

Appendix C  
Section a.  
Continuing Programs  
From 2010-2012

# Statewide Programs

## 2013-2014 CalSPREE PIP Addendum

<b>Program Name</b>	CalSPREE	<b>Date Submitted</b>	July 2, 2012
<b>Subprogram Name</b>	Energy Advisor Plug Load & Appliances Multifamily Energy Efficiency Rebate Whole Home Upgrade Residential HVAC Residential New Construction	<b>Utility Name</b>	SoCalGas
<b>Program ID</b>	SCG3701 SCG 3702 SCG3704 SCG3705 SCG3706 SCG3707	<b>IOU Program Contact</b>	Kevin Shore
		<b>Program Cycle</b>	2013-2014

This form is to be used to document any required changes to the Program Implementation Plans (PIPs). The following are triggers that will require a PIP change:

1. Changes to eligibility rules
2. Changes affecting incentive levels (indicate advice letter approval below if required)
3. Fund shifts (indicate advice letter approval below if required)
4. Portfolio Budget and Other Commission-Directed Changes
5. Changes to Program Theory/Logic Models
6. Addition or elimination of programs and/or sub-programs (indicate advice letter approval below)
7. Changes in program targets
8. Change in sub-program approach - unless the IOUs submit logic models for the sub-programs (to be defined) with IOUs
9. Changes in incented measures
10. Changes in adopted PPMs/MTIs (indicate advice letter approval below if required)

**Identify Specific Trigger (above) requiring the PIP change**

4. Portfolio Budget and Other Commission-Directed Changes <span style="float: right;">▼</span>
--

**Driver of Change:**

Aim to reduce the complexity in IOUs’ portfolios while increasing customer participation.

**Description of Change (if advice letter approval required, indicate Commission resolution or approval and provide hyperlink to advice letter):**

The current 2010-2012 CalSPREE Program consists of 8 sub-programs:

1. Multifamily Energy Efficiency Rebate
2. Home Energy Efficiency Rebates
3. Home Energy Efficiency Survey
4. Prescriptive Whole House Retrofit

The new 2013-2014 CalSPREE Program will be simplified and consist of 6 sub-programs:

1. Energy Advisor
2. Plug Load and Appliances
3. Multifamily Energy Efficiency Rebate
4. Whole Home Upgrade
5. Residential HVAC
6. Residential New Construction

The new 2013-2014 CalSPREE Program will be simplified and consist of 6 sub-programs:

**PIP Section and/or Wording to be Changed or replaced:**

Changes are throughout the 2013-2014 Statewide CalSPREE PIP

**Replacement Language or Information**

Refer to Description of Program of 2013-2014 CalSPREE PIP for details on changes

**Revised Energy Savings (If Any):**

Refer to 2013-2014 CalSPREE PIP for details

**Other PIP Changes Required:**

Refer to 2013-2014 CalSPREE PIP for details of other changes

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 1. Program Name:** CalSPREE<sup>1</sup> Program  
**Program ID:** SCG3701 SW-CALS-Energy Advisor  
 SCG3702 SW-CALS-Plug Load and Appliances  
 SCG3704 SW-CALS-MFEER  
 SCG3705 SW-CALS-EUC WHUP  
 SCG3706 SW-CALS-Residential HVAC  
 SCG3707 SW-CALS-RNC  
**Program Type:** Statewide Core Program

**2. Projected Program Budget Table**

**Table 1**

Program #	Main/Sub Program Name	Administrative Amount	Marketing Amount	Direct Implementation Amount	Incentive Amount	Total Program Budget Amount
	<b>SW CALSPREE</b>					
3701	SW-CALS-Energy Advisor	\$167,588	\$160,179	\$1,383,230	\$0	\$1,710,997
3702	SW-CALS-Plug Load and Appliances	\$523,573	\$1,666,475	\$5,801,862	\$9,139,986	\$17,131,897
3704	SW-CALS-MFEER	\$127,778	\$299,591	\$304,548	\$1,679,633	\$2,411,550
3705	SW-CALS-EUC WHUP	\$720,979	\$1,281,711	\$5,084,689	\$3,609,600	\$10,696,979
3706	SW-CALS-Residential HVAC	\$9,846	\$0	\$46,590	\$250,000	\$306,436
3707	SW-CALS-RNC	\$368,533	\$224,200	\$2,137,739	\$2,982,914	\$5,713,387
	<b>TOTAL:</b>	<b>\$1,918,298</b>	<b>\$3,632,156</b>	<b>\$14,758,659</b>	<b>\$17,662,134</b>	<b>\$37,971,247</b>

