community Participants
LivingWise (SoCalGas, SCE)	30,000 students	30,000 students

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Green Schools (SCE)	25,000 students	25,000 students
<p><b>Note:</b> There are approximately 6,000,000 K-12 students currently enrolled in California, and our K-12 programs are expected to touch only 7% of the student population over the next 2 years. However, the programs at these schools will serve as a test/pilot environment for energy efficiency and green career curriculum. * Green Pathways serves grades 9-12; goals will be determined upon approval of final budget. transition</p>		

e) Advancing Strategic Plan goals and objectives

See core program PIP.

**3. Program Implementation**

a) Statewide IOU Coordination

i. Program delivery mechanisms

WE&T Connections programs will be taking a sector strategy approach around education collaborations with K-12 and College stakeholders and organizations. The strategy’s multi-faceted goals include increasing engagement of all students, particularly minority, low-income or disadvantaged, in energy-related coursework and programs, poising them for careers in Energy Efficiency (EE) and a life-long appreciation of energy conservation and efficiency.

The California Public Utilities Commission has provided a framework to make EE a way of life in California by refocusing rate-payer funded EE programs on achieving long-term savings. Goals of this framework include (1) establishing EE education and training at all levels of California’s educational systems; and, (2) ensuring that minority low-income and disadvantaged communities fully participate in training and education programs at all levels of the Demand Side Management and EE industry.

Education collaborations are integral to achieving the goals laid out above. The K-12 and College Sector Strategy, led by the IOUs and implemented by a cross-stakeholder driven partnership, will include the below key elements to ensure these goals are achieved.

While traditional sector strategies often include specific employer hiring commitment or funding, the K-12 Sector Strategy will not directly include this component due to the target population being years away from career entry points. However, other sector strategy hallmarks will be included in this approach. These include:

- Developing a regional partnership which includes a cross-section of stakeholders from the EE sector.
- Ensuring employer commitment to help align training to market demand.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Working towards career pathway development, including “stackable” credentials that enable students’ education to build upon previous trainings.

Ultimately, via the Sector Strategy work, the IOUs will have a thorough understanding of K-12 and College resources and programs that currently exist, and, *through collaborations*, (1) propose enhancements to current programs, (2) identify new program needs that fill gaps understood from our mapping work, and (3) create opportunities to “link” programs and build education pathways. The ultimate goal is to increase the engagement of students in energy-related K-12 programs, and ultimately, energy efficiency careers.

**Key Elements**

- Supporting K-12 and college efforts to assist students to develop education based on visible career paths in EE and related fields.
- Creating and/or expanding college and university programs with EE focus.
- Fostering green campus efforts to apply EE knowledge in clear view of students and faculty.
- Continued refinement of existing curriculum to ensure EE fundamentals are included.
- Identifying career options in energy-related fields.
- Continue incorporating career exploration into programs and developing a systematic effort to institutionalize energy awareness and career awareness programs that is aligned with state content standards.
- Expanding collaborations with career academies, regional occupational programs and community colleges.

**Proposed Objectives**

- Students develop an awareness and appreciation for energy, energy conservation and the impact to the environment;
- Students develop careers that advance DSM business, policy, research and development and education; and
- Individuals from the targeted communities take advantage of programs that specialize in energy disciplines at all levels of the educational system and successfully advance themselves into rewarding careers in the energy services fields.
- Linking existing training programs, across modalities, so that students’ options are increased and pathways begin to be developed, e.g., pathways to post-secondary programs.
- Increase engagement of at-risk or disadvantaged students in energy-related coursework.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- A plan for more fully leveraging utility training centers for K-12 stakeholders.

**College and University sector**

**Green Campus (statewide)**

The Green Campus Program is implemented on college and university campuses by student interns engaged and/or enrolled in environmental studies and/or other related areas. This team of 2 – 6 student interns per campus engages other students through forums, and other means on the importance of energy conservation and the link to the environment. They also lead the way in addressing energy efficiency in the higher education sector by meeting with faculty, staff and administrators and work with them to incorporate energy, energy efficiency and discussions about a green career path into their courses/programs as well as work with campus officials to implement energy efficiency projects on campus and add value with educational outreach campaigns. Green Campus addresses behavioral and operational changes and product retrofits for campus facilities as well as serves as a direct pipeline of emerging environmental/energy professionals.

Green Campus WE&T aspects are exemplified by the advanced technical and professional development skills that the students develop as part of their internship, and that non-intern students develop from interaction with Green Campus interns. Green Campus projects include dorm energy competitions, energy efficiency curricula development, building energy assessments and recommendations, technology pilots, and outreach events. Interns actively market their projects and the program by completing monthly newsletters, working with campus and local media and presenting at conferences – including biannual program convergences.

Green Campus Program is being reviewed to determine if it qualifies as a resource program.

**Program Delivery**

Student Intern assistance to Facility Management stakeholders; Housing and Dining; and energy service companies (ESCOs), as appropriate, to help them increase measurable energy savings: Green Campus Interns play a key role in helping campus staff, administrators and energy efficiency professionals with their energy savings targets. As a means to this end, students will organize such activities as dorm energy competitions, laboratory fume hood educational campaigns and competitions, technology pilots, office energy assessments and recommendations.

- *Recruit, train and support Green Campus Interns at each campus in implementing program activities.* Interns are hired and trained to implement many aspects of the program throughout the school year. Green

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Campus program staff works closely with interns, campus stakeholders, utility partners and ESCOs as they identify their objectives and draft a detailed implementation plan.

- Hold a fall planning meeting with student organizers and IOU program managers, campus administrators, facilities staff, faculty, IOU program managers and, energy service company representatives at each campus. After conducting implementation planning exercises prior to or early in the fall term, Green Campus Interns will bring new participants up to speed on the program goals, expectations, report on activities conducted to date, unveil future plans, and solicit feed-back.
- *Building in Efficiency to the Fabric of the Academic Framework:* Program staff will work with the UC Office of the President, Office of Academic Affairs, CSU Office of Degree Programs and Educational Opportunities, or Office of the Chancellor to:
  - develop a database of EE-related courses on UC and CSU campuses,
  - consult with system-level as well as campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields, and
- Utilize the Green Campus program as a tools to promote energy, sustainability, environmental and other related courses on campus
- *Ramping Up Green Campus Reach:* Every aspect of the Green Campus Program offers a pathway to green jobs –academic course offerings, training in technical and “soft” professional skills, experiential hands-on energy efficiency projects, and providing a statewide network composed of utilities professionals, other professionals and academics, students, and program alumni. We plan to increase the number of students who participate in Green Campus activities through growing the “concentric circles” of GC activities:
  - Students who are employed as GC interns (approximately 60 students)
  - Increase the number of volunteers who participate in GC activities without being paid
  - Interns conducting awareness campaigns on campus will invite students to sign up as honorary Green Campus students and pledge to advance the WE&T message across campus. They will carry the message forward and ask others to do the same. Interns will gather pledge information so that they can be contact via email to gather information on courses they are taking or jobs they might be in.
  - Increase the number of students who take classes taught or facilitated by GC interns (currently over 600 per year total)
  - Students who are exposed to Green Campus messages on campus (This is already 400,000 student contacts per year statewide)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- *Ensure that minority, low income and disadvantaged communities fully participate in training and education programs.* Green Campus program will be made available at campuses serving low-income, minority and disadvantaged communities.
- *Mid-year and year-end meetings of all Green Campuses.* The mid-year meetings bring interns together with IOU program managers, campus administrators, faculty, and facilities staff from various campuses to share successes, discuss challenges, and plan Green Campus activities for the next half of the academic year. The year-end meetings are used to review the year's progress, recognize group and individual accomplishments or best practices, and plan for the summer and following year.
- *Coordinate with other IOU departments to promote consumer and business incentive programs.* Green Campus through IOU Account Executives will provide information to campus administrators and facilities managers about Business Incentive Programs and encourage them to take advantage of these opportunities for making energy efficiency changes more cost effective. These facilities energy savings projects are needed for numerous reasons 1) for students to see that campuses are practicing what they are teaching, and 2) to serve as a lab for students to practice energy efficiency through identification and implementation of projects on campuses, and 3) building a career pathway.

**Community College Sector**

**CCC IOU Partnership**

The 2013-2014 California Community College program will build upon, enhance, and streamline the implementation strategies employed in the 2010-2012 partnership and adopt new strategies over the life of the program as they emerge or are proven as ready for the market. The implementation plan will be refined to adopt best practices and lessons learned program elements for the 2013-2014 programs will include:

- An improved program management and structure that adopts lessons learned from the past cycle resulting in a more streamlined, effective approach;
- In the process of expanding the existing CCC training and education program from simply training facilities, operations and maintenance staff to include working with community stakeholders on curriculum development for students and industry with the objective of developing future energy professionals and a green workforce. Please refer to Advancing Strategic Plan goals and objectives for details on IOUs role in developing a Utility Workforce Education and Training program as well as our plan to ensure low income, minority and disadvantaged students are included.

**Adult School/Post High School (SCE)**

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The delivery mechanisms include in-language seminars, outreach to schools, community events, faith-based organizations and Workforce, Education & Training.

- In-language seminars: The objective of in-language seminars will be to provide a classroom style forum to empower residential customers to conserve resources by teaching them simple ways of saving electricity, gas and water. This strategy will also align itself with a goal of the WE&T Strategic Plan so that minority, low-income and disadvantaged communities fully participate in education programs by providing elements that will seek to encourage interest toward careers in the energy efficiency industry. Seminars will also be used to promote other IOU program offerings such as Comprehensive Home Performance and of course demand response and other integrated DSM offerings like Summer Discount.
- Community booths: CLEO will continue participating in prominent ethnic cultural booths such as the ‘Chinese New Year’ and ‘Harvest Moon Festivals’. This will also include coordinating with SCE’s and SoCalGas’s Energy Centers and faith-based organizations and other cultural opportunities.
- Schools outreach: In 2013-2014, the CLEO program will expand its schools outreach efforts by providing a comprehensive schools initiative. In addition to continuing the ‘Energy-Artist’ contest, this initiative will also introduce a ‘Carbon Footprint’ contest where schools could potentially compete against each other for the highest decrease in energy use. The PEAK Program will be utilized to encourage energy efficiency behavior for fourth graders. Outreach efforts will also include coordination with SCE’s Mobile Energy Unit and will also target Adult Education centers. Primary focus will involve K-12 elementary schools.
- Faith-Based Organizations (FBO’s) and Community Center outreach: Local community FBO’s and religious forums form the backbone of the ethnic community. FBO’s also provide a forum for community events and an excellent platform to market and encourage energy efficiency. CLEO will cultivate and add to the existing relationships with churches and local community centers to effectively cultivate program participation and promote energy conservation
- Community / city partnership and outreach: This outreach strategy will build upon existing relationships with the cities of Monterey Park, San Gabriel, Alhambra, Walnut, Diamond Bar and others to promote energy efficiency in the community. CLEO will place information kiosks at city community centers and will participate in community events to further promote energy efficiency in the community. CLEO will also integrate components of the program with other existing partnership programs with higher ethnic populations.
- Workforce, Education and Training: CLEO will expand its reach in the Workforce, Education and Training (WE&T) area by providing in-language energy efficiency education and training at various Adult Learning Centers and Community Colleges. The focus will be on educating those whose primary language is not English. Program participants will learn about the green jobs industry, energy efficiency measures / technologies, programs and services offered, as well as be placed on a ‘green’ career-path for participants to build upon.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

**K-12 Sector**

Some of these programs target the same grade levels but, none of the current or proposed programs target the same districts/schools. We have and will continue to ensure that students participating in one program will not also participate in another similar IOU provided program.

**PEAK (statewide) SoCalGas**

For 2013-2014, PEAK is proposed as a continuation of a successful program by PG&E, SDG&E, SoCalGas and SCE. The participating IOUs will continue to work together to ensure that the program design and delivery is consistent across the IOUs.. Other changes planned for 2013-2014 are revisions to include lessons on Water/Energy Nexus to reflect WE&T goals.

**Brief description of the program.**

PEAK Student Energy Actions (PEAK) is a standards-based energy education program for grades 3<sup>rd</sup> through 7<sup>th</sup> grade (with possible expansion into other grades), that empowers youth to save energy in their homes, schools, and communities and promotes workforce development in energy-related industries.

**Program Key Elements**

The core of this program is built on four PEAK Student Energy Actions which are used thematically to educate students on how their personal behavior and the behavior of others has a direct impact on the demand for energy and on the environment. The four PEAK Student Energy Actions are: 1) Shifting Use Off Peak Demand Times 2) Cutting Waste Through Conservation 3) Plugging Into New and Efficient Technologies 4) Exploring Renewable Energy

Overall Program Goals:

- Deliver high-quality energy education to the next generation of energy consumers.
- Actively engage students, their families, and schools to save energy through energy efficiency, smart resource management, sustainability and demand response awareness.
- Provide career awareness, career exploration, and/or career preparation to appropriate grades on industries related to energy and environmental sectors.
- Create sustainable behavioral changes that result in the achievement of immediate and long-term energy savings and demand reduction in schools and homes.
- Promote positive relationships between the end user, the community, and their serving utility.

**Program Rationale**

PEAK complements each level of the Integrated Demand Side Management model by using education as a means of shifting behavior. The Energy Coalition's PEAK

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

program will support IOUs in meeting recommendations outlined in the California Long Term Energy Efficiency Strategic Plan (CLEESP) and Workforce Education and Training (WE&T) Needs Assessment by providing integrated education on demand response, energy efficiency, energy and water conservation and sustainability through its curriculum. Participating students will receive workforce education related to career awareness, career exploration, and career preparation in order to ensure that they are equipped with the necessary pathway to enter the workforce. PEAK also promotes various rebate and incentive programs such as the Home Energy Efficiency Survey offered in Southern California Edison and Southern California Gas Company service territory.

### **Alignment with CLTEESP**

PEAK is aligned with the following CLTEESP Workforce Education and Training goals: 1) Establish energy efficiency education and training at all levels of California's educational system 2) Ensure the minority, low-income and disadvantaged communities fully participate. The PEAK program supports the state in meeting its 2020 goal to have a workforce that is trained and fully prepared to achieve California's economic energy efficiency and demand-side management workforce potential.

### **Core Program Coordination**

The PEAK program fits with the current IOU WE&T programs in that PEAK both provides and continuously develops 3 – 7 grade curriculum to include energy efficiency fundamentals (e.g. math, science, behavior) and identify career pathway options in energy-related fields. In addition, PEAK supports existing IOU programs by funneling participating student families into energy efficiency programs including distribution of IDSM education through student take-home materials. The Energy Coalition will work with the utility to further connect additional utility rebate and incentive opportunities that support energy efficiency management at the school facility level.

### **Target Audience**

PEAK is designed to engage students, educators, school district officials, school site administrators, parents, and community members. The PEAK program is tailored to educate 3rd through 12th grade students as change agents within the utility territory and develop educator expertise that supports the program core energy concepts as well as environmental education. In alignment with the CPUC's goals, PEAK will place emphasis on enrolling schools into the program that have been designated as low-income.

### **Implementation Strategy**

Implementation strategy consists of the following components:

#### **Professional Development**

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Provide a Teacher Orientation & Training session for all new PEAK teachers. Offer advanced Teacher Training and Orientation to returning teachers.
- Support innovative project development in the areas of energy and the environment.

**PEAK On-site Support**

- Complete up to 2 PEAK educational campaigns or contests per school year.
- Conduct PEAK Events and Site Visits upon request or as deemed appropriate by PEAK and school staff.
- Provide on-site career explorer/career preparation opportunities upon request or as deemed appropriate by PEAK and school staff.

**PEAK Curriculum Development**

- Enhancements to improve relevance and comprehensiveness include: STEM and service learning-components, expansion to out of school time (OST), extension to 3<sup>rd</sup> -12th grade education, and expansion of components to include , Water-Energy Nexus, Smart Meters, renewable energy and other sustainability concepts.
- It is essential for PEAK to focus its efforts on career development especially in the areas of unemployed and underemployed workers. Two components will be developed: career exploration (grades 3-8) and career preparation (grades 9-12) if applicable. The Energy Coalition will realign the current curriculum so that students will explore the careers in the energy field as they engage in energy action activities, thus providing practice and engineering for success. For the career preparation component, The Energy Coalition will develop curriculum alongside the energy education to incorporate hands-on job preparation opportunities as the students prepare for the jobs of the future.

**Program Activities**

*Water/Energy Nexus module:* PEAK will create a new module/s to include Water/Energy Nexus and how the use of one impacts the use of the other.

*Classroom Lab Toolkit:* PEAK teachers receive a toolkit that contains the supplies needed to complete each hands-on lesson for a class of 36 students. Toolkit supplies are replenished on an as-needed basis.

*Energy Challenge Software:* PEAK's website at [www.peakstudents.net](http://www.peakstudents.net) houses interactive games that allow students to simulate the effects of energy efficient behaviors at home and in the community. The web page will be expanded to include new program features; renewable energy; demand response; greenhouse gases and, their environmental impact.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

*Energy Education in the Community:* PEAK staff facilitates educational assemblies featuring Bulbman, PEAK's energy-saving mascot. Participants learn such concepts as how electricity is generated, how much energy is saved by a CFL, demand response, greenhouse gases and the 4 Student Energy Actions.

*Saving Energy at Schools Facility Audits:* Facility audits and retrofits will be offered to PEAK schools to improve facility energy use and enhance PEAK energy education. This initiative serves as an additional hands-on student learning opportunity, where students are encouraged to participate in the process and learn about the impacts of proposed changes. Students are also more engaged in energy conservation when they see that the schools are also practicing what they teach. In fact, most districts have energy managers that manage the green effort at schools and, students are able to see a green career in action.

*Coordinate with other IOU departments to promote and facilitate Consumer and Business Incentive Programs.*

*Coordinate events with Mobile Energy Unit (MEU) where available:* PEAK program activities are tailored to suit the needs of PEAK participants. This customized approach is implemented in all PEAK activities including planning special events and product distributions, developing teacher trainings, promoting green jobs through career discussions, and organizing student field trips. PEAK's proactive support generates a feedback loop which lends itself to quality internal program monitoring and ensures a constantly evolving, living program. PEAK education ultimately produces behavior modifications and attitudinal shifts that result in immediate measurable kW, kWh and therm reductions in both the student's school and home.

PEAK complements each level of the Integrated Demand Side Management model by using education as a means of shifting behavior. PEAK's comprehensive, hands-on program is correlated to the State of California's science, math and language arts standards for grades three through seven. The program teaches students the science of energy and instills an ethic of smart energy management as well as engages students on discussions about green jobs. Throughout their participation in the PEAK program, students are presented with the necessary tools to formulate thoughtful conclusions about energy usage at the individual and community levels.

**LivingWise (SoCalGas and SCE)**

For 2013-2014, LivingWise® is proposed as a continuation of a successful program partnership between SCE and SoCalGas. LivingWise® program target 5<sup>th</sup> and 6<sup>th</sup> grade students, and is usually incorporated into the science and math classes over a 4 week period. Local water providers are also contacted regarding their interest to co-sponsor the LivingWise® Program in their service territories. LivingWise® provides classroom learning activities and take-home kits to elementary and middle school classes. The kit contains energy and water-saving products such as a compact fluorescent lamp and high efficiency showerhead as well as other items to introduce

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

energy efficiency and water conservation to children and their parents. The program features a blend of classroom learning activities, hands-on energy survey and installation projects which students complete in their homes with parental assistance. In addition, LivingWise® participants will be provided lesson plans as well as classroom discussion in the area of energy efficiency, demand response, distributed generation, water conservation and careers and job opportunities in the new green economy. These lesson plans come in the form of an activity booklet that addresses electric, gas and water conservation as well as greenhouse gases, renewable energy and careers in green jobs.

### **Program Activities**

**Interactive:** Interactive school-to-home program for students

**LivingWise® Activity book:** The LivingWise Teacher Activity Guide enables teachers to meet academic content standards in science, math, and environmental. Lessons are designed to be fully comprehensive and contain the following: student learning objectives, post-activity reflection and environmental impacts.

The activity books contain the following lessons:

- Electricity;
- Natural gas;
- Water conservation;
- Renewable energy;
- Distributed generation;
- Greenhouse gases;
- Demand response; and
- Careers in the new green economy.

**Classroom activity:** Teacher-designed classroom activities that reinforce student work on critical State Standards for core subject areas (math, Science, environmental).

**Hands-on:** Hands-on projects that utilize kits containing energy and water efficiency technologies that students directly install in their homes, thus reinforcing education results.

**Family involvement:** Involvement of parents to shape family habits and awareness of the benefits of energy and water efficiency

**Fully integrated energy efficiency program:** Collaboration with Southern California Gas Co and local Water agencies ensures that program covers electric, gas, and water as well as greenhouse gases, renewable energy and careers in green jobs.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

**Coordinate with internal departments to promote and facilitate Consumer and Business Incentive Programs.**

Teachers are required to incorporate lessons from each of the following areas; electricity, natural gas, renewable resources, GHG and green jobs into their math, science or environmental classroom activities as possible. This program is very adaptable to different teaching styles and compliments California's science and math curriculum.

Initial implementation includes program customization to promote utility energy efficiency programs, demand response, distributed generation, water conservation as well as a green career path. The program also features a) pre-survey – that kids complete at the start of the program to determine their knowledge of energy efficiency, b) Household report card – that provide valuable information about household environment and conservation behaviors, c) post-survey – the kids complete after going through the program and allows us to see program effects on their knowledge.

**College and University sector**

**Green Campus**

Marketing and outreach efforts to increase the transparency of campus energy efficiency goals and results, as well as Green Campus projects: Green Campus Interns will launch termed and ongoing educational campaigns for students, faculty, staff and administrators. In order to achieve and sustain cross-campus buy-in for energy efficiency goals and projects set by individual campuses and/or utilities, the program will:

- Promote campus awareness of energy efficiency opportunities and work being done on campus. Green Campus Interns will publish a monthly newsletter describing their ongoing campus outreach efforts, in order to increase awareness about their projects and those of the campus stakeholders and university system.
- Distribute IOU Energy Savings brochures containing details about our commercial and residential EE, DR, DG and Renewable energy programs are provided on campus to administrators and students, and
- Place an emphasis on working with minority and disadvantaged groups throughout the campus.

**Community College Sector**

**California Community College IOU Partnership**

The partnership will implement a training and education (T&E) program focusing on energy efficiency courses for CCC facilities, operations and maintenance staff.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The partnership is also actively working with other CCC and community stakeholders on curriculum and Workforce Education and Training Strategies (WE&T) for students and industry to develop a green career path and workforce in support of the Strategic Plan goals. The basis of the T&E program will be to coordinate with the IOU training centers to customize existing course offerings in the HVAC, controls, lighting, commissioning, and green building areas and deliver them to the CCCs via direct training at the campuses or via telecasts or webinars to many campuses on a distributed basis.

**Adult School / Post High School**

**CLEO**

The CLEO program will promote all energy efficiency and demand reduction programs that would benefit that community using brochures and written materials, interactive displays, newspaper advertising, radio advertising, online website presence, and static displays.

The CLEO program message will encourage customers to participate in SCE's programs and services, and will coordinate with SoCalGas and the local water agencies and will promote increased awareness for customers to understand the structure and opportunities for energy conservation and efficiency, both at home and in their businesses.

**K-12 Sector**

**PEAK (statewide)**

This program will be targeted to associations, school districts and teacher conferences. Part of this marketing will include targeting low income and disadvantaged communities. The method used to identify low income and disadvantaged communities is by the percentage of students on school lunch programs. In fact, our goal is that 50% of program participants come from the low income and disadvantaged groups.

- Design & production of PEAK tradeshow marketing materials including a new marketing brochure and other targeted marketing pieces that are consistent with statewide marketing.
- Participate in community events that support marketing of program.
- Enhance the peakstudents.org website.

**LivingWise® (SoCalGas and SCE)**

Marketing consists of targeted mailing to schools and districts within the affected service area. Information about the program is mailed, emailed, faxed and made available via a web site. Interested schools or teachers would contact the third party vendor to participate in the program. The third party vendor first validates the schools are in IOU service area by contacting the IOU. Once schools have

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

been involved with the program, they request it again in following years as well as refer other teacher to the program.

- Marketing will also target low income and disadvantaged communities and, our goal is that 50% of program participants come from the low income and disadvantaged groups. Low income and disadvantaged communities are identified by the percentage of students on a school lunch program.
- Information about our residential EE, DR, DG, and renewable energy programs are provided through the LivingWise® program. This information will be included as part of class discussion as well as taken home to be discussed with parents.
- Teachers truly see the benefit of this program and the impact it has on the students and their families and, it is evidenced by requests year after year to have this program at their schools.

**K-College Outreach**

- Will continue to work with State Department of Education (Curriculum Commission) on the development of Energy and Utilities Sector Curriculum Standards that includes the science of energy, energy efficiency and some discussion about green careers.
- Will also work with the UC Office of the President of Academic Affairs and the CSU Office of Degree Programs and Educational Opportunities to 1) promote energy minor or major degree programs, 2) collaborate and/or provide expertise in the development of complementary new and revised courses that will form a comprehensive integrated approach to energy education, and 3) consult with campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields.
- Will work with CBOs, FBOs, NGOs, and others as part of the through a WE&T taskforce in an effort to advance WE&T goals.
- Will work with water management agencies, air management agencies or other government entities to establish a network of internship opportunities for students in pursuit of a green career.

b) Program delivery and coordination

i. Emerging Technologies Program

This program will have regular communication with the ETP, as emerging technologies will be very important in what is taught all levels of the education system.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

ii. Codes and Standards Program

We have discussed this WE&T effort with Codes and Standards and have agreed to keep the lines of communication open and schedule ongoing discussions.

iii. WE&T Efforts

The WE&T Connections Subprogram will support the other IOU EE Programs as appropriate.

iv. Program-specific marketing and outreach efforts (Budget provide in Table 1)

Refer to Section 6.2.a.iv. for all discussion of marketing and outreach plans.

v. Non-IOU Programs

We currently collaborate with local water agencies with a few of our programs and will continue doing so for the 2013-2014 cycle. Additionally, we will work to involve and coordinate some of our educational efforts with environmental agencies/groups to show the linkages between energy conservation and the environment.

vi. CEC work on PIER

No anticipated direct work with PIER from this Subprogram's activities.

vii. CEC work on codes and standards

The IOUs will work with the CEC and the IOU Codes and Standards programs to improve code compliance through coordinated education and training delivery.

viii. Non-utility market initiatives

Refer to WE&T Planning Subprogram Section 6.3 for more discussion on efforts in the education and community sectors.

c) Best Practices

These programs have incorporated already California Needs Assessment Study recommendations and will work to incorporate Opinion Dynamics study recommendations as the study is released in 2012.

**Green Campus** – Lessons learned from past program cycles have been transformed into best practices as well as feedback of past process and impact evaluations, and included in

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

program re-designs. Some recommendations provided in mid-cycle that were feasible for implementation, were implemented successfully. Additionally, the California Needs Assessment recommendation have incorporated has been included in the redesign for 2013-2014.

**CLEO** - Media marketing has proven to be the primary mechanism to generate community awareness about the CLEO Program and its offerings. Internal metrics further outline the importance of the marketing mix, as well.

The program relies on a dynamic EM&V to gauge the program's success and to listen to the customer for feedback. These are transformed to 'lessons learned' and incorporated in to the program strategy and offerings. For example, in 2006-2008, costly television spots were swapped for effective newspaper and radio spots, as illustrated above.

**PEAK** – The first PEAK program was launched in Laguna Beach in 1979 and since then has evolved into the comprehensive, standards based program that exists today, reaching thousands of students across California. Past experiences have lead to best practices in the following years. Additionally, PEAK is the recipient of the 2010 Governor's Environmental and Economic Leadership Award.

Another important practice that has increased in importance over the years is the early involvement of classroom teachers beginning with pre-development focus groups. Teachers are recruited to review draft materials and submit written evaluations. The piloting of selected lessons and activities with students is encouraged. Input from teachers, both formal and informal, has been valuable in the development of the teacher guides, student activity books and other materials found in the eight Energenius programs.

Exhibiting and meeting teachers at educational conferences has been another important practice. Besides providing a "pulse" to what is going on in schools teachers at these conferences offer numerous comments and ideas related to existing and future materials. Teachers for example, at an early childhood conferences were asking when PG&E will have its pre-kindergarten program as we know that "good energy-saving habits" begin early.

**LivingWise®** - Lessons learned from past program cycles have been transformed into best practices as well as feedback of past process and impact evaluations, and included in program re-designs. Some recommendations provided in mid-cycle that were feasible for implementation, were implemented successfully. Additionally, the California Needs Assessment recommendations have been incorporated in the redesign for 2013-2014 .

**Green Schools** - Lessons learned from past program cycles have been transformed into best practices as well as feedback of past process and impact evaluations, and included in program re-designs. Some recommendations provided in mid-cycle that were feasible for implementation, were implemented successfully. Additionally, the California Needs Assessment recommendations have been incorporated in the redesign for 2013-2014.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

d) Innovation

This area will be addressed once process evaluations are complete.

e) Integrated/coordinated Demand Side Management

IDSM concepts are incorporated in Connections programs on an age appropriate basis, as described in previous sections.

f) Integration across resource types

All of the University, Community College, and K-12 components will include curriculum to help students understand the science of energy, energy efficiency and conservation, demand response, and renewable and distributed generation, as well as the environmental and economic impacts of energy consumption. Also, the goal is for students to understand the energy-related environmental connections, such as global climate change and the linkage between greenhouse gas emissions and energy use. In addition, materials will go beyond the energy efficiency fundamentals and introduce information on careers and job opportunities in energy-related fields and in the green economy.

g) Pilots

No pilots are being proposed for SoCalGas.

h) EM&V

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

**4. Program Diagram**

See above Section 6.2.

**5. Program Logic Model**

Below is the logic model for the WE&T Connections Subprogram.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

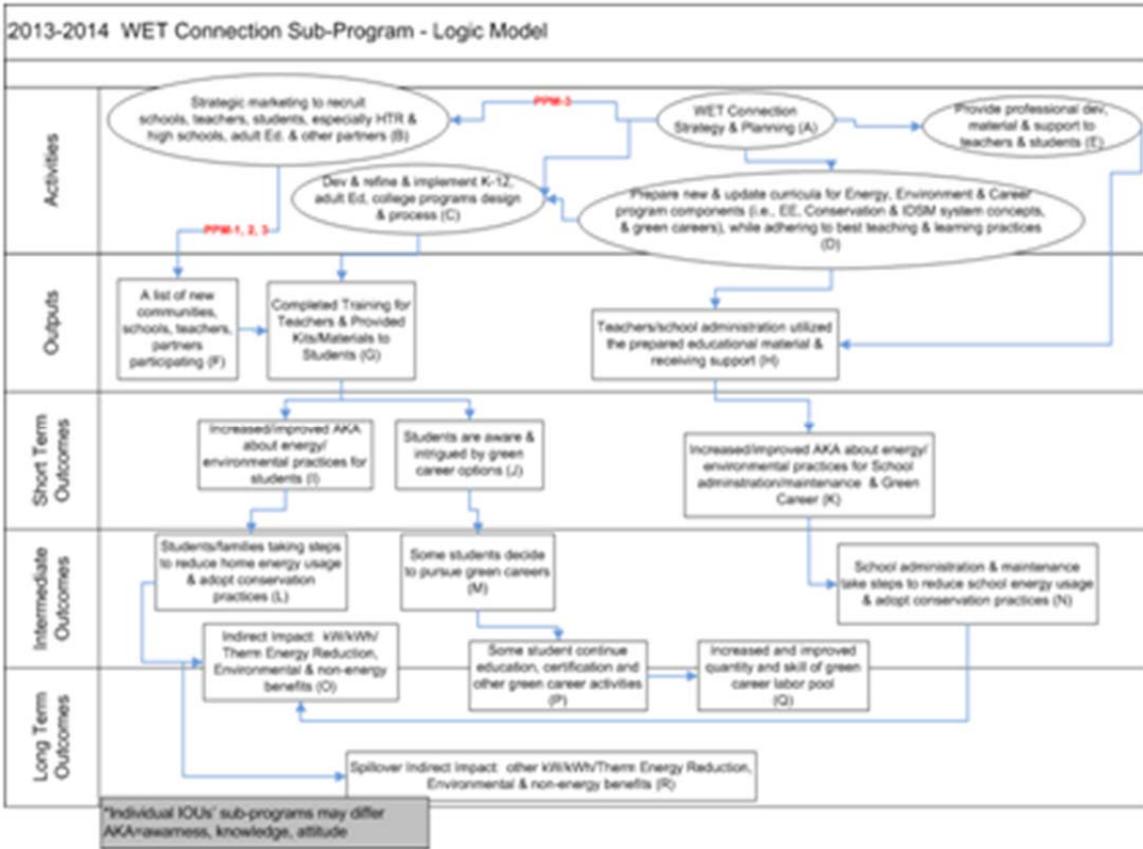

The activities shown in the Connections logic model fall into two primary categories. The first is focused on marketing programs, especially to hard-to-reach and disadvantaged communities. In addition to marketing efforts directed at Title 1 schools, this activity will include partnering with organizations that operate in the communities of Title 1 schools.

The second focus of the Connections activities is on preparing new curricula and refining program design and processes. It is expected that these activities will produce programs and curricula that lead students to understand energy and conservation and their importance, as well as how to use energy efficiently in their households. They are also expected, as a result, to influence their families to do the same. Likewise, some curricula support the incorporation of energy efficient practices and technologies in classrooms and schools.

The curricula and program design will include information and resources on career options in energy-related fields, with an intended outcome being that some of the students exposed to green career resources will ultimately decide to pursue green careers as a result.

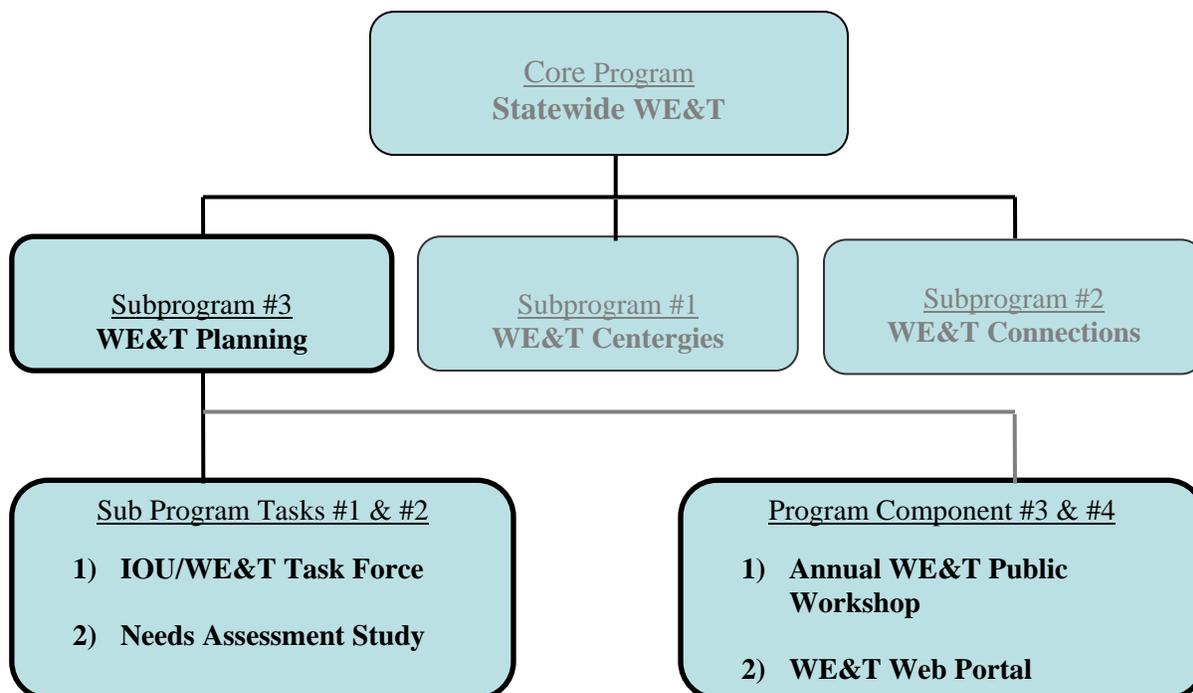

All of these activities are expected to lead to classes that improve AKA of students, their families and teachers and encourage students to pursue green career options. Activities focusing on saving energy on school campuses will also lead to improved AKA about energy and environmental practices within the school and at home for the students. Ultimately, these activities and outputs are expected to result in indirect energy savings.

# 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

6.3) Sub-Program Implementation – WE&T Planning – SCG3731

a) Statewide IOU Coordination

i. Program name

Statewide WE&T Planning is a Sub-Program within the Statewide WE&T Core Program, formed by the IOUs as a direct response to the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan). The WE&T Planning Sub-Program involves management and execution of several strategic statewide planning tasks intended to help sustain momentum in long-term WE&T development and strategic planning, including identification of funding streams and market sector specific needs.

The WE&T Planning Sub-Program was created to facilitate implementation and completion of the four key strategic tasks identified in the Strategic Plan to drive long-term WE&T development:

- 1) Form an IOU/CPUC WE&T Task Force
- 2) Conduct a Needs Assessment
- 3) Create a WE&T Specific Web Portal
- 4) Annual WE&T Public Workshops

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

In order to meet the state's growing workforce demand, a concerted planning effort that includes a variety of initiatives and funding sources beyond ratepayer funds is required. Such an effort will demand the collaboration and involvement of secondary and post-secondary education leaders, technical and professional organizations, state agencies, economic and labor development organizations, utilities, and construction and manufacturing businesses that deliver energy efficiency solutions. The IOUs will support the larger statewide effort, and will help ongoing development of WE&T programs through their WE&T Planning coordination.

ii. Program delivery mechanisms

Implementation activities will be informed by the statewide scoping study and needs assessment. The IOUs are expected to direct much of the work needed to complete the assessment, which will identify existing WE&T infrastructure and capacity, anticipate future needs, and specify urgent gaps that need to be addressed.

Based on the statewide needs assessment, a strategic plan, outlining at least existing and anticipated green collar jobs and the skill sets that are likely to be demanded by industry, will be presented. Organizing these skill sets into practical career paths should influence communication, development, and implementation of future WE&T programs.

Funding for actions based on the above mentioned scoping study, needs assessment, dialogue with stakeholders and task force conclusions will be required to impact the WE&T needs in time to support the urgent needs of the Integrated Demand Side Management (IDSMS) Portfolio. Such implementation actions may include collaboration with appropriate educational sectors as prioritized by the needs assessment to act as catalysts to enhance conventional educational efforts to accelerate the mainstream adoption of green career support.

The statewide IOU Planning tasks will be shared among any other statewide planning and training implementers and be coordinated, where plausible, with the IOU WE&T Centergies and IOU WE&T Connections Sub Programs. A statewide WE&T web portal could ultimately serve as a central repository for exchanging training and job opportunities, as well as statewide and national developments linked to California workforce initiatives.

Four specific key actions to be completed in the near term to drive long-term WE&T development and strategic planning. The Taskforce formed from the California strategic plan is intended to identify funding streams other than ratepayer funding, identify market sector specific needs, and inform short-term actions to initiate longer-term strategies for each market and educational sector.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- 1) *Energy Efficiency WE&T Task Force.* The Task Force is expected to be comprised of energy efficiency and demand side management IOU program representatives, CPUC staff, labor, industry representatives, and educational experts to fulfill administrative functions including: developing a needs assessment RFP; selecting the third party to conduct the needs assessment; and managing the needs assessment evaluation. The Task Force members will continue to help implement the goals and strategies set forth in this Strategic Plan. Beyond the representation listed above, the WE&T Task Force will rely on commitments for involvement from educators and educational administrators, labor representatives, community-based job training leaders and other non-IOU energy efficiency program implementers

The WE&T Task Force is in the early stages of formulation. Reports on existing WE&T related programs and efforts as well as discussion of new WE&T programs and efforts will be core topics of these meeting sessions. The Taskforce will provide a formal framework for all members to get updates, provide feedback and be actively involved in discussing studies, programs, projects, and WE&T efforts being implemented under the strategic plan and other related state initiatives. Task force meetings represent work sessions to review and refine WE&T coordination efforts among stakeholders.

During 2013-2014, the Task Force is no longer in its early stages of formulation and will continue to engage with stakeholders and provide updated reports on WE&T programs and efforts.

An update on Needs Assessment recommendations was provided in the Joint IOU WE&T Annual Report, submitted on May 1, 2012. Per the Guidance Decision, the IOUs will work with Commission Staff on the WE&T Task Force to develop a data request template to be submitted by Staff as needed for periodic updates on the status of the utility's Sector Strategy activities. This provides a more specific and extended role for the Task Force.

- 2) *WE&T Needs Assessment:* The Workforce Needs Assessment study identifies preliminary findings, and in some instances, recommendations, for statewide WET program and/or subprogram considerations. The Joint Utilities worked collaboratively with Energy Division staff to select a subset of these findings and/or recommendations to evaluate implementation feasibility as part of the 2010-2012 program activities, which were approved by the Commission through a joint WE&T Advice Letter. The findings of the Needs Assessment (ordered in Decision 08-09-040) and recommendations were presented within one month of dissemination at a public workshop to allow for public comments and further discussion. The findings were made publicly available through posting to the energy efficiency web portal to the service list in this

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

proceeding and the Distributed Generation and Demand Response proceedings. Within 60 days from the date of the workshop the utilities will jointly file an Advice Letter to modify the existing Workforce Education and Training statewide program consistent with the Needs Assessment.

Update from May 2012 PIP Addendum:

In compliance with Commission Decision 09-09-047, a joint IOU advice letter was approved by Energy Division by letter dated October 28, 2011.

SoCalGas has initiated steps to develop sector strategies in other sectors, including the commercial building HVAC sector, the architectural design sector, and small/medium business building audits. IOUs have restructured educational programs toward structured course series to serve particular sectors. SoCalGas has often allocated resources and partnered with community colleges and workforce investment boards to assist unemployed building operators toward completing a certificate program series.

Details on these efforts will be provided in the 2012 WE&T Annual Report.

IOUs will implement WE&T sector strategy programs started in 2012. In compliance with Decision (D.) 09-09-047, the Investor Owned Utilities submitted for approval their joint IOU Advice Letter (AL) and supplemental filing proposing modifications to the existing Statewide Workforce Education and Training (WE&T) program based on the recommendations of the WE&T Needs Assessment. The Needs Assessment recommendations focused on a Sector Strategies approach, working closer with trades associations, collaborating with more parties on credentials and certifications, restructuring Energy Center course presentment, support for curricula development, targeting of disadvantaged workers, and evaluation of workforce outcomes. Other relevant Needs Assessment recommendations focused on collaboration with the all educational sectors, career education, and evaluation plans on K-12 programs.

The AL provided a general outline of the plan the IOUs would be following to achieve progress for enhancing and more clearly demonstrating necessary changes to the IOU WE&T program to align with shifts in IOU resource program requirements and industry workforce demands. Comments submitted prior to the Guidance Decision illustrate the varying uncertainty on long-term career pathways into green jobs. The IOUs indicated actions to be achieved during 2012 based primarily in response to the Needs Assessment recommendations, recognizing there were impending change forthcoming in such areas as IOU Residential, Commercial and HVAC SW programs. The current 2013-2014 Guidance Decision provides significant guidance that will allow the IOUs to move more decisively on its Sector Strategies action plan. The general plan of action proposed for 2012 will take greater shape and the 2013-2014 period will

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

provide a critical space to apply and align Sector Strategies approaches with the Residential sector Whole Home Upgrade Program, Emerging Technologies, Commercial Buildings programs and Codes & Standards.

Per the AL, activities to develop sector strategies that are currently in progress and will be put into place as other workforce sectors become part of the Energy Centers' focus include:

- Develop partner criteria desired to help achieve goals and objectives for each targeted Sector Strategy area
- Identify potential Sector Strategy Partners based on desired criteria and existing collaborations as well as necessary “new” ones for each targeted Sector Strategy area
- Outreach to identified partners for each targeted Sector Strategy area
- Initiate IOU / Partner working group for each targeted Sector Strategy area.
- Identify shared goals & objective for each targeted Sector Strategy area.
- Develop a shared vision & mission statement with corresponding goals & objectives for each targeted Sector Strategy IOU / Partner working group
- Identify and develop timelines & roadmaps / action items / roles & responsibilities for each targeted Sector Strategy IOU / Partner working group
- Identify reporting vehicles and reporting schedule for each targeted Sector Strategy IOU / Partner working group
- Within each Sector Strategy working group, initiate identification of lessons learned / best practices and executable partnership activities that help achieve goals and objectives previously identified. These lessons learned, best practices and activities will be included in program planning for the next program cycle.

The IOUs propose continuation of the approved joint IOU AL plan of action through 2013-2014 in coordination with changes occurring among resource programs directed in this Decision, as well as workforce skills and qualifications demanded in the market place.

- 3) *WE&T Web Portal*: The web portal will include links to various demand-side management (DSM) related training programs and will allow for a single point of communication. The portal will also serve as a repository for demand-side management and energy efficiency training, educational conferences, and career opportunities. This portal will be created and funded in collaboration with other appropriate entities, and linked to the statewide energy efficiency web portal. The initial planning was to develop the WE&T web portal within the existing EE Web Portal ([www.engage360.com](http://www.engage360.com)). However, the October 13, 2011 Assigned Commissioner's Ruling from Commissioner Ferron required that IOUs suspend all spending on the EE web portal. Further direction was provided in D. 12-05-015 (OP 127) that the web portal content from Engage 360, shall be fully migrated to the Energy

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Upgrade California Whole Home Upgrade Program web portal, with the Engage 360 web portal decommissioned, by no later than the end of 2013. Once the web portal content has been migrated, the WE&T Program seeks to also minimize web portal maintenance costs while maintaining its commitment to delivering a workforce portal. IOUs will work with the ME&O program to explore creating web content linked to the statewide Whole Home Upgrade Program web portal.

IOUs propose continuing portal development of relevant WE&T functionality under EUC portal as part of 2013-2014:

- Including links to training programs, adult educational facilities, labor and trade organizations, as well as IOU training.
- Include an events and activities component that highlights upcoming green energy conferences and workshops.
- Feature a Career Center that will be organized around the Whole Home Upgrade Program.
- Include information on industry authorities, associations and advisory bodies, including the WE&T statewide Task Force.
- Leverage features of the EUC web portal that support profile pages, online repository and connectivity with IOU programs and market opportunities. Integrate/utilize available social web technologies/applications to build online interaction.
- Leverage connectivity tools/functionality of the EUC web portal to connect users with specific interests, job listings, training program announcements, webinars, and conferences.
- Explore the ability for users to communicate with other users, hosted on the site.

4) *Identify And Implement Specific Programs For Each Educational Sector:* WE&T needs are best studied and approached by supporting educational sectors. Thus, five educational sectors have been identified as key in fulfilling WE&T needs and opportunities: Kindergarten through high school, adult education and community colleges, technical training, colleges and universities, and minority, low income and disadvantaged communities.

iii. Incentive levels

Not applicable

iv. Marketing and outreach plans

*Market Transformation Information*

Completion of the Needs Assessment, along with the aggregation of other developing study workforce training could be used to establish baselines from which to establish measureable goals. A few reasonable metrics to measure

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

market transformation in the interim might be identifying funding streams for statewide parties to implement WE&T programs; WE&T Taskforce initiated actions, status and results; measuring utilization of WE&T web portal statistics.

*Market Barriers and Solutions*

The WE&T Planning Sub Program is intended to focus performs tasks that keep statewide stakeholders connected and focuses on delivering a sustainable long-term education and training network that creates a green jobs workforce. The tasks to be completed involve leveraging the resources of the CA-IOWs to help disseminate available statewide energy efficiency curricula and training from among education, labor, industry and grassroots community sectors. This will require a considerable commitment and trust among disparate agencies and entities that make up these sectors where there are inherent barriers which make it difficult to form an effective energy career training network.

The WE&T Planning is a complimentary program to make the best use of IOU resources to achieve multiple objectives. The IOU education and training activities primarily center around utilization of Energy Center and Training Center assets, but training efforts now reach beyond the internal walls of IOU facilities shown in the form of relationships with non-IOU training contractors, education institutions, community groups and governmental agencies. This is important in order for IOUs to help share a role in the growth of coordinated statewide workforce education and training. But just as the IOUs have pursued statewide consistency in offering education and training over several years, expectations to see the same occur among California's various education and training stakeholders cannot be over simplified.

The IOUs have represented a reliable and experienced delivery channel of education and training program curricula when few other options have been available. Like other service providers, all parties must expect a process that will involve progressive steps toward solutions that make achievement the State's energy objectives reasonably possible.

*Advancing Strategic Plan goals and objectives*

In support of the Strategic Plan vision that "by 2020 California's workforce is trained and engaged to provide the human capital necessary to achieve California's economic energy efficiency and demand-side management potential," IOUs plan to implement a variety of workforce development strategies that encourage and nurture the development of "green collar" jobs through their strategic planning initiatives, and education and training programs.