**3. Projected Program Gross Impacts Table**

The IOU's funding request for the proposed 2013-2014 CalSPREE Program as detailed in Table 1 above. The IOUs believe this amount is reasonable, results in a cost-effective portfolio that meets the Commission's energy savings targets for 2013-2014, and supports market transformation and the Strategic Plan.

**Table 2**

Program #	Main/Sub Program Name	2012-2013 Gross kW Savings	2012-2013 Gross kWh Savings	2012-2013 Gross Therm Savings
	<b>SW CALSPREE</b>			
3701	SW-CALS-Energy Advisor	0	0	0
3702	SW-CALS-Plug Load and Appliances	300	595,034	1,515,807
3703	SW-CALS-Plug Load and Appliances - POS	4,725	11,330,000	1,729,201
3704	SW-CALS-MFEER	7	11,593	1,157,850
3705	SW-CALS-EUC WHUP	0	0	684,288
3706	SW-CALS-Residential HVAC	0	0	0
3707	SW-CALS-RNC	2,287	1,619,704	383,064
	<b>TOTAL:</b>	<b>7,318</b>	<b>13,556,332</b>	<b>5,470,210</b>

**4. Program Description**

<sup>1</sup> D.09-09-047, p. 7, refers to the statewide residential energy efficiency subprograms as the California Statewide Subprograms for Residential Energy Efficiency ("CalSPREE")

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The 2013-2014 Residential Sector program, part of the overall Energy Upgrade California (EUC) program, is designated as the California Statewide Program for Residential Energy Efficiency (CalSPREE).

CalSPREE will offer and promote both specific and comprehensive energy solutions for residential customers. By encouraging adoption of economically viable energy efficiency technologies, practices, and services, CalSPREE will employ strategies and tactics to overcome market barriers while delivering services that support the CPUC's Long Term Energy Efficiency Strategic Plan.

The ultimate focus of CalSPREE is to:

- Facilitate, sustain, and transform the long-term delivery and adoption of energy-efficient products and services for single and multi-family dwellings;
- Cultivate, promote and sustain lasting energy-efficient behaviors by residential customers through a collaborative statewide education and outreach mechanism; and
- Meet customers' energy efficiency adoption preferences through a range of offerings including single-measure incentives and more comprehensive approaches.

To date, the California IOUs have employed a number of different residential energy efficiency subprograms that are in various stages of maturity and availability across the state. For 2013-2014 and beyond, the IOUs will integrate all of these subprograms to coordinate efforts and increase comprehensiveness of measure delivery.

CalSPREE will conduct a combination of integrated DSM and program specific marketing and outreach to drive ongoing customer participation and behavior change. Both integrated and program-specific marketing activities will work in coordination with the SW ME&O and will serve to complement those efforts.

Integrated marketing and outreach will gather, create, and deliver information to customers in a way that (1) bundles programs, products, and information and (2) customizes delivery for individual or groups of targeted customers based on market intelligence, segmentation analyses, self-selection activities, and event-based knowledge of customer's actions. To drive ongoing customer engagement, marketing and outreach will target customers with the right message, through the right channel, at the right time. Integrated marketing will cross-sell relevant DSM programs and services that emphasize the benefits of participation in multiple programs.