Training that advances the business of DSM, EE, and green energy technology benefits students, who then enter green careers and advance the State's very intense energy efficiency goals. Statewide IOU representatives, key traditional education sector representatives, the business community and professional /

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

industry associations at all levels will work together to share protocols and best practices for energy efficiency education through the WE&T Taskforce.

WE&T Planning tasks are intended to outreach to minority, low income and disadvantaged communities for greater participation. This more focused and targeted step will be coordinated with IOU Low-income, Community outreach and Community affairs departments, as well as coordination, where possible, with Marketing, Education and Outreach.

California must quickly increase and integrate statewide efforts to train people at all levels to plan, administer, and deliver energy efficiency in the public and private sectors. The effort will require planning among secondary and post-secondary educational leaders, technical and professional organizations, state agencies, economic and labor development organizations, utilities, and construction and manufacturing businesses that deliver energy efficiency solutions. The Statewide IOU WE&T Program is directed to initiate ongoing dialogue with market participants and education stakeholders by means of annual stakeholder public workshops to help advance a long-term workforce training designs and plans at all levels of California's educational systems and accommodate the dramatic increase in energy efficiency potential envisioned by the Strategic Plan.

The proposed Statewide IOU WET Program relies on collaboration among CPUC Staff, representatives from the education sector, state bodies, each of the IOUs, professional/trade organizations, and the business community to be successful in initiating energy efficiency training needs, along with recommended existing and potential educational delivery strategies and resources that will serve each market an educational sector in the Strategic Plan through 2020 and beyond.

The WE&T Program is constructed to work in cooperation with the IOUs and the WE&T Taskforce to identify sponsors and funding sources to design and expand effective workforce training activities and projects throughout the state.

***Strategy 1-1: Define, initiate and drive long-term WE&T development and strategic planning, including identification of funding streams and market sector specific needs.***

Implementation Actions:

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Potential Stakeholders	<ul style="list-style-type: none"> <li>• Statewide IOU Team, including other utilities as well as internal partners</li> <li>• CPUC Staff</li> <li>• Key traditional education sector representatives, including UC/CSU, community colleges, and accreditation programs</li> <li>• Business Community</li> <li>• Professional organizations, including the AIA and United States Green Building Council</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Conduct an in-depth formal statewide energy efficiency training and education resource inventory and needs assessment.</li> <li>• Assess current and alternative funding and partnership mechanisms for WE&amp;T activities.</li> <li>• Create a WE&amp;T specific Web portal and identify entities to co-fund and co-sponsor the Web portal with utilities. Partners shall contribute content toward Web portal</li> <li>• Initiate regular on-going dialogue with broad group of market participant and education stakeholders by way of annual workshops.</li> <li>• Establish task force to oversee and help to evaluate utility specific WE&amp;T activities.</li> </ul>
Delivery Channel	<p><i>WE&amp;T Taskforce</i> – Conduct resource inventory and needs assessment.</p> <p><i>WE&amp;T Taskforce</i> – Assess and summarize various funding mechanisms for WE&amp;T activities as a needs assessment element.</p> <p><i>WE&amp;T Taskforce</i> – Work with statewide team to develop Web portal for workforce needs.</p> <p><i>WE&amp;T Taskforce</i> – Facilitate the convening of stakeholders for initial and ongoing dialogue with stakeholders.</p> <p><i>Ed Train</i> - Collaborate with WE&amp;T program to inform the process.</p> <p><i>WE&amp;T</i> – Be specific about the scope of work to define what can/will be done and what lies outside the scope of the task force.</p>

Other long-term strategies and implementation efforts included as goals for the Statewide IOU WE&T Program are addressed in detail within the WE&T Centergies and WE&T Connections Sub-Program sections of the PIP. In summary however, they include:

***Strategy 1-2: Support the community college and adult education efforts to allow students to develop their education based on visible career paths in energy efficiency and related fields***

Potential Stakeholders	<ul style="list-style-type: none"> <li>• California Community Colleges Chancellor’s Office</li> <li>• California Board of Education</li> <li>• Adult Education Leadership</li> <li>• Department of Employment Development</li> <li>• Industry and Labor Associations</li> <li>• Business Community</li> <li>• Professional organizations with members who need to maintain accreditation</li> <li>• Building Operators Certification Program (BOC)</li> </ul>
------------------------	---

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Sub Program Implementation	<ul style="list-style-type: none"> <li>• Utilize community colleges to provide technical training, such as HVAC maintenance and building operator certification.</li> <li>• Develop appropriate linkages with K-12 programs, focusing on high-school “green academy.”</li> <li>• Coordinate with the community colleges and adult education sector to incorporate energy and resource efficiency. Component into their career laddering concept.</li> <li>• Explore ways of disseminating materials electronically through effective use of the Internet.</li> </ul>
----------------------------	--

***Strategy 1-3: Incorporate energy / resource efficiency and demand side energy management into traditional contractor and technician training, such as for plumbers and electricians, and expand training resources to produce target numbers of trained workers.***

Summary:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• California Community Colleges Chancellor’s Office</li> <li>• Community College HVAC program</li> <li>• California Board of Education</li> <li>• Adult Education Leadership</li> <li>• Department of Employment Development</li> <li>• Industry / Labor Associations</li> <li>• Technical and Vocational Training Programs</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Expand or establish training curricula and training and professional career development programs in building construction, services, building operator and other energy efficiency technical fields.</li> <li>• Establish or expand key financial and placement partnerships that demonstrate employment prospects for trained personnel.</li> <li>• Expand upon existing certification programs to try to include student certificate in “green workforce.”</li> </ul>

***Strategy 1-4: Create or expand college and university programs with energy efficiency focus and foster green campus efforts to apply this knowledge in clear view of students and faculty.***

Summary:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• California Community Colleges Chancellor’s Office</li> <li>• WE&amp;T Task Force</li> <li>• UC/CSU education system</li> <li>• ACEEE education committee</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Utilize existing UC/CSU extension programs to incorporate a continuing education curriculum component.</li> <li>• Work with Universities and colleges to expand professional energy related degree offerings and contribute to tailored curriculum.</li> <li>• Work with colleges and universities to formalize internship opportunities with energy and resource efficiency institutions, including engineering firms, architecture firms, and utility programs.</li> </ul>

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

***Strategy 1-5: Develop K-12 curriculum to include energy efficiency fundamentals (e.g., math, science, behavior) across various content areas and identify how career education in energy-related fields can be incorporated across the grades.***

Summary:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• CPUC Staff</li> <li>• Key traditional education sector representatives</li> <li>• California Board of Education</li> <li>• WE&amp;T Task Force</li> <li>• Business community</li> <li>• After-school community education programs</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Identify opportunities to leverage governor’s career technical initiative.</li> <li>• Identify opportunities to work with the California Department of Education to develop curricula with specific content for energy and GHG issues.</li> <li>• Support outreach into</li> <li>• K-12 schools on energy, water and environmental issues.</li> <li>• Support K-12 schools to develop curricula that support their local communities as part of class assignments.</li> </ul>

***Strategy 2-1: Collaboratively identify appropriate goals and strategies to build California’s energy efficiency workforce through 2020, focusing on training that increases participation from within minority, low-income and disadvantaged communities in achieving California’s economic energy efficiency potential.***

The number of units receiving education and weatherization services during 2013-2014 program period is expected to expand greatly. During 2009, WE&T will focus on expanding behavior modification in existing training programs to increase emphasis on energy efficient practices.

Additionally, training in the form of train-the-trainer sessions may be possible with third party groups to design and expand teaching of weatherization and energy efficiency in minority and disadvantage communities specifically.

Summary:

Potential Stakeholders	<p>WE&amp;T Task Force</p> <ul style="list-style-type: none"> <li>• CPUC</li> <li>• Key traditional education sector representatives</li> <li>• Business Community</li> <li>• California Community Colleges Chancellor’s Office</li> <li>• Continuing Education Programs</li> <li>• Laney and Delta College HVAC program (PG&amp;E)</li> <li>• Department of Employment Development</li> <li>• Industry / Labor Associations</li> <li>• Technical and Vocational Training Programs (e.g., State Prison System)</li> </ul>
------------------------	---

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

	<ul style="list-style-type: none"> <li>• Community Youth Centers (e.g., YMCA)</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Leverage Marketing Education and Outreach and WE&amp;T task forces to partner with community based organizations and provide targeted outreach on employment opportunities with energy efficiency.</li> <li>• Develop Low Income WE&amp;T Plan</li> <li>• Train qualified diverse business enterprises from minority, low-income and disadvantaged communities to undertake or expand efficiency services.</li> </ul>

b) Program delivery and coordination

WE&T Planning includes involvement from a wide range of stakeholders. Implemented in the appropriate manner, WE&T Taskforce members will represent technology, industry, government, community groups, utilities, education and non-energy segments which should facilitate discussion on ways to share current and emerging opportunities to expand the scope of existing WE&T training curriculum, but introduce new WE&T training activities in the area of emerging technologies, codes and standards, and non-IOU programs.

c) Best Practices

Formulation of statewide WE&T Taskforce and regularly scheduled meetings with statewide WE&T stakeholders represent a best practice that facilitates open discussion among are vested parties. The WE&T planning process will have best practice inputs gathered from evaluation of IOU education and training programs to rely upon in discussing real opportunities and the long-term considerations of programs being shared and presented to the WE&T taskforce and IOUs.

d) Innovation

The whole program can be considered innovative to the degree that statewide coordination and strategic planning is being done, which will help shape California economics in the near term.

e) Integrated/coordinated Demand Side Management

WE&T Planning includes involvement from a wide range of stakeholders. The IOU WE&T representatives in support of the long-term workforce strategy of California to achieve statewide coordination, will work to create coordinated technology demonstration and DSM training to ensure there are no missed opportunities for offering IDSM training and that opportunities to receive such training are made available to the fullest extent possible which will aid efforts in achieving energy neutral buildings by 2020.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

f) Integration across resource types

WE&T Planning includes involvement from a wide range of stakeholders. Implemented in the appropriate manner, WE&T Taskforce members will represent technology, industry, government, community groups, utilities, education and non-energy segments and facilitate discussion on ways to share current and emerging opportunities to expand the scope of existing WE&T training curriculum to include water and GHG mitigation.

g) Pilots

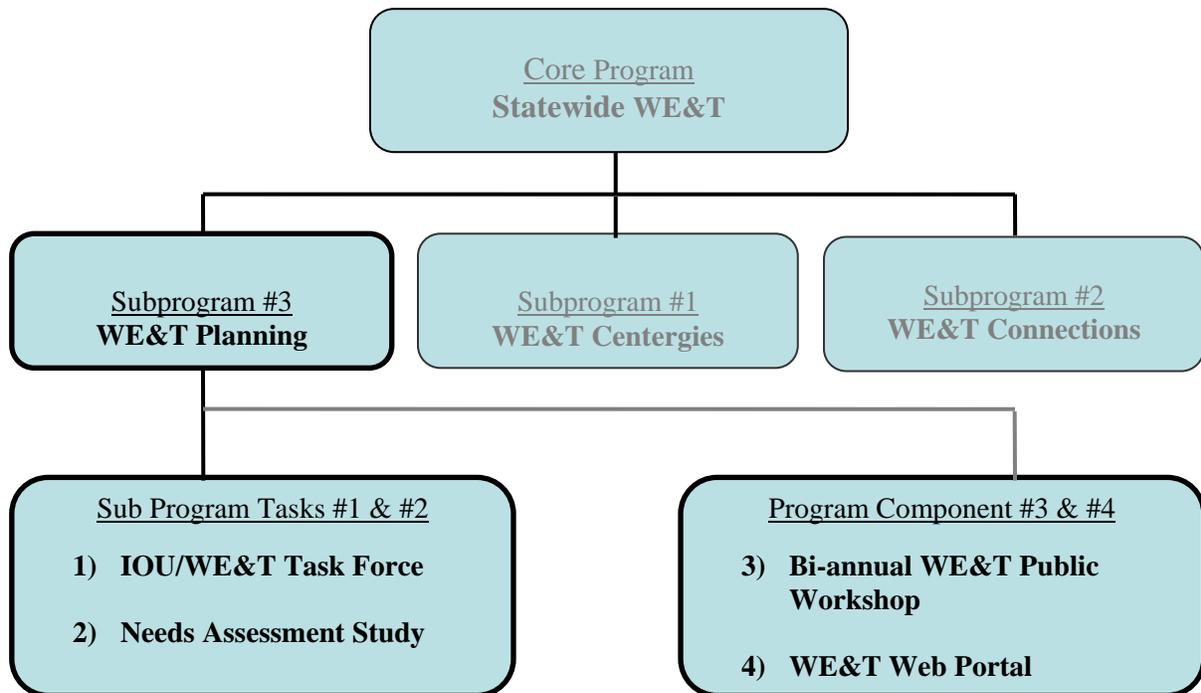

The whole program can be considered innovative to the degree that statewide coordination and strategic planning with regard to workforce training is being done in a manner that require iteration and learning in order to arrive at implementation models and action steps that can be deemed effective.

h) EM&V

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

7) Diagram of Program

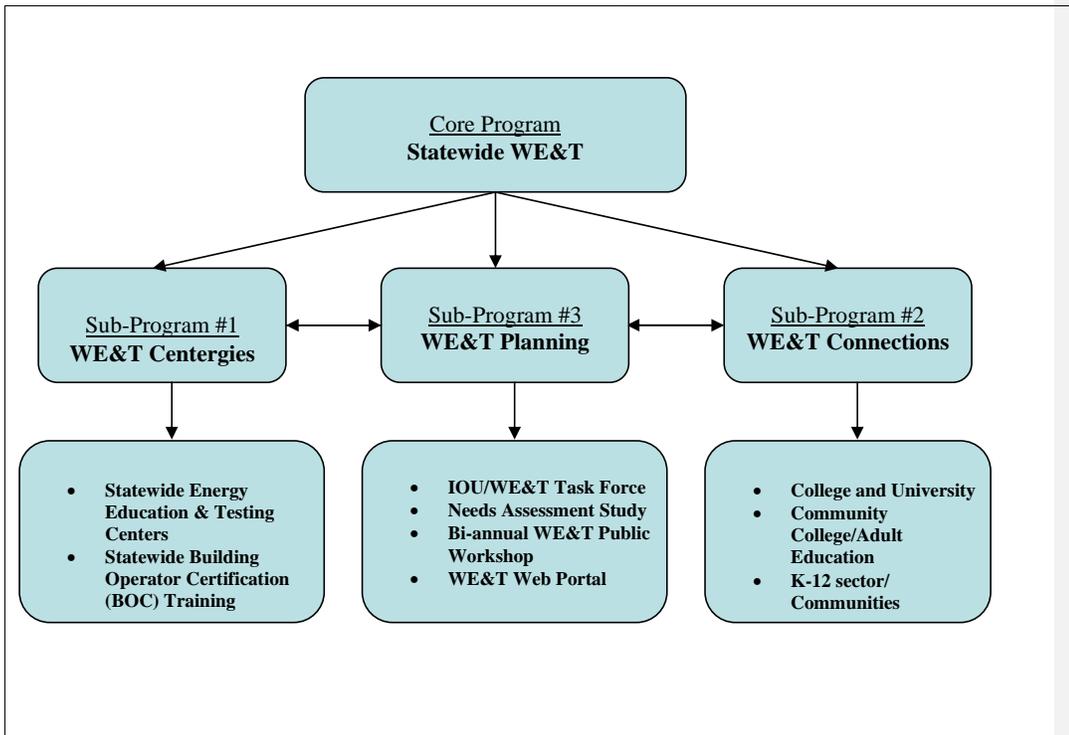

See above Section 6.2.

**4. Program Description**

a) Program description

The Statewide IOU Workforce Education and Training (WE&T) Program represents a portfolio of education, training, and workforce development planning and implementation funded by or coordinated with the Investor-Owned Utilities (IOUs): Pacific Gas and Electric (PG&E), Southern California Edison (SCE), San Diego Gas & Electric (SDG&E), and Southern California Gas ([SCGSOCALGAS](#)). Education and training are vital components of each of the IOU’s energy efficiency portfolio filings for ~~2010-2012~~[2013-2014](#) and are integral in supporting the achievement of IOU energy savings targets and the workforce objectives set forth in the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan). Workforce Education and Training has become an important crosscutting activity for the IOUs in an effort to not only educate and train current workers, but to prepare future workers to be better able to successfully perform the jobs needed to help achieve increased energy savings targets for the IOUs and California’s clean energy goals.

WE&T relies on statewide coordination to collaboratively create a comprehensive training platform that leverages the potential of key stakeholders with the resources, knowledge, and commitments to implement an education and training strategy that focuses on integrating existing workforce skills with new workforce needs, as well as expand outreach efforts to increase awareness of and demand for green careers.

California wants to expeditiously increase statewide workforce development and training relying on strategically coordinated planning and administration to deliver energy efficiency and demand side energy management in the public and private sectors. This effort will require concerted planning among secondary and post-secondary educational leaders, technical and professional organizations, state agencies, economic and labor development organizations, utilities, construction and manufacturing businesses that deliver energy management and efficiency solutions.

The Strategic Plan’s vision for WE&T is that “[b]y 2020, California’s workforce will be trained and engaged to provide the human capital necessary to achieve California’s economic energy efficiency and demand-side management potential.”<sup>2</sup> To do this, the

<sup>2</sup> California Long Term Energy Efficiency Strategic Plan, p. 74.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Statewide IOU WE&T Program must be constructed in an implementable form to: 1) initiate and drive long-term WE&T development and strategic planning, including identification of funding streams and market sector specific needs; 2) support community college and adult education efforts to develop education based on visible career paths in energy efficiency and related fields; 3) incorporate energy efficiency and integrated demand side energy management into traditional contractor and technician training; 4) support the creation or expansion of energy management and efficiency focused curriculum by college and university programs and foster this knowledge in clear view of students and faculty; 5) support development of K-12 curriculum to include a basic understanding of energy fundamentals, including environmental and greenhouse gas impacts as well as solutions to mitigate energy use impacts such as EE, DSM, and associated behavioral changes, identify how career education in energy-related fields can be incorporated across the grades, and bolster high school career counseling to improve community college enrollment in green job training programs; and 6) achieve the fullest participation by minority, low income and disadvantaged communities in training and education at all levels of DSM and the energy/resource efficiency industry. Diagram I illustrates the proposed program implementation structure for the Statewide IOU WE&T Program to best deliver the strategies outlined by the Strategic Plan.

Throughout the approved IOU Program Implementation period, the WE&T Program will strive to continuously initiate and facilitate ongoing dialogue with a broad group of market and education sector stakeholders to define, introduce and drive long-term WE&T development and solutions to establish EE and DSM education and training at all levels of California's educational system and accommodate the dramatic increase in EE activities envisioned by the Strategic Plan. [The IOUs will modify curriculum and delivery methods to incorporate feedback and guidance from sources, including the California WE&T Needs Assessment, customer feedback from the 2010-2012 Process Evaluation, and the Guidance Decision for 2013-2014. Such modifications include, but are not limited to, approaching curriculum development with the sector strategy approach.](#)

The Statewide IOU WE&T Program includes three pivotal Sub-Programs that form an integrated and cohesive structure for implementing WE&T curriculum and related activities in support of IOU energy savings targets and the long-term strategic goals for the state of California as prioritized and outlined by the Strategic Plan and Big Bold Energy Efficiency Strategies (BBEES). These three Sub-Programs include:

- i. The **WE&T Centergies Sub-Program** is generally organized around market sectors and cross-cutting segments to facilitate workforce education and training appropriate for achieving the energy savings, demand reductions and related energy initiatives required of the IOUs. The Energy Centers, which have many years of experience in creating and disseminating high-quality programs, represent the largest component of this Sub-Program and provide WE&T curriculum and related deliverables—training courses, seminars, workshops, clean energy technology demonstration, equipment efficiency testing,

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

interactive training exhibits and lectures—to promote industry trends and developments for advancing energy efficiency as a professional discipline. For many years, they have served as the IOU’s primary delivery channels for mid- and upstream workforce education and training, information dissemination, and education/outreach coordination. IOU-administered Third Party, Local Government and Emerging Technology, Codes and Standards, Heating, Ventilation and Air Conditioning (HVAC), and ~~Low Income Energy Efficiency (LIEE)~~ [Energy Savings Assistance \(ESA\)](#) programs, as well as other community-based training efforts, are supported by the Energy Centers to sponsor workforce training courses. (Refer to WE&T Centergies Sub-Program Section 6.1 for a more detailed discussion [of 2013-2014 program implementation.](#))

The Statewide Building Operator Certification (BOC) Training Partnership, the second component of this Sub-Program, will continue to play a major role in improving and maintaining California’s green collar building workforce stock of building engineers, stationary engineers, maintenance supervisors, maintenance workers, facility coordinators, HVAC technicians, electricians, , and others in the facility operation and maintenance field. The IOUs have been collaborating with BOC to offer California building operators competency-based training and certification, resulting in improved job skills and more comfortable, efficient facilities. Operators earn certification by attending training and completing project assignments in their facilities. Training topics include facility electrical, HVAC, and lighting systems; indoor air quality; environmental health and safety; and energy conservation. The IOUs will work with BOC to shape and realign the BOC certification program to be consistent with the Strategy Plan.

- ii. The **WE&T Connections Sub-Program** is organized around downstream and upstream relationships between the IOUs and the educational sector, entry and intro-level community-based training efforts that support workforce development in energy efficiency, energy management, and new emerging green careers. This Sub-Program emphasizes education curriculum and related activities that inspire interest in energy careers, new and emerging technology, and future skills development to advance the energy initiatives and goals of the state. This Sub-Program involves expanded relationship-building to foster curriculum development and related training that result from existing and expanding industry needs. IOUs will work with education institutions, labor and communities to nurture interest in green careers by K-12, community college, occupational, vocational, and major university students, as well as assist in the growth of low-income and transitional workforce targeted clean energy training programs. (Refer to WE&T Connections Sub-Program Section 6.2 for a more detailed discussion [of 2013-2014 program implementation.](#))
- iii. The **WE&T Planning Sub-Program** involves the management and execution of several strategic statewide planning tasks and resulting project implementation actions initiated by the Strategic Plan. The tasks and projects are seen as

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

instrumental in delivering mechanisms and protocols that facilitate ongoing momentum and focus on the achievement of workforce, education and training long-term goals. The WE&T Planning Sub-Program facilitates implementation and completion of the four key strategic tasks identified in the Strategic Plan to drive long-term WE&T development:

- 1) Form an IOU/CPUC WE&T Task Force
- 2) Conduct a Needs Assessment
- 3) Create a WE&T Specific Web Portal
- 4) Facilitate annual WE&T Public Workshops

(Refer to WE&T Planning Sub-Program Section 6.3 for a more detailed discussion [of 2013-2014 program implementation.](#))

b) List of current measures/curriculum

Refer to WE&T Sub-Program Sections 6.1 and 6.2 for specific detail.

i. WE&T Centergies

a. Statewide Energy Education and Testing Centers (Centers)

The Centers will continue to offer and expand their curricula to current and new audiences that make up California's energy efficiency workforce. The primary target audience for each of the Center's activities and that audience's significance to California's energy efficiency future are delineated in [Appendix Attachment 2](#). ~~Attachment 2~~ [Appendix 2](#) also includes a more comprehensive list of existing and new educational seminars that the Centers will offer at the local and statewide level. The list reflects classes that are developed around specific technologies or installation methods as well as classes that present integration among DSM programs, including distributed generation and demand response. NOTE: The course topics listed in ~~Attachment 4-2~~ will be modified during the program cycle, as new technologies are introduced into the marketplace and revised codes and standards are implemented.

b. Statewide Building Operator Certification (BOC) Training Partnership

BOC will continue to be a WE&T partner with the IOUs. The IOUs will expand and improve the BOC partnership. The "measures" to be provided in the BOC program include delivery of the Level I (7-class series) and Level II (4-class series) certification courses. BOC will also track certification statistics.

~~\*Numbers do not reflect shared BOC sessions (promotion/costs) planned with SCE.~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

ii. WE&T Connections

- a. College and University sector: The Statewide University program that operates at UC/CSU campuses offers the following as well as advances the Strategic Plan goals:
- IOU and /or program staff will work with the UC Office of the President of Academic Affairs and the CSU Office of Degree Programs and Educational Opportunities to 1) promote energy minor or major degree programs, 2) collaborate and/or provide expertise in the development of complementary new and revised courses that will form a comprehensive integrated approach to energy education, and 3) consult with campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields.
  - Student interns will work with many campus groups and organizations to promote energy efficiency and green careers to the student body.
  - Student interns will work with campus EOP Programs to ensure that minority, low income, and disadvantaged students are fully engaged in our energy efficiency and green career path programs. Many students do not apply for admission to college because no one in their family has ever attended college or because college seems too expensive. EOP aims to improve the access, retention, and graduation of students who have been historically disadvantaged, either socially or economically.
  - Student Interns promote energy efficiency throughout the campus by performing energy assessments and providing recommended actions to operate more efficiently.
  - The program provides a pathway to green jobs through professional development, training, mentoring, integrated academic curricula, internships, project based learning, and a broad-based professional networks.
  - Students are offered job shadowing and internships with IOUs, universities, other entities, and government agencies.
- b. Community College sector: The Community College program will better position California's workforce to meet the growing need for energy professionals as well as advance Strategic Plan goals:
- The California Community College training and education program currently provides energy efficiency courses for CCC facilities, operations, and maintenance staff in an effort to create an energy efficient environment, help in the development energy efficient policies, take advantage of DSM programs, and implement distributed generation programs,
  - IOUs are in the early stages of discussion with the Community Colleges to develop a Utility Workforce Education and Training program. The

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

first step is to gather labor market information from employers in the energy sector and use this information to develop new certificate and degree programs that focus on energy efficiency and demand side management.

- IOUs will work with campus EOP Programs to ensure that minority, low income, and disadvantaged students are fully engaged in our energy efficiency and green career path programs. Traditionally, minority, low income and disadvantaged students heavily favor community colleges because they are economically more feasible or because students' GPA or standardized test scores were not high enough to get into a university. EOP provides support and helps students transition to universities if that is the goal of the student. EOP aims to improve the access, retention, and graduation of students who have been historically disadvantaged, either socially or economically.
- c. K-12 sector: The various K-12 educational components all offer the following as well as advance Strategic Plan goals:
- Ensure that minority, low income, and disadvantaged communities fully participate in training and education programs: At least 50% of each program is offered in minority, low income, and disadvantaged communities, determined by school lunch program data.
  - Designed to promote green careers to K-12 students through energy and environmental curriculum and highlight green careers/jobs: Students will learn about a range of green jobs and participate in shadowing and training program and classroom instruction to help them consider and prepare for future green employment. A focus will be on experimental learning models, including contacts with both blue and white collar workers now working in the green economy.
  - Designed to educate students on energy, water, renewable energy, demand response, distributed generation, and greenhouse gases and impacts to the environment, with the goal of influencing the day-to-day energy efficiency decisions of students and their households (customer awareness focused).
  - Designed to educate schools on the benefits of implementing energy efficiency policies and demand response programs at their sites to impact energy use in schools.
  - The IOUs and/or our third party vendors will work with the State's Department of Education (Curriculum Commission) as well as Counties' Departments of Education to be included in curriculum development advisory boards so that we can contribute to tailored K-12 curriculum that includes the science of energy, energy efficiency, and some discussion about green careers.

c) List non-incentive customer services

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

i. WE&T Centergies

Common Center elements include:

- Educational seminars
- Technical consultations
- Outreach efforts
- Food Service Test Protocols
- Tool Lending Libraries
- Educational Partnerships
- [Support and collaboration with HVAC industry sector strategy](#)
- Energy Design Resources integration and collaboration

These non-incentive customer services will be used to direct the Centers' customers to the IOU's incentive programs through inclusion of program materials in class course books, through information integration on Centers' class websites, and literature displays in Centers' exhibits. (Refer to WE&T Centergies Sub-Program section 6.1 for specific details.)

## 5. Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Information

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as "Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market."<sup>3</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>4</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>5</sup>. Markets are social institutions<sup>6</sup>, and transformation requires the coordinated effort of many stakeholders at the national level,

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>7</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>8</sup>. According to York<sup>9</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>10</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>11</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>12</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>13</sup>. The ability to

<sup>13</sup> Sebold et al (2001) p. 6-5,

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>14</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>15</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>16</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>17</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric

<sup>17</sup> Pelozo & York, (1999).

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

**Program Performance Metrics (PPMs)**

Below are the approved PPMs and metric types for the Workforce Education & Training Statewide [Program](#) (Resolution E-4385, Appendix A, ~~pp 32-34~~). [These PPMs will be extended into the 2013-2014 portfolio, with the proposed modifications clarifying definitions shown below:](#)

<b>WORKFORCE EDUCATION AND TRAINING (WE&amp;T)</b>		
<i>Centergies</i>	Percent increase in educational collaboration with partners from 2011 baseline. (Tracked and reported by educational level, and by number of partners operating in Title-1 communities.) * Educational “collaboration” is defined as: seminars, outreach events and consultations as needed. These collaborations include exchanges of monetary or in-kind support and services (i.e., sharing meeting facilities, marketing/promotional services, etc.).	2b
	2. Percent increase in educational collaboration with organizations serving disadvantaged communities * Educational “collaboration” is defined as: seminars, outreach events and consultations as needed. These collaborations include exchanges of monetary or in-kind support and services (i.e., sharing meeting facilities, marketing/promotional services, etc.).	2b
	3. Number of IDSM educational classes with substantial IDSM (EE, DR, and DG) content. * “Substantial” is defined as approximately 50% or more of class content must address IDSM subject matter. <a href="#">The WE&amp;T Program staff have been in conversation with Energy Division to refine the definition of these metrics, which may change for the 2013-2014 reporting period.</a>	2b
<i>Connections</i>	1. Percent increase in educational collaboration with partners. (Tracked and reported by educational level, and by number of partners operating in Title-1 communities.)  * Educational “collaboration” is defined as: seminars, outreach events and consultations as needed. These collaborations include exchanges of monetary or in-kind support and services (i.e., sharing meeting facilities, marketing/promotional services, etc.).	2b
	2. Percent of K-12 WET Connection program participants that are from Title-1 schools	2a
	3a. Complete <u>baseline study to determine the current number of partnerships</u> .(Y/N) 3b: Number of high school continuing education outreach partnerships** in WET Connection	2a*  * Startin g 2011.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

b) Market Transformation Information

~~Per Resolution E-4385, identifies a preliminary list of objectives and a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities. These MTIs will be presented at a public workshop on November 7, 2011 to allow for public comments and further discussion before being finalized. No MTIs were identified for the WE&T Program.~~

~~As stated above, market transformation draws heavily upon diffusion of innovation theory, with the state of a market characterized by adoption rate plotted against time on the well known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects. Therefore it is problematic, if not impractical, to offer internal annual milestones towards market transformation sectors and specific program activities.~~

~~As a consequence, it is not appropriate to offer more than broad and general projections. Any targets provided in the following table are nothing more than best guesstimates, and are subject to the effects of many factors and market forces outside the control of program implementers.~~

c) Program Design to Overcome Barriers

The Statewide IOU WE&T Program structure illustrated by this document is intended to address several new and recent challenges and existing barriers in order to implement a sustainable long-term education and training strategy, while leveraging the resources of the CA-IOUs to help influence energy efficiency curriculum and training content among education, labor and community sectors in a way that incorporates best practices and coordinates investment throughout the state.

The national, statewide and local economic downturn poses a real barrier to change, creating the risk of distracted focus and resistance to invest in projects. The IOUs currently represent a long and stable commitment to energy efficiency and demand-side management education and training. The IOUs have demonstrated the ability to offer a targeted breadth of education and training program, but market transformation toward a new green workforce will require an urgent commitment to change by educational sector stakeholders.

The challenge of introducing new technology into the marketplace has historically relied on coordination between technology development, research and technology commercialization. IOUs have demonstrated flexibility in identifying new and emerging technology training needs and introducing workforce training courses to both private and

Formatted: Tab stops: 1", Left

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

public sectors. However, market transformation to meet target dates associated with net zero new construction and code adoptions will require a rebound in the economy and interest in new investment.

The IOUs offer a broad statewide contiguous view on workforce, education and training which few other parties have. The proposed implementation plan leverages the statewide IOU assets and resources to the extent possible to address gaps in the workforce landscape, and IOUs can act as conduits to identify new or successful local and regional workforce training models that can be migrated across the state into underserved areas via IOU implementation or IOU administration of third-party sponsored implementation. Such an effort cannot occur solely from IOU funding, so there will need to be additional financial stimulus from alternative resources.

WE&T Connections

Energy education is critical to assuring a stable and reliable supply of [electricity energy](#) in California. Educating students will create a new generation of Californians who understand the significance of energy in their lives, their role in its efficient use and the importance of managing our limited resources for the future. This knowledge and information can also lead to life-long energy savings habits and a concern for the environment and its limited resources for not only the students but, for their family and friends. This knowledge and education can also lead the interest in a future green career path. However, given the budget cuts at schools, cuts to curriculum and longer work hours for teachers, getting this message across may not be possible without the assistance of these IOU sponsored programs.

WE&T Connections program components are designed to be both flexible and effective across diverse learning environments. All program components promote the science of energy, energy efficiency, demand response, distributed generation, and empower K-12 and college students to become advocates of smart energy management in their homes, schools, and communities. The program effectively combines classroom learning with hands-on activities such as:

The program will address lost opportunities in the schools market by implementing a comprehensive, innovative approach that involves incorporating:

- Some of the nation's leading energy education programs. These programs are 1) designed to promote green careers through energy and environmental curriculum, 2) designed to educate students on energy, water, renewable energy, demand response, distributed generation as well as green house gases and impact to the environment, with the goal of influencing day-to-day decisions of students and their households, 3) also designed to educate schools/facilities on the benefits of implementing energy efficiency policies and demand response programs at their sites so as to impact energy use in schools and, universities and to project energy and environmental leadership by example

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- The program is developed in collaboration with natural gas, electricity and water agencies to promote and encourage the adoption of energy efficiency, demand response, distributed generation and water conservation options.
- Collaboration and integration with residential and business incentive programs that result in firm energy savings for homes and schools.

The WE&T Connections program will address the needs of schools through a combination of student, teacher, and school administrator education programs that increase their awareness and knowledge as well as provide support in developing curriculum and/or lesson plans that support these objectives. Additionally, once school-aged children learn something new like energy efficiency, they become advocates by taking that knowledge home and teaching/motivating their parents and siblings to take actions to reduce energy and water consumption. University students can conduct valuable research and effectively educate their peers and campus administrators about energy efficiency:

- Educational campaigns can result in significant energy savings on campus facilities and dorms by changing behaviors and purchasing decisions;
- Students are effective advocates, able to reach their peers, communities and high-level decision makers in promoting green jobs on campus.
- IOUs will coordinate with the Department of Education Curriculum Frameworks and Instructional Resources Division to discuss how curricula on energy efficiency fundamentals, GHG issues and global climate change can be included in the Science Framework (PG&E has submitted an application to be on the Science Curriculum Framework and Evaluation Criteria Committee for the revision of Science Framework, adoption in 2012). Additionally, coordinate with the Dept. of Ed for inclusion of curricula of green career options in energy-related fields in the Career Technical Education Framework for 7-12.
- IOUs will update the “Resource Guide for Teachers” developed by PG&E that provides an annotated listing of sites and curricula for teachers and students covering issues related to energy, energy efficiency and the environment.
- IOUs will coordinate with partners to expand outreach into K-12 schools that have curricula on energy, water, and environmental issues (e.g., California Department of Education of Education, Water Districts, California Department of Energy, California Energy Commission, Air Quality Management Districts).
- As an outcome of the collaboration of partners representing curricula mentioned above suggestions on how to integrate career options in energy-related fields will be explored. In the interim the IOU’s will review the existing curriculum programs that they support and work together to see where career options can be incorporated into their curricula.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- The IOUs and/or our third party vendors will work with the appropriate (as described in program description) K-12, Community College and University agencies responsible for developing curriculum, courses and programs needed to educate students about energy, energy efficiency and prepare them for a green career path.

d) Quantitative Program Targets

Refer to WE&T Sub-Program sections for specific details.

e) Advancing Strategic Plan goals and objectives

The proposed Statewide IOU WE&T program implementation structure, integrating WE&T Planning as a Sub-Program in parallel with the two other major statewide IOU Sub-Programs, WE&T Centergies and WE&T Connections is intended to better integrate long-term planning with WE&T implementation. As stated in the Strategic Plan, “This cross-cutting sector demands a truly statewide coordination effort that integrates energy efficiency training into a wide range of public and private programs. This effort will include the California Department of Education, the Department of Employment Development, industry and labor associations, educational institutions at all levels, technical and vocational training organizations, community based nonprofit organizations and the business community.”<sup>18</sup>

California today is faced with an unprecedented challenge: the generation of students graduating high school in 2009 will need to stabilize carbon emissions in the 30+ years of their work careers. Additionally, this generation will need to develop and train the next generation of energy technologies. Transforming California’s current building industry into one that exemplifies carbon neutrality by 2020 will require major changes in our existing market infrastructure and business models. This will result in many new jobs and industries.

One of the keys to success for future implementation of energy efficiency technologies is the need to train the next generation workforce in energy-related positions. The Statewide IOU WE&T Program, supported by the strategic activities of the WE&T Planning Sub-Program activities, establishes a connection among statewide implementers for increasing the knowledge and skills of the current generation - from local code officials, energy managers, and HVAC technicians to school teachers - to develop the muscle needed to achieve market transformation.

Achieving success in creating a workforce well educated in energy efficiency matters will require large-scale, ongoing, collaborative education, and training efforts to match evolving demands for both the type of jobs and number of workers needed to fully implement the Strategic Plan. Addressing human capital resource requirements will

---

<sup>18</sup> California Long Term Energy Efficiency Strategic Plan, p. 75.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

require collaborative efforts of federal, state, and local governments; financial institutions; community-based and non-profit organizations; industry and labor organizations and utilities. These entities present potential funding sources and opportunities for partnerships.

Students benefit from energy efficiency education and training opportunities with the ultimate goal of students entering careers in energy efficiency, advancing within their established career paths, and ultimately helping the state to meet very intense energy efficiency goals. A better trained workforce will advance the purpose of DSM implementation, policy, research and development, and education.

The educational components offered by the WE&T Connections program provide energy efficiency education and training at most levels of California's educational systems. The program also ensures that minority, low income and disadvantaged communities fully participate in training and education programs at all levels of the DSM and energy efficiency industry. The expected results are that:

1. Students develop careers, and existing workers develop skills and knowledge that advance DSM business, policy, research and development, and education; and
2. Individuals from the targeted communities take advantage of programs that specialize in energy disciplines at all levels of the educational system and successfully advance themselves into rewarding careers in the energy services fields.

The Statewide IOU WE&T Program is structured to implement workforce training and workforce curriculum development in cooperation with the California Community Colleges Chancellor's Office, the California Board of Education and Adult Education Leadership. WE&T Planning Taskforce and annual workshops will help to nurture technical training and education services that support community college and adult education within the first 12 months of the program cycle. Together, these relationships will be able to outline the foundational learning plan(s) needed to prepare students for career paths in energy efficiency and related fields. Based on experience, learning plan outlined through this collaborative effort could provide students with entry points for entering the field of energy efficiency and/or result in career development tracks within a traditional education system. IOUs would initially suggest learning plans be based on the "working backwards" exercise of asking what knowledge, skills, educational background and abilities are needed for particular sets of jobs and careers. Once these various attributes have been identified, learning plans shall be developed which will drive the development of curricula and training programs and support the knowledge and skills sets needed to prepare students for the "green collar" workforce. The Statewide IOU WE&T Program will build on existing training activities to address "gaps" in the learning plans as appropriate and diagnosed by the needs assessment.

The Statewide IOU WE&T Program is modeled to generate stronger linkages to K-12, advising on energy curriculum and coordination between K-12, Community Colleges

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Chancellor's Office and the adult education sector. The Statewide IOUs will exchange instruction and curricula with community colleges, industry and labor on HVAC, Energy Audits, Home Performance Retrofits and Building Operator Certification. The Statewide IOU WE&T Program will also advance consistency among the IOUs to use training curricula through established partnerships with the community colleges, vocational / technical / trade schools and apprenticeship programs.

The Statewide IOU WE&T Program establishes a framework for cross-sectional expansion of training curricula and related workforce development programs to address HVAC quality installation and maintenance, building construction, home performance audit and retrofit services, building operator certification, facilities maintenance, and other technical fields. The Sub-Programs will build on the established partnerships with key actors to deliver technical information through a wide variety of training and education services for upstream stakeholders such as contractors, installers, inspectors, plan checkers, designers, architects, engineers, vendors, installers, and other technical skilled personnel to increase actions, awareness, and attitudes toward energy efficiency. [\(Refer to the Statewide HVAC PIP for more information.\)](#)

The Statewide IOU WE&T Program as structured supports the Big / Bold Strategies adopted by the CPUC in the Strategic Plan by continuing to offer training programs on quality installation and maintenance of HVAC systems and equipment selection based on whole building design, training and certification, compliance improvement and new technologies. Education and Training will continue its focus on the building envelope and overall home performance by providing HVAC quality installation, maintenance and service courses based on ACCA (Air Conditioning Contractors of America) [and other appropriate](#) standards. Education and Training will also continue to offer programs on new and emerging technologies in HVAC (e.g., [ductless mini split heat pump variable refrigerant flow \(VRF\)](#) systems) and will encourage HVAC participants to become certified under the North American Technician Excellence (NATE) certification program [or other appropriate credentials](#) as a means of demonstrating technicians and installers' ability to perform quality work. [\(Refer to Statewide HVAC PIP for more information.\)](#)

The Statewide IOU WE&T Program will work with Marketing Education and Outreach implementers on effective marketing and outreach strategies that will be designed to maximize participation in green career paths. For example, to increase awareness of the availability of training and career development programs, WE&T will contribute to the Web portal project to ensure that "green education" opportunities are accessible through the Web portal.

During the first 24 months of the program cycle, the Statewide IOU WE&T Program will be a guide for collaboration among the Department of Employment Development, community colleges, technical and vocational schools, industry and labor associations specifically on building job training programs and internships for students and preparing them for energy efficiency careers and related career paths. Collaboration will be aided by recruitment of key resources to help in promoting to students and continuing

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

education participants the types of employment prospects available in energy derived from the WE&T Assessment study and other market data.

Within the first 24 months of the program cycle approval, the Statewide IOU WE&T Program structure will demonstrate its effectiveness to drive statewide coordination among key stakeholders to expand continuing education and college extension programs to include a greater focus on energy/resource efficiency, sustainability and green technologies. The Statewide IOU WE&T Program structure clearly shows the inclusion to collaborate with the UC/CSU system and California's community colleges to bring an expanded focus on energy/resource efficiency to students and faculty; utilize the extension programs available through the colleges and universities to incorporate a continuing education curriculum component; and work with these educational institutions to help them with expansion of their green degree programs. The Statewide IOU WE&T Program will seek ways of increasing awareness of the importance of energy efficiency, sustainability and green technologies to California, and the key partners will be able to positively impact participation and enrollment in educational programs and green careers.

The Statewide IOU WE&T Program enhances relationships with K-12 public and private educators to share best practices to attract students and facilitate interest in energy efficiency careers and the study of energy efficiency and GHG emissions. The WE&T Connections Sub-Program implementation, in collaboration with WE&T Planning activities, will engage industry experts and educational specialists including but not be limited to: the State Department of Education, educators working at County Offices of Education, leaders in teacher organizations [e.g., California Science Teachers Association (CSTA), California Regional Environmental Education Community (CREEC), Regional Occupational Centers and Programs (ROCP), California Integrated Waste Management Board (CIWMB), and the California Environmental Protection Agency for the K-12 market to determine the inventory of educational resources, funding mechanisms, and include a breakdown of workforce development and strategic planning needed to establish career training for energy-related fields.

The California EPA and the California Integrated Waste Management Board (CIWMB) are involved in the implementation of AB1548. This is the development of a "unified education strategy to bring education about the environment into California's primary and secondary schools."<sup>19</sup> Identified are fourteen specific environmental topics where curriculum is currently being developed. The WE&T will engage in the State Department of Education Science Framework revision to encourage incorporation of energy efficiency and renewable energy emphasis.

The Statewide IOU WE&T Program will help steer more training outreach and green careers education toward minority, low-income and disadvantaged communities. The IOU administered [LIEE-ESA](#) program is expected to dramatically expand the number of units that will receive education and weatherization services during the [2010-2012](#)~~2013-~~

Formatted: Font: 8 pt, Superscript

<sup>19</sup> [www.calepa.ca.gov/Education/EEI/workgroups/envirotopics](http://www.calepa.ca.gov/Education/EEI/workgroups/envirotopics)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

[2014](#) program cycle. To meet the significantly higher goals, more communication and joint WE&T coordination will be necessary and desirable. The Statewide IOU WE&T Program creates an implementation framework to focus on expanding behavior modification in existing training programs to increase emphasis on energy efficient practices, steps that will enable installers, weatherization crews and energy specialists to build on the information they provide to minority, low-income and disadvantaged communities to achieve California’s economic energy efficiency potential.

**6. Program Implementation**

a) Statewide IOU Coordination

As part of the overall Program Implementation Strategy, the statewide IOU WE&T program plans to institute protocols and processes to identify and facilitate statewide migration of quality training models into each IOU service area, as well as into underserved communities within the respective IOU service areas, where appropriate.

Summary table of WE&T target sectors, program implementation and implementers:

Workforce Education and Training	Sub-Program	Sub-Program coordinated implementation
Schools	Green Campus; Energenius; PEAK	WE&T; IOU UC/CSU/CCC Partnerships
Commercial Market Segments	Tool Lending; Food Service; Building Design Training; Building Operations and Maintenance	WE&T (Energy Centers); Statewide Commercial Resource Programs; IOU Local Government Partnerships; BOMA; BOC; USGBC; New Construction; Codes and Standards
HVAC Industry	Tool Lending ;ACCA; IHACI - QI/QM/QS (ACCA standards inclusive)	WE&T (Energy Centers) Community Colleges Statewide <a href="#">Residential and Commercial Resource Programs, including their HVAC Sub-Programs</a>

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Residential Market Segments	Building Design and Construction Training; Energy Partners (PG&E); CLEO ( <a href="#">SCGSOCALGAS</a> /SDGE)	WE&T (Energy Centers) BIA – Remodelers; Statewide Residential Resource Programs; New Construction; BPI; <a href="#">LIEESAP</a>
Industrial/Agriculture Market Segments	Tool Lending; Audits/Assessments	WE&T (Energy Centers) Statewide Residential Resource Programs; DOE

b) Program delivery and coordination

Three areas of focus for the IOUs to deliver training curriculum to expanded audiences are:

**Joint statewide training and seminars** – comprehensive energy efficiency and clean energy educational seminars and conferences jointly hosted, promoted and sponsored among the IOUs, municipalities, government agencies, non-profits and industry experts.

**Distance learning** – web-based platform for synchronous and asynchronous access to digitally transmitted and pre-recorded (catalogued) on-line education and training modules. Distance learning enables webcasting as a communication tool to reach larger workforce audiences with specific training topics in a low cost manner. IOUs can explore co-production and access to on-line training curriculum with other agencies (i.e., CARB, CAL-EPA) to provide more comprehensive energy solutions training.

**Outreach** – Assist community-based training programs that offer energy efficiency and hands-on training green job curriculum to trainees in minority and other disadvantaged communities. These types of relationships will be coordinated with Low-Income Energy Efficiency programs and likely piloted regionally by IOUs to develop best practices, determine cost effective designs and fine tune a model for turnkey statewide migration. IOUs can help community training programs implement best practices, measure impacts and revise programs, while helping to shape and form standardize integrated resource curriculum (i.e., water, air emissions) beyond what can be offered by IOUs.

i. Emerging Technologies Program

The Statewide WE&T Program will collaborate with the Emerging Technologies program in an improved manner to allow external participation in the ET process. Working closer with ET to increase knowledge and confidence in emerging technologies, the WE&T programs will help with implementation of these new technologies disseminating information and training to enhance market transformation and acceptance into the marketplace.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

ii. Codes and Standards Program

The Statewide WE&T Program structure segregates Sub-Program curricula to make it easier to identify training opportunities that: 1) enhance interest in C&S career positions, 2) provide training on the codification process of energy efficiency and green laws, 3) provide direct industry training on energy and green implementation strategies in response to current or impending codes and standards, and 4) prepare the workforce for code compliance improvement tasks.