Additionally, program specific marketing and outreach will be conducted in order to increase participation and reach specific program goals. Program specific marketing and outreach will target customers with a high potential to participate in a specific programs or service.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

For example, through the Plug Load and Appliances program, customers identified as having a pool may receive a targeted direct mailer prior to summer encouraging them to take advantage of the pool pump and motor rebate. By motivating customers to take an initial action, it will enable the utilities to engage customers in an ongoing conversation about the next steps they can take towards becoming better energy managers. Additionally, program specific marketing and outreach enables the utilities to conduct activities necessary to support the measure, such as developing Point of Sale rebate stickers that are placed on select appliances to drive program participation. These efforts drive enrollments that enable the utilities to meet specific program goals.

A mix of communication channels and languages will be used to reach a diverse audience. Communication channels may include: web, call center, bill messaging, email, social media, direct mail, retail partnerships, community- and faith-based partnerships, outreach, events, local government partnerships, general and ethnic media.

CalSPREE is comprised of the Energy Advisor, Plug Load and Appliances (PLA), Multi-Family Energy Efficiency Rebates (MFEER), Whole Home Upgrade (WHU), Residential Heating, Ventilation, and Air Conditioning (HVAC), and Residential New Construction (RNC) subprograms. These subprograms are described in more detail below.

### **Short description of each sub-program**

The 2013-2014 CalSPREE includes the following six subprograms:

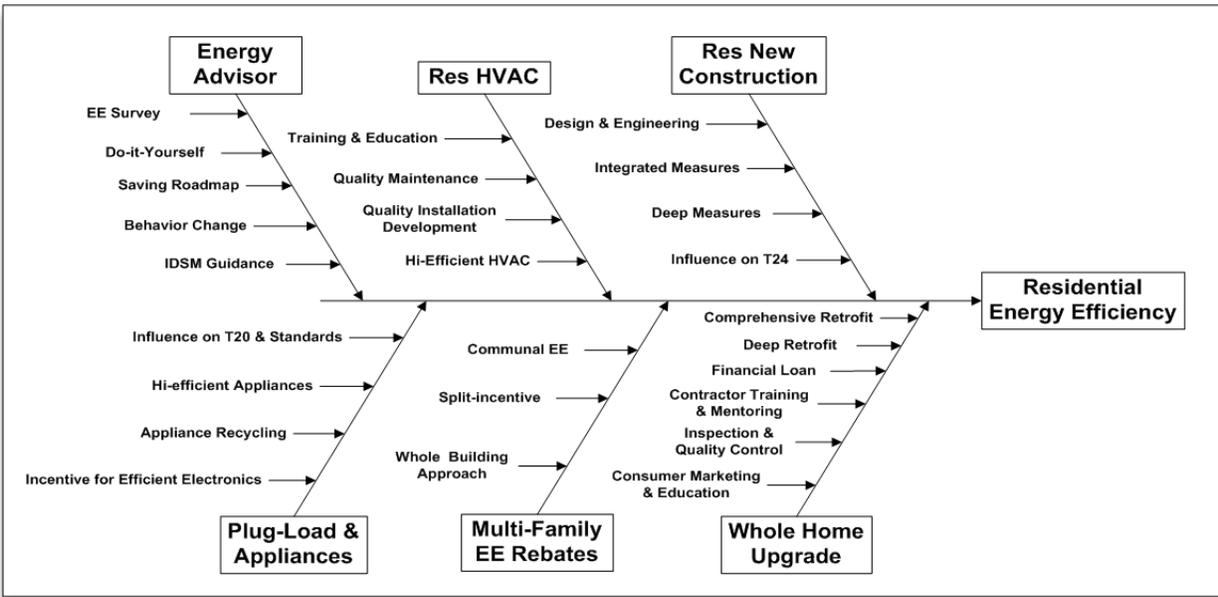

- a) Energy Advisor (EA).** The Energy Advisor subprogram will utilize interactive tools designed to engage customers and encourage participation in innovative initiatives. These initiatives are designed to help customers understand and empower them to manage their energy use, and will guide them, where appropriate, towards advancing whole-house energy solutions. Although the IOUs share similar Energy Advisor subprogram theory, design, and goals, they may implement subprogram logistics differently because of their different service territories.
- b) Plug Load and Appliances (PLA).** The Plug Load and Appliances subprogram merges the previous Home Energy Efficiency Rebate (HEER), Business Consumer Electronics (BCE) and Appliance Recycling subprograms. This subprogram will develop and build upon existing retailer relationships and will include recycling strategies and whole house solutions, plug load efficiency, performance standards, and opportunities for integration with local government, water agencies, Publically Owned Utilities (POUs), and the Demand Side Management (DSM) subprogram.
- c) Multi-Family Energy Efficiency Rebates (MFEER).** The MFEER subprogram is a continuing subprogram. This subprogram will promote energy efficiency by providing equipment rebates to owners and tenants of multifamily properties, including residential apartment buildings, condominium complexes, and mobile home parks. It will be coordinated with the Energy Savings Assistance (ESA) and the WHUP Programs.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

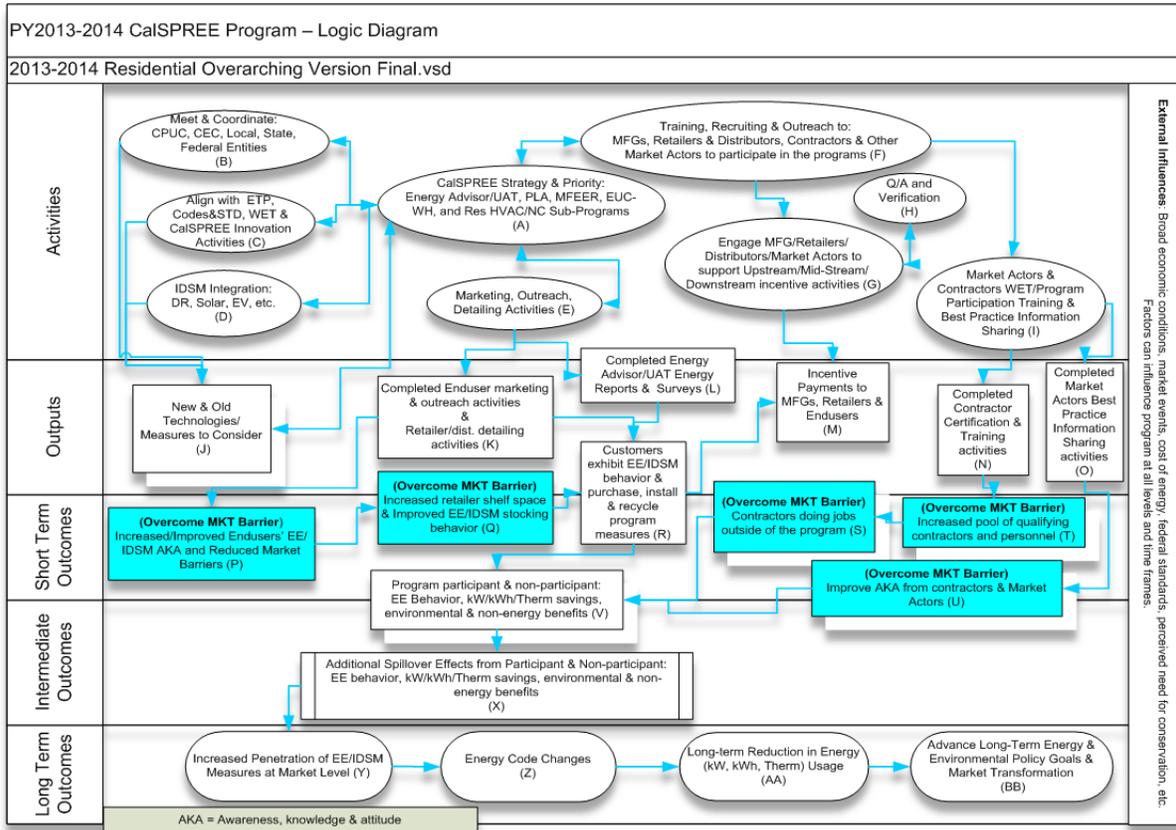

- d) Whole Home Upgrade Program (WHUP).** The Whole Home Upgrade (WHUP) subprogram is a continuing program which began as Energy Upgrade California in the 2010-2012 residential energy efficiency portfolio of the four California Investor Owned Utilities (IOUs) – Pacific Gas & Electric Company (PG&E), Southern California Edison (SCE), San Diego Gas & Electric Company (SDG&E) and Southern California Gas Company (SoCalGas). For 2013-2014, the WHUP will consolidate the previously separate Prescriptive Whole House Retrofit (PWHRP) and Local Whole House Retrofit (WHRP) and the introduction of a Multifamily component. The WHUP sub-program is designed to build customer and contractor awareness of the house-as-a-system approach to residential retrofits and the many benefits of improving the comfort, safety, and energy savings potential of the house. The WHUP approach promotes both Basic and Advanced Paths to retrofitting; these complementary paths will be presented to customers as one comprehensive offering.
- e) Residential Heating, Ventilation, and Air Conditioning (HVAC).** The Residential HVAC subprogram is a continuing program with the primary objective of driving high quality levels in California's HVAC market for technology, equipment, installation, and maintenance. An additional objective is to increase customer awareness of the value of HVAC installation and maintenance practices toward driving energy efficiency and peak load reduction. The Residential HVAC subprogram will incorporate revised measures and incentives, policies and procedures, quality assurance, marketing materials, website, and contractor training in performing HVAC installation services for residential customers.
- f) Residential New Construction (RNC).** The RNC subprogram is a continuing statewide program that consists of the California Advanced Homes Program (CAHP) and, in Southern California, the Energy Star Manufactured Homes (ESMH) Program. The Program is designed to help guide builders to produce the most efficient homes in the most cost-effective manner, and will examine methodologies for supporting the Strategic Plan target of zero net energy (ZNE) by 2020.

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

## CalSPREE Program Diagrams

## 5. Program Logic Model

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 1. Program Name:** Energy Advisor Program  
**Program ID:** 3701  
**Program Type:** Statewide Core Program

**2. Projected Program Budget Table**

**Table 1** - reference the CalSPREE for budget details

**2. Projected Program Gross Impacts Table**

**Table 2** - reference the CalSPREE for projected savings details

**4. Program Description**

**a) Describe program**

This program is a continuation of the existing statewide Energy Advisor Program (formerly known as the Home Energy Efficiency Survey-HEES program) within the residential energy efficiency portfolio. Although SDG&E, SCE, PG&E and SoCalGas share similar program theory, design and goals, each IOU may implement its program logistics differently.

In 2013-2014, the Energy Advisor program will continue to help customers understand and empower them to manage their energy use, and will guide them, where appropriate, towards advancing whole-house energy solutions. The subprogram utilizes behavioral outreach initiatives and interactive tools designed to engage customers and to encourage participation in innovative initiatives to reduce their energy consumption through behavioral solutions, program recommendations and, as warranted, IDSM opportunities.

**b) List Offerings**

Offerings vary by IOU, as outlined below:

<b>Offerings</b>	<b>SCE</b>	<b>SoCalGas</b>	<b>PG&amp;E</b>	<b>SDG&amp;E</b>
Online Survey	X	X	X	X
Mail-in Survey	X	X	N/A	X
Telephone Survey	X	N/A	X	N/A
Multifamily Survey	X	X	N/A	X
In-home Survey	X	N/A	TBD	N/A
Home Energy Reports	TBD	TBD	X	X
Online Buyer's Guide	X	X	X	X

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Energy Kits	N/A	X	N/A	X
-------------	-----	---	-----	---

**c) List Non-incentive Customer Services**

The Energy Advisor Program offers customers with interactive engagement and detailed outputs on their actual energy usage, including:

- Rate and usage analysis, and
- Household usage data and comparison.