[WE&T Centergies will work closely with the Codes and Standards Program to support development of a sector strategy to support workforce development in an area with low compliance, for example, in HVAC. WE&T will maintain ongoing communications with the C&S staff to ensure coordinated development and inclusion of code-related content.](#)

iii. WE&T Efforts

The Statewide WE&T Program will support the other IOU EE Programs as appropriate. Refer to Section 6.b.iii for each Sub-Program for additional plans, if applicable.

iv. Program-specific marketing and outreach efforts

Refer to Section 6.b.iv. for each Sub-Program, if applicable.

v. Rationale for selection of sub-contractors

Refer to Section 6.b.v. for each Sub-Program, if applicable.

vi. Non-energy activities of program

Refer to Section 6.b.vi. for each Sub-Program, if applicable.

vii. Non-IOU programs

The proposed Statewide IOU WE&T Program structure is very significant in that they represent a feasible and respected leader to help flesh out the common ground for delivering and coordinating statewide workforce training program among IOU and non-IOU sponsored trainers. WE&T as a strategic platform can help facilitate energy neutral training, coordination and funding among not only IOUs, but other stakeholders linked to California's energy plans. Refer to Section 6.b.vii for each Sub-Program for additional plans, if applicable.

viii. CEC work on [PIER Electric Program Investment Charge \(EPIC\)](#)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Refer to Section 6.b.viii. for each Sub-Program, if Not applicable.

- ix. CEC work on C&S

Please see Section 6.b.ix. for each Sub-Program, if applicable.

- x. Non-utility market incentives

Refer to Section 6.b.x. for each Sub-Program, if applicable.

c) Best Practices

In addition to showing the relationship of the Statewide WE&T Program and Sub-Programs, Diagram I also illustrates the bi-directional interaction anticipated between the Sub-Programs under this structure. This represents IOU commitment to the WE&T strategic plan and its objectives, as well as IOU interests in facilitating stakeholder input in presenting, identifying and supporting IOUs efforts to create well-coordinated processes to connect and migrate local and regional WE&T models across the state based on best practices identified by a variety of stakeholders. The WE&T taskforce, with CPUC, IOU and statewide stakeholder roles can have a long-term impact on WE&T implementation plans of IOUs by maximizing the benefits of the structure presented. Regularly scheduled meetings among WE&T taskforce members will ensure that voices can be heard, IOUs implementation plans can be discussed and long-term WE&T strategic progress is addressed. As has been described in this section in some length, by layering the strategies outlined in the Strategic Plan on the Statewide IOU WE&T PIP, the IOUs see that as a sustainable framework for achieving the various goals sought by the CPUC from the IOUs.

d) Innovation

Refer to Section 6.d. for each Sub-Program, if applicable.

e) Integrated/coordinated Demand Side Management (IDSM)

~~Refer to Section 6.e. for each Sub-Program, if applicable.~~

~~The statewide WE&T team will continue to coordinate IDSM education and training efforts by working with IDSM program staff and as a member of the IDSM Task Force. For PG&E's 2013-2014 program, PG&E will consolidate the its Local IDSM integrated education and training subprogram into the statewide WE&T program. PG&E believes that consolidating the scope and budget for local IDSM activities into PG&E's existing programs is a more streamlined, understandable way of administering local IDSM activities, since integration efforts are currently underway in various areas of PG&E's portfolio. This program provides PG&E employees, vendors, and partners with training to educate customers and foster customer participation in IDSM programs.~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

f) Integration across resource types

Refer to Section 6.f. for each Sub-Program, if applicable.

g) Pilots

~~There are a few pilot concepts that are being introduced to the WE&T Sub Program portfolios. A pilot to the Statewide IOU WE&T Program committee represents a new concept that is being implemented on a limited scale for a duration of at least one year by one or more of the IOUs, and then evaluated using internal metrics and criteria for presentation to the statewide IOU WE&T representatives. Once the statewide IOU WE&T committee agrees that a particular idea or innovation has merit—and funding among the IOUs on a statewide basis is deemed sufficient—the IOUs will adopt the pilot for statewide migration, establishing a project plan for integration as a statewide program and implementation across all IOU service areas. Each IOU will track the adopted Sub-Program pilot toward the statewide targets and goals to determine whether the pilot is generating the intended results in the new regions. Refer to WE&T Sub Program sections 6.1.g, 6.2.g, and 6.3.g for specific detail of planned pilots. As directed in D.12-05-015, the IOUs will test a sector strategy approach. No pilot programs are planned for WE&T in 2013-2014.~~

In 2012, the IOUs have started work to develop an HVAC sector strategy approach, to be implemented in 2013-2014. Details are provided in the Centergies Subprogram. PG&E's Green Pathways Program was successfully piloted in 2010-2012, and will transition to a local program for 2013-2014. More details are provided in the Connections Subprogram.

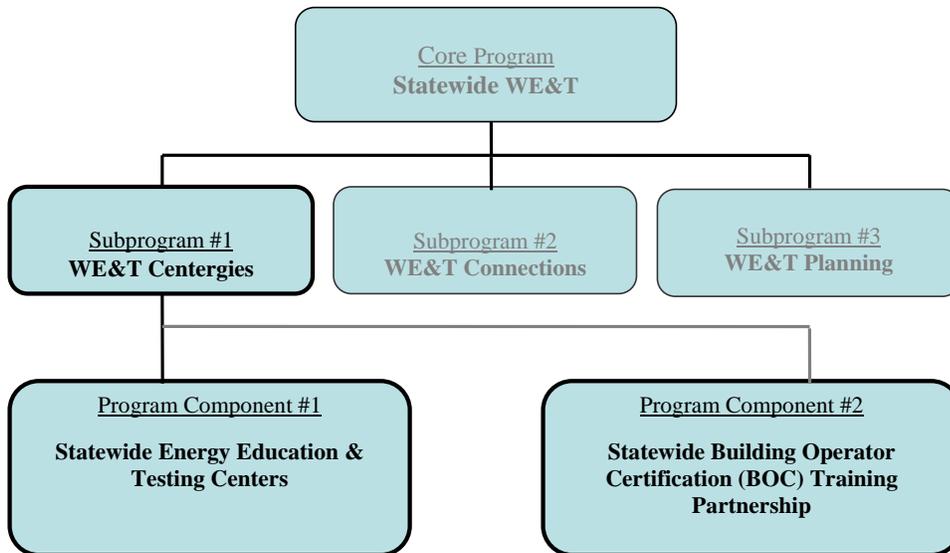

h) EM&V

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

Refer to Section 6.h. for each Sub Program, if applicable.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

6.1) Sub-Program Implementation – WE&T Centergies – [SCGSCG3729](#)

a) Statewide IOU Coordination

i. Program name

The Statewide WE&T “Centergies” is a Sub-Program within the Statewide WE&T Core Program. The “Centergies” Subprogram has two primary components which are diagramed above and described in greater detail below. Parts to the “components” shall be referred to as “elements”.

ii. Program delivery mechanisms

[The IOUs will continue to deliver workforce education and training through two delivery mechanisms: Statewide Energy Education and Testing Centers and through the Building Operator Certification \(BOC\) program.](#)

**Statewide Energy Education and Testing Centers**

Through their energy education and testing centers (Centers), California’s IOUs have been supporting the energy efficiency workforce and partnering with 3<sup>rd</sup> Party and Local Government Partnerships, in some cases, for over 30 years. The Energy Training Center (ETC), Food Service Technology Center (FSTC), and

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Pacific Energy Center (PEC) will align with the statewide WE&T goals of the Strategic Plan by addressing the training needs of the midstream and upstream mass market, commercial, industrial, and agricultural actors through state-of-the-art classes designed to enable building professionals to reduce energy consumption in new and existing residential and small commercial buildings. As disseminators of information, the Centers are structured to deliver integrated energy efficiency, demand response, and renewable energy program information through their offerings described below. The Centers serve as a “public face” in interactions with the community and as a conduit to California’s local and statewide energy efficiency programs. Through the ~~2010-2012~~[2013-2014 cycle/bridge/transition period](#), the Energy Centers will partner with appropriate California industry and labor organizations, professional organizations, trade and vocational schools, community colleges, universities, third-party entities, government partners serving low-income or disadvantaged communities, and other IOU and POU education and training centers. By delivering technical information through a wide variety of courses and technical consultations, the Energy Centers will support and enhance programs which address demand side management (DSM), demand response (DR), distributed generation (DG), water and energy use, codes and standards, emerging technologies, renewables, and all incentive programs. The Energy Centers will ensure maximum effectiveness and impacts needed to achieve long-term energy savings goals for California. With some variation at the local level, the Centers have and will continue to evolve their elements to:

- Deliver high-quality integrated educational seminars to train members of the energy efficiency workforce, including entry-level contractors, disadvantaged community members, university and community college students, architects, food service facility designers and operators, HVAC engineers, equipment installers, manufacturers, developers, and commissioning agents. Based on factors, including changes in technology, changes in codes and standards, and feedback from seminar participants, seminars will be modified to more effectively integrate topics such as distributed generation, DR, and EE as described in section 6.2.e and 6.2.f. Seminars will continue to include transferring skills on energy audits to members of the EE workforce at various stages in their careers—novices to seasoned energy auditors.
- Provide technical consultations and equipment demonstrations through building design plan and equipment schedule reviews, technical advice on new equipment and system technologies, technical advice on best-practice methods, and site visits for identifying energy efficiency opportunities. Site visits shall not replicate the efforts of the energy audits program, but rather be conducted when necessary to provide technical advice.
- Where Outreach falls under the local Center, provide on- and off-site outreach programs for disseminating technical EE information, and promoting utility

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

energy efficiency incentive programs to green- and white-collar building professionals. Outreach programs will include, but not be limited to: on-site facility tours, off-site short presentations about Centers' offerings, participation in environmental fairs and events. Centers shall work with their IOU's marketing groups so as to collaborate, but not duplicate efforts.

- Design, certify, and maintain food service equipment test protocols that allow for unbiased measurement of energy efficiency and production capacity while engaging manufacturers and chain operators to test equipment and build user accessible performance results databases. This data provides the foundation for future training programs across the Food Service spectrum as well as the technical support for rebate and other programs provided by the IOUs.
- Expand and integrate tool lending library programs that provide building and system performance measuring instrumentation, instrument use information, and measurement protocols. Tool lending libraries will loan tools free of charge to people working on short-term EE projects in California. Patrons will include building operators, facility managers, designers and other professionals who use the tools for building diagnostics, site analysis, power and energy consumption studies, research projects, and educational efforts.
- Expand energy efficiency educational partnerships with institutions that include government, professional, and trade organizations that will help Centers deliver IOU programs and information to a broader audience. Examples of such groups ~~are~~ include, but are not limited to the U.S. Green Building Council, Building Owners and Manufacturers Association, American Institute of Architects, American Society of Heating, Refrigerating, and Air-conditioning Engineers, the Association of Energy Engineers, the Illuminating Engineering Society, Institute of Heating and Air Conditioning Industries, Air Conditioning Contractors of America, Affordable Comfort Inc., Building Performance Institute, Residential Energy Services Network, Apprenticeship Training Programs, North American Technician Excellence, the National Restaurant Association, Foodservice Consultants Society International, North American Foodservice Equipment Manufacturers, National Environmental Balancing Bureau, Stationary Engineer Unions, U.S. Environmental Protection Agency / Department of ENERGY STAR, American Society for Testing and Materials, ~~and~~ the California Energy Commission, California Division of Apprenticeship Standards, International Brotherhood of Electrical Workers, National Electrical Contractors Association, Sheet Metal and Air Conditioning Contractors' National Association, Counselors of Real Estate, Institute of Real Estate Management, and the International Facility Management Association. More detail on educational partnerships is available as part of the Statewide WE&T Connections Sub-Program.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Support building energy efficiency by developing training sessions to prepare the marketplace for new HVAC codes (acceptance testing and HERS verification), technologies, and innovative whole building approaches to new and existing buildings. Since the HVAC Big Bold initiative will expand training and education aimed at the HVAC industry, the WE&T program will coordinate carefully to complement HVAC industry training by providing educational support to related market actors such as energy consultants, Home Energy Raters, engineers, architects, and home performance contractors. It is anticipated that the robust HVAC industry training proposed by the HVAC program will create important collaboration opportunities to not only increase training opportunities, but to embellish energy center offerings and impacts.
- Increase statewide Energy Design Resources (EDR) Integration. (EDR) is an existing statewide energy efficiency resource website featuring design materials on how to effectively integrate energy efficient designs into nonresidential facilities. EDR has begun developing the structure to expand the materials and tool offerings to include residential design requirements. While EDR is not funded through WE&T, EDR content is very relevant to the Centers' WE&T direction and goals. Centers will integrate EDR content (online classes, case studies, materials, etc) as statewide resources that are relevant to specific classes, outreach efforts, and consultations.

The table below summarizes common Center elements defined above.

Centers' Elements	SCE AGTAC	SCE CTAC	PG&E ETC	PG&E PEC	PG&E FSTC	SDGE SDERC	SCGS <sub>o</sub> CalGas ERC	SCGS <sub>o</sub> CalGas FSEC

\* SCGSoCalGas has not developed a feasible way to manage tool lending. Continuing discussions with other Energy Efficiency program areas to identify potential opportunities.

**A. Changes for 2013-2014 Statewide Program Coordination through IOU Energy Centers:**

The IOUs will modify Centergies curriculum and delivery methods to incorporate feedback and guidance from sources, including the California WE&T Needs Assessment, customer feedback from the 2010-2012 Process Evaluation, and the Guidance Decision for 2013-2014. Such modifications include, but are not limited to, approaching curriculum development with the sector strategy approach.

**1. Heating Ventilation and Air Conditioning (HVAC)**

IOUs will incorporate and integrate HVAC education and training programs into its Workforce Education and Training Centergies sub-program to deliver a dedicated, industry-specific education and training opportunities targeted at all levels of the HVAC value chain. As part of this effort, IOUs will convene various stakeholders from, but not limited to, community colleges, trade organizations, professional organizations, employers, and apprenticeship/pre-apprenticeship programs including through the IOU-sponsored Western HVAC Performance Alliance stakeholder collaboration group, which has WE&T-specific committees already built into its structure. This will allow for identifying skill gaps and to identify opportunities for collaboration in a coordinated effort toward implementing recommendations needed to close gaps at all levels of the industry.

**HVAC Sector Strategy Plan:**

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

In response to the Guidance Decision, the IOUs have begun work in 2012 to develop a plan as described below to expand their educational efforts toward more direct effect on trade organizations that have memberships involved with installation and maintenance of commercial HVAC systems. IOUs will test a non-residential HVAC sector strategy. A core component will be the development of a multi-stakeholder partnership to develop a full implementation plan to apply the CALCTP sector strategy approach to the HVAC non-residential industry. The IOUs will begin with Quality Maintenance to provide the foundation, and then included a Quality Installation sub-strategy. Cornerstones of the Quality Maintenance implementation plan include identifying priority emerging technologies for improving EE related non-residential HVAC systems, identifying the knowledge, skills and abilities (KSAs) professionals need to install and maintain systems efficiently and safely as well as the linkage of these KSAs to ANSI or ISO certifications, and, developing a steering committee.

IOUs will collaborate on a statewide memorandum of understanding (MOU) with the California Division of Apprenticeship Standards. The MOU will provide a framework for partnering with labor, trade, and professional organizations that resembles the existing CALCTP program. Such an MOU will help to reinforce cooperation in achieving goals of the sector strategy test of having certified training modules, performance based principles to test and diagnose the HVAC system, site information for the contractor to design and implement real solutions for customer comfort and efficiency, training that takes good HVAC technicians to the next level and gives them the tools to maximize efficiency, comfort and safety of customers in the construction of new systems, and real-time analysis to track and maintain data from completed projects by trained participants.

Because of early activities with sector strategies, IOUs will be applying recent lessons learned from their related efforts within Commercial EE to the HVAC sector strategy, as it develops.

IOUs will work with qualified partners to institute a test that will enable HVAC workforce member to attend various HVAC classes and receive credit towards industry-recognized certifications or other appropriate credentials. The IOUs will also contact and extend partnership opportunities designed to improve installation and maintenance quality of Commercial HVAC units.

The IOUs have initiated discussions to determine the parameters of an HVAC sector strategy, to be deployed in 2013. The IOUs have identified a core group from across lines of business, and externally, the IOUs have begun to discuss pilot concepts with the other IOUs and external stakeholders such as the Western HVAC Performance Alliance and the Division of Apprenticeship Standards.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Based on best practices from CALCTP and PG&E's own commercial EE sector strategy, the IOUs recommend starting with a Needs Assessment to determine where gaps and opportunities exist, prior to determining the HVAC sector strategy's specific objectives and goals. The initial research and discussions have pointed PG&E towards developing a concrete project within HVAC non-residential Quality Maintenance (QM). This is due to various reasons, including the fact that advancing HVAC Quality Installation is often based on building a larger foundation of contractors and customers adopting QM and establishing associated relationships of trust. Additionally, PG&E believes QM forms a stable and focused basis for testing a sector strategy because it is based on a single consensus industry standard. Lastly, due to the fact that a sustainable QI program is not yet in market, any initial sector strategy test would ostensibly be premature.

With Quality Maintenance as a test, the IOUs intend to glean lessons learned from that approach, to be subsequently extended into the quality installation approach to the HVAC sector strategy.

The IOUs will endeavor to have skills standards for HVAC installations established by the end of 2013. The IOUs will continue to provide necessary training as a component of the quality installation and quality maintenance programs. The current design is geared toward providing the highest possible level of installation and maintenance expertise for contractors and technicians working within the HVAC subprograms. The IOUs will continue to use the basic foundations of Title 24 acceptance testing regulations and the consensus HVAC industry standards as the basis of requirements for this training. The IOUs will continue necessary training as a component of HVAC programs. These programs will continue to evolve as needed to meet program changes as they develop.  
In order to estimate costs associated with requiring certification or sector strategy induced skills standards, the IOUs will collaborate starting in 2012 with the Commission's Energy Division through the HVAC EM&V Project Coordination Group (PCG) on the new, baseline research needed to best address questions regarding impacts or potential benefits, according to appropriate EM&V best practices.

**2. Support for California Advanced Lighting Controls Training Program (CALCTP)**

The IOUs will continue to partner with CALCTP to offer CALCTP trainings as part of their portfolio of classes to various sectors of the advanced lighting controls workforce, including electricians, contractors, business managers, installers, specifiers, marketing reps, and designers. Where appropriate, IOUs will serve as program advisors and instructors, and provide direct financial and

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

in-kind support to help sustain the program. IOU contributions will augment funding and support from other stakeholders, including employers, unions, other training partners, and manufacturers. Where appropriate, IOUs will continue to provide letters of support to secure grants to help support CALCTP and will continue to serve on the CALCTP board of directors and advise CALCTP curriculum developers.

To assess mandatory or voluntary incentive-based approaches to promoting high-road skills standards as part of the HVAC sector strategy initiative or CALCTP training, IOUs will work with relevant resource program managers to identify opportunities to create or enhance incentive programs that are linked to the participation of members of the workforce who have specific qualifications and/or credentials. For example, IOUs will explore the opportunity to provide an additional incentive directly to the customer if the customer hires a CALCTP certified electrician, in order to help create demand for participation in IOU-supported training programs such as CALCTP. The same model can be applied to the HVAC industry as well as other sector strategy approaches. In response to the guidance decision (at p. 283), the IOUs provide the following information about the CALCTP program.

<b>Request</b>	<b>CALCTP Information</b>
<u>(1) Data or estimation of the incremental customer cost, if any, of requiring skill standards;</u>	<u>(1)When the program requires CALCTP certified installers, the cost to the customer for the labor component of the project may be 10% - 15% more than prior when no certification was required.</u>
<u>(2) Data or estimation of the average and range of permitting/compliance costs across permitting jurisdictions in the IOUs' service territories;</u>	<u>(2) Compliance and permitting cost are directly associated to the cost of proper training programs for designers, installers, manufacturers, etc. which may be equivalent to an additionally 20% to the project cost. However, proper collaboration with industry associations and manufacturers may offset this cost.</u>
<u>(3) Data or estimation of impacts, if any, mandatory skill standards would have on program participation rates;</u>	<u>(3) With proper incentive levels and education of the segment, it is anticipated that adoption/participation would increase since the misperceptions of advanced lighting control systems, potential for demand response and how DR or ADR works will be corrected causing more demand for the control solution.</u>
<u>(4) Data or estimation of impacts, if any,</u>	<u>(4) It has been proven with advanced</u>

Formatted Table

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

<p><u>mandatory skill standards would have on program participation rates;</u></p>	<p><u>lighting control system assessment projects at PG&amp;E, SCE and SDG&amp;E that the customer will achieve a minimum of an additional 30% savings over traditional lighting efficiency measures. And dependent upon the level of control allowed to individual employees, savings may increase an additional 5% - 10%. With the opportunity to participation in DR, the customer will achieve even greater cost savings due to the ability to shave or control peak loads. The actual dollar values will be determined as the program adoption occurs and customer site performance is monitored and data collected.</u></p>
<p><u>(5) Any other potential benefits associated with higher standards, such as fewer call-backs, lower frequency of customers over-riding control systems, lower life-cycle costs, and increased consumer uptake of measures based on higher quality and certainty.</u></p>	<p><u>(5) Additional benefits include: a. systems do not get overridden due to better understanding as well as the system being designed and installed. Also, ease of proper training of customer personnel regardless of turnover with the local certified installer; b. IOU assessments have shown that fewer, if any, call backs will be experienced when the system is installed by a certified installer. In contrast, numerous call backs were experienced before the system was able to be commissioned when a non-certified installer was used. c) increased proper maintenance, d) higher visibility of actual energy use in lighting due to the potential of graphic interfaces and other reporting. e) ability to track GHG emission reductions. f) create market disruption as customers begin talking to others about how well their advanced lighting control system is working and saving them money due to proper design and installation.</u></p>

**3. Coordination with Energy Upgrade California's Whole Home Upgrade (EUC - WHUP)**

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The IOUs will continue to develop and produce a core set of offerings in 2013-2014 that will be geared to providing interested contractors and technicians with the program knowledge necessary to provide entry, as well as support for their continued participation into WHUP.

To increase emphasis on workforce training for WHUP, the utilities will work with various “trade organizations” to share existing and future course offerings for their membership. The sharing of these courses is intended to expand the relevant knowledge base of partnering organizations, with regards to WHUP, and thereby improve the quality of energy efficient products installed throughout California.

PG&ESoCalGas will continue its current efforts to offer “continuing education credits” for organizations such as NATE, BPI, AIA, NARI, and other certification programs to be approved. PG&E is currently working with IHACI, SMACNA, National Association of Realtors, and others.

In consultation with local governments, the utilities will expand their training networks to include specific contractor and technician training. In addition, the utilities will work with local governments to identify geographic listings of contractors and technicians who will address community needs and comply with local codes and standards. In addition, the IOUs will conduct a gap assessment with local governments to identify additional needs not currently addressed.

PG&ESoCalGas will continue to work through our local government partnerships to ensure we have identified and marketed to contractors in areas served by those local jurisdictions, including multifamily programs.

- Coordination with Energy Savings Assistance Program (ESAP) Training and Certification

In 2012 the IOUs will engage with various Community Based Organizations, Local Training Facilities and Community Colleges to identify the most appropriate methods to partner with them to serve disadvantaged members of their communities. In 2013-2014, based on results of discussions with other relevant organizations, the IOUs will develop agreements to offer or share existing curricula with these partners to better serve their communities. These curricula will be designed to provide potential employment tracks within EE through entities such as trade organizations, IOU weatherization programs and weatherization programs offered through State agencies.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

PG&E's partnership with the Energy Savings Assistance Program has provided low income utility customers with a variety of energy efficiency improvements for their homes for over 30 years. Recently a connection between the ESA Program and the PG&E PowerPathway Training Network for Energy Efficiency and Renewables has developed the methodology to articulate a portion of ESA required training to our outside partners in the network. The result has been an opportunity for our PowerPathway partners to offer some of the training to local students (generally members of disadvantaged workers within their communities) and provide a gateway to future employment with contractors participating in the ESA Program.

The community colleges and the community based organizations that have partnered with PowerPathway have demonstrated that they can offer equivalent training for skills based training through their facilities which results in a reduced cost to contractors wishing to hire new assessors and installers for the program. The result of the articulation also reduces the initial cost of training for participating contractors (a key consideration in the hiring decision) making the individual more likely to be successful in their employment search. In addition, the contractors that have taken advantage of this symbiotic relationship have also found it has resulted in essentially these prescreened candidates are more likely to be long term employees of the program. PG&E expects that relationship will add stability of the workforce and provide a long term job opportunity for those students that wish such an opportunity.

- Real Estate Agent Training

In 2012 the IOUs will make an initial introduction of courses designed to stimulate interest within the Real Estate community to expand their knowledge of benefits of EE in resale of residential and commercial properties as well as provide continuing education opportunities through partnership with various local, state and national oversight entities. Consultations in 2012 with relevant stakeholders are planned to continue into 2013-2014, so that ongoing feedback can lead to continuous improvement of these efforts. In 2013-2014 these offerings will be restructured, if necessary, and expanded to meet increased needs of these groups.

The utilities in 2012 will make initial entries into partnerships with various real estate groups within their territories in an attempt to gauge possible obstacles to WHUP trainings to enhance knowledge of EE by their memberships. In addition, the first forays into workshop offerings will be targeted at areas likely to be receptive to the sessions. In 2013-2014 the partnerships and offerings will be increased to provide a better

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

understanding of the value of WHUP in real estate transactions. Consultations in 2012 with relevant stakeholders are planned to continue into 2013-2014, so that ongoing feedback can lead to continuous improvement of these efforts.

PG&E has partnered with California's real estate community with the delivery of two classes where students learn the science behind home performance and energy efficiency measures, how to determine their value, and how to finance and promote these measures in homes. PG&E collaborated with local realtor and appraiser professional associations in hosting and promoting these classes. A local EUCWHUPWHHPP representative gives a short presentation on the program. The "Green Homes: Valuation Expertise for Appraisers and Realtors" class has been approved for continuing education units (CEUs) from OREA (state Office of Real Estate Appraisers) and DRE (Department of Real Estate).

**4. Additional information Required in Guidance Decision**

• Serving Low Income and Disadvantaged Communities

IOUs will build partnerships with community-based organizations to offer on-location joint utility workshops in disadvantaged communities. These workshops will promote IOU low income programs, training, and certification opportunities at IOU Energy Centers and community-based organization locations. IOUs will explore providing presentations and materials in languages other than English, as appropriate to each community and partnership, to overcome any barriers of communication to customers in the disadvantaged communities. Please see additional information regarding efforts to serve low income and disadvantaged communities in Attachment 1 to this addendum.

• Other Program Coordination

WE&T will work with the Continuous Energy Improvement Program to introduce the CEI process, lessons learned, and case study input to community colleges and universities. CEI has a goal of integrating into energy engineering curriculum. IOUs will also work with CEI to assess and determine specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges. IOUs will also continue with WE&T coordination and cost sharing to bridge-transition the linkages and integrate sector strategy approaches.

PG&ESCGSoCalGas has begun implementing a sector strategy to accelerate the development of the Commercial demand-side management

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.65", No bullets or numbering

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

workforce needed by PG&E, the other IOUs and larger EE industry. This implementation is the result of statewide research and cross-stakeholder collaboration, with a focus on deepening partnerships between education and industry. Core programs have already been developed to link WE&T to energy goals. Moving forward, PG&ESCGSoCalGas will be refining those programs, developing new programs and building an overall project plan for deliverables in 2012 as well as in 2013 and beyond. This strategy has already begun to provide key lessons for application towards similar strategies within other priority sectors.

In 2013-2014, WE&T will work with the Benchmarking and IDSM Programs in similar manner as proposed for the Continuous Energy Improvement Program to introduce the processes, lessons, and case studies curriculum to working energy management professionals, industry professionals, IOUs will consider a sector strategies approach in furthering development of these collaborative effort.

- Safety Related Training

The IOUs currently conduct Natural Gas Appliance Testing (NGAT) training where appropriate, and in particular when working with providers of low income weatherization programs. No lead or asbestos abatement certification is currently required as part of IOUs' low income weatherization training programs, only identification of potential conditions, because licensed contractors are expected to obtain such training as required.

PG&ESCGSoCalGas through many of its contractor training programs currently provides training and consulting services for the appropriate combustion safety protocols (Natural Gas Appliance Testing (NGAT) or LIHEAP Combustion Appliance Safety (CAS) protocols for the Low Income Energy Efficiency-Energy Savings Assistance Program's weatherization programs, and augmented Building Performance Institute (BPI) protocols for Energy Upgrade California-Whole Home Upgrade Program non-low income weatherization programs. Although EPA RRP (Renovation, Repair and Painting Rule) certification is not provided as a part of PG&E's utility low income residential weatherization training curricula, all participating contractors are required to be EPA RRP certified.

- Attachments to Addendum in Response to Guidance Decision

Attached to this addendum in Attachment 2 is SCGSoCalGas's list of courses and programs planned for 2013-2014, using the template provided

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

in the Guidance Decision (Appendix C). Course offerings may be modified, based on market training demands and input from industry stakeholders. Per WE&T's Joint Advice Letter<sup>20</sup>, IOUs will redesign and structure select courses offered in 2013-2014 such that they become part of a series.

**Local Energy Center Program Changes for PG&E Only:**

**Zero Net Energy**

— For 2013-2014, PG&E will transition its Zero Net Energy (ZNE) Pilot Program education and training efforts into its Workforce Education and Training Centergies sub-program. The Centergies team will partner with the ZNE team to deliver:

- At least 25 public educational workshops on key ZNE topics, with a focus on two integrated workshops series that have been developed on the design of residential ZNE and non residential ZNE buildings, respectively.
- “Train the trainer” workshops on ZNE design that will enable information about ZNE and relevant design strategies and technologies to reach a wider audience within the building design community more quickly.
- Development of online education module, focusing on the design of ZNE communities and buildings and/or case studies of recently completed ZNE projects.
- Two stakeholder forums, one each year. These forums bring together key ZNE players and stakeholders for presentations and discussion of major ZNE-related subjects. These forums encourage and support interaction between stakeholders such as utility staff, policymakers, developers, builders, architects, engineers, state and local governments, and the business community.

ZNE will continue to maintain and update the ZNE program website with relevant events and information. The website will host completed technology studies, case studies, and links to online education modules on ZNE design.

---

<sup>20</sup> SDG&E 2260-E-B/2041-G-B, SCGSOCALGAS 4249-B, SCE 2588-E-B, and PG&E 3212-G-B/3852-E-B

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

**Statewide Building Operator Certification (BOC) Training Partnership**

In addition to IOU coordination of Energy Center activities, the IOUs will continue to offer Building Operator Certification training to the commercial building workforce in their territories.

**Statewide Building Operator Certification (BOC) Training Partnership**

Building operators are a sector of California’s green collar workforce that will continue to play a major role in improving and maintaining California’s energy efficient building stock.

Buildings at all scales—small commercial to high-rise commercial and universities—that are designed to operate at a high level of energy efficiency and comfort often fall short of design expectations for many reasons, including unexpected occupancy or use patterns, malfunctioning controls, incorrect installation, and equipment that falls out of calibration over time. Building operators and facility managers play major roles in ensuring buildings are performing at the level of efficiency and comfort they were designed to perform.

Building Operator Certification (BOC®) is a national program providing education and accreditation in the field of energy efficiency of commercial and institutional buildings. BOC has been recognized by the American Council for an Energy Efficient Economy (ACEEE) as one of the country’s “Exemplary Programs.” With more than 6,000 facility professionals earning the credential, BOC is widely recognized by key employers as a means to distinguish skill proficiency for energy management in buildings.

As an active national training program, BOC is well positioned to provide training for workers looking to establish or enhance their building energy efficiency skill sets as well as those who may need foundational building and energy efficiency training as an entry point to a growing clean energy career path. BOC’s target workforce audience includes building engineers, stationary engineers, maintenance supervisors, maintenance workers, facility coordinators, HVAC technicians, electricians, operations supervisors, operations technicians, and others in the facility operation and maintenance field.

The BOC curriculum supports a credential at two levels. The Level I certification provides a strong grounding in commercial building systems, the key energy using equipment within the building, and how improved energy management technology and practices can reduce operating costs, improve comfort and productivity, and reduce the building’s carbon footprint. The Level II certification builds on the Level I competencies with additional technical specificity in key building energy use areas such as HVAC, controls, and electrical equipment. In total, the BOC curriculum offers a comprehensive 130 hours of training. A list of class topics for Level I and II are provided in the [Appendix Attachment 2](#).

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

*BOC Beyond the Classroom*

BOC offers a classroom training component supplemented by both an exam process for credentialing and a practicum component. Participants utilize a set of project assignments which help ensure that energy management principles are well understood and can be actively applied in buildings. The program has had numerous third party evaluations over the past 10 years and has been rated very positively by participants and their employers. These evaluations have consistently reported significant energy savings for employers who utilize credentialed BOC employees. Utilities across the country are supporting BOC and many utilize the core training program as a means for professional development of their internal staff.

*Employers and BOC*

BOC is being used by employers across the country for their energy management training needs. Public agencies, private employers, property managers, schools, universities, and healthcare institutions are all active BOC participants. Many companies and public institutions use BOC as a component of their professional development track for their employees. Examples of employers using BOC include California State University System, Irvine Company, Providence Health System, Raytheon, State Farm Insurance, and Washington State General Administration.

*IOUs and BOC*

The IOUs have been collaborating with BOC to offer California building operators competency-based training and certification, resulting in improved job skills and more comfortable, efficient facilities. Through a coordinated effort, the four California IOUs offer BOC training to their commercial and institutional customers. The statewide program combines classroom training, exams and in-facility project assignments to train and certify building engineers and O&M technicians in the practice of energy efficient building operation and maintenance. NEEC has implemented the program for the IOUs since 2002.

The IOUs will work with BOC to shape and realign the BOC certification program to be consistent with the California Long Term Energy Efficiency Strategy Plan (Strategic Plan) [as well as other guiding documents, including the California WE&T Needs assessment and the Guidance Decision](#). Changes to the BOC curriculum and program will include:

- Following up with program participants to assess content implementation into existing facilities;
- Expanding the number of and improving the dissemination of case studies of model energy efficiency projects conducted by program participants in combination with other demand side management (ex: onsite generation and demand response) improvements when applicable;

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Incorporating BOC materials and findings into broader IOU Centers' curriculum and vice-versa;
- Better integration between BOC and other utility and utility-sponsored integrated EE, DR, and distributed generation programs;
- Better integration between BOC and other utility-sponsored energy efficiency education and other demand side management programs, including the BOMA Energy Efficiency Program (BEEP);
- Continuous updating of curriculum materials to include information about monitoring and operating zero-net energy buildings;
- Emphasizing diagnostic and troubleshooting strategies in BOC curriculum and including materials of the use of measurement equipment; and
- Developing an annual awards program for BOC program participants annual awards program to recognize graduates for their energy efficiency building operations implementation efforts, including improved building performance from measured energy savings, documented improvement in occupant satisfaction/comfort, or document tenant complaints.
- Per feedback received from the 2010-2012 Process Evaluation via Opinion Dynamics, offering the BOC four-part webinar series as a cost-effective way to address a growing demand for web-based learning, increasingly limited budgets among building operations staff, and for continuing education credits for maintaining certification.
- As resources allow, working with local workforce investment boards (WIBs) to develop specific programs to offer BOC trainings to experienced, but displaced building operators at a significant discount. Such programs will also include opportunities to implement course material into actual buildings as well as development of "soft skills," including resume writing and interview techniques.

*Local BOC Program Variations among IOUs:*

IOUs will implement the BOC program statewide as described above throughout their territories.

**2013-2014 BOC Course and 4-Part Technical Webinar Series Targets**

	2013			2014

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

iii. Incentive levels

Not applicable.

iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms

~~Each of the Energy Centers will develop and distribute two (2) course calendars per year to potential attendees, including mid- and upstream target groups and past participants. The ETC's course calendars will be mailed using a database of more than 60,000 names. For the PEC, distribution will be made to 45,000 potential attendees.~~ Over the years, the Energy Centers have identified and cataloged these individuals as having the greatest capability of exerting significant influence on the energy efficiency decisions of customers based on the multiplier effect. Energy Centers will continue to expand their marketing efforts by incorporating innovative and creative approaches to reach new target audiences including industry and labor partners, colleges and universities, local governments, and third party partnerships, and will continue to cross-market their courses through its established relationships with various professional organizations. Energy Centers have and will continue to rely on email promotions to people in their combined database of potential students. The Centers will continually update their database to ensure accuracy and targeted marketing for seminars.

Training sessions and workshops will be marketed through ~~PG&E's Energy Centers' combined education and~~ [SCGSoCalGas's Internet Event Business Management System \(IEBMS\)](#) training website ([www.socalgasSoCalGas.com/erc](#)), the ~~Energy Upgrade California-Whole Home Upgrade Program web site~~ [Flex Your Power e-newsire publication](#), professional organizations' websites, HVAC distributors and vendors, California Community Colleges, energy fairs, trade shows, and energy efficiency / environmental events designed to increase awareness of the [ETC Energy Centers](#) and ~~its their~~ education programs to prospective participants. ~~In addition, other programs in PG&E's portfolio will support the activities of the ETC by recommending classes and services and collaborating to develop new courses targeted to their individual needs.~~

Over the past several years, the Energy Centers have worked with labor and industry to qualify many of their courses for accreditation. Through these outreach efforts, the ~~ETC has~~ [Energy Centers have](#) been able to certify many of its ~~residential classes~~ for continuing education credits from the following organizations: Build It Green (BIG), North American Technical Excellence (NATE), American Institute of Architects (AIA), National council for the Qualification of Lighting Professionals (NCQLP), and the National Association of the Remodeling Industry (NARI). The U.S. Green Building Council (USGBC)

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

will soon begin a continuing education program for its LEED™ Accredited Professionals to maintain their accreditation, thus providing another target audience for the Energy Centers' courses. ~~Both the ETC and PEC~~[The Energy Centers](#) will continue to reach out to these and other industry groups and labor organizations, and will expand their marketing to vocational training institutions and programs which serve low-income, disadvantaged communities.

The Energy Centers will leverage their long-standing partnerships with the California Community Colleges, UC/CSU system, State of California Community Services Department, USDOE Industrial Technology Program, the Building Operator Certification (BOC), and the California Energy Commission Industrial and Agricultural Programs during ~~2010-2012~~[2013-2014](#) as part of its overall marketing and outreach efforts to attract and train the next generation of the green collar workforce. In addition, the ~~ETC~~[Energy Centers](#) will partner with the ~~Energy Savings Assistance Program~~[Low Income Energy Efficiency \(LIEEESA\)](#) to improve, expand, and extend training offerings to disadvantaged communities. The ~~ETC~~[Energy Centers](#) will also coordinate with the ~~LIEE~~[ESA](#) Program to enhance recruitment of low-income workers.

FSTC works directly with ~~SCE and the CTAC and FSEC (SCG)~~[SCGSoCalGas](#) on coordinating the seminars and events relating to food service. ~~FSTC~~[The statewide food service energy center team](#) provides the technical support for the statewide ~~Kitchen~~[Energy Wise Food Service](#) Equipment rebate programs and for target market incentives for food service. The target audience for FSTC ~~and the~~[statewide energy center](#) activities is to a significant extent; corporate or franchise customers whose decision makers are located outside of PG&E's service territory or, more likely, outside of California. FSTC maintains close communication with the other IOUs ~~and the food service energy center teams~~ in order to provide coordination of programs or information aimed at these customers.

- v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable

*Carbon neutrality* – ~~ETC~~[Energy Centers](#) will support AB32 compliance by incorporating waste and greenhouse gas (GHG) emissions reduction information into all appropriate training courses. ~~ETC~~[Energy Centers](#) will prioritize its training and DSM efforts based on the carbon content of sources used to meet building energy loads and by challenging people to eliminate carbon consumption. Technical expertise, educational programs and support for the Big Bold Zero Energy New Home goal and California's vision of achieving zero net energy residential buildings by 2020 and commercial buildings by 2030, will also be made, as well as training on methods needed to achieve deep energy savings retrofits for existing homes.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

*Codes and Standards* – The Energy Centers will continue their long-standing partnership with the Codes and Standards team and the California Energy Commission (CEC) to offer training on the latest updates to the Title 24 Energy Standard through improved code compliance and design / installation methods for exceeding code requirements in residential new construction and HVAC retrofits.

FSTC [and the statewide food service energy center team](#) provides technical support to staff of the CEC as Title 20 appliance regulations are developed for commercial food service equipment. Efficiency regulations for commercial kitchen equipment tend to go hand-in-hand with the voluntary ENERGY STAR program. The ENERGY STAR database and criteria are used to qualify (through testing and labeling) the top quartile of equipment efficiency while CEC seeks to through regulation the bottom quartile of equipment on the same list.

FSTC works with the Bay Area Air Quality Management District (based in San Francisco) directly or through ASHRAE on projects and technologies aimed at efficiently reducing food service effluents. For the major equipment categories and candidates for national energy and water savings, the FSTC [and the statewide food service energy center team](#) will provide technical support to establish efficiency criteria for EPA’s ENERGY STAR program. On an appliance-by-appliance basis, FSTC [and the statewide food service energy center team](#) will work with EPA and leading manufacturers to implement ENERGY STAR for commercial food service equipment and to support the Federal Energy Management Program (FEMP) interagency program on energy-efficient federal purchasing.

FSTC [and the statewide food service energy center team](#) will continue to work with the LEED “Working Group” to finalize the list of recommended prescriptive measures and baselines for energy modeling of commercial food service facilities. This group provides insight and submits formal CIRs on EA Credit 1 to the Retail Core Committee to help mature the language to yield a clear guideline for all types of retailers, including restaurants.

vi. Similar IOU and POU programs

The food service (FS) programs offered by the three IOUs are coordinated through two levels, first at the FS program level through interactions between FSTC (PG&E), FSEC (~~SempraSoCal Gas~~~~SCGSoCalGas~~), [and the Energy Innovations Center \(SDG&E\)](#)~~and CTAC (SCE) Food Service~~ to develop program offerings, schedule combined outreach programs, and develop support programs such as Rebate Workpapers. Second, the FS programs are coordinated at the Energy Center level through the statewide Energy Center coordinating committee. The Food Service Coordination deals with the scheduling and logistics of cooperative events such as seminars and supporting outreach materials, workshops, Executive Planning Committee meetings, outreach events such as

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

trade shows, joint energy efficiency program advertisements, and trade articles and general promotion of both the seminar and rebate programs.

b) Program delivery and coordination

~~PG&E's Energy Centers have been national leaders in the field of energy efficiency workforce education, training and technical advice for a combined total of almost 50-80 years. Over this time, both Energy Centers have received numerous local, Bay Area, state and national awards and recognition for their training programs. Between 2013-2014~~2010-2012, the Energy Centers will work closely with all programs to coordinate and conduct seminars and workshops that address the knowledge and skill gaps of builders, developers, contractors, designers, installers, plant engineers and operators, agricultural owners and managers, and city and county building department staffs. Additional services will include technical assistance and support, consultations and tool loans.

i. Emerging Technologies program

The Energy Centers will continue to coordinate and collaborate with the Emerging Technologies program to introduce new equipment, installation practices, and whole building concepts to key market actors. Such support helps expand implementation of new energy efficiency products and services. For example, Energy Centers partner with Emerging Technology projects by: developing demonstration and testing facilities, jointly developing curricula, organizing product showcases, and incorporating new products into training sessions.

~~The ETC and PEC will do more to support California's vision of achieving zero net energy residential buildings by 2020 and commercial buildings by 2030 through the Big Bold Zero Energy Home Program and California Solar Initiative (CSI) by creating a focused training curriculum and resource support center. In addition, the ETC and PEC~~ERC will collaborate with the Emerging Technologies (ET) program to coordinate training programs for training the trainer and training programs with information about technologies on the horizon for introduction to the marketplace. ET will also play a significant role in advising the PEC on fixed and portable displays and exhibits for its interactive lighting classroom. ~~The FSTC works directly with ET programs on issues and technologies of mutual interest. Specifically, FSTC has worked to bring ventilation controls and water heaters to market, using ET funding where appropriate. FSTC's work in Standard Test Methods development and lab and field testing provides the technical basis for much new technology. FSTC also uses its PIER research opportunities to further support the ET efforts.~~

In 2013-2014, Business Incubation Support or Technology Resource Incubator Outreach (TRIO) will focused on providing training and networking for developers of energy saving technologies

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The IOUs will coordinate efforts with the eCodes and sStandards program and with the California Energy Commission to identify critical early planning workforce training needs for advanced technologies.

IOUs will collaborate with their respective Emerging Technologies groups, the statewide Emerging Technologies Coordinating Council, State agencies, and IOU codes and standards groups to identify and deliver on opportunities for teaching targeted parts of the workforce about emerging technology products as they relate to energy savings opportunities through energy efficiency and demand response. WE&T programs will also include content on proper installation and commissioning of ET products/systems.

ii. Codes and Standards Program

The Centers will collaborate through their educational seminars with compliance improvement efforts planned by the Codes and Standards (C&S) Program. Typically, these efforts will focus on training of building department staff. Centers will focus on building standards training for architect, engineers, energy consultants, home performance contractors, home energy raters, and green building programs.

The Energy Centers will directly impact improved compliance with Title 24 energy standards through rigorous updates that go beyond new construction to include revolutionary impacts on the existing housing market. The ETC and PEC will work with HVAC contractors and building department officials to overcome information and training barriers to code compliance and enforcement. Since 1998, the Energy Centers have proactively offered training on Title 24 code updates and changes to residential / small commercial building standards. The ETC and PEC will continue to go “beyond code” by providing state-of-the-art, building science-based information about the best available systems, technologies and techniques for minimizing building and operational energy consumption while optimizing whole building or system performance and occupant satisfaction or enhanced productivity. Additionally, the FSTC and the statewide food service energy center team provides technical support to C&S staff for Title 20 appliance and Title 24 building regulations as relating to commercial food service equipment, operations and facilities.

In collaboration with WE&T, C&S will enhance support for the appropriate market actor roles responsible for new and emerging codes and standards implementation according to priorities established by needs assessments. C&S will collaborate with the WE&T Centergies sub-program to not only prepare contractors and technicians to implement current codes, but to also prepare them with technical training on advanced technologies that are projected to become part of reach codes and then the statewide code.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

In support of the Zero Net Energy goals, C&S will continue to build on existing training offerings and will expand activities to coordinate more closely with WE&T. In collaboration with WE&T, C&S will develop a sector strategy to support workforce development in an area with low compliance, for example, the Commercial Air Conditioning Quality Maintenance and Installation Program. C&S will maintain ongoing communications with WE&T staff to ensure coordinated development and inclusion of code-related content

WE&T programs will offer market actor-specific training on Codes and Standards to address ongoing code changes and code compliance.

iii. WE&T efforts

*Energy Centers*

The Centers will collaborate and coordinate where possible to be in alignment with California's Strategic Plan. Statewide collaboration among Centers will increase sub-program consistency and information/cost sharing for what the Centers offer to their customers (seminars, tool lending library development assistance, portable exhibits).

*BOC Program*

In alignment with the goals of the Strategic Plan, BOC's curricula incorporate relevant information about the Emerging Technologies, Codes and Standards, and HVAC Quality Installers/Quality Maintenance programs. As appropriate, BOC instructors will enhance the depth of the learning experience by discussing new technologies and ways to meet and exceed the state's code and standards.

Through its two levels of training and certification, BOC offers supplemental training in existing technical positions by providing knowledge and skill building for technician-level facilities personnel including building engineers, stationary engineers, maintenance supervisors, maintenance workers, facility coordinators, HVAC technicians, electricians, general repairers, and head custodians.

BOC has been recognized by several industry and labor organizations as one of value to its members. This recognition reflects the program's efforts to meet the needs of these organizations through solid, industry relevant curricula development. Among the organizations recognizing BOC's training program are the International Facility Management Association (IFMA), the Building Owners and Managers Institute (BOMI), the National School Plant Management Association (NSPMA), local chapters of the society of healthcare engineering, and the California State Employees Trades Council (SETC). NEEC also partners with California statewide partnerships including the UC/CSU/IOU Partnership and other Local Government Partnerships (e.g. Association of Monterey Bay Area Governments).

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- iv. Program-specific marketing and outreach efforts (Budget provided in Table 1)

*Energy Centers*

Each of the Centers will distribute their own print calendars to a more focused target audience to ensure notifications of Centers' offerings reach key actors. Innovative and creative approaches will be applied to attract and retain new customers and market actors to the Centers. This will include aligning the Centers' activities with corporate and statewide direction. Centers will contribute content to the Statewide Web portal described above and below. Classes and other Center activities will be promoted through the following venues: the Centers' print calendars, collaboration with professional and trade organizations, Center's Web sites, Centers' email communications with students who have opted in to receiving email notifications, and other partnerships, including non-profit organizations and existing academic channels (community colleges, UC/CSU).

Centers will continue to promote and collaborate on marketing efforts with established and new partnerships involving other utility segments, across utilities, and with government, academic, research, professional/trade, and non-profit organizations focused on efforts supporting the Strategic Plan.