In addition, the program provides information and literature on energy efficiency and IDSM Programs:

- Residential Energy Efficiency
- California Solar Initiative (CSI)
- Peak Demand Initiatives (DR)

The information provided through the Energy Advisor program will be coordinated on a statewide level. This information provided will include historical usage data for customers. The program options provide a platform to measure sustainable reductions in energy usage for the customer and the IOU's. In addition, data collected from the survey questionnaire will be utilized to provide targeted marketing and strategic planning opportunities for all Residential energy efficiency and demand response programs. The Energy Advisor program will be the primary mechanism to drive customers to save energy by educating the customer on their household usage, while comparing household usage with similar households. Statewide coordination efforts may also afford the program to provide information promoting the whole-house approach with information leading customers to whole-house products and services, including energy efficiency product and service providers, rebate program applications and customer service touch points.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Program Performance Metrics (PPMs)**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Energy Advisor Program (Resolution E-4385, Appendix A, p 34).

<b>SW PROGRAM/ Sub Program</b>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>
<b>Energy Advisor (EA)</b>	Percentage of Energy Advisor participants that enroll in (a) whole house and (b) other resource programs	2b

**b) Market Transformation Indicators (MTI)**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

**c) Program Design to Overcome Barriers**

Promoting energy and water efficiency to the residential customer provides opportunities to foster market transformation. The main barriers include:

- Lack of current energy performance;
- Lack of energy efficiency information;
- Lack of awareness of specific measures and practices

To overcome these barriers, the Energy Advisor Program will provide accurate and comprehensive information about energy and water saving strategies, customized recommendations and suggestions for energy and water conservation and installation of energy-saving measures, and detailed analysis of energy billing, energy usage, and energy costs, based on actual household consumption. This information encourages permanent changes in customers’ attitudes and actions toward energy conservation by helping them understand their usage, as well as providing information on a wide variety of possible measures, practices, and actions. The program will also continue to provide information in multiple languages to overcome language barriers for non-English-speaking customers.

Marketing is a key component in the success of the Energy Advisor Program, first to generate awareness of the program, and second - and more important - to encourage completion of a survey. Marketing plans will be discussed statewide to ensure consistency and sharing of best practices.

Statewide delivery mechanisms continue to include online tools. The individual utilities may also provide other survey and engagement offerings if they feel these types are

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

warranted. Online tools will be coordinated with a statewide emphasis to share best practices. Each IOU will have a delivery method capable of serving customers in multiple languages to bridge language barriers among California’s diverse population.

It is necessary to persuade Californians to commit to energy conservation. For many, this will be a gradual process facilitated by readily available, well placed educational materials that help the customer understand their energy usage and encourage the customer to make the greater commitment to participate in behavior and equipment based IDSM improvements. In accordance with the driving behavior change elements of energy improvement, each utility will seek to reach at least 5% of their customers through a variety of behavior change inclusive offerings.

**SoCalGas Behavioral:**

Behavioral savings are funded through SoCalGas Advanced Meter project, Decision 10-04-027, which found conservation estimates as reasonable and required SoCalGas to ensure that the estimated conservation savings are attained. SoCalGas will establish a system to track and attribute the conservation impacts of its AMI rollout. Every six months, SoCalGas shall file a report of measured savings. If the project is falling short of SoCalGas’ projections the company will submit revisions to its outreach plan to increase awareness, participation, and durability of conservation actions among customers.

Upon completion of the Advanced Meter project, SoCalGas will incorporate successful behavioral programs and techniques into the energy efficiency portfolio.

While the interactive survey and/or reports and action plans should result in changes in customer utilization, it cannot be considered a conclusion of the process. Rather, once customers have been engaged through the Energy Advisor program, utilities may motivate them to achieve even greater conservation savings through additional education on-line, by e-mail, by mail, by telephone, or through any other appropriate mechanism.

**d) Quantitative Program Targets**

The proposed targets may be modified due to funding restrictions, especially for the 2013-2014 transition period (transition years).