*BOC Program*

Northwest Energy Efficiency Council (NEEC) works closely with the IOUs to promote Building Operator Certification (BOC) seminars. IOU-sponsored BOC classes shall be mentioned in Energy Centers' calendars and email-marketing campaigns targeting commercial and institutional customers. NEEC will also target potential participants with direct marketing materials including informational brochures, case studies and bi-annual bulletins. The program's website also serves as a promotional channel. In ~~2013-2014~~2010-2012, BOC will undertake promotional activities that build on customer interest in national initiatives such as the ENERGY STAR® Challenge and LEED for Existing Buildings. It will also work with large employers to organize closed-enrollment sessions for facilities engineering departments at a single site. Where the IOUs offer the Building Owners and Managers Association (BOMA) Energy Efficiency Program seminars, BOC shall be cross-marketed.

BOC will continue to promote training and certification through its highly successful educational partnerships with professional associations representing the facilities engineers. These include the International Facility Management Association (IFMA), Building Owners and Managers Association (BOMA), Association of Physical Plant Administrators (APPA - higher education), National School Plant Management Association, and the American Society Healthcare Engineering (ASHE). BOC will participate in the annual events and program meetings of these associations to share information about opportunities to reduce

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

operating costs through energy efficient building operations.

v. Non-energy activities of program

The Centers and BOC shall remain focused on delivering content centered around integrated DSM programs, including EE, DR and distributed generation. The Centers have and will continue to explore other program topics that do not have direct energy connections, but that do contribute to improving California's building stock. Such topics include indoor air quality, occupant comfort, recycling, and environmental stewardship and preservation. The LEED™ Green Building Rating System provides an outline for other topics that can help inform Centers' program managers and instructors about other resource types.

The Energy Centers provide low-cost centralized meeting space for the benefit of program implementers. Volume of activity for non-energy program participants ~~at the ETC and PEC~~ lowers the average cost of energy efficiency training due to volume discounts. Non-energy participants are not subsidized by this program. FSTC supports water conservation through its work on hot water heating and use in FS, hot water systems research, testing and rating of water using cooking and refrigeration equipment. Air Quality work is being coordinated with Air Quality Districts on reduction of kitchen effluents.

vi. Non-IOU Programs

IOU program will interact with CEC, ARB, Air Quality Management Districts, local government programs and other government programs as applicable. The Centers will interact with the CEC to develop and deliver training to support improved compliance with building and appliance standards. Compliance with retrofit HVAC requirements is a key strategy in the Big Bold Initiative that will rely on collaborative training efforts.

The Sacramento Municipal Utilities District (SMUD) operates its Energy Technology Center (ETC) that provides similar functions as the IOU's Centers. The IOUs will reach out to SMUD to collaborate on WE&T elements. The IOUs are active partners with Community Colleges to support and embellish green career technical education. ~~For example, PG&E is working with Laney College to develop and deliver an "Energy Efficiency and HVAC Symposium" targeting career and technical education programs in the Community Colleges.~~ This collaboration will provide professional development for instructors to aid in adjustments to curricula to support green job training. Such an endeavor may set the stage for expanded collaboration to support instructors and develop additional programs. ~~A second example includes active participation in the California Advanced Lighting Controls Training Program (CALCTP) currently underway with several institutions, including Pacific Gas and Electric Company, Southern California Edison, and California Lighting Technology Center. CALCTP aims to~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

deliver a “train the trainer” series of classes to industry groups such as electrical unions and trade organizations.

The ETC has conducted weatherization related training for the State Department of Community Services Development in partnership for the last 30 years. In fact, the ETC was originally designed as a hands on weatherization training center for State programs. In conjunction with other EPC efforts, BOC has and will continue to support CEC adoption of minimum energy efficiency standards.

Additionally, the FSTC works with or provides support to the following programs:

**National Restaurant Association (NRA):** The FSTC has maintained a working relationship with the NRA since its inception in 1987. In fact, the NRA co funded the build out of the FSTC and provided cofounding on several occasions over the past two decades. The FSTC is currently recognized as a [technical] partner in NRA’s new Conserve Initiative that is featuring energy efficient and green restaurant design and operation. (<http://conserve.restaurant.org/>)

**Multi Unit Architects, Engineers and Construction Officers (MAECO):** MAECO is a study group of the NRA that the FSTC has supported for two decades, attending meetings and presenting the results of our research into restaurant efficiency.

**California Restaurant Association (CRA):** In parallel with the NRA, the FSTC has worked with the California Restaurant Association, providing energy efficiency education in publications and equipment shows. The FSTC authored a series for the CRA bulletin titled the Green Sheets since 2003. (<http://www.fishnick.com/saveenergy/greensheets/>)

**Thimmakka—Ethnic “Green” Business Program:** FSTC served as a technical resource, helping develop low cost / no cost energy savings solutions for small and ethnic restaurant operators in the greater bay area. (<http://www.thimmakka.org/>)

**Bay Area Green Business Program:** FSTC served as technical resource, helping to develop energy assessment checklist for green business certification program. (<http://www.greenbiz.ca.gov/>)

**Green Café Network (Small restaurant “Green” business program):** FSTC served as technical resource, helping develop low cost / no cost energy savings solutions for small restaurant operators in SF. (<http://www.greencafenetwork.org/>)

**California Urban Water Conservation Council (CUWCC):** The FSTC has been a primary resource to the CUWCC and members such as EBMUD and Metropolitan Water as they developed educational and incentive programs for commercial foodservice in California. (<http://www.euwcc.org/>)

**Foodservice Consultants Society International (FCSI):** The FSTC has maintained a working relationship with this professional association for many years. More recently, we have been very active in its outreach initiatives, specifically the Super Regional education program. (<http://www.fcsi.org/>)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~North American Food Equipment Manufacturers (NAFEM): NAFEM has been a long supporter of the FSTC, tapping our technical resources for its educational initiatives. We have also been involved in developing the On-Line Kitchen Protocol and the new Life Cycle Cost Models. The FSTC is a member of NAFEM's Technical Liaison Committee. (<http://www.nafem.org/>)~~

~~ASHRAE: The FSTC has been an active participant in ASHRAE program, research and standards activities. Technical committee work is currently focused on commercial kitchen ventilation, refrigeration and water heating. ASHRAE is one of the FSTC's key channels to the engineering and large facility design communities.~~

~~ASTM: ASTM is the standards organization that ratifies and publishes all of the standard test methods developed by the FSTC. To date, the foodservice test method portfolio includes more than 35 test methods.~~

~~International Mechanical Code (IMC): FSTC submits code change proposals with respect to commercial kitchen ventilation. Over the past few years, we have been successful in over 20 code proposals.~~

- vii. CEC work on [PIER Electric Program Investment California \(EPIC\)](#)

~~Refer to IOU's Centers' PIPs for details at the local Center level. Not Applicable~~  
~~The PEC will collaborate with Lawrence Berkeley National Laboratory, the National Institute of Standards and Testing, and consulting firms on a CEC PIER project to support the development of the Universal Translator (UT). The UT is a software tool that supports building operators and engineers to document building energy performance and energy efficiency project planning. The UT is an extension of the PEC's tool-lending library described in Section 4.i.~~

~~FSTC works closely with the CEC PIER program on such issues as Commercial Kitchen Ventilation, hot water heating and distribution, and advanced kitchen appliances. FSTC works as a research contractor for PIER in conjunction with PG&E's CEE and ATS departments on Kitchen Gas and Electric use and hot water research.~~

- viii. CEC work on codes and standards

~~The Centers will work with the CEC and the IOU C&S programs to improve code compliance through coordinated education and training delivery. For more details on these integration efforts, refer to the HVAC WE&T PIP. The ETC provides expert consultation and advice for building standards development as well as advocacy support in collaboration with the Codes and Standards Program.~~

- ix. Non-utility market initiatives

~~The Energy Centers collaborate with certification and training initiatives by the following organizations: North American Technician Excellence (NATE), Affordable Comfort, Inc. (ACI), Building Performance Institute (BPI), National~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Association of the Remodeling Industry (NARI), American Institute of Architects (AIA), BuildItGreen (BIG), and Home Energy Rating System (HERS) Providers [California Building Performance Contractors Association (CBPCA), U.S. Green Building Council (USGBC), American Society of Heating, Refrigerating, and Air-conditioning Engineers (ASHRAE), California Home Energy Efficiency Rating System(CHEERS) and CALCerts].

FSTC [and the statewide food service energy center team](#) utilizes ~~its~~[their](#) relationships with ENERGY STAR and various restaurant and food service industry organizations to promote their programs and leverage these relationships to pursue ~~PG&E's~~ efficiency objectives. (Refer to Section 6.2.b.v. above.)

c) Best Practices

Centers will develop classes, displays, and materials with current information that highlights and demonstrates best practices for efficient installation and equipment through field-experience and case studies from existing programs, including Savings by Design and Energy Design Resources. Centers' offerings will emphasize whole building and system performance in conjunction with design intent. Implementation of hands-on learning methods that are applied in the field creates an opportunity for partnering with EM&V and/or 3rd party evaluators to follow up with course participants to assess impact upon practice and/or energy savings. A description of this pilot program appears in Section 6.1-g below. The Centers will continue to implement best practice methods as prescribed in prior statewide evaluation reports, including "Evaluation of the 2003 Statewide Education and Training Services Program" by Wirtshafter Associates, Inc., 2005 and "2004-2005 Statewide Education, Training and Services Program Evaluation" by KEMA, 2007.

Many of the training programs conducted through the Energy Centers incorporate adult learning theory by utilizing a "hands-on" approach that enables students to visualize and experience the impact proper system design, installation and maintenance can have on operation and energy efficiency. ~~For example, the ETC's functional HVAC training unit, a "best practice" implemented by the ETC in 2005, provides participants an opportunity to see first hand how proper charging, duct sealing and other actions made to HVAC systems impact their energy use and the ETC's training house provides students with the ability to see and touch quality insulation installation, high efficiency lighting exhibits, weatherization techniques and more.~~

~~The PEC's lighting classroom allows students to experience both poor and good quality lighting. Participants in the Energy Audits class use tools from the Tool Lending Library and the PEC to learn ways of measuring building performance; the overcast sky simulator and Heliodon allow class participants to test physical models of buildings for daylighting and shading performance; and interactive energy modeling software classes provide students the opportunity to learn effective use of the software in a group setting with an instructor.~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Throughout the ~~2013-2014~~~~2010-2012~~ ~~cycle~~~~bridge~~~~transition~~ ~~period~~, the ~~ETC and PEC~~~~Energy Centers~~ will develop additional training props and equipment for use in many of the courses offered to enhance learning and provide real-world experience in the classroom. In addition, both Energy Centers will expand their courses to include more “Train the Trainer” classes to expand the reach of their training efforts and materials. ~~See Section 6.1.g.iii for more information on “Train the Trainer” activities.~~

FSTC, through its research, testing, and constant customer contact continually updates its technology and operational practices knowledge base. The Best Practice partner Program is a manifestation of this constant improvement.

The ETC also interacts with Affordable Comfort, Inc., in a leadership, planning and strategic mode to audition and recruit the best talent and state-of-the-art topics for delivery in California, capitalizing on long-term relationships that gain access to best practice providers.

BOC teaches commercial and institutional facility staff how to operate and maintain building systems for energy efficiency, optimal performance, and occupant comfort. BOC combines classroom training, exams, and in-facility project assignments to train and certify building engineers and operations and maintenance technicians in the practice of energy-efficient building operation and maintenance. The curriculum was developed to provide knowledge and skill building for technician-level facility personnel including HVAC technicians, electricians, general repairers, and head custodians. BOC curriculum is taught by practicing professionals who implement best practice building operations strategies toward improving building energy efficiency. The curriculum is updated on a regular basis. Trained instructors share best practices with one another as BOC curriculum is updated on an annual basis.

d) Innovation

In ~~2013-2014~~~~2010-2012~~, the IOU Energy Education and Testing Centers will undertake three pilot projects that will serve to shape programs for future filings. These pilot projects are discussed in Section 6.1-g below. The Centers will also continue to keep their Centers and offerings up-to-date with current and upcoming technologies.

- *Increased use of the Internet to deliver education and training programs as real-time simulcasts, real-time Webinars, and archived on-demand classes:* While these applications have been implemented by some Centers in the past, all Centers will implement and progress this delivery method further to reach a wider audience and to increase program cost-effectiveness.
- *Expanded curriculum to support California Energy Efficiency Action Plan for 2020:* The IOU Centers will develop teaching material on topics such as climate change, energy neutral growth, effective mass transit and Plug-In Hybrid Vehicles, and effective implementation of green technologies. Centers will need to pilot,

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

experiment and partner with local Universities, science museums and other parties with expertise to provide a balanced view on these complex topics.

- *Emphasis on Adult Learning Principles:* Centers will complete the revision of seminar content and curriculum based on adult learning principles to which they were exposed as part of the KEMA program evaluation effort “2004-2005 Statewide Education, Training and Services Program Evaluation”, submitted in 2007. Such learning principles emphasized hands-on “learn by doing” training. Some members of the Centers’ training staff at the centers have been trained on these principles and will integrate them with the goals of promoting energy efficient behavior participating in available EE programs. The expected benefit of utilizing Adult Learning Principles is an increase in participant retention of knowledge, awareness and comprehension leading to greater EE behavior and program impact.
- Centers will work together and collaboratively with other utility groups (i.e. Emerging Technologies) to develop new exhibits with up-to-date technology that can be either replicated and/or shared across utilities to maximize cost-effectiveness of new exhibit development.
- Centers will work together and collaboratively with other utility groups and stakeholders to create an educational series describing paths to zero net energy residential buildings by 2020 and commercial buildings by 2030. This is in support of CPUC and CEC commitments and directives.

*BOC Innovation*

As a credential program, BOC is uniquely positioned to maintain a long term relationship with graduates through its certification renewal program. Graduates must earn continuing education hours annually to maintain the BOC credential. This provides an opportunity to direct graduates to the utility education and training centers to earn continuing education hours towards renewal.

Energy efficiency project work also qualifies for continuing education. Graduates may earn continuing education hours through engagement of EE and DR projects at their facilities. In 2006, almost 20% of BOC graduates earned hours through completion of efficiency projects. Finally, BOC graduates and their supervisors are informed about energy efficiency and demand response program opportunities through the BOC Bulletin, a bi-annual newsletter mailed to 1,500 California IOU customers.

Continue, and even increase, utility presence at BOC trainings: Students expressed satisfaction with utility account representative presentations in BOC classes. This should be continued and even expanded on by involving account reps in promoting BOC to key accounts in advance of the course series start date.

e) Integrated/coordinated Demand Side Management

Centers will develop their programs to incorporate other DSM opportunities, including demand response (DR), and distributed generation. The Centers have taken the first steps

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

toward integrating DG and energy efficiency into their exhibits and educational seminars. They have also developed seminars and exhibits focused on DG, EE, and DR. The next step is to work with the DG and DR groups to develop programs that integrate the three in a way that is consistent with other utility programs and with the long-term energy efficiency strategic plan towards zero net energy residential buildings by 2020 and commercial buildings by 2030. Centers will integrate training offerings with codes and standards programs as described in section 6-b above.

NEEC recognizes California's demand side management needs are not fully addressed through energy efficiency alone, but rather through a blend of multiple DSM options including rigorous building ~~and appliance~~ codes and standards, demand response, and on-site generation. The BOC curricula are structured to offer flexibility for the incorporation and promotion of relevant demand side management options (rebate and non-rebate) available through the IOUs. NEEC has and will continue to work with the IOU's to customize BOC curriculum to the California market to address technologies and practices associated with demand reduction and to stimulate uptake of utility programs in energy efficiency, demand response, and on-site generation. In 2005 and 2006, BOC curriculum modules were supplemented with material on the topics of enhanced automation strategies for demand reduction and operational best practices to ensure persistence of savings from building retro-commissioning. In 2008, BOC curriculum modules were supplemented with material on the topic of O&M practices for sustainable buildings covering a full range of resource conservation topics. The curricula are also flexible to include information pertaining changes and/or implications to support implementation of and compliance with the CEC's Title 24 to Title 24 2008 Building Energy Efficiency Standards, AB32 (Greenhouse Gas Reduction bill), and other initiatives.

[In 2013-2014, WE&T will work with the Benchmarking and IDSM Programs in similar manner as proposed for the Continuous Energy Improvement Program to introduce the processes, lessons, and case studies curriculum to working energy management professionals, industry professionals.- IOUs will consider a sector strategies approach in furthering development of these collaborative efforts.](#)

f) Integration across resource types

IOU Centers recognize that energy efficiency can be achieved through programs that go beyond traditional energy efficiency education and training. The Centers have and will continue to offer seminars and build partnerships that remain focused on energy efficiency and go a step further to show the benefits of energy efficiency upon other areas (e.g., air quality). The Centers will also work together and collaboratively with other utility groups and stakeholders to incorporate the benefits of achieving efficiencies with other types of resources (e.g. water efficiency) upon whole building energy use. This integration can be achieved by developing courses on specific topics like water efficiency since any use of water requires energy consumption. The highest impact for water efficiency integration occurs when water is also heated on site. The LEED™ Green

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Building Rating System provides an outline for other topics that can help to inform Center program managers and instructors about other resource types.

BOC's Level II course structure offers unique flexibility to integrate the curricula from other resource management areas relevant to building operation and maintenance such as water, waste, and indoor air quality. Level II supplemental classes are offered in tandem with core classes to customize the course series to regional and topical interests in the California building operator market. Three one-day supplemental classes in the topics of water efficiency, O&M for sustainable buildings, indoor air quality, and demand response have been developed and successfully delivered to 500 building operators since the program's inception.

g) Pilots

No pilots are proposed for Centergies Subprogram. Several sector strategy initiatives will be pursued in coordination with IOU programs, as discussed in previous sections.

h) EM&V

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

IOUs will continue to work with EM&V to assess market penetration of Centers' elements, including educational seminars' and tool lending libraries' potential impacts upon energy savings directly related to education and training. IOUs will also work collaboratively in the development of pilot projects described in Section 6.1.g above.

The ETC and PEC will work with EM&V to develop new methods for arriving at energy savings as a result of specific approaches to workforce education and training, as well as their tool lending library programs. Successful methodology will be incorporated into their elements in future filings. The FSTC completed utility EM&V evaluations in 2003 (run by Equipoise) and in 2007 (run by PA Consulting Group). These survey efforts looking at the efficacy of technical information transfer channels used by FSTC are being repeated by the CPUC in 2008-10. The CPUC evaluation is being implemented by ODC and involves the contacting of seminar and outreach participants to determine the efficacy of the services provided.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues. BOC has been the beneficiary of a significant body of evaluation research exploring the program's impacts on the energy efficiency behaviors of participants. Two third-party process evaluations conducted in 2003 and 2005 of the California Statewide BOC program found high satisfaction with BOC among students and employers. Most students and their supervisors credit the training with increasing students' energy efficiency behaviors and having a positive influence on energy efficiency decisions at their facilities. Additionally, IOU involvement in BOC reflected well on the utilities and was found to contribute to the program's overall success.~~

~~NEEC will continue to work with third-party evaluators to support evaluation efforts and to incorporate recommendations in program development and implementation<sup>7</sup>.~~

Program Diagram

See above Section 6.2.

**8. Program Logic Model**

Below is the logic model for the WE&T Centergies Subprogram. ÷

The activities specified in the logic model focus on several types of actions. One is to promote and market center services to target audiences. These activities involve gathering labor market information from employers in the energy sector and designing programs to meet their needs. They also include leveraging existing relationships with colleges, and professional and trade organizations to market courses and other energy center offerings.

A second activity focus is marketing and reaching out to disadvantaged communities to facilitate energy-related job skills in those communities. This will be accomplished by partnering with industry and labor organizations, professional organizations, trade and vocational schools, community colleges, third-party entities, government organizations and other partners that service low-income or disadvantaged communities in order to reach members of these communities and bring them into energy center training programs.

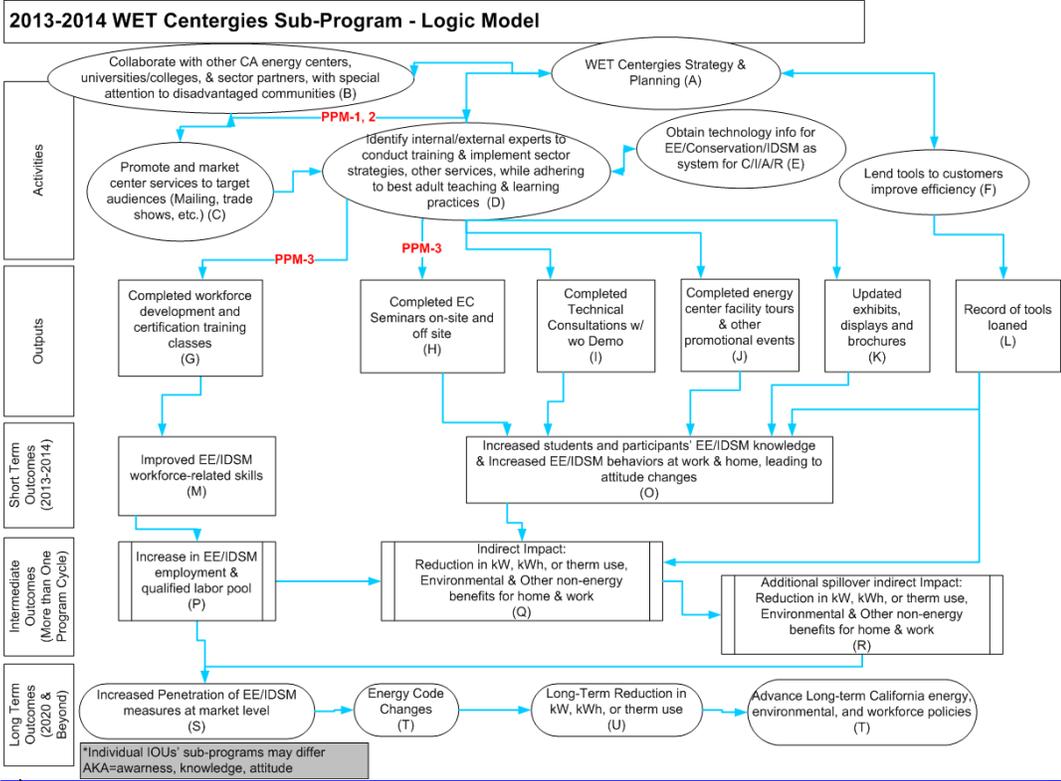

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

A third activity focus is to identify internal and external experts to conduct training and other services, while adhering to best practices in adult learning. The centers are developing and using many new training props to give students first-hand experience with how energy-saving technologies and practices work and how they produce savings. They are also including energy modeling tools to teach students to estimate savings resulting from the technologies and practices they learn in the classes. In addition, the centers are reviewing seminar content to be sure the adult learning principles are being incorporated.

A fourth activity in the logic model is the lending of tools to customers that will allow them to judge the energy efficiency of their equipment and make changes and adjustments to increase efficiency.

All of these activities are all expected to result in classes, consultations, promotional events, exhibits, and tool lending that increase participants' energy efficiency and IDSM knowledge and behaviors. Ultimately, these activities and outputs are expected to result in indirect energy savings.

6.2) Sub-Program Implementation – WE&T Connections SCG3730

**1. Program Description**

a) Describe program Statewide IOU Coordination  
 1. Program name

The Statewide WE&T Connections is a Sub Program within the Statewide WE&T Core Program.

WE&T Connections is a three-fold marketing, outreach and workforce education and training program. This Sub-Program offers K-12, Adult Education (post-high school), Technical Training, Community College and University level education programs that support the Strategic Plan’s vision for educating and training California’s workforce for “green” jobs.

- First, the programs promote green careers to K-12, Adult Education (post-high school), Technical Training, Community College and University students through energy and environmental curriculum, college credit courses at high schools, college degree programs, job shadowing and internships.

The IOUs and/or our third party vendors will continue to work with California State Department of Education (Curriculum Commission) as well as curriculum coordinators from the County Offices of Education to be included in curriculum

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

development advisory boards so that we can contribute to tailored K-12 curriculum that includes the science of energy, energy efficiency, [Demand Response](#), [Renewable Resources](#) and some discussion about green careers. We will also work with the [California Community College Chancellor's office](#), UC Office of the President of Academic Affairs and the CSU Office of Degree Programs and Educational Opportunities to 1) promote energy minor or major degree programs, 2) collaborate and/or provide expertise in the development of complementary new and revised courses that will form a comprehensive integrated approach to energy education, and 3) consult with campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields. Throughout the process, we will also work to incorporate and promote a green career path.

- Second, the programs are intended to educate students on energy, water, renewable energy, demand response, distributed generation as well as green-house gases and the environmental impact, with the goal of influencing day-to-day decisions of students and their households.
- Third, the programs educate K-12/Community Colleges/Universities on the benefits of adopting energy efficiency and demand response policies at their facilities to help them save energy and money. Having these programs at schools and campuses serves to reinforce that schools practice what they preach. Some students truly pay close attention to see if the schools are just providing lip service or if they are leading by example.

**b) List measures**

WE&T Connections program offers five energy education program components— Green Campus, [DEEP](#), PEAK, Energenius, LivingWise, [Green Pathways](#) and Green Schools— and effectively integrates [specific content for](#) the science of energy, energy efficiency, water conservation, renewable energy, demand response, distributed generation, green house gases to address awareness in the communities, barriers faced by schools as well as growth and demand for green careers. These programs are designed to be both flexible and affective across diverse learning environments as well as to empower K-12/college students to become advocates of smart energy management in their homes, schools, and communities. Each program component will also leverage all other available energy efficiency, demand response, and distributed generation programs for consumers as well as existing business incentives for schools, all to achieve immediate and long-term energy savings and demand reduction in homes, communities, schools and universities.

**c) List non-incentive customer services**

WE&T Connections is a non-incentive based, education and training sub-program.

**2. Program Rationale and Expected Outcome**

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

a) Quantitative Baseline and Market Transformation Information

See core program Section 5.a. for program performance metrics (PPMs) and Section 5.b. market transformation information.

b) Market Transformation Indicators (MTIs)

There were no market transformation indicators (MTIs) identified for the WE&T program.

c) Program Design to Overcome Barriers

Energy education is critical to assuring a stable and reliable supply of electricity in California. Educating students will create a new generation of Californians who understand the significance of energy in their lives, their role in its efficient use and the importance of managing our limited resources for the future. This knowledge and information can also lead to life-long energy savings habits and a concern for the environment and its limited resources for not only the students but, for their family and friends. This knowledge and education can also lead the interest in a future green career path. However, given the budget cuts at schools, cuts to curriculum and longer work hours for teachers, getting this message across may not be possible without the assistance of these IOU-sponsored programs.

WE&T Connections program components are designed to be both flexible and effective across diverse learning environments. All program components promote the science of energy, energy efficiency, demand response, distributed generation, and empower K-12 and college students to become advocates of smart energy management in their homes, schools, and communities. The program effectively combines classroom learning with hands-on activities.

The program will address lost opportunities in the school market by implementing a comprehensive, innovative approach that involves incorporating:

- Some of the nation's leading energy education programs. These programs are 1) designed to promote green careers through energy and environmental curriculum, 2) designed to educate students on energy, water, renewable energy, demand response, distributed generation as well as greenhouse gases and their impact to the environment, with the goal of influencing day-to-day decisions of students and their households, and 3) also designed to educate schools/facilities on the benefits of implementing energy efficiency policies and demand response programs at their sites to impact energy use in schools and, universities and to project energy and environmental leadership by example.
- The program components are developed in collaboration with natural gas, electricity and water agencies to promote and encourage the adoption of energy efficiency, demand response, distributed generation and water conservation options.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Collaboration and integration with residential and business incentive programs that result in firm energy savings for homes and schools.

Energy costs for schools can be an enormous expense and are often the second largest expense for schools after employee salaries. Declines in school funding over the last 20 years have left little to no room in budgets for incorporating high performance measures during major repairs or renovation in existing buildings. This is where our business incentives programs come into play when promoting these educational programs to schools. Not only are these educational components funded by the IOUs, but the schools can also see a measurable utility savings. Also, when the schools teach something that children can take home that helps parents save on their utility bills, the parents are more likely to be active in their students' education. Failure to take advantage of these educational and facility programs represents a significant missed opportunity.

The U.S. Department of Energy estimates that schools could save approximately 20% of their energy costs by incorporating energy efficiency measures<sup>21</sup>. To start, schools can begin with no cost behavioral and operational changes. Additional funds and/or incentives are needed before schools would seriously consider the more serious energy efficient options.

IOUs will continue to promote low-to-no-cost energy efficiency measures, as well as retrofits programs for their school facilities. In most cases, the benefit of the IOUs assisting school in ways to save on energy cost is the selling point to getting school district cooperation in implementing the educational components. Schools practicing what they teach with respect to energy efficiency, demand response, distributed generation and other helps reinforce the importance of practicing smart energy management with students, thus creating a new generation of energy smart citizens and potential future members of a green workforce.

The WE&T Connections program will address the needs of schools through a combination of student, teacher and school administrator education programs and increase their awareness and knowledge as well as provide curriculum and/or lesson plans that support these objectives. Also, once school-aged children learn something new like energy efficiency, they are great advocates for taking that knowledge home and teaching/motivating their parents and siblings to take actions to reduce energy and water consumption. University students can conduct valuable research and effectively educate their peers as well as campus administrators about energy efficiency:

- Students are effective advocates, able to reach their peers, communities and high-level decision makers in promoting green jobs on campus.
- Educational campaigns can result in significant energy savings on campus facilities and dorms by changing behaviors and purchasing decisions.

---

<sup>21</sup> Per DOE website. [<http://www.eere.energy.gov/buildings/info/schools/>]  
[[http://eere.energy.gov/buildings/energysmartschools/howto\\_operating.html](http://eere.energy.gov/buildings/energysmartschools/howto_operating.html)]

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- The IOUs and/or our third-party vendors will develop curriculum and lesson plans for K-12 as well as work with the appropriate community college and university agencies responsible for, college courses and programs needed to educate students about energy, energy efficiency and prepare them for a green career path.

Addressing the interaction between energy and water use is essential, as well as the link between energy conservation and the reduction in greenhouse gases. Water conservation lowers energy use and energy bills; particularly, when energy used to heat water can be reduced and energy conservation reduces emission and global warming. The utilities and water agencies will extend the reach of their programs and services and promote integrated solutions.

The primary goal of the program is to educate and create awareness among K-12 and college students about the importance of energy and water efficiency and how to apply at home and in their communities what is learned at school and to promote green careers to K-12 and college students to meet California’s need for green jobs, A secondary goal of the program is to improve public education facilities and inform facility operators and administrators about the benefits of energy efficient equipment and operation practices.

The basis of the program theory is that increased awareness will result in increased levels of energy and water efficiency in communities and at home where energy conservation starts, and increase conservation efforts at schools and universities. The combination of education and environmental awareness at schools and campuses are expected to motivate students not only to change their energy use behavior, but also to provide them with another very real and worthy option for a career path.

d) Quantitative Program Targets  
The proposed targets may be modified due to funding restrictions.

e) Advancing Strategic Plan goals and objectives

See core program PIP.

**3. Program Implementation**

a) Statewide IOU Coordination

i. Program delivery mechanisms

WE&T Connections programs will be taking a sector strategy approach around education collaborations with K-12 and College stakeholders and organizations. The strategy's multi-faceted goals include increasing engagement of all students, particularly minority, low-income or disadvantaged, in energy-related coursework and programs, poising them for careers in Energy Efficiency (EE) and a life-long appreciation of energy conservation and efficiency.

The California Public Utilities Commission has provided a framework to make EE a way of life in California by refocusing rate-payer funded EE programs on achieving long-term savings. Goals of this framework include (1) establishing EE education and training at all levels of California's educational systems; and, (2) ensuring that minority low-income and disadvantaged communities fully participate in training and education programs at all levels of the Demand Side Management and EE industry.

Education collaborations are integral to achieving the goals laid out above. The K-12 and College Sector Strategy, led by the IOUs and implemented by a cross-stakeholder driven partnership, will include the below key elements to ensure these goals are achieved.

While traditional sector strategies often include specific employer hiring commitment or funding, the K-12 Sector Strategy will not directly include this component due to

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

the target population being years away from career entry points. However, other sector strategy hallmarks will be included in this approach. These include:

- Developing a regional partnership which includes a cross-section of stakeholders from the EE sector.
- Ensuring employer commitment to help align training to market demand.
- Working towards career pathway development, including “stackable” credentials that enable students’ education to build upon previous trainings.

Ultimately, via the Sector Strategy work, the IOUs will have a thorough understanding of K-12 and College resources and programs that currently exist, and, through collaborations, (1) propose enhancements to current programs, (2) identify new program needs that fill gaps understood from our mapping work, and (3) create opportunities to “link” programs and build education pathways. The ultimate goal is to increase the engagement of students in energy-related K-12 programs, and ultimately, energy efficiency careers.

**Key Elements**

- Supporting K-12 and college efforts to assist students to develop education based on visible career paths in EE and related fields.
- Creating and/or expanding college and university programs with EE focus.
- Fostering green campus efforts to apply EE knowledge in clear view of students and faculty.
- Continued refinement of existing curriculum to ensure EE fundamentals are included.
- Identifying career options in energy-related fields.
- Continue incorporating career exploration into programs and developing a systematic effort to institutionalize energy awareness and career awareness programs that is aligned with state content standards.
- Expanding collaborations with career academies, regional occupational programs and community colleges.

**Proposed Objectives**

- Students develop an awareness and appreciation for energy, energy conservation and the impact to the environment;
- Students develop careers that advance DSM business, policy, research and development and education; and
- Individuals from the targeted communities take advantage of programs that specialize in energy disciplines at all levels of the educational system and successfully advance themselves into rewarding careers in the energy services fields.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- [Linking existing training programs, across modalities, so that students' options are increased and pathways begin to be developed, e.g., pathways to post-secondary programs.](#)
- [Increase engagement of at-risk or disadvantaged students in energy-related coursework.](#)
- [A plan for more fully leveraging utility training centers for K-12 stakeholders.](#)

**College and University sector**

**Green Campus (statewide)**

The Green Campus Program is implemented on [UC/CSU college and university](#) campuses by student interns engaged and/or enrolled in environmental studies and/or other related areas. This team of 2 – 6 student interns per campus engages other students through forums, and other means on the importance of energy conservation and the link to the environment. They also lead the way in addressing energy efficiency in the higher education sector by meeting with faculty, staff and administrators and work with them to incorporate energy, energy efficiency and discussions about a green career path into their [curriculum, and courses/programs as well as](#) work with [them campus officials](#) to implement energy efficiency projects [on campus](#) and add value with educational outreach campaigns. Green Campus addresses behavioral and operational changes and product retrofits for campus facilities as well as serves as a direct pipeline of emerging environmental/energy professionals.

Green Campus WE&T aspects are exemplified by the advanced technical and professional development skills that the students develop as part of their internship, [and that non-intern students develop from interaction with Green Campus interns.](#) Green Campus projects include dorm energy competitions, energy efficiency curricula development, building energy assessments and recommendations, technology pilots, and outreach events. Interns actively market their projects and the program by completing monthly newsletters, working with campus and local media and presenting at conferences – including biannual program convergences.

[Green Campus Program is being reviewed to determine if it qualifies as a resource program.](#)

**Program Delivery**

Student Intern assistance to Facility Management stakeholders; Housing and Dining; and energy service companies (ESCOs), as appropriate, to help them increase measurable energy savings: Green Campus Interns play a key role in helping campus staff, administrators and energy efficiency professionals with their energy savings targets. As a means to this end, students will organize such activities as dorm energy competitions, laboratory fume hood educational

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

campaigns and competitions, technology pilots, office energy assessments and recommendations.

- *Recruit, train and support Green Campus Interns at each campus in implementing program activities.* Interns are hired and trained to implement many aspects of the program throughout the school year. Green Campus program staff works closely with interns, campus stakeholders, utility ~~partnersies~~ and ESCOs as they identify their objectives and draft a detailed implementation plan.
- ~~Hold a ff~~ All planning meetings ~~with include~~ student organizers and IOU program managers, campus administrators, facilities staff, faculty, IOU program managers and, energy service company representatives at each campus. After conducting implementation planning exercises prior to or early in the fall term, Green Campus Interns will bring new participants up to speed on the program goals, expectations, report on activities conducted to date, unveil future plans, and solicit feed-back.
- *Building in Efficiency to the Fabric of the Academic Framework:* Program staff will work with the UC Office of the President, Office of Academic Affairs, ~~and~~ CSU Office of Degree Programs and Educational Opportunities, ~~or Office of the Chancellor~~ to:
  - develop a database of EE-related courses on UC and CSU campuses,
  - consult with system-level as well as campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields, and
- ~~Utilize the Green Campus program as a tools to promote energy, sustainability, environmental and other related courses on campus diffuse EE courses throughout the UC and CSU systems by offering all campuses the opportunity to be selected for inclusion in piloting a new Statewide Green Campus Energy Career Pathway Program.~~
- ~~Building the Workforce in Collaboration with Industry:~~ Program staff will organize a California Energy Efficiency Student Mentoring Program. ~~This program will bring together the energy efficiency industry, IOUs, government energy regulatory agencies, community colleges, and UC/CSU campuses to pilot an intern program in which students will take a semester off their academic studies to work for a private or public entity doing energy efficiency related work. The result will be better trained graduates who know the efficiency field and the businesses in it, and energy businesses that have semi-skilled, low-cost help who are primed to join their workforce when they graduate.~~
- *Ramping Up Green Campus Reach:* Every aspect of the Green Campus Program offers a pathway to green jobs –academic course offerings, training in technical and “soft” professional skills, experiential hands-on energy

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

efficiency projects, and providing a statewide network composed of utilities professionals, other professionals and academics, students, and program alumni. We plan to increase the number of students who participate in Green Campus activities through growing the “concentric circles” of GC activities:

- Students who are employed as GC interns (approximately 60 students)
- Increase the number of volunteers who participate in GC activities without being paid
- Interns conducting awareness campaigns on campus will invite students to sign up as honorary Green Campus students and pledge to advance the WE&T message across campus. They will carry the message forward and ask others to do the same. Interns will gather pledge information so that they can be contact via email to gather information on courses they are taking or jobs they might be in.
- Increase the number of students who take classes taught or facilitated by GC interns (currently over 600 per year total)
- Students who are exposed to Green Campus messages on campus (This is already 400,000 student contacts per year statewide)

- ~~Ensure that minority, low income and disadvantaged communities fully participate in training and education programs. Green Campus [program will be made available at campuses serving low-income, minority and disadvantaged communities.](#) will work with campus EOP Programs to ensure this group of students is also fully engaged in our energy efficiency and green career path programs. Many students do not apply for admission to college because no one in their family has ever attended college or because college seems too expensive. EOP aims to improve the access, retention and graduation of students who have been historically disadvantaged, either socially or economically. EOP assists students by providing admissions and academic support services. EOP serves students from all ethnic backgrounds, and Green Campus will ensure that they are fully engaged in this program. Working with the EOP program as well as other similar programs will ensure that low income, minority, and disadvantaged groups are engaged in the WE&T goals.~~
- ~~EOP Provides access opportunities for historically underserved students (Low Income, first generation college) by making higher education a possibility for prospective students with potential~~
- ~~EOP is empowered to admit those who demonstrate potential, and recognizes that potential is not measured by GPA or standardized testing alone.~~
- *Mid-year and year-end meetings of all Green Campuses.* The mid-year meetings bring interns together with IOU program managers, campus

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

administrators, faculty, and facilities staff from various campuses to share successes, discuss challenges, and plan Green Campus activities for the next half of the academic year. The year-end meetings are used to review the year's progress, recognize group and individual accomplishments or best practices, and plan for the summer and following year.

- *Coordinate with other IOU departments to promote [consumer and facilitate business incentive programs](#). Green Campus through IOU Account Executives will provide information to campus administrators and facilities managers about Business Incentive Programs and encourage them to take advantage of these opportunities for making energy efficiency changes more cost effective. These facilities energy savings [programs-projects](#) are needed for [two things: numerous reasons, 1\) the campuses need to get some benefit for these educational programs being on their campuses, and 2\) for students to see that campuses are practicing what they are teaching, and 2\) to serve as a lab for students to practice energy efficiency through identification and implementation of projects on campuses, and 3\) building a career pathway.](#)*

**Community College Sector**

**California Community College (possible statewide) CCC IOU Partnership**

The ~~2010-2012~~2013-2014 California Community College program will build upon, enhance, and streamline the implementation strategies employed in the ~~2006-2008-2010-2012~~ partnership and adopt new strategies over the life of the program as they emerge or are proven as ready for the market. The implementation plan will be refined to adopt best practices and lessons learned program elements for the ~~2010-2012~~2013-2014 programs will include:

- An improved program management and structure that adopts lessons learned from the past cycle resulting in a more streamlined, effective approach;
- In the process of expanding the existing CCC training and education program from simply training facilities, operations and maintenance staff to include working with community stakeholders on curriculum development for students and industry with the objective of developing future energy professionals and a green workforce. Please refer to Advancing Strategic Plan goals and objectives for details on IOUs role in developing a Utility Workforce Education and Training program as well as our plan to ensure low income, minority and disadvantaged students are included.

**DEEP (SCE only)**

[DEEP is an employment development program that trains and educates California Community College students in the areas of energy efficiency and demand side reduction integrated demand side reduction through classroom learning, projects, and](#)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

outreach within the campus community. Along with preparing students for green careers, the program will produce reductions in operational costs for California Community Colleges by promoting the understanding of demand response, resource conservation, and carbon emission reduction.

**Three Program Goals**

Promote Sustainability and Efficiency Awareness

DEEP students will learn about sustainable lifestyles and promote what they have learned.

DEEP students will be guided by program coordinators, faculty and administrative staff on campus. They will familiarize themselves with current on-campus practices in building construction, recycling, green procurement, and renewable energy. They will work to integrate new concepts of sustainability into existing classes. DEEP students will provide the link between campus sustainability, academic infusion of sustainability concepts, and the green workforce.

Engage Students with Hands on Learning & Promote Peer to Peer Learning Opportunities

DEEP students will work closely with stakeholders and organizations on campus to create and implement energy efficiency projects, and conduct outreach campaigns. These guided efforts will work toward providing students with a hands-on experience, bring the campus realized energy saving opportunities, enhance building performance, and provide multiple other benefits.

Provide Green Workforce Exposure and Real World Experience

DEEP students will have opportunities to be exposed to domestic and international companies. They will develop relationships to future careers via interactions with companies such as Chevron Energy Solutions, ACCO Engineered Systems, Powersmiths, Lime Energy, Siemens's Industry Inc, Sunflower, Growing Energy Labs, Honeywell Building Solutions, and Growing Energy Labs.

Students will be exposed to the benefits of transferring to four-year colleges and learn how their educational interests relate to professional careers in energy.

**Program Approach**

The DEEP Program is primarily student driven and allows valuable innovators to take an active role in driving Community College campuses to meet the needs of the developing green economy.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

An effective Peer to Peer teaching model is encouraged. This allows students to teach others about energy and exponentially increases campus-wide energy awareness.

The recruitment, screening, and participant selection will be facilitated in close collaboration with participating campuses and the Foundation for California Community Colleges. All employee relation issues will be managed by the Foundation's Human Resources Department utilizing the SAGE system. Each selected school will receive funding for forty hours per week to be distributed among four to six part time DEEP students. Positions will be allocated \$10 per hour for an average of approximately 10 hours per week for the duration of program participation.

Student participants will work collaboratively with key stakeholders to create campus-wide goals and create a customized list of strategies to achieve those goals. Each team will assign roles and responsibilities to respective members.

**Adult School/Post High School (SCE)**

The delivery mechanisms include in-language seminars, outreach to schools, community events, faith-based organizations and Workforce, Education & Training.

- In-language seminars: The objective of in-language seminars will be to provide a classroom style forum to empower residential customers to conserve resources by teaching them simple ways of saving electricity, gas and water. This strategy will also align itself with a goal of the WE&T Strategic Plan so that minority, low-income and disadvantaged communities fully participate in education programs by providing elements that will seek to encourage interest toward careers in the energy efficiency industry. Seminars will also be used to promote other IOU program offerings such as Comprehensive Home Performance and of course demand response and other integrated DSM offerings like Summer Discount.
- Community booths: CLEO will continue participating in prominent ethnic cultural booths such as the 'Chinese New Year' and 'Harvest Moon Festivals'. This will also include coordinating with SCE's and SCGSoCalGas's Energy Centers and faith-based organizations and other cultural opportunities.
- Schools outreach: In 2013-2014, the CLEO program will expand its schools outreach efforts by providing a comprehensive schools initiative. In addition to continuing the 'Energy-Artist' contest, this initiative will also introduce a 'Carbon Footprint' contest where schools could potentially compete against each other for the highest decrease in energy use. The PEAK Program will be utilized to encourage energy efficiency behavior for fourth graders. Outreach efforts will also include coordination with SCE's Mobile Energy Unit and will also target Adult Education centers. Primary focus will involve K-12 elementary schools.
- Faith-Based Organizations (FBO's) and Community Center outreach: Local community FBO's and religious forums form the backbone of the ethnic community. FBO's also provide a forum for community events and an excellent platform to market and encourage energy efficiency. CLEO will cultivate and add to the existing

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- [relationships with churches and local community centers to effectively cultivate program participation and promote energy conservation](#)
- [Community / city partnership and outreach: This outreach strategy will build upon existing relationships with the cities of Monterey Park, San Gabriel, Alhambra, Walnut, Diamond Bar and others to promote energy efficiency in the community. CLEO will place information kiosks at city community centers and will participate in community events to further promote energy efficiency in the community. CLEO will also integrate components of the program with other existing partnership programs with higher ethnic populations.](#)
  - [Workforce, Education and Training: CLEO will expand its reach in the Workforce, Education and Training \(WE&T\) area by providing in-language energy efficiency education and training at various Adult Learning Centers and Community Colleges. The focus will be on educating those whose primary language is not English. Program participants will learn about the green jobs industry, energy efficiency measures / technologies, programs and services offered, as well as be placed on a 'green' career-path for participants to build upon.](#)

**K-12 Sector**

Some of these programs target the same grade levels but, none of the current or proposed programs target the same districts/schools. We have and will continue to ensure that students participating in one program will not also participate in another similar IOU provided program.

**PEAK (statewide) (PG&E, SCE and SCGSoCalGas)**

For ~~the 2010 to 2012-2013-2014 transition period~~ program cycle, PEAK is proposed as a continuation of a successful program by PG&E, SDG&E, [SCGSoCalGas](#) and SCE. ~~In the 2006-2008 program cycle PEAK was stand alone in PG&E and SDG&E service areas but, was a joint program in SCE and SCG service areas. For the 2010-2012-2013-2014 program cycles, †The participating IOUs will continue plan to work together to ensure that the program design and delivery is consistent across the IOUs, operate as a statewide program.~~ Other changes planned for ~~2010-2012-2013-2014~~ are revisions to include lessons on [green house gases, DSM and green careers Water/Energy Nexus](#) to reflect WE&T goals.

~~PEAK staff meets with school district representatives, such as principals, to explain the year long program commitment; plans a customized program for their schools; and targets 3<sup>rd</sup>-7<sup>th</sup> grade levels. PEAK then trains teachers through its curriculum, hands on lab activities, and toolkits. In turn, teachers educate their students about the science of energy, energy efficiency and environmental consequences. Using service-learning as a framework, students are prompted to apply their knowledge to real life situations in their homes, schools, and communities. Throughout the school year, students and teachers are supported in a variety of ways, such as: product distributions, educational assemblies, interactive website and software, e newsletters, contests, community recognition, and field trips to power plants and renewable energy generation plants. Via the website, PEAK participants are offered structured~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

course curricula recommendations on in a variety of EE savings topics including: electric, gas, water and renewable energy use. PEAK's diverse offerings foster strong relationships with schools and school districts, as well as a positive connection between the end user, the community, and the utility. **Brief description of the program.**

PEAK Student Energy Actions (PEAK) is a standards-based energy education program for grades 3<sup>rd</sup> through 7<sup>th</sup> grade (with possible expansion into other grades), that empowers youth to save energy in their homes, schools, and communities and promotes workforce development in energy-related industries.

**Program Key Elements**

The core of this program is built on four PEAK Student Energy Actions which are used thematically to educate students on how their personal behavior and the behavior of others has a direct impact on the demand for energy and on the environment. The four PEAK Student Energy Actions are: 1) Shifting Use Off Peak Demand Times 2) Cutting Waste Through Conservation 3) Plugging Into New and Efficient Technologies 4) Exploring Renewable Energy

Overall Program Goals:

- Deliver high-quality energy education to the next generation of energy consumers.
- Actively engage students, their families, and schools to save energy through energy efficiency, smart resource management, sustainability and demand response awareness.
- Provide career awareness, career exploration, and/or career preparation to appropriate grades on industries related to energy and environmental sectors.
- Create sustainable behavioral changes that result in the achievement of immediate and long-term energy savings and demand reduction in schools and homes.
- Promote positive relationships between the end user, the community, and their serving utility.

**Program Rationale**

PEAK complements each level of the Integrated Demand Side Management model by using education as a means of shifting behavior. The Energy Coalition's PEAK program will support IOUs in meeting recommendations outlined in the California Long Term Energy Efficiency Strategic Plan (CLEESP) and Workforce Education and Training (WE&T) Needs Assessment by providing integrated education on demand response, energy efficiency, energy and water conservation and sustainability through its curriculum. Participating students will receive workforce education related to career awareness, career exploration, and career preparation in order to ensure that they are equipped with the necessary pathway to enter the workforce. PEAK also promotes various rebate and incentive programs such as the Home Energy Efficiency

## **2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan**

Survey offered in Southern California Edison and Southern California Gas Company service territory.

### **Alignment with CLTEESP**

PEAK is aligned with the following CLTEESP Workforce Education and Training goals: 1) Establish energy efficiency education and training at all levels of California's educational system 2) Ensure the minority, low-income and disadvantaged communities fully participate. The PEAK program supports the state in meeting its 2020 goal to have a workforce that is trained and fully prepared to achieve California's economic energy efficiency and demand-side management workforce potential.

### **Core Program Coordination**

The PEAK program fits with the current IOU WE&T programs in that PEAK both provides and continuously develops 3 – 7 grade curriculum to include energy efficiency fundamentals (e.g. math, science, behavior) and identify career pathway options in energy-related fields. In addition, PEAK supports existing IOU programs by funneling participating student families into energy efficiency programs including distribution of IDSM education through student take-home materials. The Energy Coalition will work with the utility to further connect additional utility rebate and incentive opportunities that support energy efficiency management at the school facility level.

### **Target Audience**

PEAK is designed to engage students, educators, school district officials, school site administrators, parents, and community members. The PEAK program is tailored to educate 3rd~~th~~ through 12th grade students as change agents within the utility territory and develop educator expertise that supports the program core energy concepts as well as environmental education. In alignment with the CPUC's goals, PEAK will place emphasis on enrolling schools into the program that have been designated as low-income.

### **Implementation Strategy**

How will the program be implemented? Key steps?

Implementation strategy consists of the following components:

#### **Professional Development**

- Provide a Teacher Orientation & Training session for all new PEAK teachers. Offer advanced Teacher Training and Orientation to returning teachers.
- Support innovative project development in the areas of energy and the environment.

#### **PEAK On-site Support**

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Complete up to 2 PEAK educational campaigns or contests per school year.
- Conduct PEAK Events and Site Visits upon request or as deemed appropriate by PEAK and school staff.
- Provide on-site career explorer/career preparation opportunities upon request or as deemed appropriate by PEAK and school staff.

**PEAK Curriculum Development**

- Enhancements to improve relevance and comprehensiveness include: STEM and service learning-components, expansion to out of school time (OST), extension to 3<sup>rd</sup> -12th grade education-, and expansion of components to include . Water-Energy Nexus, Smart Meters, renewable energy and other sustainability concepts.
- As part of the WE&T filing, it is essential for PEAK to focus its efforts on career development especially in the areas of unemployed and underemployed workers. Two components will be developed: career exploration (grades 3-8) and career preparation (grades 9-12) if applicable. The Energy Coalition will realign the current curriculum so that students will explore the careers in the energy field as they engage in energy action activities, thus providing practice and engineering for success. For the career preparation component, The Energy Coalition will develop curriculum alongside the energy education to incorporate hands-on job preparation opportunities as the students prepare for the jobs of the future.

**Program Activities**

*Home Energy Efficiency Survey (HEES):* The program will provide a HEES survey for students to take home and have completed by their parents. The teachers will treat this as a homework assignment and have the kids bring the completed survey back within a specified time. The surveys will then be mailed in to the IOU SCE (coordinating IOU) and the families will receive their kit (CFL, showerhead and aerators) in a few weeks. The kit contents are worked into the lesson plans.

*PEAK Curriculum:* The PEAK Teacher Guide Book enables teachers to meet academic content standards in science, math, and language arts for grades three through seven. The curriculum lessons are designed to be covered over one school year. Lessons are designed to be fully comprehensive and contain the following: student learning objectives, lab instructions, post activity reflection questions and suggested community activities. In addition, each lesson (electricity, gas and renewable energy) emphasizes one or more of the PEAK Student Energy Actions, compelling students to apply their classroom learning to real life situations and behaviors.

*Greenhouse Gas and Energy Career/Water/Energy Nexus module:* PEAK will create a new module/s to include Water/Energy Nexus and how the use of one impacts the use of the other. Green House Gases and their environmental impact as well and Career development discussion promoting a green career path into their lesson plan curricula.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~*Teacher Training:* PEAK teachers participate in a day-long professional development seminar on PEAK's academic content and how to deliver the curriculum in the classroom. Teachers are encouraged to utilize lesson plans from each segment (electricity, natural gas, renewable resources, GHG, careers in the green workforce) of the program curriculum.~~

*Classroom Lab Toolkit:* PEAK teachers receive a toolkit that contains the supplies needed to complete each hands-on lesson for a class of 36 students. Toolkit supplies are replenished on an as-needed basis.

*Energy Challenge Software:* PEAK's website at [www.peakstudents.net](http://www.peakstudents.net) houses interactive games that allow students to simulate the effects of energy efficient behaviors at home and in the community. The web page will be expanded to include new program features; renewable energy; demand response; green-house gases and, their environmental impact.

*Energy Education in the Community:* PEAK staff facilitates educational assemblies featuring Bullman, PEAK's energy-saving mascot. Participants learn such concepts as how electricity is generated, how much energy is saved by a CFL, demand response, green-house gases and the 4 Student Energy Actions.

*Saving Energy at Schools Facility Audits:* Facility audits and retrofits will be offered to PEAK schools to improve facility energy use and enhance PEAK energy education. This initiative serves as an additional hands-on student learning opportunity, where students are encouraged to participate in the process and learn about the impacts of proposed changes. Students are also more engaged in energy conservation when they see that the schools are also practicing what they teach. In fact, most districts have energy managers that manage the green effort at schools and, students are able to see a green career in action.

*Coordinate with other IOU departments to promote and facilitate Consumer and Business Incentive Programs.*

*Coordinate events with Mobile Energy Unit (MEU) where available:* PEAK program activities are tailored to suit the needs of PEAK participants. This customized approach is implemented in all PEAK activities including planning special events and product distributions, developing teacher trainings, promoting green jobs through career discussions, and organizing student field trips. PEAK's proactive support generates a feedback loop which lends itself to quality internal program monitoring and ensures a constantly evolving, living program. PEAK education ultimately produces behavior modifications and attitudinal shifts that result in immediate measurable kW, kWh and therm reductions in both the student's school and home.

PEAK complements each level of the Integrated Demand Side Management model by using education as a means of shifting behavior. PEAK's comprehensive, hands-on program is correlated to the State of California's science, math and language arts

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

standards for grades three through seven. The program teaches students the science of energy and instills an ethic of smart energy management as well as engages students on discussions about green jobs. Throughout their participation in the PEAK program, students are presented with the necessary tools to formulate thoughtful conclusions about energy usage at the individual and community levels.

**Energenius Pre-K to 8 Program (statewide to be established(PG&E only)**

The Energenius Program, in its 21 years of existence, has reached close to one million students in both public and private schools within the PG&E service area. These highly rated educational materials are designed for students from pre-kindergarten through middle school. They are correlated to California Department of Education Content Standards and are reviewed and/or piloted during the development process by classroom teachers. Each of the eight existing Energenius programs include curriculum guides with detailed lesson plans, student activity books, calendars (for primary grades), and take-home materials on energy efficiency for parents and guardians.

The WE&T goals of the California Long Term Energy Efficiency Strategic Plan (CLTEESP) are reflected in the content and in the marketing strategies of the Energenius program. Section 9.5 of the Strategic Plan stresses that curriculum should include energy efficiency fundamentals and identify career options in energy-related fields. All programs are in the process or have incorporated these concepts. The Energenius program, in meeting goal 2 has implemented a comprehensive marketing plan to ensure that minority, low income and disadvantaged communities fully participate in its program.

The eight programs that are presently being marketed include: We Saved Energy Today—pre-kindergarten; Energenius Big Book Program for kindergarten—grade 1; Energy and Me! for grades 2-3; Energenius E Program for grades 4-5; Trees, Energy, and the Environment for grades 4-6; Energy Check Up for the Environment for grades 4-6; Water, Energy and the Environment for grades 4-6; and Transportation, Energy, and the Environment for grades 6 and above. Grade level designations relate to how each program is correlated to California Content Standards. However, teachers are the ones to decide which materials best meet the needs and skill levels of their own students.

The main focus of all the Energenius programs is on energy efficiency. As age appropriate content is included on the science of energy, environmental impacts of energy use and energy production, the water-energy nexus, greenhouse gas emissions, global climate change, demand response, and distributed generation. Content is also included on careers and jobs (awareness and exploration) with an emphasis on those in the green and clean tech areas.

Learning about energy, energy efficiency, and the environment should begin at an early age and continue through elementary, middle and high school, and beyond. The knowledge, information and skills can lead to lifelong habits and concern for the environment and the protection of the Earths' limited natural resources. Students

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

are also discovering in the Energenius program materials information (as age appropriate) on green jobs and careers.

*Launching of Energenius Programs and Resource Guides*

Two new Energenius Programs for middle school students will be available by end of 2012 and marketed beginning in 2013. A unit on non-renewable and renewable energy sources offers students an introduction to various sources of energy. Research and in-class activities provide the background for students to analyze the costs and benefits of various energy sources.— Students will also analyze the environmental impacts of the energy sources and learn how their own daily energy choices impact the environment. A section of the program relates to jobs and careers in renewable energy fields. The other new Energenius program is Smart Technology, Energy, and the Environment. This unit focuses on the smart grid, smart meters, and how technology allows consumers to better manage their energy consumption. Content related to demand response and distributed generation is introduced along with a look to a future where many consumers of energy will also be producers of energy. Careers related to the development /installation of the smart grid are among those covered in this unit.

*Green Career Resource Guide*

The new Energenius Green Career Resource Guide provides high school counselors and other educators a listing of resources they can use with students who are interested in learning about careers and jobs in the green economy. A range of annotated websites along with a section on search techniques will help introduce students to training and educational opportunities to secure green careers and jobs in the future.

*Online Energy Resources for Educators*

The Online Energy Resources for Educators guide has been updated and is available both online and in a print version. This annotated guide provides educators a hundred plus web resources for teaching about energy and the environment.

*Revising of Energenius Educational Program*

Two of the Energenius programs will be updated and revised in 2013 to be in compliance with expanded content defined in the CLTEESP and the Needs Assessment. Both programs will also provide activities related to career awareness with an emphasis on green careers in energy related fields. The Light Right Program for grades 4-6 uses lighting as a way to explore energy, technological changes and

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

personal energy habits. As students take actions at school and home to be energy efficient they learn how they are also reducing greenhouse emissions that contribute to global climate change. The Energenius E Program (grades 4 – 5) developed in 2005 will be updated to include information on how the use of electricity and natural gas is measured. Students will learn in this unit about the greenhouse effect, greenhouse gas emissions and global climate change. Included in this E Program will be content on how energy production and energy use impacts the environment.

*Green Action Teams*

A new green Energenius program will bring resources to high schools wanting to implement green action teams. Resources include consultation services by a green team implementation specialist. A consultant will provide site visits, phone consultations, and green team planning sessions. The consultant will work closely with staff and students to define activities and facilitate the actual establishment of a green team. One of the early team activities will be an energy survey of the school to help establish potential links to retrofit incentive programs. Upon a review of the survey results an energy expert will analyze potential energy savings at the site and make recommendations to the school and school district. Once a plan is developed other resources can be brought in by the utility. Green action team members might also choose to implement a water saving program, a green career day, or introduce a new composting/recycling program. An additional activity for high school green team members would be to partner with local middle schools to help them establish their own teams.

Since 1991, Energenius has expanded and flourished providing educational materials to over 700,000 students in public and private schools throughout the PG&E service area. Expansion statewide with eventual use of the WE&T “Web Portal” as the teacher access point is now possible. These materials are designed for students from kindergarten through grade eight and are correlated to California Content Standards. Each of the seven existing programs include a complete curriculum package featuring detailed lesson plans, student activity booklets, calendars, energy calculators and take home materials for family members.

Program units focus on energy efficiency and safety around electricity and natural gas and include Energenius Kindergarten Habits (grades 1-3), Energenius e-Kit (grades 4-5), Energenius Bill Buster, the Light Right program (grades 6-8), Trees and the Environment (grades 4-6), and Transportation, Clean Air, and the Environment (grades 6-8).

Learning about energy, energy efficiency, energy safety and the environment should begin in the early years of school and continue through high school and college. This knowledge and information can lead to life long energy savings habits and a concern for the environment and its limited resources.

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

### *Curriculum Development*

For 2010-2012~~2013-2014~~, *Energenius* will develop new program materials, “Energenius Branching Out”, targeted to upper elementary and middle school students. These materials will focus on energy related environmental connections, such as global climate change and the linkage between greenhouse gas emissions, energy production and energy use. The new materials will help students explore and analyze the trade offs of the various alternative energy sources. In addition alternative energy resources, and integrated demand side management. In addition, the materials will go beyond the energy efficiency fundamentals and introduce information on career and job opportunities in energy related and in the green economy. This as well as all educational programs will help interest youth in future green career paths.

### *High School Program*

The Energenius Program is a K-8<sup>th</sup> grade curriculum program on energy, energy efficiency, and the environment. The program does not currently extend into high school, so a new program, Green Pathways, will be developed and piloted (see 6.2.g) for high school students. This career development program will explore the landscape of environmental and energy careers. Green Pathways enables students to expand and apply what they learned in the Energenius program in the context of developing personal interests and planning career goals and strategies in the green economy. Extending beyond high school, Green Pathways will link and leverage program resources with the Community Colleges providing additional educational opportunities for students to pursue green jobs and careers. Together, Energenius and Green Pathways provide a comprehensive “green” education and career development experience.

### *School Presentations*

The program will develop resources and presentation materials to help schools that are interested in going green. Resources will include models for assemblies, classroom presentations or helping them coordinate implementation of green projects at their site. Coordination would include helping them develop an action plan and timeline for implementing the various green projects. Once the plan is developed they will go to the community for support for implementation. The local Waste Management company can help set up a recycling program, the water district and PG&E can do a walk through of the campus to identify water and energy efficiency tips. The class or club would decide based on their time availability what is reasonable to accomplish.

### *Energy Patrol*

School workshops will be conducted using the Energenius Energy Patrol Handbook and videos. Workshops will include an actual monitoring activity and all schools will receive follow up assistance with implementation... Energy Patrol programs help schools to monitor energy waste and energy efficient actions at the school site.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

*Green Careers Curriculum for Secondary Students*

New program materials that focus on both living and working in a green global economy will be developed for high school students. This curriculum will provide students background knowledge on renewable energy and energy efficiency, trends in green job growth, green careers today and those projected for the future. The high school program will include references to the California Career Technical Education (CCTE) model curriculum standards. The curriculum will be made available to career centers, environmental groups on campus and could serve as a guide to holding green job fairs and career days on campus. This high school material will support the Green Pathways program.

The new program designed for middle school students will provide career awareness activities that relate to green jobs and careers. The materials will provide students the background needed to understand the relationship between energy efficiency, renewable energy and the green jobs and careers that are available. This middle school program will be marketed through the existing channels that the Energenius K-8 program series is at this time.

*Curriculum on Analyzing Energy Use:* Introduce a mini curriculum that supports the use of the Home Energy Efficiency Survey (HEES). Piloting of these materials is in progress in the second quarter of 2009. The goal of this unit is to interest students and their families in ways that they can save energy at home.

*Conference, Exhibits and Presentations:* Our goal is to attend at least 10 educational conferences annually to promote Energenius materials and workshops and to provide general information on energy efficiency. When possible, presentations during the conference will be made.

*Resource Guide for Teachers:* Maintain a yearly update on "Energy Education Resource Booklet" which provides an annotated listing of sites for teachers and students covering issues on energy, energy efficiency, and the environment.

Energenius will coordinate with PEAK Student Energy Actions educational program or other K-12 programs where possible. PEAK compliments Energenius by covering demand side management concepts (shifting use to off-peak hours) and the science of energy.

Expansion statewide teachers would be able to access information on these program materials and order them through the statewide WE&T "Web Portal". **Green Pathways High School (9-12 grade) program (PG&E only)**

For 2013-2014, Green Pathways will be a local PG&E program. Green Pathways is a green workforce development high school program. The program was approved and developed during 2010-2012. (Filed Advice letter #3080-G/3596-E.) The pilot included research, development, and testing in collaboration with student and adult

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

stakeholder groups. The goal of the pilot—to determine proof of concept for a program that addresses unmet market needs and regulatory requirements—was accomplished. Green Pathways is now positioned to serve students and communities in the PG&E service area in 2013-2014 with the potential to reach students and communities statewide thereafter.

Green Pathways is the only targeted high school Connections program that leverages the online environment and social networking trends in education, utilizing online learning and communication. The Green Pathways online course completes the K-college level program continuity in energy efficiency education and career preparation. The online community engages professionals in the green workforce to inform and inspire students to pursue green careers. By leveraging the reach, economy, and scale inherent in online resources, Green Pathways provides a strategy that introduces California's emerging high school-college workforce to opportunities to contribute creatively and productively to California's environmental sustainability solutions.

The WE&T goals of the California Long Term Energy Efficiency Strategic Plan (CLTEESP) and the 2012 Needs Assessment Recommendations are reflected in the goals, content, and marketing strategies of Green Pathways. Section 9.5 of the Strategic Plan stresses that curriculum should include energy efficiency fundamentals and identify career options in energy related fields. These concepts are integrated into the Green Pathways online course and community. Green Pathways also provides pivotal gateway information and experiences to prepare high school students to identify and secure future internships and work opportunities. The online community will represent our cross sector partners from industry, trade and professional organizations, educational institutions, and local and state agencies. It will engage multiple stakeholder groups representing diverse market sectors such as business, industry, government, and CBOs. Green Pathways will be made available to geographically and socio-economically diverse communities within the PG&E service area. In meeting Goal 2 of the Strategic Plan, Green Pathways has already implemented a marketing plan to ensure that minority, low income, and disadvantaged communities have full access to the program. Green Pathways includes four key elements: an online course, a web-based learning community, volunteer green professionals (Green Gurus), and teacher professional development. These components provide students with a unique workforce development resource that integrates career preparation with environmental sustainability and green employment. It also provides teachers with a relevant, real world, green curricular context that enhances their curriculum. It seeks to increase students' awareness and involvement in their community about local environmental challenges, strategies and solutions, and related career opportunities.

Online Course

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

The Green Pathways course provides a flexible vehicle for use by educational institutions, CBOs, and independent and home school students. Delivery options could involve one consolidated period of time or span a few weeks or semester. The multi-week course complements teacher's curriculum and can be used in conjunction with a variety of high school courses. It can also be integrated into after school programs, clubs, or CBOs' youth programs. Green Pathways equips students with the knowledge, skills, and resources to begin a path toward green careers. Course content is divided into modules that include Environmental Sustainability Challenges, green careers addressing those challenges, and career exploration/preparation strategies. Online tools and resources include career assessments, the Department of Labor's jobs database, video/media, and discussions with Green Gurus and Career Coaches. Course completion includes certificates of completion and possible course credit options.

### Online Community

The online learning community is a communication and collaboration hub to achieve dual goals of (1) providing environmental sustainability content and (2) catalyzing resource sharing across regions, market sectors, and organizations. Students and teachers build relationships with peers from other school districts and communities that otherwise would not be possible. It hosts Green Gurus and Career Coaches in a variety of interactive formats including blogs, Q&A, discussions, and webinars. These experts offer information and guidance and serve as a source of networking contacts, potential internships, and possible work opportunities. Students create a personal profile that showcases their green career interests, work and volunteer experience, and desired pathway. As members of the Green Pathways community, students may participate in community activities as they build their path toward a green career.

### Professional Development

Professional development ensures the successful delivery of Green Pathways by educators and program directors. For many, an online course and communication platform may be new. Leader preparation introduces the knowledge and skills needed for orchestrating a successful online learning experience. Instructional materials and web-based training sessions will be provided. Ongoing interaction among participating leaders will encourage learning from each other and support a successful implementation.

### Collaboration and Community Building

In the service of developing tomorrow's green workforce today, Green Pathways creates motivation and a vehicle for cross-sector collaboration, community building, and communication. Green Pathways is positioned to link and leverage its resources and those of our partners and related initiatives such as the IOU Connections, Centergies programs, and the Green Pathways Sector Strategy. The program will reach out to Workforce Investment Boards, representatives of local and state agencies, professional and trade organizations, unions, and providers of

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

apprenticeships and training programs. These partner resources —along with community college, four year, and graduate programs— will provide relevant job, preparation, training, and internship information to Green Pathways students and teachers locally and regionally.

**LivingWise (SCGSoCalGas and SCE)**

For the 2010 to 2012 program cycle;2013-2014 transition period.

LivingWiseLivingWise® is proposed as a continuation of a successful program partnership between SCE and SCGSoCalGas. LivingWiseLivingWise® program target 5<sup>th</sup> and 6<sup>th</sup> grade students, and is usually incorporated into the science and math classes over a 4 week period. Local water providers are also contacted regarding their interest to co-sponsor the LivingWiseLivingWise® Program in their service territories. LivingWiseLivingWise® provides classroom learning activities and take-home kits to elementary and middle school classes. The kit contains energy and water-saving products such as a compact fluorescent lamp and high efficiency showerhead as well as other items to introduce energy efficiency and water conservation to children and their parents. The program features a blend of classroom learning activities, hands-on energy survey and installation projects which students complete in their homes with parental assistance. In addition, LivingWiseLivingWise® participants will be provided lesson plans as well as classroom discussion in the area of energy efficiency, demand response, distributed generation, water conservation and careers and job opportunities in the new green economy. These lesson plans come in the form of an activity booklet that addresses electric, gas and water conservation as well as green-house gases, renewable energy and careers in green jobs.

**Program Activities**

**Interactive:** Interactive school-to-home program for students

**LivingWise® Activity book:** The LivingWise Teacher Activity Guide enables teachers to meet academic content standards in science, math, and environmental. Lessons are designed to be fully comprehensive and contain the following: student learning objectives, post-activity reflection and environmental impacts.

The activity books contain the following lessons:

- Electricity;
- Natural gas;
- Water conservation;
- Renewable energy;
- Distributed generation;
- Greenhouse gases;
- Demand response; and
- Careers in the new green economy.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

**Classroom activity:** Teacher-designed classroom activities that reinforce student work on critical State Standards for core subject areas (math, Science, environmental).

**Hands-on:** Hands-on projects that utilize kits containing energy and water efficiency technologies that students directly install in their homes, thus reinforcing education results.

**Family involvement:** Involvement of parents to shape family habits and awareness of the benefits of energy and water efficiency

**Fully integrated energy efficiency program:** Collaboration with Southern California Gas Co and local Water agencies ensures that program covers electric, gas, and water as well as greenhouse gases, renewable energy and careers in green jobs.

**Coordinate with ~~other SCE~~ internal departments to promote and facilitate Consumer and Business Incentive Programs.**

Teachers are required to incorporate lessons from each of the following areas: electricity, natural gas, renewable resources, GHG and green jobs into their math, science or environmental classroom activities as possible. This program is very adaptable to different teaching styles and compliments California's science and math curriculum.

Initial implementation includes program customization to promote utility energy efficiency programs, demand response, distributed generation, water conservation as well as a green career path. The program also features a) pre-survey – that kids complete at the start of the program to determine their knowledge of energy efficiency, b) Household report card – that provide valuable information about household environment and conservation behaviors, c) post-survey – the kids complete after going through the program and allows us to see program effects on their knowledge.

**Green Schools (SCE)**

**College and University sector**

**Green Campus**

Marketing and outreach efforts to increase the transparency of campus energy efficiency goals and results, as well as Green Campus projects: Green Campus Interns will launch termed and ongoing educational campaigns for students, faculty, staff and administrators. In order to achieve and sustain cross-campus buy-in for energy efficiency goals and projects set by individual campuses and/or utilities, the program will:

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- Promote campus awareness of energy efficiency opportunities and work being done on campus. Green Campus Interns will publish a monthly newsletter describing their ongoing campus outreach efforts, in order to increase awareness about their projects and those of the campus stakeholders and university system. ~~The students will also coordinate to bring a Mobile Energy Unit (MEU) to campus awareness events where available.~~
- Distribute IOU Energy Savings brochures containing details about our commercial and residential EE, DR, DG and Renewable energy programs are provided on campus to administrators and students, and
- Place an emphasis on working with minority and disadvantaged groups throughout the campus.

**Community College Ssector**  
**DEEP (SCE only)**

~~This program is targeting community colleges on a limited basis. Working with the Community College Chancellor's Office to target campuses with strong sustainability programs.~~

**California Community College IOU Partnership**

The partnership will implement a training and education (T&E) program focusing on energy efficiency courses for CCC facilities, operations and maintenance staff. The partnership is also actively working with other CCC and community stakeholders on curriculum and Workforce Education and Training Strategies (WE&T) for students and industry to develop a green career path and workforce in support of the Strategic Plan goals. The basis of the T&E program will be to coordinate with the IOU training centers to customize existing course offerings in the HVAC, controls, lighting, commissioning, and green building areas and deliver them to the CCCs via direct training at the campuses or via telecasts or webinars to many campuses on a distributed basis.

~~The CCC approach was established in the 2006-2008 program cycle on a pilot basis, and will expand it to a comprehensive program offering for 2012-2012.~~

**Adult School / Post High School**

**CLEO**

~~The CLEO program will promote all energy efficiency and demand reduction programs that would benefit that community using brochures and written materials, interactive displays, newspaper advertising, radio advertising, online website presence, and static displays.~~

~~The CLEO program message will encourage customers to participate in SCE's programs and services, and will coordinate with SCGSoCalGas and the local water agencies and will promote increased awareness for customers to understand~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

the structure and opportunities for energy conservation and efficiency, both at home and in their businesses.

**K-12 Sector**

**PEAK (statewide)**

This program will be targeted to associations, school districts and ~~will be included in up to 8~~ teacher conferences ~~a year~~. Part of this marketing will include targeting low income and disadvantaged communities. The method used to identify low income and disadvantaged communities is by the percentage of students on school lunch programs. In fact, our goal is that 50% of program participants come from the low income and disadvantaged groups.

~~Information about our residential EE, DR, DG, and renewable energy programs are provided with our Peak program. This information is intended to be included as part of class discussion as well as taken home to be discussed with parents.~~

~~Schools that have used this program and see the impact it has on the students, request the program year after year as well as inform other teachers about the benefits. Even though every new year brings new students, we try to broaden the programs reach to a few new schools every year.~~

- -Design & production of PEAK tradeshow marketing materials including a new marketing brochure and other targeted marketing pieces that are consistent with statewide marketing.
- Participate in community events that support marketing of program.
- Enhance the peakstudents.org website.

**Energenius (statewide to be established PG&E only)**

~~Each year, more than 10,000 teachers receive a targeted mailing that promotes the Energenius program materials. Annually, the Energenius program exhibits at 11 educational conferences to market the program to teachers. Educational conferences provide a way each year to contact more than 15,000 teachers and other educators.~~

~~The Energenius Program in 2013-14 will increase its marketing effort by implementing new internal collaborations within PG&E and expanding upon present efforts. Over the last decade the Energenius take home materials for families have included information that support the low income programs, rebate offers, and home energy efficiency surveys. Each year up to 80,000 families have received this information brought home by their children who have used the Energenius student materials. In addition, PG&E materials on energy efficiency and those on low income programs are always available at the teacher conferences where the Energenius program is exhibited. Samples of these materials in languages other than English are also displayed.~~

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

Going forward, the Energenius program will help facilitate the promotion of the educational materials by staff working with the low income programs. While in the communities they could distribute Energenius promotional posters and flyers. In addition within PG&E there are staff and volunteers (e.g. Ambassadors, Junior Achievement) who are in contact with schools and/or teachers that could help promote the programs.

In 2013-14 PG&E will be researching ways to link the Energenius information on its website with external partners that interact with schools in its service area.

The Energenius program will be marketed in three major ways. A targeted mailing is done twice a year, September and February to about 10,000 teachers statewide. The teacher names are acquired through Market Data Retrieval and the mailing is done by the fulfillment house. Another method of marketing includes attending up to 10 teacher conferences a year. Energenius materials are displayed and teachers can order them at the conference or instructed to go online. Program staff attend professional association meetings, distributing information on educational programs, including but not limited to: The Coalition of Adequate School Housing (CASH), California Association of School Business Officials (CASBO); Small School Districts Association and American Association of School Administrators. Additionally, Energenius staff will make presentations to school district facility managers and school administrator meetings.

- A great majority of teachers that order these materials year after year and have made it part of their regular curriculum.
- Our marketing will target low income and disadvantaged communities and, our goal is that 50% of program participants come from the low income and disadvantaged groups.

### Green Pathways (PG&E only)

Green Pathways will be marketed within the PG&E service area. As a green career curricular resource, Green Pathways complements a range of curriculum and program offerings in schools, CBOs, and for independent and home school students. Environmental and green curricular offerings such as other IOU Connections and Centergies programs, Green and New Energy Academies, Career Technical Education, and ROP and AP classes will be targeted. Other marketing targets include courses that prepare students for their senior year internships, as well as after school programs, green clubs, and career preparation programs through community organizations.

Each target program has corresponding local or state conferences and meetings at which Green Pathways will present informational material. Webinars or short online dialogues will be hosted to share information about Green Pathways. Collaboration and co-marketing with other programs will expand our reach.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Social media including Facebook, Twitter, and Green Pathways offer avenues to reach educators, organizations, and Green Gurus.

**LivingWiseLivingWise® (SCGSoCalGas and SCE)**

Marketing consists of targeted mailing to schools and districts within the affected service area. Information about the program is mailed, emailed, faxed and made available via a web site. Interested schools or teachers would contact the third party vendor to participate in the program. The third party vendor first validates the schools are in IOU service area by contacting the IOU. Once schools have been involved with the program, they request it again in following years as well as refer other teacher to the program.

- Our mMarketing will also target low income and disadvantaged communities and, our goal is that 50% of program participants come from the low income and disadvantaged groups. Low income and disadvantaged communities are identified by the percentage of students on a school lunch program.
- Information about our residential EE, DR, DG, and renewable energy programs are provided through the LivingWiseLivingWise® program. This information will be included as part of class discussion as well as taken home to be discussed with parents.
- Teachers truly see the benefit of this program and the impact it has on the students and their families and, it is evidenced by requests year after year to have this program at their schools.

**Green Schools (SCE)**

~~Since this program is implemented at the district level, this program is target marketed to school districts in the IOU service area. The program will also continue to expand the reach to low income students (currently 68% of schools have greater than 50% qualifying for reduced school lunches). This is a K-12 school program but at the request of the PUC, we in support of the California Needs Assessment, will make every effort to enroll a greater number of high schools in the program so as to prepare students for careers in the green workforce and/or higher education with an emphasis in a green career.~~

- ~~• Information about our residential EE, DR, DG, and renewable energy programs are provided through the Green Schools program. This information will be included as part of class discussion as well as taken home to be discussed with parents.~~
- ~~• This program was a two year program for program cycle 2006-2008 but will be changing to a one year program starting in 2010-20122013-2014. The reason for making this program change was to make this program available to more districts/schools/teachers. We receive many district requests asking us to continue the program; however, we cannot forsake all other customers in our service area. We explain that our hope was for~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~the program to provide a foundation for energy conservation to continue at your school district and, offer our support in other ways.~~

**K-College Outreach**

**Mobile Education Unit (SCE only)**

~~SCE will also use specially trained individuals teach students about energy and promote integrated tools and services to customers, and to help SCE build awareness, while creating a real-time, interactive connection with the customer.~~

- Will continue to work with State Department of Education (Curriculum Commission) on the development of Energy and Utilities Sector Curriculum Standards to be included in curriculum development advisory boards so that we can contribute to tailored K-12 curriculum that includes the science of energy, energy efficiency and some discussion about green careers.
- Will also work with the UC Office of the President of Academic Affairs and the CSU Office of Degree Programs and Educational Opportunities to 1) promote energy minor or major degree programs, 2) collaborate and/or provide expertise in the development of complementary new and revised courses that will form a comprehensive integrated approach to energy education, and 3) consult with campus-specific administrators to define additional courses needed to meet the growing need for graduates with skills in energy efficiency and related fields.
- Will work with CBOs, FBOs, NGOs, and others as part of the through a WE&T taskforce in an effort to advance WE&T goals.
- Will work with water management agencies, air management agencies or other government entities to establish a network of internship opportunities for students in pursuit of a green career.

b) Program delivery and coordination

i. Emerging Technologies Program

This program will have regular communication with the ETP, as emerging technologies will be very important in what is taught all levels of the education system.

ii. Codes and Standards Program

We have discussed this WE&T effort with Codes and Standards and have agreed to keep the lines of communication open and schedule ongoing discussions.

iii. WE&T Efforts

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The WE&T Connections ~~Sub Program~~Subprogram will support the other IOU EE Programs as appropriate.

- iv. Program-specific marketing and outreach efforts (Budget provide in Table 1)

Refer to Section 6.2.a.iv. for all discussion of marketing and outreach plans.

- v. Non-IOU Programs

We currently collaborate with local water agencies with a few of our programs and will continue doing so for the ~~2010-2012~~2013-2014 cycle. Additionally, we will work to involve and coordinate some of our educational efforts with environmental agencies/groups to show the linkages between energy conservation and the environment.

- vi. CEC work on PIER

No anticipated direct work with PIER from this ~~Sub Program~~Subprogram's activities.

- vii. CEC work on codes and standards

The IOUs will work with the CEC and the IOU Codes and Standards programs to improve code compliance through coordinated education and training delivery.

- viii. Non-utility market initiatives

Refer to WE&T Planning ~~Sub Program~~Subprogram Section 6.3 for more discussion on efforts in the education and community sectors.

c) Best Practices

~~2006-2008 Process Evaluations are not yet complete but, we are prepared to make modifications to programs once a list of improvements are provided. These programs have incorporated already California Needs Assessment Study recommendations and will work to incorporate Opinion Dynamics study recommendations as the study is released in 2012.~~

**Green Campus** – Lessons learned from past program cycles have been transformed into best practices as well as feedback of past process and impact evaluations, and included in program re-designs. Some recommendations provided in mid-cycle that were feasible for implementation, were implemented successfully. Additionally, ~~initial feedback from 2006-2008 process and impact evaluations-~~ the California Needs Assessment recommendation have incorporated has been included in the redesign for ~~the 2010-2012~~2013-2014, transition period program cycle. ~~Final evaluation reports and recommendations are not yet available.~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~DEEP~~—DEEP was created as a result of the CA Needs Assessment study from 2011. The study identified a gap in service for this community college sector and SCE moved quickly to close that gap by developing an innovative community college program.

CLEO - Media marketing has proven to be the primary mechanism to generate community awareness about the CLEO Program and its offerings. Internal metrics further outline the importance of the marketing mix, as well.

The program relies on a dynamic EM&V to gauge the program's success and to listen to the customer for feedback. These are transformed to 'lessons learned' and incorporated in to the program strategy and offerings. For example, in 2006-2008, costly television spots were swapped for effective newspaper and radio spots, as illustrated above.

**PEAK** – The first PEAK program was launched in Laguna Beach in 1979 and since then has evolved into the comprehensive, standards based program that exists today, reaching thousands of students across California. Past experiences have lead to best practices in the following years. Additionally, PEAK is the recipient of the 2010 Governor's Environmental and Economic Leadership Award.

~~Energenius—This educational series continually evolves to address the changing needs of classroom teachers and their students. The Energenius program strives to create quality materials that reflect California State Department of Education (CDE) frameworks and connect with content standards.~~

Another important practice that has increased in importance over the years is the early involvement of classroom teachers beginning with pre-development focus groups. Teachers are recruited to review draft materials and submit written evaluations. The piloting of selected lessons and activities with students is encouraged. Input from teachers, both formal and informal, has been valuable in the development of the teacher guides, student activity books and other materials found in the eight Energenius programs.

Exhibiting and meeting teachers at educational conferences has been another important practice. Besides providing a "pulse" to what is going on in schools teachers at these conferences offer numerous comments and ideas related to existing and future materials. Teachers for example, at an early childhood conferences were asking when PG&E will have its pre-kindergarten program as we know that "good energy-saving habits" begin early. With this encouragement, a new Energenius pre-K program is being launched in 2012. The Energenius educational program series has flourished since 1991. Over the years the program materials have been updated and enhanced and at present new units are under development. Teachers are always used to review and field test materials during the development phase and on-going evaluation of existing materials allow educators to have input into updates and revisions.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~Energenius materials now under development will all have content related to green careers and jobs, greenhouse gas emissions, global climate change, environmental impacts of energy production and use. As age appropriate this content will also be added to the existing program K-8 materials. The appeal of all the Energenius program materials includes that lessons and activities make clear connections to California Content Standards in science and other disciplines. These correlations to the Energenius materials are important to teachers and school administrators and help ensure that the content is taught.~~

~~**LivingWiseLivingWise®** - Lessons learned from past program cycles have been transformed into best practices as well as feedback of past process and impact evaluations, and included in program re-designs. Some recommendations provided in mid-cycle that were feasible for implementation, were implemented successfully. Additionally, the California Needs Assessment recommendations have been incorporated initial feedback from 2006-2008 process and impact evaluations has been included in the redesign for the 2010-20122013-2014 transition period program cycle. Final evaluation reports and recommendations are not yet available.~~

~~**Green Schools** - Lessons learned from past program cycles have been transformed into best practices as well as feedback of past process and impact evaluations, and included in program re-designs. Some recommendations provided in mid-cycle that were feasible for implementation, were implemented successfully. Additionally, the California Needs Assessment recommendations have been incorporated in the redesign for the 2013-2014 transition period.  
Additionally, initial feedback from 2006-2008 process and impact evaluations has been included in the redesign for the 2010-20122013-2014 program cycle. Final evaluation reports and recommendations are not yet available.~~

d) Innovation

~~This area will be addressed once process evaluations are complete.~~

~~**DEEP**—This program was developed and implemented as a result of to address a gap in services was identified in the CA Needs Assessment study of 2011. We will address this area once process evaluations are complete.~~

~~**Energenius**—The program materials have been developed by PG&E so the cost for implementing statewide (printing and developing new programs with statewide reach) keeps the cost low. It is relatively easy to make changes to the curriculum and incorporate information about energy efficiency programs and services, issues related to global climate change, and green careers.~~

~~**Green Schools**—Its unique approach integrates school facility energy savings with energy savings instruction and action for students to use in school, their homes and their community.~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

e) Integrated/coordinated Demand Side Management

Refer back to Section 6.2.a.ii for more information.

IDSM concepts are incorporated in Connections programs on an age appropriate basis, as described in previous sections.

Formatted: Highlight

f) Integration across resource types

All of the University, Community College, and K-12 components will ensure that include curriculum to help students understand the science of energy, energy efficiency and conservation, demand response, and renewable and distributed generation, as well as the environmental and economic impacts of energy consumption. Also, the goal is for students to understand the energy-related environmental connections, such as global climate change and the linkage between greenhouse gas emissions and energy use. In addition, materials will go beyond the energy efficiency fundamentals and introduce information on careers and job opportunities in energy-related fields and in the green economy.

g) Pilots

No pilots are being proposed for SoCalGas.

~~**Green Pathways (PG&E):** This program will be piloted in the PG&E service area in 2010-2012/2013-2014. This is a career development program for high school students throughout California that will cultivate the next generation of "green" professional and vocational careers. Green Pathways creates an interactive learning environment utilizing web-based dialogues and other network-based communications that engage students and teachers with practicing and retired professionals in business and industry, professors and researchers in higher education, and local and state government. It incorporates the fundamentals of career development planning and strategy in the context of energy and environmental education. A repository of information resources will be created and made available through multiple electronic formats for wider distribution. The program will be conducted in conjunction with high school classes and will provide teachers with curricular resources for guiding students. It can develop linkages to California community college programs and provide resources to career counselors, professors and students. This pilot will initially target Bay Area schools and will scale to involve high schools/community colleges in multiple geographical areas in 2011. **Green Training Collaborative (SCG):** This program will be piloted by SCG will continue in 2013-2014. This is a pilot program to involve local community education institutions and training programs in energy-related career development strategy sessions. SCG will coordinate with regional implementers of such career programs to discuss projects that allow students and other potential green workforce candidates to explore energy efficiency, integrated demand side management technologies and resources management techniques. The program would be to add experience to participants pursuing green careers and employment~~

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

unique to the region. The program will be evaluated to determine best practices that evolve in tailoring career development coordination for specific regional needs. The program will rely upon fund and resource sharing from among the collaborative.

h) EM&V

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.

IOUs will continue to work with EM&V to assess market effectiveness and impacts of educational education training programs. IOUs will also work collaboratively in the development of their pilot projects described in Section 6.1.g. The IOUs currently working with Opinion Dynamics with regard to final process and impact program evaluations conducted in 2008. Once the evaluations are complete, the IOUs will review and determine if and how to incorporate into our program plans.

**4. Program Diagram**

See above Section 6.2.

**5. Program Logic Model**

Below is the logic model for the WE&T Connections Subprogram. ±

The activities shown in the Connections logic model fall into two primary categories. The first is focused on marketing programs, especially to hard-to-reach and disadvantaged communities. In addition to marketing efforts directed at Title I schools, this activity will include partnering with organizations that operate in the communities of Title I schools.

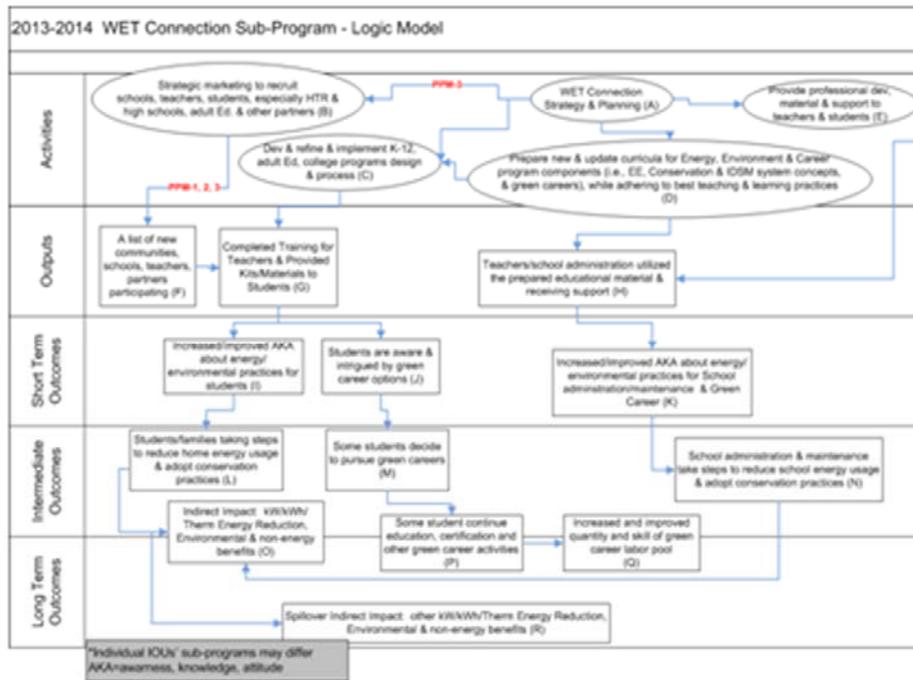

The second focus of the Connections activities is on preparing new curricula and refining program design and processes. It is expected that these activities will produce programs and curricula that lead students to understand energy and conservation and their importance, as well as how to use energy efficiently in their households. They are also expected, as a result, to influence their families to do the same. Likewise, some curricula support the incorporation of energy efficient practices and technologies in classrooms and schools.

The curricula and program design will include information and resources on career options in energy-related fields, with an intended outcome being that some of the students

## 2013- 2014 Energy Efficiency Programs Statewide Workforce, Education and Training Program Program Implementation Plan

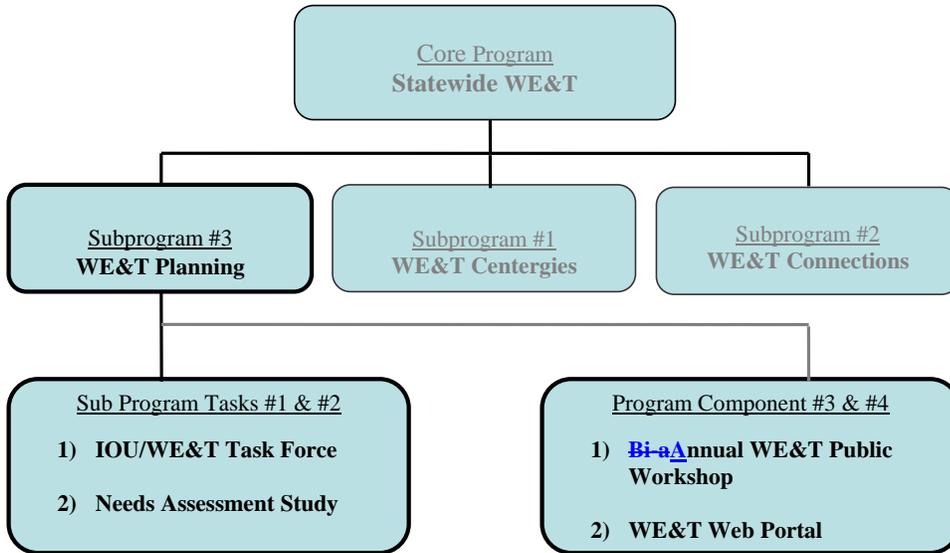

exposed to green career resources will ultimately decide to pursue green careers as a result.

All of these activities are expected to lead to classes that improve AKA of students, their families and teachers and encourage students to pursue green career options. Activities focusing on saving energy on school campuses will also lead to improved AKA about energy and environmental practices within the school and at home for the students. Ultimately, these activities and outputs are expected to result in indirect energy savings.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

6.3) Sub-Program Implementation – WE&T Planning – SCG3731

a) Statewide IOU Coordination

i. Program name

Statewide WE&T Planning is a Sub-Program within the Statewide WE&T Core Program, formed by the IOUs as a direct response to the California Long-Term Energy Efficiency Strategic Plan (Strategic Plan). The WE&T Planning Sub-Program involves management and execution of several strategic statewide planning tasks intended to help sustain momentum in long-term WE&T development and strategic planning, including identification of funding streams and market sector specific needs.

The WE&T Planning Sub-Program was created to facilitate implementation and completion of the four key strategic tasks identified in the Strategic Plan to drive long-term WE&T development:

- 1) Form an IOU/CPUC WE&T Task Force
- 2) Conduct a Needs Assessment
- 3) Create a WE&T Specific Web Portal
- 4) Annual WE&T Public Workshops

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

In order to meet the state's growing workforce demand, a concerted planning effort that includes a variety of initiatives and funding sources beyond ratepayer funds is required. Such an effort will demand the collaboration and involvement of secondary and post-secondary education leaders, technical and professional organizations, state agencies, economic and labor development organizations, utilities, and construction and manufacturing businesses that deliver energy efficiency solutions. The IOUs will support the larger statewide effort, and will help ongoing development of WE&T programs through their WE&T Planning coordination.

ii. Program delivery mechanisms

Implementation activities will be informed by the statewide scoping study and needs assessment. The IOUs are expected to direct much of the work needed to complete the assessment, which will identify existing WE&T infrastructure and capacity, anticipate future needs, and specify urgent gaps that need to be addressed.

Based on the statewide needs assessment, a strategic plan, outlining at least existing and anticipated green collar jobs and the skill sets that are likely to be demanded by industry, will be presented. Organizing these skill sets into practical career paths should influence communication, development, and implementation of future WE&T programs.

Funding for actions based on the above mentioned scoping study, needs assessment, dialogue with stakeholders and task force conclusions will be required to impact the WE&T needs in time to support the urgent needs of the Integrated Demand Side Management (IDSM) Portfolio. Such implementation actions may include collaboration with appropriate educational sectors as prioritized by the needs assessment to act as catalysts to enhance conventional educational efforts to accelerate the mainstream adoption of green career support.

The statewide IOU Planning tasks will be shared among any other statewide planning and training implementers and be coordinated, where plausible, with the IOU WE&T Centergies and IOU WE&T Connections Sub Programs. A statewide WE&T web portal could ultimately serve as a central repository for exchanging training and job opportunities, as well as statewide and national developments linked to California workforce initiatives.

Four specific key actions to be completed in the near term to drive long-term WE&T development and strategic planning. The Taskforce formed from the California strategic plan is intended to identify funding streams other than ratepayer funding, identify market sector specific needs, and inform short-term actions to initiate longer-term strategies for each market and educational sector.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- 1) *Energy Efficiency WE&T Task Force.* The Task Force is expected to be comprised of energy efficiency and demand side management IOU program representatives, CPUC staff, labor, industry representatives, and educational experts to fulfill administrative functions including: developing a needs assessment RFP; selecting the third party to conduct the needs assessment; and managing the needs assessment evaluation. The Task Force members will continue to help implement the goals and strategies set forth in this Strategic Plan. Beyond the representation listed above, the WE&T Task Force will rely on commitments for involvement from educators and educational administrators, labor representatives, community-based job training leaders and other non-IOU energy efficiency program implementers

The WE&T Task Force is in the early stages of formulation. Reports on existing WE&T related programs and efforts as well as discussion of new WE&T programs and efforts will be core topics of these meeting sessions. The Taskforce will provide a formal framework for all members to get updates, provide feedback and be actively involved in discussing studies, programs, projects, and WE&T efforts being implemented under the strategic plan and other related state initiatives. Task force meetings represent work sessions to review and refine WE&T coordination efforts among stakeholders.

[During 2013-2014, the Task Fforce is no longer in its early stages of formulation and will continue to engage with stakeholders and provide updated reports on WE&T programs and efforts.](#)

[An update on Needs Assessment recommendations was provided in the Joint IOU WE&T Annual Report, submitted on May 1, 2012. Per the Guidance Decision, the IOUs will work with Commission Staff on the WE&T Task Force to develop a data request template to be submitted by Staff as needed for periodic updates on the status of the utility's Sector Strategy activities. This provides a more specific and extended role for the Task Force.](#)

- 2) *WE&T Needs Assessment:* ~~An in depth formal statewide training and education resource inventory and needs assessment is necessary for long-range strategic planning and delivery. The needs assessment and resource inventory will be structured to produce short-, near- and long-term workforce strategies to support each sector defined in the Plan. The assessment will be completed by a third-party with its process managed by the CPUC and IOUs, in collaboration with the California Department of Education and other involved stakeholders.~~ The Workforce Needs Assessment study identifies preliminary findings, and in some instances, recommendations, for statewide WET program and/or subprogram considerations. The Joint Utilities ~~will~~ work collaboratively with Energy Division staff to select a subset of these

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

findings and/or recommendations to evaluate implementation feasibility as part of the 2010-2012 program activities, [which were approved by the Commission through a joint WE&T Advice Letter](#). The findings of the Needs Assessment (ordered in Decision 08-09-040) and recommendations [will be](#) presented within one month of dissemination at a public workshop to allow for public comments and further discussion. The findings [will be](#) also be made publicly available through posting to the energy efficiency web portal ([engage360.com](http://engage360.com)) to the service list in this proceeding and the Distributed Generation and Demand Response proceedings. Within 60 days from the date of the workshop the utilities will jointly file an Advice Letter to modify the existing Workforce Education and Training statewide program consistent with the Needs Assessment.

Update from May 2012 PIP Addendum:

In compliance with Commission Decision 09-09-047, a joint IOU advice letter was approved by Energy Division by letter dated October 28, 2011. [PG&E Advice 3212-G-B/3852-E-B can be found at this link:](#)  
[http://www.pge.com/nots/rates/tariffs/tm2/pdf/ELEC\\_3852-E-B.pdf](http://www.pge.com/nots/rates/tariffs/tm2/pdf/ELEC_3852-E-B.pdf).

~~In addition to the information provided in PG&E's Advice 3212-G-B/3852-E-B, in 2012, PG&E launched a Commercial EE Sector Strategy at a Strategic Convening (Convening) in order to get alignment and coordination around the creation of the Commercial EE jobs necessary to reach PG&E's portfolio goals, as well as initiate new partnerships. PG&E SCGSOCALGASoCalGas has initiated steps to develop sector strategies in other sectors, including the commercial building HVAC sector, the architectural design sector, and small/medium business building audits. PG&E has IOUs have restructured educational programs toward structured course series to serve particular sectors. PG&E SCGSOCALGASoCalGas has also often allocated resources and partnered with community colleges and workforce investment boards to assist unemployed building operators toward completing a certificate program series.~~

Details on these efforts will be provided in the 2012 WE&T Annual Report.

[IOUs will implement WE&T sector strategy programs started in 2012. In compliance with Decision \(D.\) 09-09-047, the Investor Owned Utilities submitted for approval their joint IOU Advice Letter \(AL\) and supplemental filing proposing modifications to the existing Statewide Workforce Education and Training \(WE&T\) program based on the recommendations of the WE&T Needs Assessment. The Needs Assessment recommendations focused on a Sector Strategies approach, working closer with trades associations, collaborating with more parties on credentials and certifications, restructuring Energy Center course presentment, support for curricula development, targeting of disadvantaged workers, and evaluation of workforce outcomes. Other relevant Needs](#)

Formatted: Indent: Left: 0.25"

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Assessment recommendations focused on collaboration with the all educational sectors, career education, and evaluation plans on K-12 programs.

The ~~Advice-Letter~~ provided a general outline of the plan the IOUs would be following to achieve progress for enhancing and more clearly demonstrating necessary changes to the IOU WE&T program to align with shifts in IOU resource program requirements and industry workforce demands. Comments submitted prior ~~previous to this final CPUC~~the Guidance ~~d~~Decision illustrate the varying uncertainty on long-term career pathways into green jobs. The IOUs indicated quarterly actions to be achieved during 2012 based primarily in response to the Needs Assessment recommendations, recognizing there were impending change forthcoming in such areas as IOU Residential, Commercial and HVAC SW programs. The current 2013-2014 Guidance Decision-09-11-014 provides significant guidance that will allow the IOUs to move more decisively on its Sector Strategies action plan. The general plan of action proposed for 2012 will take greater shape and the 2013-2014 period ~~transition cycle~~ will provide a critical space to apply and align Sector Strategies approaches with the Residential sector ~~Energy Upgrade California-Whole Home Upgrade Program~~program, Emerging Technologies, Commercial Buildings programs and Codes & Standards.

Per the ~~Joint IOU A~~Advice-Letter, activities to develop sector strategies that are currently in progress and will be put into place as other workforce sectors become part of the Energy Centers' focus include:

- Develop partner criteria desired to help achieve goals and objectives for each targeted Sector Strategy area
- Identify potential Sector Strategy Partners based on desired criteria and existing collaborations as well as necessary "new" ones for each targeted Sector Strategy area
- Outreach to identified partners for each targeted Sector Strategy area
- Initiate IOU / Partner working group for each targeted Sector Strategy area.
- Identify shared goals & objective for each targeted Sector Strategy area.
- Develop a shared vision & mission statement with corresponding goals & objectives for each targeted Sector Strategy IOU / Partner working group
- Identify and develop timelines & roadmaps / action items / roles & responsibilities for each targeted Sector Strategy IOU / Partner working group
- Identify reporting vehicles and reporting schedule for each targeted Sector Strategy IOU / Partner working group
- Within each Sector Strategy working group, initiate identification of lessons learned / best practices and executable partnership activities that help achieve goals and objectives previously identified. These lessons learned, best practices and activities will be included in program planning for the next program cycle.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The IOUs propose continuation of the approved joint IOU Advice-Letter plan of action through 2013-2014 in coordination with changes occurring among resource programs directed in this Decision, as well as workforce skills and qualifications demanded in the market place.

— *WE&T Web Portal:* The web portal will include links to various demand-side management (DSM) related training programs and will allow for a single point of communication. The portal will also serve as a repository for demand-side management and energy efficiency training, educational conferences, and career opportunities. This portal will be created and funded in collaboration with other appropriate entities, and linked to the statewide energy efficiency web portal.

- 3) The initial planning was to develop the WE&T web portal within the existing EE Web Portal (www.engage360.com). However, the October 13, 2011 Assigned Commissioner's Ruling from Commissioner Ferron required that IOUs suspend all spending on the EE web portal. Further direction was provided in D. 12-05-015 (OP 127) that the web portal content from Engage 360, shall be fully migrated to the Energy Upgrade California Whole Home Upgrade Program web portal, with the Engage 360 web portal decommissioned, by no later than the end of 2013. Once the web portal content has been migrated, the WE&T Program seeks to also minimize web portal maintenance costs while maintaining its commitment to delivering a workforce portal. IOUs will work with the ME&O program to explore creating web content linked to the statewide the practicalities of Energy Upgrade California-Whole Home Upgrade Programweb portal.

IOUs propose continuing portal development of relevant Phase 1 & 2 WE&T functionality under EUC portal as part of 2013-2014 transition:

- Including links to training programs, adult educational facilities, labor and trade organizations, as well as IOU training.
- Include an events and activities component that highlights upcoming green energy conferences and workshops.
- Feature a Career Center that will be organized around the Energy Upgrade California-Whole Home Upgrade ProgramProgram.
- Include information on industry authorities, associations and advisory bodies, including the WE&T statewide Task Force.
- Leverage features of the EUC web portal that support profile pages, online repository and connectivity with IOU programs and market opportunities. Integrate/utilize available social web technologies/applications to build online interaction.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

- [Leverage connectivity tools/functionality of the EUC web portal to connect users with specific interests, job listings, training program announcements, webinars, and conferences.](#)
- [Explore the ability for users to communicate with other users, hosted on the site.](#)

4) *Identify And Implement Specific Programs For Each Educational Sector:*  
WE&T needs are best studied and approached by supporting educational sectors. Thus, five educational sectors have been identified as key in fulfilling WE&T needs and opportunities: Kindergarten through high school, adult education and community colleges, technical training, colleges and universities, and minority, low income and disadvantaged communities.

iii. Incentive levels

Not applicable

iv. Marketing and outreach plans

*Market Transformation Information*

Completion of the Needs Assessment, along with the aggregation of other developing study workforce training could be used to establish baselines from which to establish measureable goals. A few reasonable metrics to measure market transformation in the interim might be identifying funding streams for statewide parties to implement WE&T programs; WE&T Taskforce initiated actions, status and results; measuring utilization of WE&T web portal statistics.

*Market Barriers and Solutions*

The WE&T Planning Sub Program is intended to focus performs tasks that keep statewide stakeholders connected and focuses on delivering a sustainable long-term education and training network that creates a green jobs workforce. The tasks to be completed involve leveraging the resources of the CA-IOUs to help disseminate available statewide energy efficiency curricula and training from among education, labor, industry and grassroots community sectors. This will require a considerable commitment and trust among disparate agencies and entities that make up these sectors where there are inherent barriers which make it difficult to form an effective energy career training network.

The WE&T Planning is a complimentary program to make the best use of IOU resources to achieve multiple objectives. The IOU education and training activities primarily center around utilization of Energy Center and Training Center assets, but training efforts now reach beyond the internal walls of IOU facilities shown in the form of relationships with non-IOU training contractors, education institutions, community groups and governmental agencies. This is important in order for IOUs to help share a role in the growth of coordinated

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

statewide workforce education and training. But just as the IOUs have pursued statewide consistency in offering education and training over several years, expectations to see the same occur among California’s various education and training stakeholders cannot be over simplified.

The IOUs have represented a reliable and experienced delivery channel of education and training program curricula when few other options have been available. Like other service providers, all parties must expect a process that will involve progressive steps toward solutions that make achievement the State’s energy objectives reasonably possible.

*Advancing Strategic Plan goals and objectives.*

In support of the Strategic Plan vision that “by 2020 California’s workforce is trained and engaged to provide the human capital necessary to achieve California’s economic energy efficiency and demand-side management potential,” IOUs plan to implement a variety of workforce development strategies that encourage and nurture the development of “green collar” jobs through their strategic planning initiatives, and education and training programs.

Training that advances the business of DSM, EE, and green energy technology benefits students, who then enter green careers and advance the State’s very intense energy efficiency goals. Statewide IOU representatives, key traditional education sector representatives, the business community and professional / industry associations at all levels will work together to share protocols and best practices for energy efficiency education through the WE&T Taskforce.

WE&T Planning tasks are intended to outreach to minority, low income and disadvantaged communities for greater participation. This more focused and targeted step will be coordinated with IOU Low-income, Community outreach and Community affairs departments, as well as coordination, where possible, with Marketing, Education and Outreach.

California must quickly increase and integrate statewide efforts to train people at all levels to plan, administer, and deliver energy efficiency in the public and private sectors. The effort will require planning among secondary and post-secondary educational leaders, technical and professional organizations, state agencies, economic and labor development organizations, utilities, and construction and manufacturing businesses that deliver energy efficiency solutions. The Statewide IOU WE&T Program is directed to initiate ongoing dialogue with market participants and education stakeholders by means of annual stakeholder public workshops to help advance a long-term workforce training designs and plans at all levels of California’s educational systems and accommodate the dramatic increase in energy efficiency potential envisioned by the Strategic Plan.

Formatted: Space After: 0 pt

Formatted: Font: Not Italic

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

The proposed Statewide IOU WET Program relies on collaboration among CPUC Staff, representatives from the education sector, state bodies, each of the IOUs, professional/trade organizations, and the business community to be successful in initiating energy efficiency training needs, along with recommended existing and potential educational delivery strategies and resources that will serve each market an educational sector in the Strategic Plan through 2020 and beyond.

The WE&T Program is constructed to work in cooperation with the IOUs and the WE&T Taskforce to identify sponsors and funding sources to design and expand effective workforce training activities and projects throughout the state.

***Strategy 1-1: Define, initiate and drive long-term WE&T development and strategic planning, including identification of funding streams and market sector specific needs.***

Implementation Actions:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• Statewide IOU Team, including other utilities as well as internal partners</li> <li>• CPUC Staff</li> <li>• Key traditional education sector representatives, including UC/CSU, community colleges, and accreditation programs</li> <li>• Business Community</li> <li>• Professional organizations, including the AIA and United States Green Building Council</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Conduct an in-depth formal statewide energy efficiency training and education resource inventory and needs assessment.</li> <li>• Assess current and alternative funding and partnership mechanisms for WE&amp;T activities.</li> <li>• Create a WE&amp;T specific Web portal and identify entities to co-fund and co-sponsor the Web portal with utilities. Partners shall contribute content toward Web portal</li> <li>• Initiate regular on-going dialogue with broad group of market participant and education stakeholders by way of annual workshops.</li> <li>• Establish task force to oversee and help to evaluate utility specific WE&amp;T activities.</li> </ul>
Delivery Channel	<p><i>WE&amp;T Taskforce</i> – Conduct resource inventory and needs assessment.</p> <p><i>WE&amp;T Taskforce</i> – Assess and summarize various funding mechanisms for WE&amp;T activities as a needs assessment element.</p> <p><i>WE&amp;T Taskforce</i> – Work with statewide team to develop Web portal for workforce needs.</p> <p><i>WE&amp;T Taskforce</i> – Facilitate the convening of stakeholders for initial and ongoing dialogue with stakeholders.</p> <p><i>Ed Train</i> - Collaborate with WE&amp;T program to inform the process.</p> <p><i>WE&amp;T</i> – Be specific about the scope of work to define what can/will be done and what lies outside the scope of the task force.</p>

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

Other long-term strategies and implementation efforts included as goals for the Statewide IOU WE&T Program are addressed in detail within the WE&T Centergies and WE&T Connections Sub-Program sections of the PIP. In summary however, they include:

***Strategy 1-2: Support the community college and adult education efforts to allow students to develop their education based on visible career paths in energy efficiency and related fields***

Potential Stakeholders	<ul style="list-style-type: none"> <li>• California Community Colleges Chancellor’s Office</li> <li>• California Board of Education</li> <li>• Adult Education Leadership</li> <li>• Department of Employment Development</li> <li>• Industry and Labor Associations</li> <li>• Business Community</li> <li>• Professional organizations with members who need to maintain accreditation</li> <li>• Building Operators Certification Program (BOC)</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Utilize community colleges to provide technical training, such as HVAC maintenance and building operator certification.</li> <li>• Develop appropriate linkages with K-12 programs, focusing on high-school “green academy.”</li> <li>• Coordinate with the community colleges and adult education sector to incorporate energy and resource efficiency. Component into their career laddering concept.</li> <li>• Explore ways of disseminating materials electronically through effective use of the Internet.</li> </ul>

***Strategy 1-3: Incorporate energy / resource efficiency and demand side energy management into traditional contractor and technician training, such as for plumbers and electricians, and expand training resources to produce target numbers of trained workers.***

Summary:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• California Community Colleges Chancellor’s Office</li> <li>• Community College HVAC program</li> <li>• California Board of Education</li> <li>• Adult Education Leadership</li> <li>• Department of Employment Development</li> <li>• Industry / Labor Associations</li> <li>• Technical and Vocational Training Programs</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Expand or establish training curricula and training and professional career development programs in building construction, services, building operator and other energy efficiency technical fields.</li> <li>• Establish or expand key financial and placement partnerships that demonstrate employment prospects for trained personnel.</li> <li>• Expand upon existing certification programs to try to include student certificate in “green workforce.”</li> </ul>

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

***Strategy 1-4: Create or expand college and university programs with energy efficiency focus and foster green campus efforts to apply this knowledge in clear view of students and faculty.***

Summary:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• California Community Colleges Chancellor’s Office</li> <li>• WE&amp;T Task Force</li> <li>• UC/CSU education system</li> <li>• ACEEE education committee</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Utilize existing UC/CSU extension programs to incorporate a continuing education curriculum component.</li> <li>• Work with Universities and colleges to expand professional energy related degree offerings and contribute to tailored curriculum.</li> <li>• Work with colleges and universities to formalize internship opportunities with energy and resource efficiency institutions, including engineering firms, architecture firms, and utility programs.</li> </ul>

***Strategy 1-5: Develop K-12 curriculum to include energy efficiency fundamentals (e.g., math, science, behavior) across various content areas and identify how career education in energy-related fields can be incorporated across the grades.***

Summary:

Potential Stakeholders	<ul style="list-style-type: none"> <li>• CPUC Staff</li> <li>• Key traditional education sector representatives</li> <li>• California Board of Education</li> <li>• WE&amp;T Task Force</li> <li>• Business community</li> <li>• After-school community education programs</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Identify opportunities to leverage governor’s career technical initiative.</li> <li>• Identify opportunities to work with the California Department of Education to develop curricula with specific content for energy and GHG issues.</li> <li>• Support outreach into</li> <li>• K-12 schools on energy, water and environmental issues.</li> <li>• Support K-12 schools to develop curricula that support their local communities as part of class assignments.</li> </ul>

***Strategy 2-1: Collaboratively identify appropriate goals and strategies to build California’s energy efficiency workforce through 2020, focusing on training that increases participation from within minority, low-income and disadvantaged communities in achieving California’s economic energy efficiency potential.***

The number of units receiving education and weatherization services during ~~2013-2014~~~~2010-2012~~ program period is expected to expand greatly. During 2009, WE&T will focus on

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

expanding behavior modification in existing training programs to increase emphasis on energy efficient practices.

Additionally, training in the form of train-the-trainer sessions may be possible with third party groups to design and expand teaching of weatherization and energy efficiency in minority and disadvantage communities specifically.

Summary:

Potential Stakeholders	<p>WE&amp;T Task Force</p> <ul style="list-style-type: none"> <li>• CPUC</li> <li>• Key traditional education sector representatives</li> <li>• Business Community</li> <li>• California Community Colleges Chancellor’s Office</li> <li>• Continuing Education Programs</li> <li>• Laney and Delta College HVAC program (PG&amp;E)</li> <li>• Department of Employment Development</li> <li>• Industry / Labor Associations</li> <li>• Technical and Vocational Training Programs (e.g., State Prison System)</li> <li>• Community Youth Centers (e.g., YMCA)</li> </ul>
Sub Program Implementation	<ul style="list-style-type: none"> <li>• Leverage Marketing Education and Outreach and WE&amp;T task forces to partner with community based organizations and provide targeted outreach on employment opportunities with energy efficiency.</li> <li>• Develop Low Income WE&amp;T Plan</li> <li>• Train qualified diverse business enterprises from minority, low-income and disadvantaged communities to undertake or expand efficiency services.</li> </ul>

b) Program delivery and coordination

WE&T Planning includes involvement from a wide range of stakeholders. Implemented in the appropriate manner, WE&T Taskforce members will represent technology, industry, government, community groups, utilities, education and non-energy segments which should facilitate discussion on ways to share current and emerging opportunities to expand the scope of existing WE&T training curriculum, but introduce new WE&T training activities in the area of emerging technologies, codes and standards, and non-IOU programs.

c) Best Practices

Formulation of statewide WE&T Taskforce and regularly scheduled meetings with statewide WE&T stakeholders represent a best practice that facilitates open discussion among are vested parties. The WE&T planning process will have best practice inputs gathered from evaluation of IOU education and training programs to rely upon in discussing real opportunities and the long-term considerations of programs being shared and presented to the WE&T taskforce and IOUs.

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

d) Innovation

The whole program can be considered innovative to the degree that statewide coordination and strategic planning is being done, which will help shape California economics in the near term.

e) Integrated/coordinated Demand Side Management

WE&T Planning includes involvement from a wide range of stakeholders. The IOU WE&T representatives in support of the long-term workforce strategy of California to achieve statewide coordination, will work to create coordinated technology demonstration and DSM training to ensure there are no missed opportunities for offering IDSM training and that opportunities to receive such training are made available to the fullest extent possible which will aid efforts in achieving energy neutral buildings by 2020.

f) Integration across resource types

WE&T Planning includes involvement from a wide range of stakeholders. Implemented in the appropriate manner, WE&T Taskforce members will represent technology, industry, government, community groups, utilities, education and non-energy segments and facilitate discussion on ways to share current and emerging opportunities to expand the scope of existing WE&T training curriculum to include water and GHG mitigation.

g) Pilots

The whole program can be considered innovative to the degree that statewide coordination and strategic planning with regard to workforce training is being done in a manner that require iteration and learning in order to arrive at implementation models and action steps that can be deemed effective.

h) EM&V

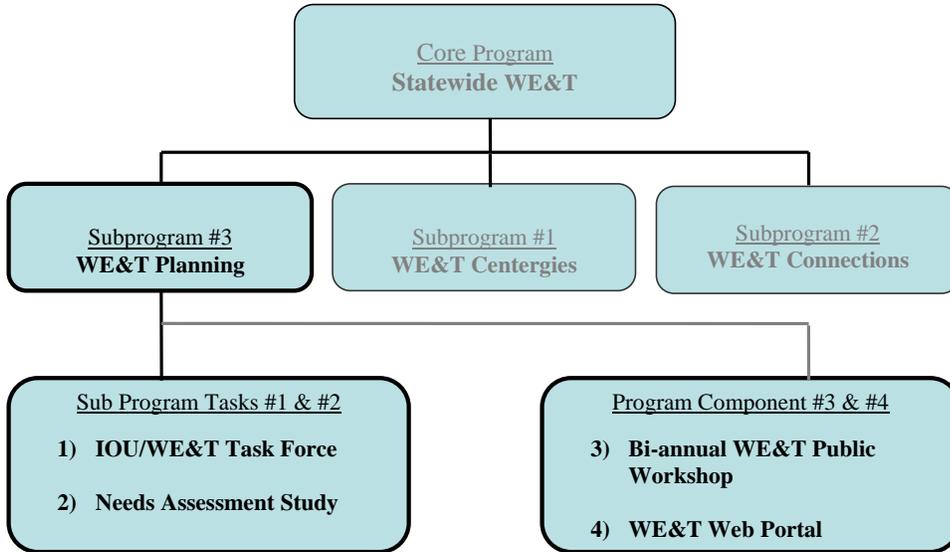

[The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and the Energy Division. Development of these plans will occur after the final program design is approved by the CPUC and, in many cases after program implementation has begun, since the plans need to be based on identified program design and implementation issues.](#)

**2013- 2014 Energy Efficiency Programs  
Statewide Workforce, Education and Training Program  
Program Implementation Plan**

~~IOUs will continue to work with EM&V to assess market effectiveness and impacts of educational education training programs. Collaborating with the WE&T Taskforce, IOUs will take input from stakeholders on proposing reasonable and supportable ways to measure workforce training effectiveness, market transformation and progress in achieving long term strategic goals.~~

7) Diagram of Program

See above Section 6.2.

Below is the logic model for the WE&T Connections Subprogram:-

Note: On December 2, 2010, the Commission issued Resolution E 4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for Workforce Education and Training.

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

**ATTACHMENT 1**

**2013-2014 WE&T Program Implementation Plan Addendum**

**Joint IOU Response to Staff Request for Additional Information<sup>i</sup>**

Energy Division application guidance requested the IOUs include in this addendum the following information, as applicable, for relevant WE&T programs:

- Describe “soft skill” training efforts such as business and sales development, marketing skills, and hands-on training strategies.

**IOU Response:**

“Soft skill” training efforts include classes that teach students critical non-technical skills that will help them during the interview process and/or while on the job interacting with customers. Such skills include sales and marketing, communication skills, interview techniques, resume writing, and workplace conduct.

There is some ‘soft skill’ training provided at IOU Energy Centers through, and as part of, industry member organizations. Rather than conduct these trainings themselves, the IOUs propose to provide students a list of resources available through existing organizations like workforce investment boards, community college courses, and professional development resources. Where appropriate, IOUs will also partner with organizations that provide such soft skills to better direct interested participants to resources for acquiring soft skills.

PG&E will build upon its “soft skills” classes, including courses on financial analysis classes for selling energy efficiency. Such classes provide the energy efficiency workforce tools for calculating and presenting the right financial model for presenting a case to invest in energy efficiency to various audiences, including customers, CEOs, individual contributors, etc.

- Include estimates of training related costs for programs, participating contractors, and customers, as well as related increases in energy savings benefits, lower costs over lifecycle of equipment, and creation of higher quality jobs.

**IOU Response:**

As the IOUs implement sector strategies, they will gather estimates of training related costs for programs, participating contractors, and customers. IOUs will work with EM&V to assess and track related increases in energy savings benefits, lower costs over lifecycle of equipment, and creation of higher quality jobs.

At the time of drafting this Program Implementation Plan, since IOUs are in the process of planning sector strategies for various sectors, information requested herein does not

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

yet exist. However, requested information about CALCTP is provided in the Centergies Subprogram and provided again below for reference.

- 1) When the program requires CALCTP certified installers, the cost to the customer for the labor component of the project may be 10% - 15% more than prior when no certification was required.
  - 2) Compliance and permitting cost are directly associated to the cost of proper training programs for designers, installers, manufacturers, etc. which may be equivalent to an additionally 20% to the project cost. However, proper collaboration with industry associations and manufacturers may offset this cost.
  - 3) With proper incentive levels and education of the segment, it is anticipated that adoption/participation would increase since the misperceptions of advanced lighting control systems, potential for demand response and how DR or ADR works will be corrected causing more demand for the control solution.
  - 4) It has been proven with advanced lighting control system assessment projects at PG&E, SCE and SDG&E that the customer will achieve a minimum of an additional 30% savings over traditional lighting efficiency measures. And dependent upon the level of control allowed to individual employees, savings may increase an additional 5% - 10%. With the opportunity to participation in DR, the customer will achieve even greater cost savings due to the ability to shave or control peak loads. The actual dollar values will be determined as the program adoption occurs and customer site performance is monitored and data collected.
  - 5) Additional benefits include: a. systems do not get overridden due to better understanding as well as the system being designed and installed. Also, ease of proper training of customer personnel regardless of turnover with the local certified installer; b. SCE proved in their assessments, fewer, if any, call backs will be experienced when the system is installed by a certified installer. In contrast, an SDG&E project required numerous call backs before the system was able to be commissioned when a non-certified installer was used. c) increased proper maintenance, d) higher visibility of actual energy use in lighting due to the potential of graphic interfaces and other reporting. e) ability to track GHG emission reductions. f) create market disruption as customers begin talking to others about how well their advanced lighting control system is working and saving them money due to proper design and installation.
- Identify existing skill standards and certification supported by the training activities. Identify any new standards to be developed including identification of partnership entities that will help develop them. Include descriptions of efforts to ensure program contractors support high road strategies and track and report on these efforts.

**IOU Response:**

The IOUs will work with existing and new industry partnerships and applicable DSM programs to support and promote new skills standards training. Currently, the IOUs offer education and training from among the following continuing education and certificate programs and organizations:

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

- American Institute of Architects (AIA)
- American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE)
- APPA: Leadership in Educational Facilities
- ASIS International
- Association of Energy Engineers (AEE)
- Association for Facilities Engineering (AFE)
- Building Owners and Managers Association (BOMA)
- BOMI International
- Building Performance Institute (BPI)
- California Home Energy Rating System (C-HERS)
- Carpet and Rug Institute (CRI)
- Cleaning Management Institute (CMI)
- CoreNet Global
- Counselors of Real Estate (CRE)
- Institute of Real Estate Management (IREM)
- International Brotherhood of Electrical Workers (IBEW)
- International Facility Management Association (IFMA)
- ISSA, The Worldwide Cleaning Industry Association
- National Association of the Remodeling Industry (NARI)
- National Council on Qualifications for the Lighting Professions (NCQLP)
- National Electrical Contractors Association (NECA)
- North American Technician Excellence (NATE)
- San Diego Association of Realtors (SDAR)
- Society for College and University Planning (SCUP)
- Society of Industrial and Office Realtors (SIOR)
- U.S. Green Building Council (USGBC)

As part of their shift toward a sector strategy approach and as identified in the Needs Assessment, where applicable and possible, IOUs will work with organizations to modify course content and/or create credential programs that result in stackable credentials that are of value to employers.

Residential and Commercial HVAC Quality Maintenance and Quality Installation programs in the portfolio ensure that contractors support high-road strategies through the programs' requirements that the minimum level of services conducted and incentivized through the programs are based on the HVAC industry's own set of quality standards that define the appropriate high-road level of installation and maintenance services for customers. Tracking of the success of these program requirements that demand high-road quality levels is done through the regular tracking of these HVAC programs that measure the increasing use of these practices as the uptake in the programs grow.

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

- Describe how the program will target low-income and disadvantaged populations for participation in training programs and/or demand side management (DSM) program delivery.

**IOU Response:**

IOUs will leverage existing communication channels to reach members of low-income and disadvantaged communities. At a local and regional level, IOUs work with local community-based organizations that have established relationships to support their low-income and disadvantaged population. This is often done with the aid of Public Affairs, Community Relations and Diverse Business Enterprises. IOUs will also collaborate with their individual low-income energy efficiency program managers and partners as another channel toward reaching low-income and disadvantaged persons and helping to increase their awareness and participation in IOU education and training opportunities.

Through its PowerPathway Training Network for Energy Efficiency (PPTNEE), PG&E will continue and expand its partnerships with organizations, including but not limited to RichmondBUILD, Rising Sun Energy Center, Proteus, Inc., and the Central Valley Opportunity Center, that have been serving members of the disadvantaged and low income communities. Such partnerships will allow PG&E to leverage their resources and subject matter expertise to work with organizations that already have those connections to low-income and disadvantaged populations.

- Describe how the program will support entry level career pipelines and pathways supporting development of entry level skills leading to higher skill sets utilizing state apprenticeship and pre-apprenticeship programs as appropriate.

**IOU Response:**

IOUs will collaborate with existing implementers of career skills development programs targeted to high school students with degrees, continuing education and post-secondary students for entry level career pipelines and pathways and higher skill sets aligned with pre-apprenticeship and state apprenticeships. Given the wide range of apprenticeship and pre-apprenticeship programs, IOUs will work with State agencies, including the California Division of Apprenticeship Standards, to determine which apprentice/pre-apprenticeship programs should be targeted during 2013-2014. The goal of the partnerships will be to increase awareness and participation in the wide range of training options for students to develop their careers. Trainings will support the spectrum of knowledge and skill level being applicable to someone just entering the energy field, to someone seeking to advance his/her place in a specific career path.

IOUs will collaborate on an effort to develop a statewide memorandum of understanding (MOU) with the California Division of Apprenticeship Standards. The MOU will provide a framework for partnering with labor, trade, and professional organizations that resembles the existing CALCTP program.

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

- For WE&T sector strategy efforts describe which characteristics will be sought for employer partners, such as level of joint investment in training efforts, support and participation in apprenticeship programs, enforcement of permitting, code, safety compliance, and other labor laws.

**IOU Response:**

IOUs will involve other organizations that can help to leverage existing and new IOU training opportunities. Potential partners will be sought from government agencies, employers, community colleges, labor organizations, manufacturers, professional organizations, and community-based organizations. IOUs will expect partners to commit direct and indirect resources toward developing specific sector strategies. Partners will need to help drive training program participation to their target audiences, and will be expected to support and participate in apprenticeship programs, support and enforcement of permitting, code and safety compliance and other laws, as appropriate to their roles and activities involved, include participating in leadership roles where possible.

- Also, describe the following: Describe the governance structure within sector strategy partnerships, such as processes for agenda development, recording minutes, and decision making;

**IOU Response:**

Each sector strategy effort will be led by one IOU with other IOUs as major contributors and partners. IOU sector strategies efforts will include a steering committee to drive overall development and governance over the strategy. Some sector strategy efforts could require an Advisory Council to drive specific issues within the strategy such as certifications or knowledge, skills, and abilities attached to a particular occupation. The lead IOU will be responsible for assuring that meeting logistics, including agenda development, meeting notices, and recording/disseminating minutes are well-orchestrated.

- Describe the process to develop a mutually agreed upon plan to support existing or new training certifications for each subsector or technology in the non-residential HVAC sector strategy effort and any other sector strategy efforts the IOUs pursue;

**IOU Response:**

All 2013-2014 sector strategy approaches will include a plan for cross-sector stakeholder support towards an existing or new certification, or other appropriate set of qualifications that lead to support of Strategic Plan goals. Such industry-recognized credentials are an essential and necessary hallmark of a successful sector strategy. IOUs will work closely with the internal and external team involved in the HVAC installation programs and associated stakeholders, including through the Western HVAC Performance (WHPA) to develop a mutually agreed plan to support any appropriate existing or new training certifications or set of qualifications for each aspect of the non-residential HVAC sector strategy effort. A similar approach is anticipated in coordinating a sector strategies approach on WE&T intervention for Emerging Technology adoption, codes adoption

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

with Codes & Standards and targeted training of market agents critical to the success of Energy Upgrade California. Through careful and thorough assessment of options, and ongoing and open dialogue with varied stakeholders across the sector at issue, the strategy will be predicated on cross-stakeholder support towards an agreed-upon certification(s) or other appropriate set(s) of qualifications.

- Describe how the program will develop skill upgrade programs that are aligned with the state approved apprenticeship training programs. Skill upgrade programs should include robust entry prerequisites and pathways to other educational establishments.

**IOU Response:**

IOUs will collaborate with stakeholders in a manner similar to that of the WE&T Taskforce structure, taking input on revisions to the sector strategies approach, course portfolio, and training partnerships. IOUs will also work with implementers of career skills development on career pipelines and pathways that lead into higher skill set training equivalents to those of pre-apprenticeship and state approved apprenticeship. IOUs will create a forum for discussion among these stakeholders to continuously evaluate training alignment. Given the wide range of apprenticeship and pre-apprenticeship programs, IOUs will work under an MOU with State agencies, including the California Division of Apprenticeship Standards, to determine which pre-apprentice/apprenticeship programs should be targeted during 2013-2014. A core component of this plan will be the development of partnerships, which will include an implementation plan similar to that used in the CALCTP sector strategies approach

- Include a separate table indicating allocated funding for:
  - Sector strategy efforts

**IOU Response:**

The IOUs do not see Sector Strategy efforts as mutually exclusive of current WE&T Centergies implementation strategy. IOUs will support sector strategies as a way of restructuring portions of their programs to focus on specific audiences. IOU staff will be allocated on priority sector strategies efforts such as for Commercial HVAC, but in all cases being efficient and effective in funding sector strategies efforts.

PG&E will continue to support CALCTP as a proven sector strategy approach toward upskilling the lighting sector, including electricians, installers, middle-management and salespersons. PG&E will lead the statewide sector strategy effort for commercial HVAC, considering both quality installation and quality maintenance efforts for the program WE&T connection, in order to determine a best path for a timely pilot, and so that the pilot can lead most directly to improvements of the broader HVAC workforce education and training effort. Other sector strategy efforts will include, but not be limited to the architectural design sector as well as small/medium business commercial building auditors.

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

Where appropriate, all sector strategy efforts will be advised by stakeholders, including community colleges, 4-year colleges and universities, trade organizations, labor organizations, professional organizations, and state agencies.

- Efforts to target low-income and disadvantaged populations

**IOU Response:**

IOUs will proactively partner with community-based organizations, workforce investment boards, community colleges and other local workforce development and training programs to both articulate training leading to certification and assist in easy access to energy center offerings. In addition, where applicable, IOUs will continue to or begin to partner with their internal groups that serve low income and disadvantaged communities.

PG&E will continue its support of the Energy Savings Assistance Program (ESAP). ESAP provides no-cost weatherization services to low-income households who meet the CARE income guidelines. Services provided include attic insulation, energy efficient refrigerators, energy efficient furnaces, weather-stripping, caulking, low-flow showerheads, water heater blankets, and door and building envelope repairs which reduce air infiltration.

- Describe an evaluation plan that will collect, monitor, and track:
  - Hours of instruction and locations of classes;
  - Partner organizations and related co-funding / resource sharing arrangements;
  - Specific commitments from employers that support high-road strategies
  - Number, specific occupation, skill level, and demographic characteristics of participants;
  - Associated certifications and skill standard requirements being leveraged with current training efforts. Track new standards developed and/or required for DSM program delivery;
  - Training completion and job placement rates;
  - A listing of resource programs that are aligned with training and certification WE&T efforts ;
    - Include a description of career pathways in which the relevant resource program is embedded, including points of entry and paths for advancement;
  - Improvements in the quality of installations and / or service activities for contractors participating in the sector strategy.
  - Strategies to identify job creation and metrics that result from sector strategy training activities and coordination of training activities with core DSM programs.

**IOU Response:**

IOUs have been making changes to their tracking methods, processes, and infrastructure. To protect customer privacy, certain data such as specific occupation,

**2013-2014 Energy Efficiency Programs  
Workforce Education and Training Program  
Program Implementation Plan**

skill level, and demographic characteristics of participants will be collected on a voluntary basis during time of registration.

Data such as job placement rates, commitments from employers, strategies to identify job creation will be tracked for specific sector strategies as opposed to the thousands of energy center participants that participate in energy center classes.

Tracking information such as improvements in the quality of installations and/or service activities for contractors participating in IOU sector strategy efforts and strategies to identify metrics that result from sector strategy training activities and coordination of training activities with core DSM programs will be considered and monitored with assistance from IOU EM&V groups within the collaborative EM&V effort managed by CPUC Energy Division.

---

<sup>i</sup> Attachment 1 is additional information the Staff requested be provided in its May 24, 2012 guidance documents, Appendix F.

## 2013 -2014 WE&T Course / Program Listing Legend:

	<b>Column Header</b>	<b>Definition</b>	<b>Code</b>
(1)	Ed. Level	Education Sector	CSU, UC, K-12, CC (Community College), Trade / Labor (including IOU only courses)
(2)	Collaborators	External Entities Partnering with the IOU to provide resources for training effort (ex: Facilities, materials, trainers, outreach)	List Name of Collaborator
(3)	Class Length	Number of Days	Half-Day, Full Day, Two Day, Three Day, Annual (if traditional school schedule), etc.
(4)	Continuing Education, Entry Level, or Both	Indicate if the target audience for the class are entry level participants or continuing education or both.	C - Continuing Education, E - Entry Level, Both - B Include the designation EE, DR, and /or DG to indicate which demand side resources are covered by the class.
(5)	Integration - Existing Bldgs.	The class incorporates other demand side technologies (EE, DR, & DG) via an integrated systems approach.	X - if applicable
(6)	Zero Net Energy	The class addresses primarily new buildings, incorporating all demand side technologies (EE, DR, & DG) in a whole building perspective.	X - if applicable
(7)	Low Income Outreach	The class is actively promoted to low income participants and a procedure is in place to make it more affordable and convenient for these entities to participate.	X - if applicable
(8)	Emerging Technology	The class includes training for emerging technologies	X - if applicable

## 2013 -2014 WE&T Course / Program Listing Legend:

	Column Header	Definition	Code
(9)	Sector Strategies	The class is offered as part of a more comprehensive 'sector strategy" (Pursuant to SDG&E AL 2260-E-B/ 2041-G-B <i>et al.</i> ) effort involving educational/ training partnerships with external partners and addresses recommendations identified in the Statewide WE&T needs assessment, published by UCB in March of 2011.	X - if applicable
(10)	Needs Assessment	The class addresses a recommendation area included in the Statewide WE&T needs assessment.	Indicate which NA recommendation area the class addresses; SS - Skills Standards, C - Certifications, JP - Job Placement.)
(11)	Market Sector	Indicate what market sector the course caters to. Use the same market sectors identified in the strategic plan. If codes & standards are included in the training indicate by including "C&S" after the market sector identification.	Commercial, Residential, Industrial, Agricultural

## 2013-2014 PIP Addendum

<b>Program Name</b>	Statewide Integrated Demand-Side Management Program	<b>Date Submitted</b>	7/2/2012
<b>Subprogram Name</b>	NA	<b>Utility Name</b>	SoCalGas
<b>Program ID</b>	SCG 3734	<b>IOU Program Contact</b>	Ron Sugimoto
		<b>Program Cycle</b>	2013-2014

This form is to be used to document any required changes to the Program Implementation Plans (PIPs). The following are triggers that will require a PIP change:

1. Changes to eligibility rules
2. Changes affecting incentive levels (indicate advice letter approval below if required)
3. Fund shifts (indicate advice letter approval below if required)
4. Portfolio Budget and Other Commission-Directed Changes
5. Changes to Program Theory/Logic Models
6. Addition or elimination of programs and/or sub-programs (indicate advice letter approval below)
7. Changes in program targets
8. Change in sub-program approach - unless the IOUs submit logic models for the sub-programs (to be defined) with IOUs
9. Changes in incented measures
10. Changes in adopted PPMs/MTIs (indicate advice letter approval below if required)

### Identify Specific Trigger (above) requiring the PIP change

4. Portfolio Budget and Other Commission-Directed Changes

### Driver of Change:

For IDSM, SoCalGas will continue to develop the infrastructure and tools for creating a cross-cutting approaches and tools to enable sustainable building projects and communities. The new construction Sustainable Communities program will now be integrated into this program. The original focus of the Sustainable Communities program was a specific master-planned community, Rancho Mission Viejo (RMV), due to economic circumstances, this project has not progressed. This program will now be open to other projects to carry out the program's original objectives.

### Description of Change (if advice letter approval required, indicate Commission resolution or approval and provide hyperlink to advice letter):

N/A

### PIP Section and/or Wording to be Changed or replaced:

See attached red-line PIP

### Replacement Language or Information

See attached red-lined PIP

### Revised Energy Savings (If Any):

This is a non resource program

### Other PIP Changes Required:

N/A

IDSMS is a non-resource program.

**4. Program Description**

a) Description

The California Long Term Energy Efficiency Strategic Plan (Strategic Plan) encourages programs that integrate the full range of demand-side management (DSM) options including energy efficiency (EE), demand response (DR), and distributed generation (DG) as fundamental to achieving California’s strategic energy goals. This program implementation plan (PIP) presents the coordinated effort that Pacific Gas and Electric Company (PG&E), Southern California Edison (SCE), San Diego Gas and Electric Company (SDG&E) and Southern California Gas Company (SoCalGas), (together referred to as “the IOUs”) will make to integrate those DSM options in full collaboration with the Commission’s Energy Division in compliance with Decisions (D.) 09-09-047 and D.05-12-015 that approved the IOU IDSMS Statewide program and required continuation of IDSMS activities.

In addition to the IOUs’ individual IDSMS pilots, projects, programs, and activities, the IOUs established a Statewide Integration Task Force (Task Force). Responsibilities of the Task Force have encompassed activities that promote, in a statewide-coordinated fashion, two specific IDSMS strategies identified in the Strategic Plan. These include

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

stakeholder coordination (Strategy 1.3)<sup>1</sup> and new technologies (Strategy 1.4)<sup>2</sup>. The IOUs believe that Strategy 1.1—“Carry out integrated marketing of DSM opportunities across all customer classes” should be coordinated with the statewide Marketing, Education and Outreach (ME&O) efforts (*see* SW ME&O PIP filed in a separate application in R.09-11-014) and implemented at the local level by the IOUs focused on particular segment and customer-specific strategies.

In 2013-2014, the IDSM Task Force will continue to expand its role as a coordinating body across many proceedings, programs, and across the IOUs to identify gaps, best practices and to improve efficiencies around delivery of programs in a comprehensive manner to customers. Taskforce representatives will strive to actively participate in all applicable proceedings to help develop of a record in each proceeding that will aid in developing policies, funding opportunities, and mechanisms to promote IDSM.

Decision 12.05.015 directs the IOUs to continue and expand integration efforts in the following areas:

- **Increased Coordination** across different proceedings with the IDSM Task Force as lead.
- **IDSM Funding:** Consideration of appropriate funding from the other proceedings to support IDSM efforts
- **Increased involvement of Stakeholders:** Inclusion of stakeholders and experts in the efforts of the IDSM Task Force
- **Information on IDSM Projects:** Detailed information on the Pilot programs and projects
- **Audits:** Continued development of the integrated Audit tool
- **IDSM Marketing:** Increased integrated marketing efforts and improved reporting / communicating with ED
- **IDSM Tracking Databases:** Improved databases for tracking integrated projects

b) Statement of Problem and Solutions to Overcome the Problem

There is a policy requirement and need to focus on integration of DSM activities and programs on a statewide and local level by customers, utilities, regulators, and legislators.

The CPUC’s Strategic Plan provides its vision that “energy efficiency, energy conservation, demand response, advanced metering, and distributed generation technologies are offered as elements of an integrated solution that supports energy and carbon reduction goals immediately, and eventually water and other resource conservation goals in the future.” The State Legislature has proposed Assembly Bill

---

<sup>1</sup> *Id.*, Strategy 1.3: Develop integrated DSM programs across resources, including energy, water, and transportation.

<sup>2</sup> *Id.*, Strategy 1.4: Promote development and support of new technologies that enable or facilitate DSM Coordination and Integration.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

AB51,<sup>3</sup> requiring the Commission to integrate the DSM programs within its jurisdiction in order to enable offerings of integrated packages that will maximize savings and minimize costs to ratepayers.

In order to ensure that the vision of IDSM progresses operationally to meet the Strategic Plan, the Task Force will continue to identify and promulgate best practices, address implementation and policy issues, and design effective metrics to measure progress on IDSM.

The Task Force will focus on include the eight tasks as defined in D. 09-09-047:

**1. Development of a proposed method to measure cost-effectiveness for integrated projects and programs including quantification and attribution methods that includes GHG and water reductions benefits and the potential long-term economic and electric/gas hedging benefits.**

*a. Description:*

The Commission has approved the California Standard Practice Manual that serves as the reference document for proposed cost effectiveness tests and methodologies for EE programs. Rulemaking (R.) 07-01-041 is considering identifying and approving a cost effectiveness methodology for DR programs, and R.08-03-008 is considering cost effectiveness methodologies to measure the cost benefit of DG programs. To effectively integrate DSM program design, a set of internally consistent proposed cost-effectiveness methodologies need to be developed for integrated projects, and for program efforts that seek to combine all of these demand side resource options within an integrated portfolio. Cost effectiveness is being considered in R.09-11-014.

*b. Tasks and Timelines:*

- Under contract to the IOUs, Black and Veatch completed a white paper on integrated cost effectiveness and presented observations and recommendations via public workshop in 2011. The progress of this activity has been on hold pending guidance from the Energy Division.
- The IOUs and CPUC will work together on next steps for integrated cost – effectiveness efforts.

**2. Development of proposed measurement and evaluation protocols for IDSM programs and projects.**

*a. Description:*

---

<sup>3</sup> Assembly Bill No. 51, Amended in Assembly June 1, 2009, Amended in Assembly May 5, 2009, Amended in Assembly April 14, 2009, California legislature—2009–10 regular session; An act to amend Section 399.4 of the Public Utilities Code Relating to Energy.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

In order to effectively evaluate IDSM programs, activities and pilots, specific protocols need to be developed to document and attribute energy savings, demand reductions, and CO<sub>2</sub> reductions from various DSM customer activities. The Task Force will coordinate with IOU and ED EM&V resources to develop a proposal of appropriate metrics for assessing integration.

Draft EM&V protocols will also be applied to the IOU IDSM pilot programs. This exercise will allow for immediate feedback as to the feasibility of the draft IDSM EM&V protocols.

***b. Tasks and Timelines:***

- The Task Force will explore a phased approach to developing appropriate EM&V protocols for IDSM programs and projects. In collaboration with IOUs, ED EM&V resources will develop a white paper that will be publicly vetted.
- Energy Division has put the development of the EM&V white paper on hold until the next steps are determined for the Integrated Cost Effectiveness development activity.
- The IOUs and CPUC will work together on next steps for integrated EM&V efforts.

**3. Review IDSM enabling emerging technologies for potential inclusion in integrated programs.**

***a. Description:***

The Commission has approved various research and development (R&D) and Emerging Technologies (ET) programs in both Energy Efficiency and Demand Response that promote IDSM. The ET program will focus on integrating hybrid and renewable technologies as well as study and assess interactive effects, especially for technologies like lighting and HVAC. The program will launch demonstration showcases and scaled field placement featuring integrated energy systems for proof-of-concept, technology and usability assessment, market exposure, and public awareness. The IDSM Task Force will track the results of the ET program's technology integration and help chart its future course and monitor the inclusion of integrated ET products into customer projects.

***b. Tasks and Timelines:***

- The IOUs will explore leveraging emerging-technology efforts through various channels to offer and promote multiple integrated measures such as efficient lighting, HVAC equipment, or pumps coupled with controls that will provide both energy savings and auto-DR capabilities. The IOUs will also explore leveraging existing or emerging technologies that individually or as a system combine EE, DR, DG, AMI, or water-savings potential as part of an integrated program offering.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

**4. Development of cross-utility standardized integrated audit tools using PG&E's developed audits as a starting point.**

*a. Description:*

Program evaluation studies conducted for program cycles 2002, 2003, and 2004-2005 clearly identify energy surveys and customer site audits as one of the most powerful tools in creating awareness of energy conservation potential. The IOUs currently offer integrated audits to medium and large customers (generally with demands upwards of 200 kW) that include appropriate EE, DR, and DG/CSI project and/or program recommendations. Integrated audits are described in the Commercial, Industrial, and Agriculture Statewide PIPs under the Customer Services sub-program.

**Standardization of Audit and Survey Tools**

The IOUs are working to standardize a statewide online audit tools portfolio and customize audit recommendations based on customer profiles, operating characteristics, market sector potential, and cost-effectiveness of the offering. This process will consider more meaningful ways to implement the audit and survey tools for the customer and identify choices of potential measures in various DSM programs or technologies specific to a particular customer.

*b. Tasks and Timelines:*

- Timeline for the online tool development for each utility can be found in the Commercial PIP.

**5. Track integration pilot programs to estimate energy savings and lessons learned and develop standard integration best practices that can be applied to all IOU programs based on pilot program evaluations and the results of additional integration promoting activities (i.e., EM&V and cost-benefit results).**

*a. Description:*

In addition to the formal Task Force, internal IOU teams will actively participate in discussions of the pilots, perform assessments based on data collected from the pilot program managers, and return recommendations based on lessons learned to the management-level staff of the Task Force.

During the 2013-2014 portfolio cycle, the IOUs shall work with Commission Staff to ensure that an adequate level of detail is provided in their reports on Integrated Demand Side Management pilot efforts. In addition, per the Commission direction, the table below describes all Integrated Demand-Side Management pilot programs and projects. The offerings address CPUC guidance

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

on resource comprehensiveness, design characteristics, promotion of emerging technologies, and the testing of integrated cost-effectiveness and evaluation methodologies that support IDSM objectives.

**Integrated Pilots**

Pilot Program	Demand Side Resources Included (1)	Enabling Technologies Included (2)	Emerging Technologies Included (3)	Existing or New Construction (4)	% of ZNE Anticipated (program / avg project)		Anticipated Savings kWh (program / avg project)		Anticipated Savings kW (program / avg project)		Anticipated Savings Therms (program / avg project)		Program Cycle Budget Allocation (6)	Estimated Avg Cost Per Building	Accounts Included in the Pilot (7)	Notes
PG&E- Zero Net Energy	EE, DR, DG	AMI, O	X	RMC NFRN C	40-50%	40-50%	n/a	n/a	n/a	n/a	n/a	n/a	\$6 million (2010-12)	n/a	25	Other (O) Enabling Technologies as appropriate based on building type.
SCE- Zero Net Energy	EE, DR, DG	AMI, Battery Storage	X	NC	75	80	4000	200	10	0.5	3000	150	400,000	20,000	30	Have looked at AMI; including any enabling or emerging technologies that make sense for a specific project

**b. Tasks and Timelines:**

- During the 2013-2014 period, the IOUs will explore existing project tracking and reporting systems and determine the best approach to consolidate and improve these systems across multiple programs (EE, DR, DG/CSI) and business areas to benefit customers, customer facing staff, internal planning and reporting.

**6. Develop regular reports on progress and recommendations to the Commission.<sup>5</sup>**

**a. Description:**

The Task Force has developed a communications strategy that will include regular meetings and reports to the ED; template under review.

**b. Tasks and Timelines:**

<sup>5</sup> Heading remains consistent with CPUC directive in D. 09-09-047.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

- Since Q1 2010, the IOUs have provided quarterly reports accessible through EEGA; discussions are ongoing to determine the appropriate reporting requirements for 2013-2014.
- The Task Force (including IOU and Energy Division representatives) meets, in person, as needed, for deep dives and will continue in 2013-14.
- The Task Force, including subcommittees, holds planning and coordination conference calls to discuss progress on integrated activities and will continue in 2013-2014.
- The Statewide IOU Integration team participates on conference calls for SW collaboration, communication, and preparation for Task Force meetings and will continue in 2013-2014.

**7. Organize and oversee internal utility IDSMS strategies by establishing internal Integration Teams with staff from EE, DR, DG, marketing, and delivery channels.**

***a. Description:***

The IOUs will establish internal integration teams with representatives from EE, DR, Energy Savings Assistance Program (ESAP), distributed generation (DG)/Solar, green programs, marketing and delivery channels.

***b. Deliverables of the Integration Team:***

- Facilitate and communicate to promote inclusion of EE, DR, solar and other offerings (e.g., DG, Rates) into comprehensive energy cost reduction offerings to customers
- Coordinate with marketing team to promote integrated offerings including a centralized marketing function and consistent messaging
- Develop and implement sales and program training for integrated offerings including a targeted customers approach and sales training plan
- Coordinate responses to Commission directives, inquiries and data requests
- Coordinate development and delivery of integrated programs to create seamless market-segment-based customer solutions
- Coordinate/track delivery and progress of integrated pilots and activities
- Participate in regulatory proceedings and filings to maintain consistent, coordinated message
- Review and provide comments on regulatory filings
- SCE has committed to developing and begin implementation of an IDSMS Action Plan that sets goals, strategies, and tactics across the organization to facilitate and optimize efficiencies gained through the utilization of integrated approaches. SoCalGas, where the service territories overlap significantly, will endeavor to partner with them in this to find synergies and economies of scale.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

In order to educate and share best practices and experience with integrated products, marketing, and sales; integrated sales training will be developed, or in some cases continued, for the IOU customer facing, marketing and the Program teams. Training will focus on how to present integrated audits and offerings to customers and promote knowledge transfer among participants. Elements will include:

- Sales representatives from all appropriate delivery channels and program staff will be trained on IDSM integration to improve the sales effectiveness of programs
- Incorporate IDSM into external events and internal training of customer-facing staff, as appropriate

***b. Tasks and Timelines:***

These tasks are ongoing within each utility.

**8. Provide feedback and recommendations for the utilities' integrated marketing campaigns including how the working group will ensure that demand response marketing programs approved as category 9 Demand Response programs are coordinated with EE integrated marketing efforts.**

***a. Description:***

All IOUs are conducting Residential and Non-residential outreach events, developing and delivering collateral, and utilizing website updates and campaigns to cross market programs. Research on customer approach has also been conducted on the effectiveness and appropriate order, timing and combination of bundling of programs to customers.

Integrated Local Marketing Education and Outreach Strategy

The IOUs' integrated marketing plans are designed to generate ongoing customer engagement in Energy Efficiency, Demand Response and other DSM programs and services, by providing residential and non-residential customers with the right message, through the right channel, at the right time. The plans will leverage and complement the SW ME&O activities, which will be designed to "provide general energy education and demand side management program information," (D.12-05-015, OP 117a) while "prompting residential and small business customers to immediately take action." (OP 117f)

In 2013-2014, a new Statewide ME&O campaign will focus on creating awareness and educating customers about energy management and integrated DSM. The IOUs expect to leverage the increased interest generated by the SW ME&O campaign and use that point of contact and education as a step towards deeper EE engagement. The IOU's local integrated marketing strategy will focus

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

on helping customers understand the relevance of EE programs and services and enabling customers to take actions that are appropriate to their needs -- including one-time measures such as rebates as well as deeper whole house retrofits. This local EE marketing strategy will be coordinated through a variety of channels and tactics, with the intent of reaching customers at the right place and at the right time to drive increased participation and ongoing engagement.

**Integrated Local Marketing Education and Outreach Messaging**

In order to provide customers with relevant messages, the IOUs will use segmentation and internal data analysis to help refine our current understanding of customers' IDSM needs, by customer segment and target offerings appropriately. By cross-selling DSM programs and services that are meaningful to the customer, the IOUs will encourage customers to take action.

When appropriate, integrated messaging will deliver information to customers in a way that bundles relevant EE, DR and other DSM programs and services. For example, the IOUs will develop print and electronic case studies that feature customers who have implemented integrated solutions in order to address their energy management needs.

In addition to cross-selling DSM programs and promoting bundled solutions through integrated campaigns, integrated messaging will also be designed to motivate customers to enroll in web-based billing and analysis tools. This action will enable and encourage customers to better understand and manage their energy usage by taking advantage of the online tools. It will also provide the utilities with additional opportunities to continue to cross-sell DSM programs and services.

**Integrated Local Marketing Education and Outreach Tactics**

Local integrated marketing campaigns leverage multiple tactics and multiple communications that combine to present customers with a holistic view of programs and service offerings and a connection to the actions customers can take to participate. To reach California's diverse customers, the IOUs will use a mix of communication channels and languages. When possible, the IOUs will utilize the customer's preferred method for receiving communications. Marketing channels may include, but are not limited to: customer call centers, business account representatives, direct mail, email, IOU and 3<sup>rd</sup> Party websites, bill inserts, outreach events, partnership activities, social media, and ethnic advertising.

**Integrated Local Marketing Education and Outreach Reporting**

To increase and showcase marketing integration, IOUs will continue to conduct regular coordination meetings to share integration results, review best practices, and identify potential areas for improvement. For example, in May 2012, the IOUs presented an overview of their marketing integration efforts at the Quarterly

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

IDSMS Task Force meeting. Additionally, IOUs will continue to submit updates of their integrated marketing activities within their quarterly report.

***b. Tasks and Timelines:***

- The Task Force will continue to work in 2013-2014 with the statewide ME&O effort to ensure integrated messaging and coordination at a statewide level and will identify areas of integration with other demand-side programs by identifying and developing a product planning/review process that involves ME&O members of the IDSMS Task Force.
- In 2013-2014, the Task Force will conduct internal review of local utility marketing efforts where there are opportunities to integrate messages and campaigns, resources, and program offerings that promote demand side integration of AMI, DR, EE, and DG resources.
- The IOUs will continue to share information with the Task Force on local IOU integrated marketing, training, and education efforts. The IOUs will report all integrated marketing activities in the quarterly reports and will highlight integrated marketing efforts at the regular IDSMS Task Force meetings.

***c) Program Goals, Strategies and Measurable Objectives***

The primary purpose of the Task Force is to facilitate the integration of the full range of IOU DSM program options for California. To achieve this purpose the Task Force will pursue several objectives:

**1. Determine membership and identify key liaisons and stakeholders**

Initial Task Force membership will include representatives from each of the utilities, non-utility representatives as appropriate, and from the Commission's Energy Division. Utility membership will include people representation from strategic planning, EE, ESAP, DR and DG programs as well as emerging technologies, marketing, delivery channels and regulatory coordination, and possibly advanced metering. Statewide membership may be expanded to include representatives from the municipal utilities, the California Energy Commission (CEC) and other stakeholders. The Task Force may have regular representation from each of the leads of the other SW Program working groups, such as Industrial, Agricultural, Commercial, Residential, ME&O, WE&T, and New Construction.

In the 2013-2014 period, the IDSMS Task Force will make strides to include subject matter experts and other external stakeholders in the discussions of the eight specific directives in order to get perspective and additional feedback on the various topics and subjects. As directed, the IOUs will work in collaboration with the CPUC to identify and invite stakeholders to participate where and when appropriate.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

The Task Force will coordinate and communicate with teams associated with other programs and proceedings. Included in this effort is the ESA Integration Working Group; the Task Force and the ESA Integration Working Group /subcommittee work together to maintain directional alignment and to identify and report on best practices across the EE, ESAP and other proceedings.

2. Continue to identify and describe progress of:
  - Existing utility activities, efforts, programs and pilots,
  - IDSM best practices, and
  - IDSM metrics (including pilots) and cost effectiveness methodologies
3. Identify key issues affecting successful integration, such as cost-effectiveness, enhancing progress on technical innovations and regulatory jurisdictional issues. The Task Force will work with ET and program planning staff to develop potential solutions to the issues raised, and then follow through to see that the solutions are represented in future program modifications.
4. Develop metrics and reporting mechanism for tracking success of integrated efforts (EM&V protocols) consistent with the EM&V development plan described earlier in section 4.A.2.
5. Develop proposals for policy and program initiatives necessary to forward IDSM.
6. Establish program-funding protocols.
7. Identify and recommend adoption of enabling/supporting policies for inclusion in appropriate DSM programs and reports consistent with descriptions in prior sections of this PIP.
8. Identify and propose changes to inhibiting policies, metrics, and reports consistent with descriptions in prior sections of this PIP.

***Tasks and Timelines***

Goals defined above will involve ongoing efforts of the Task Force.

d) Target Audience(s)

The target audience for this statewide IDSM program effort is IDSM stakeholders including, but not limited to, the IOUs, CPUC, CEC, DSM solutions providers (e.g., EE service providers, DR aggregators, CSI installers) and utility customers.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

e) Identify If and How this Program will Provide any Elements of Workforce Education and Training (WE&T)

To date, the Task Force has collaborated with the WE&T SW team to develop the acceptable protocol for integrated training at the training centers. The Task Force will continue to identify and report best practices. Any IOU budgets associated with Integrated WE&T are included in the WE&T PIP.

**5. Program Rationale and Expected Outcome**

The Strategic Plan calls for an ongoing task force to establish a blueprint for integration. A statewide non-resource program is an effective means of coordinating such a blueprint.

a) Quantitative Baseline and Market Transformation Information

Program Performance Metrics (PPMs)

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Integrated Demand Side Management Statewide Program (Resolution E-4385, Appendix A):

PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
1. Awareness and knowledge among relevant IOU program staff (to be specified – e.g. account reps, engineers that administer the audit (3 <sup>rd</sup> party); program designers and managers) regarding how IDSM relates to and impacts their efforts and programs	2b
2. Number and percentage of integrated audits provided to each customer class and NAICS code.	2b
3. A status report that identifies how well “integrated” (EE, DR, DG) all IOU demand-side energy program offerings and components are (e.g., CEI, Commercial, Agricultural, Industrial, Residential, Audits) including lessons learned, best practices, improvement plans, and how the program portfolio is addressing strategic planning goals / objectives. D.09-09-047 also provides directives regarding integration, as well as the IDSM program objectives specified in the PPM Worksheet. The report will review how the IOUs have developed internal and external frameworks that support integration of IDSM programs and technologies. (Y/N)	2b

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

<p>4. Number and percent of integrated audit participants (identify NRA participants) in all customer classes (Residential, Commercial, Industrial, Agriculture) that implement recommended DSM measures / participate in other DSM programs (EE, DR, DG – Track which categories implemented / participated in) or other recommended technical process and practice improvements. (If possible, identify whether participants received incentives or not.)*</p> <p>*Data sources for reporting will come from (a) program tracking databases and (b) process evaluation to refine estimates.</p>	2b
<p>5. Program participant awareness of IDSM practices in each of the market sector subprograms.</p>	2b

b) Market Transformation Information

No MTIs have been approved for this program.

c) Program Design to Overcome Barriers

As stated in the Strategic Plan, “Historically, demand side management (DSM) options for energy consumers have been “siloeed” activities within regulatory bodies, utilities, environmental organizations, and among private sector service providers. The current narrow focus on a single product offering does not maximize energy savings nor minimize the costs of program delivery.” The Task Force and associated integration efforts within each utility is working to overcome this and other barriers to maximize benefits for customers and reduce costs for ratepayers.

d) Quantitative Program Targets

Not applicable for this non-resource program.

e) Advancing Strategic Plan goals and objectives

In support of the Strategic Plan,<sup>7</sup> the IOUs will evaluate the DSM pilot programs and determine what components will lead to successful DSM integration, consistent with the strategies in the Strategic Plan. The Task Force will discuss the applicability of these Emerging Technologies and initiatives in the context of IDSM. The ET program will undertake a coordinated effort to support innovation in EE, DR, and renewable / self-generation. ET forums will be used by the Task Force to review and vet proposed ET technologies that can be funded and integrated across DSM programs. Lastly, through coordinated DSM marketing, the Task Force will promote program integration across the DSM campaigns in order to maximize EE, DR, & DG opportunities.

**6. Program Implementation**

<sup>7</sup> California Long Term Energy Efficiency Strategic Plan, Section 8,4 pp. 72-73.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

a) Statewide IOU Coordination

This is a statewide program.

- i. Integrated Demand Side Management
- ii. All program delivery mechanisms

As described earlier in this document, the Task Force does not replace the individual IOU governance of DSM programs and is not intended to duplicate reporting or regulatory activities.

- iii. Marketing materials and message

The Task Force will work with the Statewide and internal IOU M&O teams to leverage statewide awareness and coordinated program messaging; and, explore utilizing educational efforts that direct customers to local utility integration efforts and offerings.

- iv. IOU program interactions with CEC, air resources boards, air quality management districts, local government programs, other government programs, community-based organizations, non-governmental organizations, manufacturers, retailers, trade and business associations, as applicable.

The IDSM Task Force will explore opportunities to interact with other programs/ organizations that could include municipal utilities, local and state governments, water districts and DSM solutions providers to offer integrated services, obtain input/feedback, share knowledge/best practices, and generally promote IDSM efforts and activities. Expansion of Task Force participation may be in the form of periodic expert input and ad hoc workshops as needed to solicit input from the broader group of participants in a fair and equitable manner. Future program milestones, lessons learned, and best practices can be shared with outside stakeholders to further IDSM activity outside of IOU programs.

- v. Similar IOU and POU programs

The IDSM Task Force will coordinate with all IOU SW programs and will interact with other programs/ organizations, municipalities and DSM solutions providers to offer integrated services. Future program milestones, lessons learned, and best practices can be shared with outside stakeholders to further IDSM activity outside of IOU programs.

b) Program Delivery Mechanisms

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

The Task Force will not be involved in direct implementation but will develop and provide the knowledge necessary to promote integrated program delivery mechanisms.

c) Marketing Plan

The Task Force will not be providing direct marketing services, but the coordination of marketing will be an integral part of integrated approaches and will be included in each individual program's approach where applicable. In addition, as described in Task 8, above, the Task Force will work with the Statewide and internal IOU M&O teams to leverage statewide awareness and coordinated program messaging; and, explore utilizing educational efforts that direct customers to local utility integration efforts and offerings.

d) Best Practices

The Task Force's involvement in reviewing utility integration activities, pilots and practices (e.g., Zero Net Energy, Food Processing) will lead to the establishment of Integrated Best Practices.

e) Innovation

Individual utilities are working on integrated approaches locally to meet customer needs on a comprehensive, solutions-based level and coordinating and tracking of these integrated pilots and activities.

f) Integrated/Coordinated Demand Side Management

The basis of this program is entirely integrated and coordinated demand side management on a statewide basis with local efforts feeding into the overall strategy.

g) Integration Across Resource Types

Where possible, the Task Force will continue to identify opportunities for integrating across non-energy areas like water and electric vehicles. Most likely, this information will come from pilots and other customer-focused activities and will be considered future pilots and best practice recommendations.

h) Pilots

The Task Force will be the principal governance structure to track the integrated efforts of the IOUs and develop SW metrics to evaluate their success. The Task Force will identify pilots, projects, programs and activities being conducted by individual IOUs that might be replicated in other parts of the state. As described in section 4.b.5, above, integrated pilots and activities will continue to be identified and tracked by the Task Force in Quarterly Reports. A critical component of evaluating these pilots, projects, and program activities is identifying what data should be captured to optimally evaluate the

## 2013-2014 Energy Efficiency Programs Statewide Integrated Demand-Side Management Program Program Implementation Plan

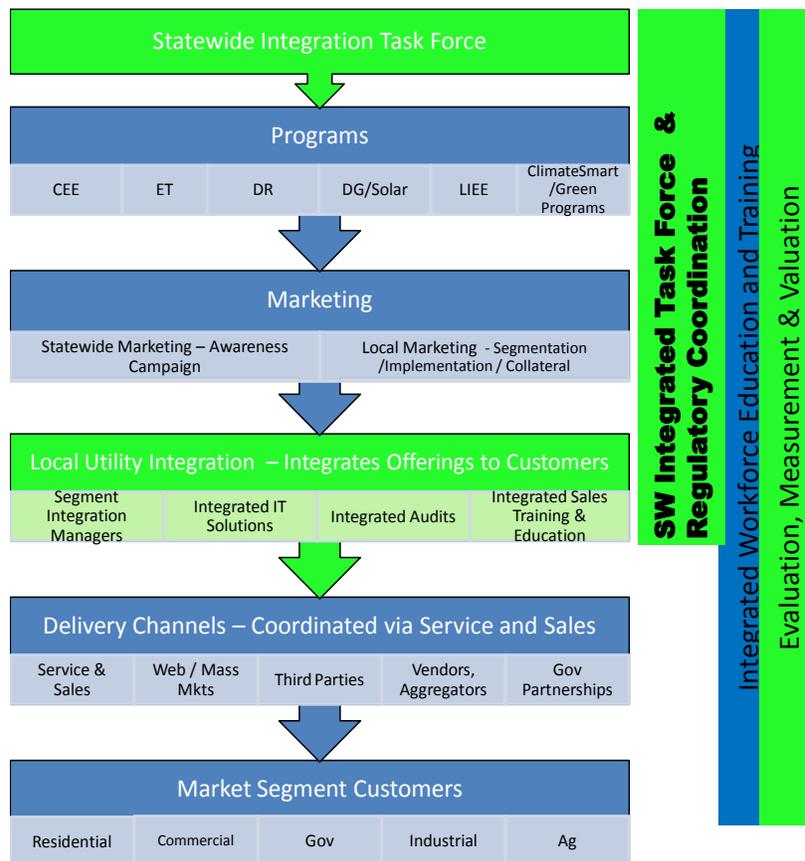

ongoing success of these pilots and IDSM activities. The Task Force will coordinate with ED staff to ensure that an adequate level of data is collected.

i) EM&V

The Task Force will continue tracking and measuring the metrics described in Section 5 of this PIP, leveraging evaluation studies and resources where appropriate. The IDSM Omnibus Process Evaluation is underway and will provide recommendations for overcoming barriers and improving future IDSM offerings. Subsequent evaluation needs will be determined at the conclusion of the Omnibus Evaluation.

### 7. Program Diagram

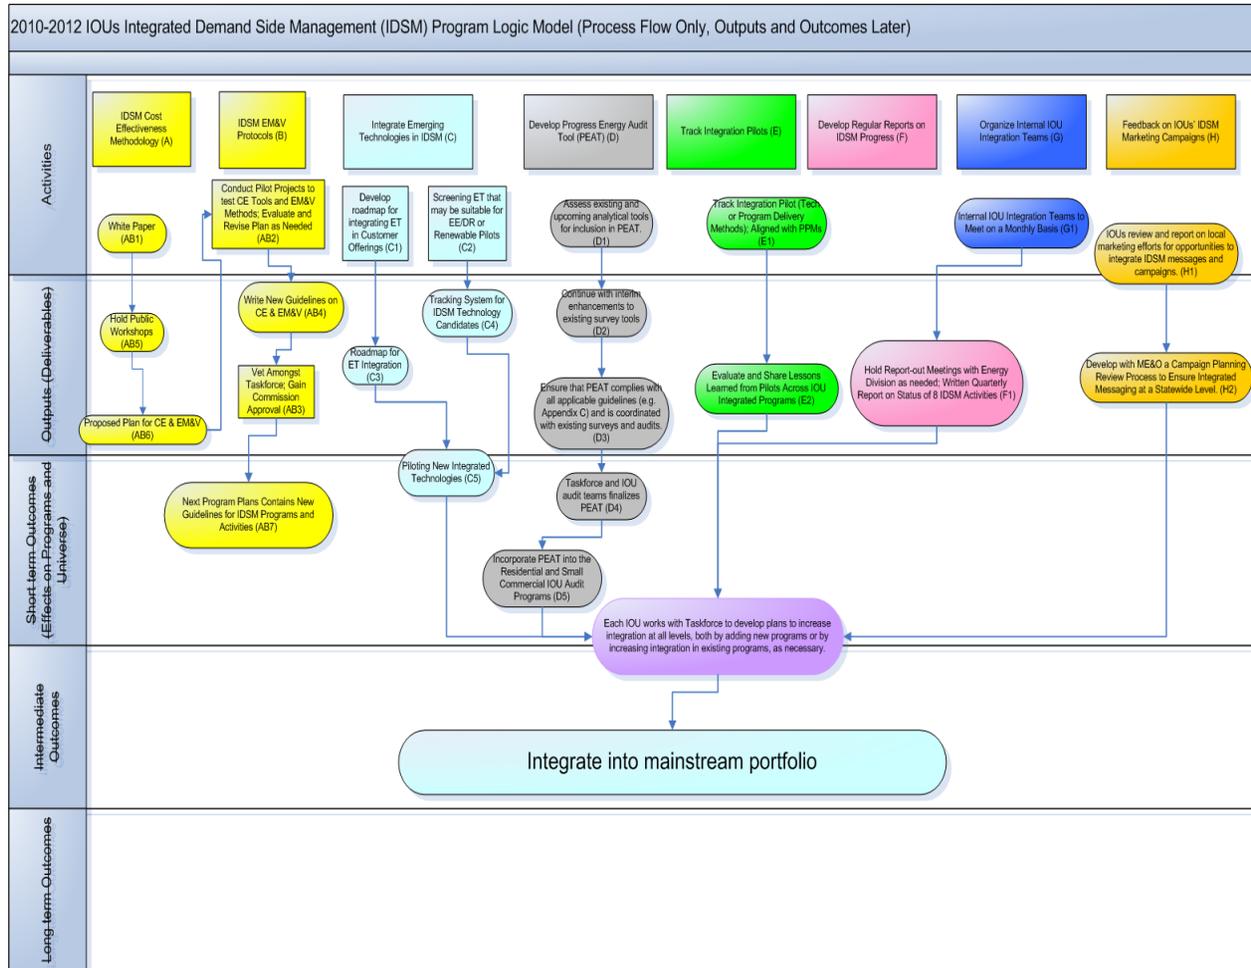

#### Program Diagram – IDSM Task Force

# 2013-2014 Energy Efficiency Programs Statewide Integrated Demand-Side Management Program Program Implementation Plan

## 8. Program Logic Model

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Integrated Demand Side Management Program.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

**9. Local Sustainable Communities Case Studies Program**

The SoCalGas IDSM Program is made up of two major, but related, components.

1. The previously addressed Statewide IDSM effort
2. The Sustainable Communities Case Studies Program

SoCalGas' Sustainable Communities (SC) program provides the framework for the design and building of communities that support the environment through energy- and resource-efficiency. SC helps to enhance quality of life by protecting and preserving natural resources and improving economic development. Incentives and other assistance are available to developers, building owners, and design teams that construct highly energy-efficient buildings with sustainable design, and long-term energy-efficiency.

This highly innovative program will be SoCalGas' flagship program providing the path for all other programs in meeting California's long-term energy efficiency goals, including zero net energy homes by 2020. This program will enable market transformation resulting in measurable energy efficiency, integrated demand response, distributed generation, renewables and natural resource savings while optimizing long term ecological, social and economic health of California. It accomplishes this by comprehensively integrating the "vertical" development (buildings and their components) with the "horizontal" development (land and utility and transportation infrastructure) over the full planning horizon. This holistic approach to program design and implementation is coupled with a new management model and evolutionary improvements in energy, water and air quality savings over the project life.

Another key feature of SC's flagship approach is its longer-term focus and crosscutting implementation to avoid trapping the key market players in the usual "organizational silos." SC achieves this through the unique partnership between SoCalGas and the Master Developer by developing early market interventions deployed by 3rd party implementers upstream of the usual core programs. This innovation produces more productive and resilient market change with greater cost-effectiveness.

**Sustainable Design and Construction Training**

A training program and training materials will be developed for participating builders and contractors. The training, for both residential and non-residential building, will cover all relevant issues including sustainable design and construction impacting energy efficiency, solar, water, waste, utility infrastructure (smart grid and AMI), and transportation.

A metric of this service will be determined in tracking the impact early intervention and training have on increasing energy-efficient design of residential structures. Developing training goals and objectives, curriculum and tracking of buildings energy performance will be used to measure success of the training. The minimum specifications will be covered in the training developed to help encourage and monitor innovative design and exceeding building performance targets set by the developer and utilities. The utility will support training developed and provided by developer's consultants for builder subcontractors.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

The incorporation of a Learning Center within the development is proposed to help educate and build awareness of energy efficiency, renewable generation and sustainable measures that have been incorporated into the development. The Learning Center will create a powerful teaching tool due to its interactive software and real time graphics. This tool could demonstrate the community's energy savings compared to non-efficient developments, showcase the development's green features and show environmental impacts and equivalent comparisons. In addition, kiosks will contain renewable energy education and incorporate actual data related to utility owned on-site generation. The center would be strategically located within the community near a school, library, or public center. This location could also be used for utility hosted energy workshops highlighting energy efficiency and green building design.

**Sustainable Design Assistance**

Design assistance will be provided to participating engineers, architects, planners, and builders. The program will encourage innovative and less traditional approaches to meeting and exceeding sustainability goals. Design assistance will occur much earlier in the development process than traditional utility offerings to embrace this flagship program's crosscutting nature and to better leverage its holistic ambitions and goals.

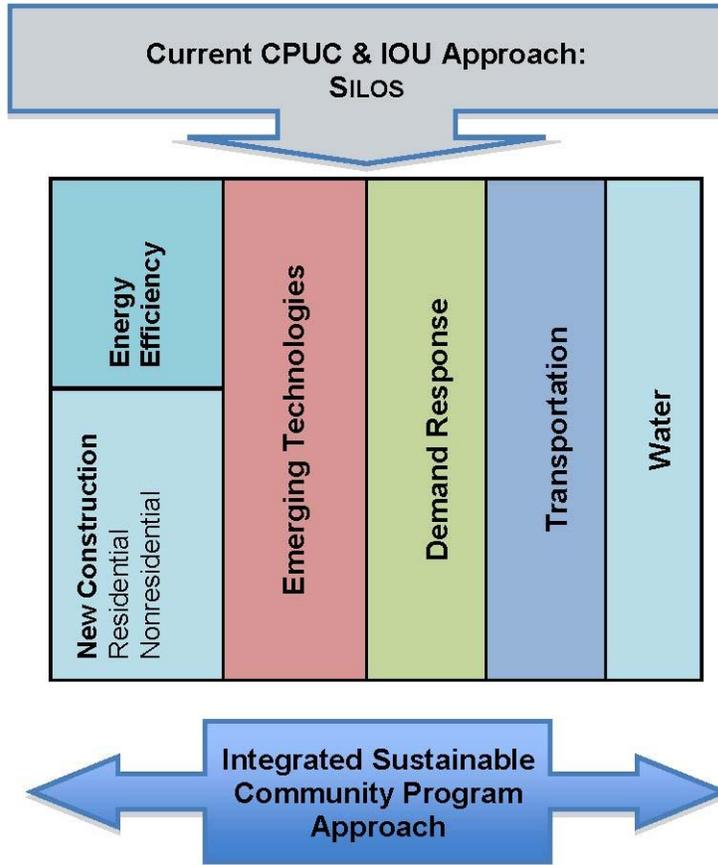

**Residential Modeling Procedure and Protocol Development**

Because builders will be required to submit documentation illustrating how their designs will meet the sustainability requirements, this program will develop the modeling procedures and other requirements for this documentation. Sustainability targets would be set at 35% above Title 242 for all residential building and would also include participation in the New Solar Homes Partnership program to foster development of renewable energy on each residential building. Similar energy performance targets would be established for commercial projects with corresponding participation in the CSI program.

2 Title 24 2005.

**The New Paradigm . . .**

. . . an integrated management approach

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not strong confidence would not be productive. Therefore, the utilities respectfully exclude "draft" metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

As explained immediately above, the utilities propose to provide these draft metrics when available.

#### Program Design to Overcome Barriers

- SoCalGas program offerings work in silos and result in lost savings opportunities at the community level.
- The Pilot will work directly with the Community Developer to achieve integration across community energy end-uses such as buildings, transportation, water, and generation. This allows 100% participation by the community and encourages the developer to be innovative and aggressive in setting energy efficiency and renewable energy goals.
- Working through the Community Developer will enable SoCalGas to influence multiple types of consultants (architects, landscape architects, urban designers, transportation engineers, mechanical and electrical engineers), trades (mechanical, electrical, plumbing, roofing, and renewable installers) and supply chain partners such as manufacturers as

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

well as local governments.

- Program cycles are too short for stakeholders with long-term planning and development horizons. 3-year program cycles ignore market conditions and long project lead-times.
- Master-planned communities typically have twenty year planning horizons which is much longer than typical IOU program timelines. This program resolves this by proposing a sufficient timeline that allows for full program integration into the development plan. Master-planned communities typically have twenty year planning horizons. Front-loading the program recommendations will maximize market transformation and allow the program benefits to properly deliver over the full length of the master development process.

For example, Rancho Mission Viejo's Ranch Plan went through a decade of science-based planning, and processing; development of the first planning area (PA1) will commence once the market recovers, hopefully by 2010 ([www.TheRanchPlan.com](http://www.TheRanchPlan.com)). Another example is Otay Ranch, a large master planned community in Chula Vista went through a ten-year planning process, opened in 1999, and ten years later still is nowhere near completion despite being San Diego County's top selling planned community. (<http://otayranch.com/about/aboutIndex.shtml>). This program resolves this by proposing a sufficient timeline that allows for full program integration into the development plan.

- IOUs and non-governmental organizations lack the coordinated efforts that are needed to accomplish the goals. Disincentives exist at the CPUC, CEC, and IOUs that delay and inhibit effective and persistent market transformation:

Incentives availability is unpredictable for long-term stakeholders, and they are unable to utilize or secure them for projects.

Current organizational "silos" at IOUs and CPUC associated with various rulings make it impractical to do an integrated and comprehensive sustainable communities program. This creates missed opportunities for EE and DR savings up and down the energy supply and demand chains.

Utility customers are seeking integrated solutions addressing their entire energy infrastructure needs from smart appliances, smart meters, smart grid functionality including vehicle-to-grid capability, to promoting grid-enabled renewables. Existing program structures prevent appropriate creation and delivery of an integrated market solution.

#### Advancing Strategic Plan goals and objectives

SoCalGas' Sustainable Communities (SC) program supports the Statewide Strategic Plan, and promoting a sustainable future for Southern California. By addressing environment concerns and energy and resource efficiency, the program seeks to support the residential 2020 goals of zero net energy in new construction. Coupled with the focus on sustainable design and green building practices, the program is uniquely positioned to influence the

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

design and construction of sustainable communities in its broadest definition. Consistent with The California Long Term Energy Efficient Strategic Plan, Residential New Construction will reach “zero net energy” (ZNE) performance for all new single and multi-family homes by 2020, and commercial new construction will increasingly embrace zero net energy performance (including clean, on site distributed generation), reaching 100% penetration of new starts in 2030. Near term, by 2011, 50% of new homes will surpass 2005 Title 24 energy efficiency standards by 35%; 10% will surpass 2005 Title 24 standards by 55%..

#### Residential

To support the CLTEESP objectives, SoCalGas proposes a separate *Sustainable Communities Case Studies* program that focuses on the Ranch Plan being developed by the Master-planned community company.

The program guides the target community toward this goal by setting beyond-code minimums in the interim, which facilitates building to ZNE in the target timeframe. The Pilot will incorporate a Learning Center within the development to educate builders and homeowners as well as provide the Community Developer access to SoCalGas’ full gamut of energy efficiency programs.

The program will provide design assistance for builders, during which SoCalGas will push for the incorporation of innovative building practices. The pilot integrated approach will include a comprehensive array of strategies including energy-efficiency measures, educational opportunities for demand response, onsite renewable distributed generation (as applicable), and smart meters.

#### Commercial

*New construction will increasingly embrace zero net energy performance (including clean, distributed generation), reaching 100 percent penetration of new starts in 2030.(Goal 1)*

*Codes and Standards: Adopt aggressive and progressive minimum energy codes and standards for buildings and plug loads, effective code compliance and enforcement, and parallel, tiered voluntary energy efficiency standards (Strategy 1). The Pilot sets increasingly rigid energy efficiency goals that provide a workable path to achieving this goal. Specifically, at least 75% of commercial square footage must be 20% better by 2012.*

#### Innovation

Sustainable Communities will be SoCalGas’ flagship program providing the path for all other programs to meet California’s long-term energy-efficiency goals, including net-zero energy homes by 2020.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

SC enables enhanced market transformation resulting in measurable energy efficiency, integrated demand response, distributed generation, renewables and natural resource savings while optimizing long-term ecological, social and economic health of California. It accomplishes this by comprehensively integrating the “vertical” development (buildings and their components) with the „horizontal“ development (land and utility and transportation infrastructure) over the full planning horizon. This holistic approach to program design and implementation is coupled with a new management model and evolutionary improvements in energy, water and air quality savings over the project life.

Master-planned communities typically have twenty-year planning horizons which is why weaving the vertical program elements with horizontal elements are so critical to its success. This program is unique in its breath and the level of integration to achieve long-term savings for: electricity, natural gas, water, wastewater, carbon emissions, and greenhouse gases.

Sustainable Communities recognizes that master-planned community developments provide a “proving ground” for interrelated pilot program offerings. This program will help SoCalGas and the CPUC to better understand barriers and opportunities with different stakeholders as part of a pilot/program rather than from numerous disjointed efforts. In addition to establishing SoCalGas as a leader in promoting sustainable development, SC provides the CPUC the opportunity to establish their leadership and overall policy guidance in support of these innovative programs.

The process for developing sustainable, livable land-use practices and building design is creative, technical and, participatory. The basic principles of sustainable development merge similar objectives to protect and restore the natural environment while providing nurturing, high-quality communities for people to work and live in.

The common fundamental characteristic throughout the program is its focus on performance approaches rather than prescriptive approaches to fully integrate building systems with infrastructure enabling SoCalGas into California’s Smart Grid. The Smart Grid concept overlaps various functions such as smart meters, smart appliances, demand response, self-generation, highly efficient PV systems and transportation.

**Integrated/coordinated Demand Side Management**

Fundamental to SC’s innovative design is it fully embraces an IDSM methodology by closely “knitting” EE, DR, DG and renewables across development components. Its very nature speaks to integration to form synergistic impacts that are typically unattainable through EE business as usual.

At a minimum, all marketing materials will be developed to support energy-efficient design process in helping cross promote demand response to educate customers on the availability of IOU DR programs/Smart Meters etc. Additional work will take place during the three-year program cycle to evaluate closer linkages between EE and DR via Program Managers and success with this concept with various case study projects. Additionally, this feedback

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

mechanism establishes a means to facilitate technology approaches that enable SC to crosscut organizational silos in achieving its strategic vision.

Integration across resource types (energy, water, air quality, etc.)

SC is a comprehensive program with a cross-cutting focus on energy-design, green building practices, and increased utilization of renewable resources. Infrastructure, transportation planning, energy, water, materials, and waste are all addressed in the program rather than as separate elements. This provides the opportunity for exponential energy- and resource-savings throughout the community – giving SoCalGas and developers the ability to shift to cleaner forms of energy to power our communities. The key difference is that SC approaches the market with the Master Developer as its focus. Rather than address market barriers at the tail end of the market cycle, SC deals with barriers earlier in the development process thereby enhancing and improving its leverage to create substantially greater impacts as displayed in the table below. The pilot will engage with CEC, DOE, MWD and other government agencies responsible for various aspects of New Construction in California.

***Integrated Community-Based Solutions***

The main elements addressed by the participating projects will be structured around three key concepts – Environment, Resources, and Energy – with a detailed focus to the following principles:

- Sustainable site design
- Energy efficiency
- Advanced renewables integration
- Pollution reduction
- Water efficiency
- Indoor air quality
- Resource preservation
- Smart Grid
- Integrating local Governments
- Transportation.
- Smart Land-Use Options (ex: mixed housing, walk-ability / bike-ability)

These energy- and land-use practices, sensitive to both the human community and natural environment, will be achieved through the *Sustainable Communities Case Studies* program and will allow the utility to initiate a collaborative partnership with the design community, developers, builders and related industries.

**Master-planned community (to be determined)**

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

To support the *Case Study* program concept and to integrate it into the *Sustainable Communities* program, SoCalGas proposes a separate *Sustainable Communities Case Studies* program that will focus on a to be selected Plan being developed by a Master-planned community developer.

These projects will be comprised open space, residential units, commercial construction, schools, hospitals and other related development.

The project will be developed with sustainability as its guiding principle and addresses. This would include:

- Interdependence of humanity and nature
- Intergenerational stewardship
- Optimized value
- Design with natural systems
- Conservation of natural resources
- High-performance design technologies
- Resource-efficient healthy materials
- Elimination of waste
- Multi-modal transportation
- Innovation, education, and ongoing evolution

The project will also address quantitative environmental metrics of:

- Energy use
- Air pollution
- Greenhouse gases
- Water use
- Storm water and runoff

The tools developed, results achieved and lessons learned from the pilot have direct application Statewide and will be shared to further advance sustainable development elsewhere in California. This provides a much-needed proving ground serving to enrich sustainable community development at a cost-effective level unattainable through traditional approaches.

### **Project Opportunities**

Utilizing the first plans as a case study will provide both short- and long-term opportunities for energy savings and other benefits in a cost-effective environment. It will also provide a comprehensive mix of energy-efficient market potential for multiple residential, commercial, and retail sectors. It will provide a model to successfully implement the programmatic initiatives found in the Strategic Plan.

Working through the community developer will enable the IOU to influence multiple types of consultants (architects, landscape architects, urban designers, transportation engineers, and mechanical and electrical engineers), trades (mechanical, electrical, plumbing, roofing, and

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

renewable installers), and supply chain partners such as manufacturers as well as local governments.

### **Project Funding**

The Sustainable Communities Model developed by CTG Energetics, Inc. and the selected Master-Planned Community Sustainability Team, is the core controlling element in the analysis of the Project. Funding for the development and maintenance of the Sustainable Communities Model is needed to support the case study and evaluate the energy and environmental impacts, and sustainable design decision making for the chosen project. This Sustainable Communities Model will be the core controlling element in the analysis of the project. The Sustainable Communities Model® (SCM) quantifies total environmental impacts (including energy use, water use, greenhouse gas emissions, air pollution emissions, stormwater, transportation impacts, solid waste, and other factors) allowing communities to optimize planning and design decisions that result in the greatest environmental benefit for the least cost. The SCM takes a quantitative, systems-based approach towards sustainability. This enables a project's design team to "connect" each specialty's detailed analyses together to explore and optimize environmental impacts that cross disciplinary boundaries. The landscape architect can explore the impacts that various planting palettes has on building energy use (shading, microclimate modification, evaporative cooling), water consumption, carbon sequestration and embodied environmental impacts such as the amount of embodied energy/carbon in water. The SCM is scalable over a wide range of community sizes, and can be applied to "communities" ranging from municipalities, to large master planned developments/re-developments, to academic and corporate campuses, down to individual buildings.

Funding for the development and maintenance of the Sustainable Communities Model is needed to support the case study and evaluate the energy and environmental impacts, and sustainable design decision making for both the phases and the broader project. The funds are anticipated to support five key areas of the Sustainable Communities Model:

1. Implementation of the entire project in SCM to facilitate further investigation and analysis
2. Support of on-going plan design changes (densities, unit types, etc.)
3. Development and refinement of peer review and referencing methodologies to support the environmental benefit calculations, and
4. Development of new calculations and modules needed to support specific decision points for the project (e.g. large scale photovoltaic, cogeneration, district heating and cooling, etc.)

Additional funding will be required to cover:

- An on-site HERS-certified inspector during the build-out of the project. This inspector will perform the required tests and inspections and will ensure consistency and quality in the Planning Area 1 homes.
- Full-time, on-site technical support for 3rd party inspections and tests of building to ensure quality, program compliance, energy savings, and measurement and verification.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

- Sales training
- Timeline of completion
  - The program will roughly be scheduled through the end of 2014, but the master development and results will continue for up to 20 years, or 2034.
- Timeline of results
  - Some results will be available annually; a more comprehensive study will be completed at the end of the program cycle.
- The Statewide IDSM program is tasked with developing an appropriate cost effectiveness methodology for integrated projects/pilots. The methodology will be used for this pilot as it becomes available.

The Green Energy Systems (GES) program (see Statewide New Construction PIP, Savings By Design for an example) will explore the potential for utility ownership of major energy efficiency equipment to facilitate the installation of the highest efficiency HVAC systems in commercial buildings. The program recognizes that building owner financing is constrained and without utility ownership, the system design will not maximize energy savings. The objective of GES is to capture energy efficiency opportunities that would otherwise be lost for the 20 to 30 year life of the HVAC equipment. This pilot will build on the success of the Sustainable Communities program that incorporates utility ownership of clean energy generation systems on customer facilities.

Under GES, SoCalGas will seek to identify projects with the following characteristics:

- The project is of sufficient size to warrant the effort (>\$2,000,000 investment)
- The building is intended to be owner occupied or owner managed
- The HVAC system is a central plant configuration

If an appropriate project is identified, with an owner willing to enter into a contractual agreement with the utility to own and operate the building's HVAC central plant, then the utility will file an advice letter for approval of incremental capital and maintenance costs and will demonstrate that the project meets the following criteria of the project is cost effective as a stand-alone energy-efficiency project and delivers incremental energy savings beyond what the building owner would otherwise have installed.

If approved, the utility will sub-contract out the design, construction, and operation of the facility but will serve as project manager to ensure it is constructed and operated at the design efficiency levels.

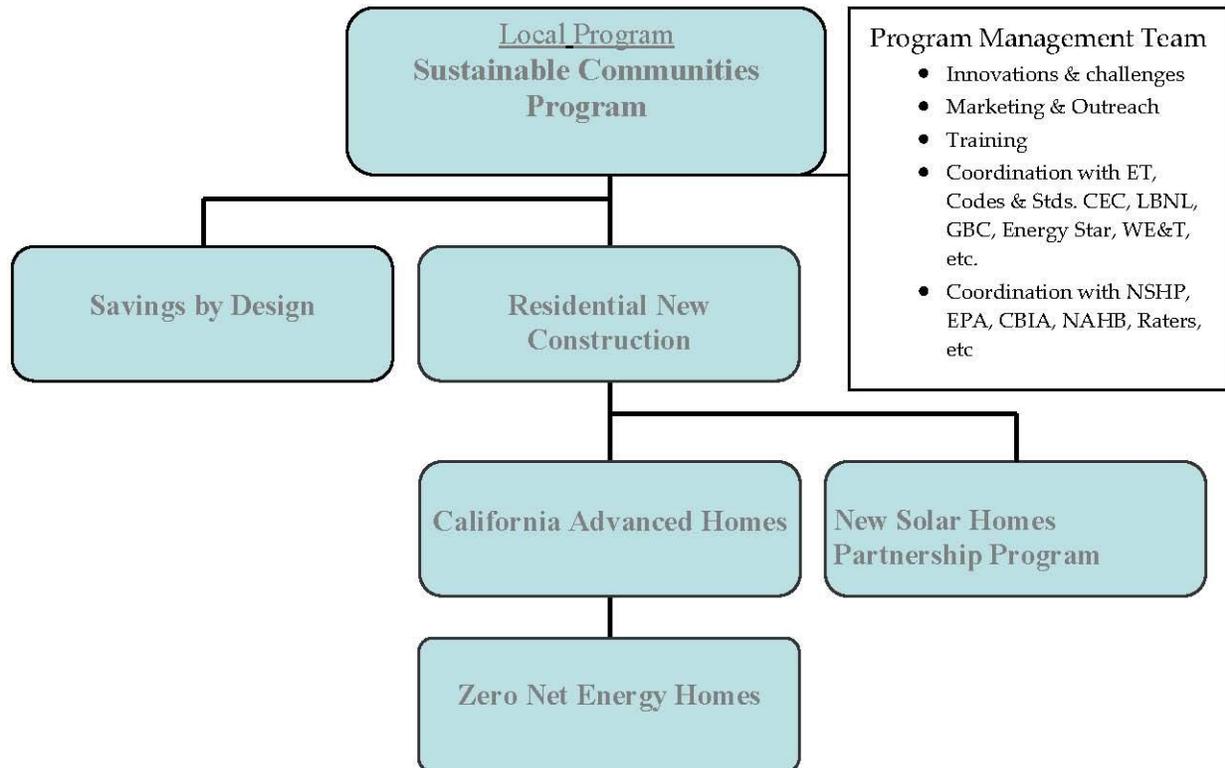

**2013-2014 Energy Efficiency Programs

**4. Program Description**

a) Description

The California Long Term Energy Efficiency Strategic Plan (Strategic Plan) encourages programs that integrate the full range of demand-side management (DSM) options including energy efficiency (EE), demand response (DR), and distributed generation (DG) as fundamental to achieving California’s strategic energy goals. This program implementation plan (PIP) presents the coordinated effort that Pacific Gas and Electric Company (PG&E), Southern California Edison (SCE), San Diego Gas and Electric Company (SDG&E) and Southern California Gas Company (SoCalGas), (together referred to as “the IOUs”) will make to integrate those DSM options in full collaboration with the Commission’s Energy Division in compliance with Decisions (D.) 09-09-047 and D.05-12-015 that approved the IOU IDSMS Statewide program and required continuation of IDSMS activities.

**Formatted:** Indent: Left: 0.25", Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: -0.5" + Indent at: 0.75", Tab stops: Not at 0.5"

**Deleted:** 105

In addition to the IOUs’ individual IDSMS pilots, projects, programs, and activities, the IOUs established a Statewide Integration Task Force (Task Force). Responsibilities of the Task Force have encompassed activities that promote, in a statewide-coordinated fashion, two specific IDSMS strategies identified in the Strategic Plan. These include

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

stakeholder coordination (Strategy 1.3)<sup>1</sup> and new technologies (Strategy 1.4)<sup>2</sup>. The IOUs believe that Strategy 1.1—“Carry out integrated marketing of DSM opportunities across all customer classes” should be coordinated with the statewide Marketing, Education and Outreach (ME&O) efforts (*see* SW ME&O PIP [filed in a separate application in R.09-11-014](#)) and implemented at the local level by the IOUs focused on particular segment and customer-specific strategies.

In 2013-2014, the IDSM Task Force will continue to expand its role as a coordinating body across many proceedings, programs, and across the IOUs to identify gaps, best practices and to improve efficiencies around delivery of programs in a comprehensive manner to customers. Taskforce representatives will strive to actively participate in all applicable proceedings to help develop of a record in each proceeding that will aid in developing policies, funding opportunities, and mechanisms to promote IDSM.

Decision 12.05.015 directs the IOUs to continue and expand integration efforts in the following areas:

- **Increased Coordination** across different proceedings with the IDSM Task Force as lead.
- **IDSM Funding:** Consideration of appropriate funding from the other proceedings to support IDSM efforts
- **Increased involvement of Stakeholders:** Inclusion of stakeholders and experts in the efforts of the IDSM Task Force
- **Information on IDSM Projects:** Detailed information on the Pilot programs and projects
- **Audits:** Continued development of the integrated Audit tool
- **IDSM Marketing:** Increased integrated marketing efforts and improved reporting / communicating with ED
- **IDSM Tracking Databases:** Improved databases for tracking integrated projects

b) Statement of Problem and Solutions to Overcome the Problem

There is a policy requirement and need to focus on integration of DSM activities and programs on a statewide and local level by customers, utilities, regulators, and legislators.

The CPUC’s Strategic Plan provides its vision that “energy efficiency, energy conservation, demand response, advanced metering, and distributed generation technologies are offered as elements of an integrated solution that supports energy and carbon reduction goals immediately, and eventually water and other resource conservation goals in the future.” The State Legislature has proposed Assembly Bill

<sup>1</sup> *Id.*, Strategy 1.3: Develop integrated DSM programs across resources, including energy, water, and transportation.

<sup>2</sup> *Id.*, Strategy 1.4: Promote development and support of new technologies that enable or facilitate DSM Coordination and Integration.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

AB51,<sup>3</sup> requiring the Commission to integrate the DSM programs within its jurisdiction in order to enable offerings of integrated packages that will maximize savings and minimize costs to ratepayers.

In order to ensure that the vision of IDSM progresses operationally to meet the Strategic Plan, the Task Force will continue to identify and promulgate best practices, address implementation and policy issues, and design effective metrics to measure progress on IDSM.

The Task Force will focus on include the eight tasks as defined in D. 09-09-047:

**1. Development of a proposed method to measure cost-effectiveness for integrated projects and programs including quantification and attribution methods that includes GHG and water reductions benefits and the potential long-term economic and electric/gas hedging benefits.**

*a. Description:*

The Commission has approved the California Standard Practice Manual that serves as the reference document for proposed cost effectiveness tests and methodologies for EE programs. Rulemaking (R.) 07-01-041 is considering identifying and approving a cost effectiveness methodology for DR programs, and R.08-03-008 is considering cost effectiveness methodologies to measure the cost benefit of DG programs. To effectively integrate DSM program design, a set of internally consistent proposed cost-effectiveness methodologies need to be developed for integrated projects, and for program efforts that seek to combine all of these demand side resource options within an integrated portfolio. Cost effectiveness is being considered in R.09-11-014.

*b. Tasks and Timelines:*

- Under contract to the IOUs, Black and Veatch completed a white paper on integrated cost effectiveness and presented observations and recommendations via public workshop in 2011. The progress of this activity has been on hold pending guidance from the Energy Division.
- The IOUs and CPUC will work together on next steps for integrated cost – effectiveness efforts.

**2. Development of proposed measurement and evaluation protocols for IDSM programs and projects.**

*a. Description:*

**Deleted:** medium and long term

**Deleted:** is maintained and

**Deleted:** the IOUs, in collaboration with the Energy Division, formed the IDSM Statewide Task Force. The

**Deleted:** has met regularly to

**Deleted:** identify

**Deleted:** , and report to the CPUC as described below.

**Deleted:** ¶

¶ This Task Force does not replace the individual IOU governance of DSM programs and is not intended to duplicate reporting or regulatory activities. Rather, the Task Force will specifically look for important opportunities, identify barriers, and work through the IOU program staff to promote the advancement of IDSM, using lessons learned and best practices to establish a continuous improvement process.

<sup>3</sup> Assembly Bill No. 51, Amended in Assembly June 1, 2009, Amended in Assembly May 5, 2009, Amended in Assembly April 14, 2009, California legislature—2009–10 regular session; An act to amend Section 399.4 of the Public Utilities Code Relating to Energy.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

In order to effectively evaluate IDSM programs, activities and pilots, specific protocols need to be developed to document and attribute energy savings, demand reductions, and CO2 reductions from various DSM customer activities. The Task Force will coordinate with IOU and ED EM&V resources to develop a proposal of appropriate metrics for assessing integration.

**Deleted:** Similar to the cost effectiveness methodology, in o

**Deleted:** so that all

**Deleted:** are properly documented and appropriately attributed

**Deleted:** the

Draft EM&V protocols will also be applied to the IOU IDSM pilot programs. This exercise will allow for immediate feedback as to the feasibility of the draft IDSM EM&V protocols.

**b. Tasks and Timelines:**

- The Task Force will explore a phased approach to developing appropriate EM&V protocols for IDSM programs and projects. In collaboration with IOUs, ED EM&V resources will develop a white paper that will be publicly vetted.
- Energy Division has put the development of the EM&V white paper on hold until the next steps are determined for the Integrated Cost Effectiveness development activity.
- The IOUs and CPUC will work together on next steps for integrated EM&V efforts.

**Deleted:** conducting

**Deleted:** based upon findings for the approach to cost-effectiveness. The approach could will be similar to the cost effectiveness plan described above

**Deleted:** to determine

**Deleted:** <#>The IOUs and CPUC will work together to continue discussions on integrated EM&V efforts and determine appropriate next steps.¶

**3. Review IDSM enabling emerging technologies for potential inclusion in integrated programs.**

**a. Description:**

The Commission has approved various research and development (R&D) and Emerging Technologies (ET) programs in both Energy Efficiency and Demand Response that promote IDSM. The ET program will focus on integrating hybrid and renewable technologies as well as study and assess interactive effects, especially for technologies like lighting and HVAC. The program will launch demonstration showcases and scaled field placement featuring integrated energy systems for proof-of-concept, technology and usability assessment, market exposure, and public awareness. The IDSM Task Force will track the results of the ET program's technology integration and help chart its future course and monitor the inclusion of integrated ET products into customer projects.

**Deleted:** review end uses and technologies that could to

**Deleted:** The Task Force will be the appropriate forum to discuss the applicability of these new technologies and initiatives in the context of IDSM. The ET program will undertake a coordinated effort to support innovation in EE, DR, and renewable / self-generation. ET forums for the Task Force to review and vet proposed ET technologies that can be funded and integrated across DSM programs. ¶

**Deleted:** also

**Deleted:** and

**Deleted:** be tracking

**Deleted:** helping

**Deleted:** to

**Deleted:** Working with the IOUs' ET programs' data sources, the Task Force will also track

**Deleted:** ¶

**Deleted:** The IOUs individually and the Task Force as a group will continue to track emerging technologies that have some combination of EE, DR and/or renewable self-generation capabilities, or other integrated relationships to potentially pilot integrated product offerings (in addition to marketing) to customers.

**b. Tasks and Timelines:**

- The IOUs will explore leveraging emerging-technology efforts through various channels to offer and promote multiple integrated measures such as efficient lighting, HVAC equipment, or pumps coupled with controls that will provide both energy savings and auto-DR capabilities. The IOUs will also explore leveraging existing or emerging technologies that individually or as a system combine EE, DR, DG, AMI, or water-savings potential as part of an integrated program offering.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

**4. Development of cross-utility standardized integrated audit tools using PG&E’s developed audits as a starting point.**

**a. Description:**

Program evaluation studies conducted for program cycles 2002, 2003, and 2004-2005 clearly identify energy surveys and customer site audits as one of the most powerful tools in creating awareness of energy conservation potential. The IOUs currently offer integrated audits to medium and large customers (generally with demands upwards of 200 kW) that include appropriate EE, DR, and DG/CSI project and/or program recommendations. Integrated audits are described in the Commercial, Industrial, and Agriculture Statewide PIPs under the Customer Services sub-program.

**Standardization of Audit and Survey Tools**

The IOUs are working to standardize a statewide online audit tools portfolio and customize audit recommendations based on customer profiles, operating characteristics, market sector potential, and cost-effectiveness of the offering. This process will consider more meaningful ways to implement the audit and survey tools for the customer and identify choices of potential measures in various DSM programs or technologies specific to a particular customer.

**b. Tasks and Timelines:**

- Timeline for the online tool development for each utility can be found in the Commercial PIP.

**5. Track integration pilot programs to estimate energy savings and lessons learned and develop standard integration best practices that can be applied to all IOU programs based on pilot program evaluations and the results of additional integration promoting activities (i.e., EM&V and cost-benefit results).**

**a. Description:**

In addition to the formal Task Force, internal IOU teams will actively participate in discussions of the pilots, perform assessments based on data collected from the pilot program managers, and return recommendations based on lessons learned to the management-level staff of the Task Force.

During the 2013-2014 portfolio cycle, the IOUs shall work with Commission Staff to ensure that an adequate level of detail is provided in their reports on Integrated Demand Side Management pilot efforts. In addition, per the Commission direction, the table below describes all Integrated Demand-Side Management pilot programs and projects. The offerings address CPUC guidance

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

- ~~Since Q1 2010, the IOUs have provided~~ quarterly reports ~~accessible~~ through EEGA; ~~discussions are ongoing to determine the appropriate reporting requirements for 2013-2014.~~
- The Task Force (including IOU and Energy Division representatives) ~~meets, in person, as needed, for deep dives and will continue in 2013-14.~~
- ~~The Task Force, including subcommittees, holds~~ planning and coordination conference calls ~~to discuss progress on integrated activities and will continue in 2013-2014.~~
- ~~The Statewide IOU Integration team participates on~~ conference calls for SW collaboration, communication, and preparation for Task Force meetings ~~and will continue in 2013-2014.~~

**7. Organize and oversee internal utility IDSM strategies by establishing internal Integration Teams with staff from EE, DR, DG, marketing, and delivery channels.**

**a. Description:**

~~The IOUs will establish~~ internal integration teams ~~with representatives from~~ EE, DR, ~~Energy Savings Assistance Program~~ (ESAP), distributed generation (DG)/Solar, green programs, marketing and delivery channels.

**b. Deliverables of the Integration Team:**

- Facilitate and communicate to promote inclusion of EE, DR, solar and other offerings (e.g., DG, Rates) into comprehensive energy cost reduction offerings to customers
- Coordinate with marketing team to promote integrated offerings including a centralized marketing function and consistent messaging
- Develop and implement sales and program training for integrated offerings including a targeted customers approach and sales training plan
- Coordinate responses to Commission directives, inquiries and data requests
- Coordinate development and delivery of integrated programs to create seamless market-segment-based customer solutions
- Coordinate/track delivery and progress of integrated pilots and activities
- Participate in regulatory proceedings and filings to maintain consistent, coordinated message
- Review and provide comments on regulatory filings
- ~~SCE has committed to developing and begin implementation of an IDSM Action Plan that sets goals, strategies, and tactics across the organization to facilitate and optimize efficiencies gained through the utilization of integrated approaches. SoCalGas, where the service territories overlap significantly, will endeavor to partner with them in this to find synergies and economies of scale.~~

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

In order to educate and share best practices and experience with integrated products, marketing, and sales; integrated sales training will be developed, or in some cases, continued, for the IOU customer facing, marketing and the Program teams. Training will focus on how to present integrated audits and offerings to customers and promote knowledge transfer among participants. Elements will include:

- Sales representatives from all appropriate delivery channels and program staff will be trained on IDSM integration to improve the sales effectiveness of programs.
- Incorporate IDSM into external events and internal training of customer-facing staff, as appropriate.

**b. Tasks and Timelines:**

These tasks are ongoing within each utility.

**8. Provide feedback and recommendations for the utilities' integrated marketing campaigns including how the working group will ensure that demand response marketing programs approved as category 9 Demand Response programs are coordinated with EE integrated marketing efforts.**

**a. Description:**

All IOUs are conducting Residential and Non-residential outreach events, developing and delivering collateral, and utilizing website updates and campaigns to cross market programs. Research on customer approach has also been conducted on the effectiveness and appropriate order, timing and combination of bundling of programs to customers.

Integrated Local Marketing Education and Outreach Strategy

The IOUs' integrated marketing plans are designed to generate ongoing customer engagement in Energy Efficiency, Demand Response and other DSM programs and services, by providing residential and non-residential customers with the right message, through the right channel, at the right time. The plans will leverage and complement the SW ME&O activities, which will be designed to "provide general energy education and demand side management program information," (D.12-05-015, OP 117a) while "prompting residential and small business customers to immediately take action." (OP 117f)

In 2013-2014, a new Statewide ME&O campaign will focus on creating awareness and educating customers about energy management and integrated DSM. The IOUs expect to leverage the increased interest generated by the SW ME&O campaign and use that point of contact and education as a step towards deeper EE engagement. The IOU's local integrated marketing strategy will focus

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

on helping customers understand the relevance of EE programs and services and enabling customers to take actions that are appropriate to their needs -- including one-time measures such as rebates as well as deeper whole house retrofits. This local EE marketing strategy will be coordinated through a variety of channels and tactics, with the intent of reaching customers at the right place and at the right time to drive increased participation and ongoing engagement.

**Integrated Local Marketing Education and Outreach Messaging**

In order to provide customers with relevant messages, the IOUs will use segmentation and internal data analysis to help refine our current understanding of customers' IDSM needs, by customer segment and target offerings appropriately. By cross-selling DSM programs and services that are meaningful to the customer, the IOUs will encourage customers to take action.

**Deleted:** IOU integrated marketing efforts will expand upon leverage the SW ME&O activities, by leveraging key engagement opportunities, such as requests for new service, customer program participation, and/or business customer meetings with account representatives. ¶

**Formatted:** Font: 12 pt, Underline

When appropriate, integrated messaging will deliver information to customers in a way that bundles relevant EE, DR and other DSM programs and services. For example, the IOUs will develop print and electronic case studies that feature customers who have implemented integrated solutions in order to address their energy management needs.

**Deleted:**

**Deleted:** C

**Deleted:** S

In addition to cross-selling DSM programs and promoting bundled solutions through integrated campaigns, integrated messaging will also be designed to motivate customers to enroll in web-based billing and analysis tools. This action will enable and encourage customers to better understand and manage their energy usage by taking advantage of the online tools. It will also provide the utilities with additional opportunities to continue to cross-sell DSM programs and services.

**Deleted:** .

**Integrated Local Marketing Education and Outreach Tactics**

Local integrated marketing campaigns leverage multiple tactics and multiple communications that combine to present customers with a holistic view of programs and service offerings and a connection to the actions customers can take to participate. To reach California's diverse customers, the IOUs will use a mix of communication channels and languages. When possible, the IOUs will utilize the customer's preferred method for receiving communications. Marketing channels may include, but are not limited to: customer call centers, business account representatives, direct mail, email, IOU and 3<sup>rd</sup> Party websites, bill inserts, outreach events, partnership activities, social media, and ethnic advertising.

**Formatted:** Font: 12 pt, Underline

**Formatted:** Underline

**Integrated Local Marketing Education and Outreach Reporting**

To increase and showcase marketing integration, IOUs will continue to conduct regular coordination meetings to share integration results, review best practices, and identify potential areas for improvement. For example, in May 2012, the IOUs presented an overview of their marketing integration efforts at the Quarterly

**Formatted:** Font: 12 pt, Underline

**5. Program Rationale and Expected Outcome**

The Strategic Plan calls for an ongoing task force to establish a blueprint for integration. A statewide non-resource program is an effective means of coordinating such a blueprint.

a) Quantitative Baseline and Market Transformation Information

Program Performance Metrics (PPMs)

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Integrated Demand Side Management Statewide Program (Resolution E-4385, Appendix A):

PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
1. Awareness and knowledge among relevant IOU program staff (to be specified – e.g. account reps, engineers that administer the audit (3 <sup>rd</sup> party); program designers and managers) regarding how IDSM relates to and impacts their efforts and programs	2b
2. Number and percentage of integrated audits provided to each customer class and NAICS code.	2b
3. A status report that identifies how well “integrated” (EE, DR, DG) all IOU demand-side energy program offerings and components are (e.g., CEI, Commercial, Agricultural, Industrial, Residential, Audits) including lessons learned, best practices, improvement plans, and how the program portfolio is addressing strategic planning goals / objectives. <u>D.09-09-047 also provides</u> directives regarding integration, as well as the IDSM program objectives specified in the PPM Worksheet. The report will review how the IOUs have developed internal and external frameworks that support integration of IDSM programs and technologies. (Y/N)	2b

**Deleted:** and

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

4. Number and percent of integrated audit participants (identify NRA participants) in all customer classes (Residential, Commercial, Industrial, Agriculture) that implement recommended DSM measures / participate in other DSM programs (EE, DR, DG – Track which categories implemented / participated in) or other recommended technical process and practice improvements. (If possible, identify whether participants received incentives or not.)*  *Data sources for reporting will come from (a) program tracking databases and (b) process evaluation to refine estimates.	2b
5. Program participant awareness of IDSM practices in each of the market sector subprograms.	2b

b) Market Transformation Information

No MTIs have been approved for this program.

c) Program Design to Overcome Barriers

As stated in the Strategic Plan, “Historically, demand side management (DSM) options for energy consumers have been “siloed” activities within regulatory bodies, utilities, environmental organizations, and among private sector service providers. The current narrow focus on a single product offering does not maximize energy savings nor minimize the costs of program delivery.” The Task Force and associated integration efforts within each utility is working to overcome this and other barriers to maximize benefits for customers and reduce costs for ratepayers.

d) Quantitative Program Targets

Not applicable for this non-resource program.

e) Advancing Strategic Plan goals and objectives

In support of the Strategic Plan,<sup>7</sup> the IOUs will evaluate the DSM pilot programs and determine what components will lead to successful DSM integration, consistent with the strategies in the Strategic Plan. The Task Force will discuss the applicability of these Emerging Technologies and initiatives in the context of IDSM. The ET program will undertake a coordinated effort to support innovation in EE, DR, and renewable / self-generation. ET forums will be used by the Task Force to review and vet proposed ET technologies that can be funded and integrated across DSM programs. Lastly, through coordinated DSM marketing, the Task Force will promote program integration across the DSM campaigns in order to maximize EE, DR, & DG opportunities.

**6. Program Implementation**

<sup>7</sup> California Long Term Energy Efficiency Strategic Plan, Section 8.4 pp. 72-73.

**Deleted:** The Strategic Plan recognizes that the process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>6</sup>. Resolution E-4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.¶

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

a) Statewide IOU Coordination

This is a statewide program.

- i. Integrated Demand Side Management
- ii. All program delivery mechanisms

As described earlier in this document, the Task Force does not replace the individual IOU governance of DSM programs and is not intended to duplicate reporting or regulatory activities.

iii. Marketing materials and message

The Task Force will work with the Statewide and internal IOU M&O teams to leverage statewide awareness and coordinated program messaging, and explore utilizing educational efforts that direct customers to local utility integration efforts and offerings.

- iv. IOU program interactions with CEC, air resources boards, air quality management districts, local government programs, other government programs, community-based organizations, non-governmental organizations, manufacturers, retailers, trade and business associations, as applicable.

The IDSM Task Force will explore opportunities to interact with other programs/ organizations that could include municipal utilities, local and state governments, water districts and DSM solutions providers to offer integrated services, obtain input/feedback, share knowledge/best practices, and generally promote IDSM efforts and activities. Expansion of Task Force participation may be in the form of periodic expert input and ad hoc workshops as needed to solicit input from the broader group of participants in a fair and equitable manner. Future program milestones, lessons learned, and best practices can be shared with outside stakeholders to further IDSM activity outside of IOU programs.

v. Similar IOU and POU programs

The IDSM Task Force will coordinate with all IOU SW programs and will interact with other programs/ organizations, municipalities and DSM solutions providers to offer integrated services. Future program milestones, lessons learned, and best practices can be shared with outside stakeholders to further IDSM activity outside of IOU programs.

**Deleted:** Rather, the Task Force will work with different programs and delivery channels and will specifically look for important opportunities, identify barriers, and work through the IOU program staff to promote the advancement of IDSM, using lessons learned and best practices to establish a continuous improvement process.

**Deleted:** The Task Force will not be providing direct marketing services, but the coordination of marketing will be an integral part of integrated offerings included in each individual approach. In addition, as described in Task 8, above, t

**Deleted:** Marketing and Outreach

**Deleted:** .

**Deleted:** ing

**Deleted:** local

**Deleted:** .

**Deleted:** as needed

**Deleted:** IOU and ED staff sitting on the taskforce will identify when such inclusions would be useful.

**Deleted:** Similar to item iv., above, t

**Deleted:** .

b) Program Delivery Mechanisms

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

The Task Force will not be involved in direct implementation but will develop and provide the knowledge necessary to promote integrated program delivery mechanisms.

c) Marketing Plan

The Task Force will not be providing direct marketing services, but the coordination of marketing will be an integral part of integrated approaches and will be included in each individual program's approach where applicable. In addition, as described in Task 8, above, the Task Force will work with the Statewide and internal IOU M&O teams to leverage statewide awareness and coordinated program messaging; and, explore utilizing educational efforts that direct customers to local utility integration efforts and offerings.

**Deleted:** In addition, as described in Task 8, above, the Task Force will work with the Statewide Marketing and Outreach and internal IOU M&O teams to leverage statewide awareness and coordinated program messaging, and education efforts directing customers to utility local integration efforts and offerings.

d) Best Practices

The Task Force's involvement in reviewing utility integration activities, pilots and practices (e.g., Zero Net Energy, Food Processing) will lead to the establishment of Integrated Best Practices.

**Deleted:** an

e) Innovation

Individual utilities are working on integrated approaches locally to meet customer needs on a comprehensive, solutions-based level and coordinating and tracking of these integrated pilots and activities.

**Deleted:** ¶

**Deleted:** The context of this PIP and effort is entirely innovative in that this statewide effort has not been undertaken before by the IOUs. Innovative aspects of this program include coordination with the development of integrated audit tools, integrated cost effectiveness and EM&V approaches that cross over multiple proceedings. In addition, the

f) Integrated/Coordinated Demand Side Management

The basis of this program is entirely integrated and coordinated demand side management on a statewide basis with local efforts feeding into the overall strategy.

**Deleted:** i

**Deleted:** .

**Deleted:** g

g) Integration Across Resource Types

Where possible, the Task Force will continue to identify opportunities for integrating across non-energy areas like water and electric vehicles. Most likely, this information will come from pilots and other customer-focused activities and will be considered future pilots and best practice recommendations.

h) Pilots

The Task Force will be the principal governance structure to track the integrated efforts of the IOUs and develop SW metrics to evaluate their success. The Task Force will identify pilots, projects, programs and activities being conducted by individual IOUs that might be replicated in other parts of the state. As described in section 4.b.5, above, integrated pilots and activities will continue to be identified and tracked by the Task Force in Quarterly Reports. A critical component of evaluating these pilots, projects, and program activities is identifying what data should be captured to optimally evaluate the

**Deleted:** and in Table 2

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

ongoing success of these pilots and IDSM activities. The Task Force will coordinate with ED staff to ensure that an adequate level of data is collected.

**Deleted:** Consistent with Ordering Paragraph 130 of Decision 12.05.015, Tt

j) EM&V

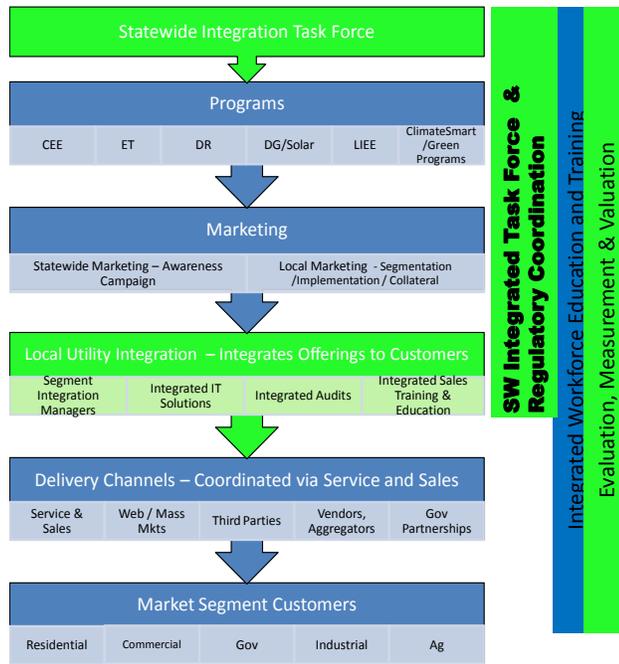

**Deleted:** ¶  
¶

The Task Force will continue tracking and measuring the metrics described in Section 5 of this PIP, leveraging evaluation studies and resources where appropriate. The IDSM Omnibus Process Evaluation is underway and will provide recommendations for overcoming barriers and improving future IDSM offerings. Subsequent evaluation needs will be determined at the conclusion of the Omnibus Evaluation.

**Deleted:** In addition, at the time of this filing, t  
**Deleted:** s being carried out by the Energy Division. The Omnibus Evaluation  
**Deleted:** assess the successes and remaining barriers faced by the IOUs during efforts to integrate their demand side management offerings, and it will

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

**9. Local Sustainable Communities Case Studies Program**

The SoCalGas IDSM Program is made up of two major, but related, components.

1. The previously addressed Statewide IDSM effort
2. The Sustainable Communities Case Studies Program

SoCalGas' Sustainable Communities (SC) program provides the framework for the design and building of communities that support the environment through energy- and resource-efficiency. SC helps to enhance quality of life by protecting and preserving natural resources and improving economic development. Incentives and other assistance are available to developers, building owners, and design teams that construct highly energy-efficient buildings with sustainable design, and long-term energy-efficiency.

This highly innovative program will be SoCalGas' flagship program providing the path for all other programs in meeting California's long-term energy efficiency goals, including zero net energy homes by 2020. This program will enable market transformation resulting in measurable energy efficiency, integrated demand response, distributed generation, renewables and natural resource savings while optimizing long term ecological, social and economic health of California. It accomplishes this by comprehensively integrating the "vertical" development (buildings and their components) with the "horizontal" development (land and utility and transportation infrastructure) over the full planning horizon. This holistic approach to program design and implementation is coupled with a new management model and evolutionary improvements in energy, water and air quality savings over the project life.

Another key feature of SC's flagship approach is its longer-term focus and crosscutting implementation to avoid trapping the key market players in the usual "organizational silos." SC achieves this through the unique partnership between SoCalGas and the Master Developer by developing early market interventions deployed by 3rd party implementers upstream of the usual core programs. This innovation produces more productive and resilient market change with greater cost-effectiveness.

**Sustainable Design and Construction Training**

A training program and training materials will be developed for participating builders and contractors. The training, for both residential and non-residential building, will cover all relevant issues including sustainable design and construction impacting energy efficiency, solar, water, waste, utility infrastructure (smart grid and AMI), and transportation.

A metric of this service will be determined in tracking the impact early intervention and training have on increasing energy-efficient design of residential structures. Developing training goals and objectives, curriculum and tracking of buildings energy performance will be used to measure success of the training. The minimum specifications will be covered in the training developed to help encourage and monitor innovative design and exceeding building performance targets set by the developer and utilities. The utility will support training developed and provided by developer's consultants for builder subcontractors.

**Formatted:** Font: (Default) Times New Roman, 12 pt

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

The incorporation of a Learning Center within the development is proposed to help educate and build awareness of energy efficiency, renewable generation and sustainable measures that have been incorporated into the development. The Learning Center will create a powerful teaching tool due to its interactive software and real time graphics. This tool could demonstrate the community's energy savings compared to non-efficient developments, showcase the development's green features and show environmental impacts and equivalent comparisons. In addition, kiosks will contain renewable energy education and incorporate actual data related to utility owned on-site generation. The center would be strategically located within the community near a school, library, or public center. This location could also be used for utility hosted energy workshops highlighting energy efficiency and green building design.

**Sustainable Design Assistance**

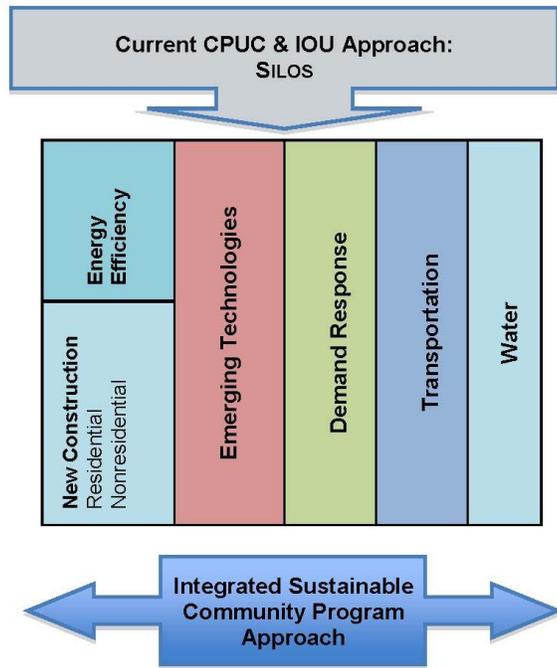

Design assistance will be provided to participating engineers, architects, planners, and builders. The program will encourage innovative and less traditional approaches to meeting and exceeding sustainability goals. Design assistance will occur much earlier in the development process than traditional utility offerings to embrace this flagship program's crosscutting nature and to better leverage its holistic ambitions and goals.

**Residential Modeling Procedure and Protocol Development**

Because builders will be required to submit documentation illustrating how their designs will meet the sustainability requirements, this program will develop the modeling procedures and other requirements for this documentation. Sustainability targets would be set at 35% above Title 242 for all residential building and would also include participation in the New Solar Homes Partnership program to foster development of renewable energy on each residential building. Similar energy performance targets would be established for commercial projects with corresponding participation in the CSI program.  
2 Title 24 2005.

Program Implementation Plan

**Figure 1: Sustainable Communities Crosscutting Approach**

2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan

**Figure 2: Sustainable Communities Integrated Savings Approach**

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not strong confidence would not be productive. Therefore, the utilities respectfully exclude "draft" metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

As explained immediately above, the utilities propose to provide these draft metrics when available.

Program Design to Overcome Barriers

- SoCalGas program offerings work in silos and result in lost savings opportunities at the community level.
- The Pilot will work directly with the Community Developer to achieve integration across community energy end-uses such as buildings, transportation, water, and generation. This allows 100% participation by the community and encourages the developer to be innovative and aggressive in setting energy efficiency and renewable energy goals.
- Working through the Community Developer will enable SoCalGas to influence multiple types of consultants (architects, landscape architects, urban designers, transportation engineers, mechanical and electrical engineers), trades (mechanical, electrical, plumbing, roofing, and renewable installers) and supply chain partners such as manufacturers as

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

well as local governments.

- Program cycles are too short for stakeholders with long-term planning and development horizons. 3-year program cycles ignore market conditions and long project lead-times.
- Master-planned communities typically have twenty year planning horizons which is much longer than typical IOU program timelines. This program resolves this by proposing a sufficient timeline that allows for full program integration into the development plan. Master-planned communities typically have twenty year planning horizons. Front-loading the program recommendations will maximize market transformation and allow the program benefits to properly deliver over the full length of the master development process.

For example, Rancho Mission Viejo's Ranch Plan went through a decade of science-based planning, and processing; development of the first planning area (PA1) will commence once the market recovers, hopefully by 2010 ([www.TheRanchPlan.com](http://www.TheRanchPlan.com)). Another example is Otay Ranch, a large master planned community in Chula Vista went through a ten-year planning process, opened in 1999, and ten years later still is nowhere near completion despite being San Diego County's top selling planned community. (<http://otayranch.com/about/aboutIndex.shtml>). This program resolves this by proposing a sufficient timeline that allows for full program integration into the development plan.

- IOUs and non-governmental organizations lack the coordinated efforts that are needed to accomplish the goals. Disincentives exist at the CPUC, CEC, and IOUs that delay and inhibit effective and persistent market transformation;

Incentives availability is unpredictable for long-term stakeholders, and they are unable to utilize or secure them for projects.

Current organizational "silos" at IOUs and CPUC associated with various rulings make it impractical to do an integrated and comprehensive sustainable communities program. This creates missed opportunities for EE and DR savings up and down the energy supply and demand chains.

Utility customers are seeking integrated solutions addressing their entire energy infrastructure needs from smart appliances, smart meters, smart grid functionality including vehicle-to-grid capability, to promoting grid-enabled renewables. Existing program structures prevent appropriate creation and delivery of an integrated market solution.

Advancing Strategic Plan goals and objectives

SoCalGas' Sustainable Communities (SC) program supports the Statewide Strategic Plan, and promoting a sustainable future for Southern California. By addressing environmental concerns and energy and resource efficiency, the program seeks to support the residential 2020 goals of zero net energy in new construction. Coupled with the focus on sustainable design and green building practices, the program is uniquely positioned to influence the

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

design and construction of sustainable communities in its broadest definition. Consistent with The California Long Term Energy Efficient Strategic Plan, Residential New Construction will reach “zero net energy” (ZNE) performance for all new single and multi-family homes by 2020, and commercial new construction will increasingly embrace zero net energy performance (including clean, on site distributed generation), reaching 100% penetration of new starts in 2030. Near term, by 2011, 50% of new homes will surpass 2005 Title 24 energy efficiency standards by 35%; 10% will surpass 2005 Title 24 standards by 55%..

Residential

To support the CLTEESP objectives, SoCalGas proposes a separate *Sustainable Communities Case Studies* program that focuses on the Ranch Plan being developed by the Master-planned community company.

The program guides the target community toward this goal by setting beyond-code minimums in the interim, which facilitates building to ZNE in the target timeframe. The Pilot will incorporate a Learning Center within the development to educate builders and homeowners as well as provide the Community Developer access to SoCalGas’ full gamut of energy efficiency programs.

The program will provide design assistance for builders, during which SoCalGas will push for the incorporation of innovative building practices. The pilot integrated approach will include a comprehensive array of strategies including energy-efficiency measures, educational opportunities for demand response, onsite renewable distributed generation (as applicable), and smart meters.

Commercial

*New construction will increasingly embrace zero net energy performance (including clean, distributed generation), reaching 100 percent penetration of new starts in 2030.(Goal 1)*

*Codes and Standards: Adopt aggressive and progressive minimum energy codes and standards for buildings and plug loads, effective code compliance and enforcement, and parallel, tiered voluntary energy efficiency standards (Strategy 1). The Pilot sets increasingly rigid energy efficiency goals that provide a workable path to achieving this goal. Specifically, at least 75% of commercial square footage must be 20% better by 2012.*

Innovation

Sustainable Communities will be SoCalGas’ flagship program providing the path for all other programs to meet California’s long-term energy-efficiency goals, including net-zero energy homes by 2020.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

SC enables enhanced market transformation resulting in measurable energy efficiency, integrated demand response, distributed generation, renewables and natural resource savings while optimizing long-term ecological, social and economic health of California. It accomplishes this by comprehensively integrating the “vertical” development (buildings and their components) with the „horizontal“ development (land and utility and transportation infrastructure) over the full planning horizon. This holistic approach to program design and implementation is coupled with a new management model and evolutionary improvements in energy, water and air quality savings over the project life.

Master-planned communities typically have twenty-year planning horizons which is why weaving the vertical program elements with horizontal elements are so critical to its success. This program is unique in its breath and the level of integration to achieve long-term savings for: electricity, natural gas, water, wastewater, carbon emissions, and greenhouse gases.

Sustainable Communities recognizes that master-planned community developments provide a “proving ground” for interrelated pilot program offerings. This program will help SoCalGas and the CPUC to better understand barriers and opportunities with different stakeholders as part of a pilot/program rather than from numerous disjointed efforts. In addition to establishing SoCalGas as a leader in promoting sustainable development, SC provides the CPUC the opportunity to establish their leadership and overall policy guidance in support of these innovative programs.

Deleted: „

The process for developing sustainable, livable land-use practices and building design is creative, technical and participatory. The basic principles of sustainable development merge similar objectives to protect and restore the natural environment while providing nurturing, high-quality communities for people to work and live in.

The common fundamental characteristic throughout the program is its focus on performance approaches rather than prescriptive approaches to fully integrate building systems with infrastructure enabling SoCalGas into California’s Smart Grid. The Smart Grid concept overlaps various functions such as smart meters, smart appliances, demand response, self-generation, highly efficient PV systems and transportation.

Integrated/coordinated Demand Side Management

Fundamental to SC’s innovative design is it fully embraces an IDSM methodology by closely “knitting” EE, DR, DG and renewables across development components. Its very nature speaks to integration to form synergistic impacts that are typically unattainable through EE business as usual.

Deleted: „

At a minimum, all marketing materials will be developed to support energy-efficient design process in helping cross promote demand response to educate customers on the availability of IOU DR programs/Smart Meters etc. Additional work will take place during the three-year program cycle to evaluate closer linkages between EE and DR via Program Managers and success with this concept with various case study projects. Additionally, this feedback

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

mechanism establishes a means to facilitate technology approaches that enable SC to crosscut organizational silos in achieving its strategic vision.

Integration across resource types (energy, water, air quality, etc.)

SC is a comprehensive program with a cross-cutting focus on energy-design, green building practices, and increased utilization of renewable resources. Infrastructure, transportation planning, energy, water, materials, and waste are all addressed in the program rather than as separate elements. This provides the opportunity for exponential energy- and resource-savings throughout the community – giving SoCalGas and developers the ability to shift to cleaner forms of energy to power our communities. The key difference is that SC approaches the market with the Master Developer as its focus. Rather than address market barriers at the tail end of the market cycle, SC deals with barriers earlier in the development process thereby enhancing and improving its leverage to create substantially greater impacts as displayed in the table below. The pilot will engage with CEC, DOE, MWD and other government agencies responsible for various aspects of New Construction in California.

**Integrated Community-Based Solutions**

The main elements addressed by the participating projects will be structured around three key concepts – Environment, Resources, and Energy – with a detailed focus to the following principles:

- Sustainable site design
- Energy efficiency
- Advanced renewables integration
- Pollution reduction
- Water efficiency
- Indoor air quality
- Resource preservation
- Smart Grid
- Integrating local Governments
- Transportation
- Smart Land-Use Options (ex: mixed housing, walk-ability / bike-ability)

These energy- and land-use practices, sensitive to both the human community and natural environment, will be achieved through the *Sustainable Communities Case Studies* program and will allow the utility to initiate a collaborative partnership with the design community, developers, builders and related industries.

**Master-planned community (to be determined)**

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

To support the *Case Study* program concept and to integrate it into the *Sustainable Communities* program, SoCalGas proposes a separate *Sustainable Communities Case Studies* program that will focus on a to be selected *Plan* being developed by a Master-planned community developer.

These projects will be comprised open space, residential units, commercial construction, schools, hospitals and other related development.

The project will be developed with sustainability as its guiding principle and addresses. This would include:

- Interdependence of humanity and nature
- Intergenerational stewardship
- Optimized value
- Design with natural systems
- Conservation of natural resources
- High-performance design technologies
- Resource-efficient healthy materials
- Elimination of waste
- Multi-modal transportation
- Innovation, education, and ongoing evolution

The project will also address quantitative environmental metrics of:

- Energy use
- Air pollution
- Greenhouse gases
- Water use
- Storm water and runoff

The tools developed, results achieved and lessons learned from the pilot have direct application Statewide and will be shared to further advance sustainable development elsewhere in California. This provides a much-needed proving ground serving to enrich sustainable community development at a cost-effective level unattainable through traditional approaches.

### **Project Opportunities**

Utilizing the first plans as a case study will provide both short- and long-term opportunities for energy savings and other benefits in a cost-effective environment. It will also provide a comprehensive mix of energy-efficient market potential for multiple residential, commercial, and retail sectors. It will provide a model to successfully implement the programmatic initiatives found in the Strategic Plan.

Working through the community developer will enable the IOU to influence multiple types of consultants (architects, landscape architects, urban designers, transportation engineers, and mechanical and electrical engineers), trades (mechanical, electrical, plumbing, roofing, and

**2013-2014 Energy Efficiency Programs

Program Implementation Plan**

renewable installers), and supply chain partners such as manufacturers as well as local governments.

**Project Funding**

The Sustainable Communities Model developed by CTG Energetics, Inc. and the selected Master-Planned Community Sustainability Team, is the core controlling element in the analysis of the Project. Funding for the development and maintenance of the Sustainable Communities Model is needed to support the case study and evaluate the energy and environmental impacts, and sustainable design decision making for the chosen project. This Sustainable Communities Model will be the core controlling element in the analysis of the project. The Sustainable Communities Model® (SCM) quantifies total environmental impacts (including energy use, water use, greenhouse gas emissions, air pollution emissions, stormwater, transportation impacts, solid waste, and other factors) allowing communities to optimize planning and design decisions that result in the greatest environmental benefit for the least cost. The SCM takes a quantitative, systems-based approach towards sustainability. This enables a project's design team to "connect" each specialty's detailed analyses together to explore and optimize environmental impacts that cross disciplinary boundaries. The landscape architect can explore the impacts that various planting palettes has on building energy use (shading, microclimate modification, evaporative cooling), water consumption, carbon sequestration and embodied environmental impacts such as the amount of embodied energy/carbon in water. The SCM is scalable over a wide range of community sizes, and can be applied to "communities" ranging from municipalities, to large master planned developments/re-developments, to academic and corporate campuses, down to individual buildings.

Funding for the development and maintenance of the Sustainable Communities Model is needed to support the case study and evaluate the energy and environmental impacts, and sustainable design decision making for both the phases and the broader project. The funds are anticipated to support five key areas of the Sustainable Communities Model:

1. Implementation of the entire project in SCM to facilitate further investigation and analysis
2. Support of on-going plan design changes (densities, unit types, etc.)
3. Development and refinement of peer review and referencing methodologies to support the environmental benefit calculations, and
4. Development of new calculations and modules needed to support specific decision points for the project (e.g. large scale photovoltaic, cogeneration, district heating and cooling, etc.)

Additional funding will be required to cover:

- An on-site HERS-certified inspector during the build-out of the project. This inspector will perform the required tests and inspections and will ensure consistency and quality in the Planning Area 1 homes.
- Full-time, on-site technical support for 3rd party inspections and tests of building to ensure quality, program compliance, energy savings, and measurement and verification.

**2013-2014 Energy Efficiency Programs  
Statewide Integrated Demand-Side Management Program  
Program Implementation Plan**

- Sales training
- Timeline of completion
  - The program will roughly be scheduled through the end of 2014, but the master development and results will continue for up to 20 years, or 2034.
- Timeline of results
  - Some results will be available annually; a more comprehensive study will be completed at the end of the program cycle.
- The Statewide IDSM program is tasked with developing an appropriate cost effectiveness methodology for integrated projects/pilots. The methodology will be used for this pilot as it becomes available.

The Green Energy Systems (GES) program (see Statewide New Construction PIP, Savings By Design for an example) will explore the potential for utility ownership of major energy efficiency equipment to facilitate the installation of the highest efficiency HVAC systems in commercial buildings. The program recognizes that building owner financing is constrained and without utility ownership, the system design will not maximize energy savings. The objective of GES is to capture energy efficiency opportunities that would otherwise be lost for the 20 to 30 year life of the HVAC equipment. This pilot will build on the success of the Sustainable Communities program that incorporates utility ownership of clean energy generation systems on customer facilities.

Under GES, SoCalGas will seek to identify projects with the following characteristics:

- The project is of sufficient size to warrant the effort (>\$2,000,000 investment)
- The building is intended to be owner occupied or owner managed
- The HVAC system is a central plant configuration

If an appropriate project is identified, with an owner willing to enter into a contractual agreement with the utility to own and operate the building's HVAC central plant, then the utility will file an advice letter for approval of incremental capital and maintenance costs and will demonstrate that the project meets the following criteria of the project is cost effective as a stand-alone energy-efficiency project and delivers incremental energy savings beyond what the building owner would otherwise have installed.

If approved, the utility will sub-contract out the design, construction, and operation of the facility but will serve as project manager to ensure it is constructed and operated at the design efficiency levels.

**Figure 2: Sustainable Communities Program Linkages**

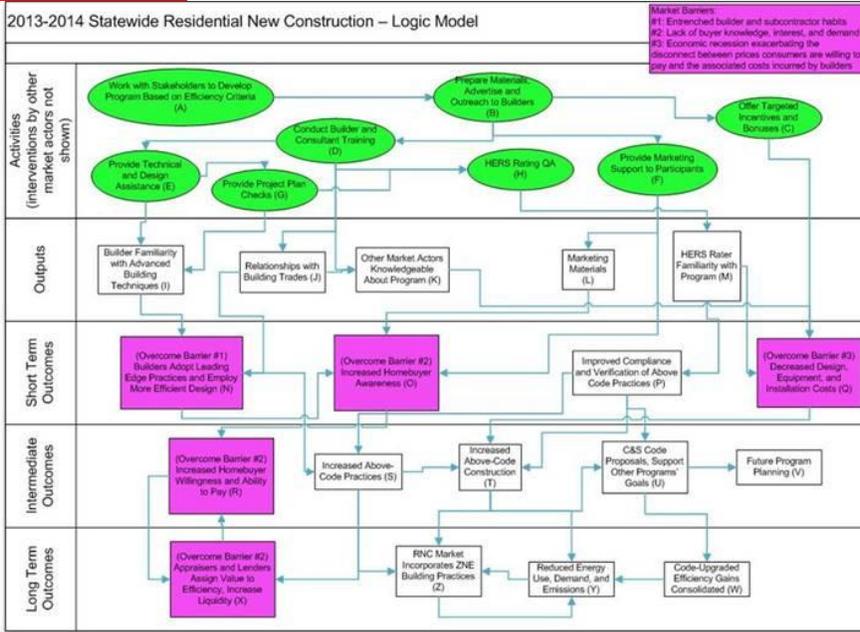

<b>Master Developer</b>	
<b>OPPORTUNITIES</b>	<b>CHALLENGES</b>
<b>Integrated community-based approach</b>	Funding format and prescriptive incentives not conducive
<b>Reduce energy consumption and increase renewables</b>	Added costs viewed as too high vs. return
<b>Influence multiple stakeholders</b>	Current incentive programming focused only on homeowner and builder
<b>Implement research and pilot programs</b>	Master Developer not included in existing incentive structure
<b>Stimulate market transformation</b>	Funding cycles too short for Master Developer timeframes