<b>IOU</b>	<b>Program Target by 2012</b>	<b>Program Target by 2013</b>	<b>Program Target by 2014</b>
<b>SDG&amp;E</b>	3,000	5,000	5,000
<b>SCE</b>	21,875	26,000	26,000
<b>SoCalGas</b>	10,000	10,000	10,000

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>PG&amp;E</b>	40,000	40,000	40,000
-----------------	--------	--------	--------

**e) Advancing Strategic Plan goals and objectives**

The Energy Advisor program will advance the strategic plan goals and objectives of the Strategic Plan as outlined:

- Goal 2.2: Residential Sector including Low-Income - Tracking Transform home improvement markets to apply whole-house energy solutions to existing homes - The Energy Advisor Program will plan to deliver a new survey which will strive to implement decision triggers and call to action to support advancement of whole-house energy solutions. The surveys and/or reports will also pursue initiatives to reduce the growth of plug load energy consumption through behavioral and technical solutions.
- Goal 8.3: DSM Coordination and Integration - Deliver integrated DSM options that include efficiency, demand response, energy management and self generation measures, through coordinated marketing and regulatory integration - The Energy Advisor Program will seek opportunities to partner with municipalities, governmental and water agencies and other stakeholders if applicable to promote water and energy conservation. Further integration strategies may also include IDSM, Energy Savings Assistance (ESA) program and other energy efficiency programs.
- Goal 9.2 - Workforce, Education and Training - Ensure that minority, low-income and disadvantaged communities fully participate in training and education programs at all levels of the DSM and energy efficiency industry - This strategy falls in line with a goal of the WE&T Strategic Plan intended to ensure that minority, low-income and disadvantaged individuals fully participate in training and education programs at all levels of demand-side management and energy efficiency.

**6. Program Implementation**

**a) Statewide IOU coordination**

**i. Program delivery mechanisms**

The Energy Advisor Program is delivered to customers through multiple offerings. See section 4) b) above for program offerings by utility.

**ii. Incentive levels**

This program does not offer monetary incentives.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**iii. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

Marketing efforts will be coordinated statewide to develop a portfolio of communication methods. The utilities can use these methods, including but not necessarily limited to, blast e-mails, flyers, on-line marketing, direct mail, trigger marketing, and/or lifestyle packages as suits the target audience, the message, and the resources.

**iv. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Energy Advisor program does not interact, as such, with other programs or organizations. However, the program will maintain the flexibility to coordinate program services to support initiatives generated by agencies.

**v. Similar IOU and POU programs**

The Energy Advisor program provides a consistent and recognizable presence throughout the state and offers a menu of similar services and processes implemented statewide by PG&E, SDG&E, SCE and SoCalGas. The program will work with municipalities, when applicable to offer this service and/or partner in the information provided. Efforts will be made to provide consistent reporting of program results across the state where applicable.

The program also will be implemented in close association with other residential energy efficiency programs. The Energy Advisor program will be the starting point for residential customers to tap into the IOU's residential energy efficiency services. Through marketing, education and outreach, each program will encourage end-users to adopt multiple measures to gain the benefits associated with an integrated whole-house approach to energy efficiency.

The Energy Advisor program will leverage its survey information to provide information and referrals to other energy efficiency programs. Aggregated data from on-line surveys and other program efforts will be examined to provide direct marketing opportunities as applicable.

The Energy Advisor program collaborates with the ESA program by making the service available to them and by providing customers with residential program information. Energy Advisor will coordinate with local and other outreach efforts, as appropriate.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) Program**

The Energy Advisor program will collaborate statewide with emerging technologies initiatives and incorporate other measures into the customer energy report, as warranted, to support the Strategic Plan.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- ii. Codes & Standards program**

Continuous improvements and enhancements will be coordinated statewide to ensure the Energy Advisor Program maintains consistency with updates to codes and standards. Additionally, whenever analysis of the Energy Advisor program related data suggests an area that may be of interest to codes and standards, the program will proactively provide appropriate direction.
- iii. WE&T efforts**

The Energy Advisor program will collaborate with WE&T efforts where appropriate to share information and best practices.
- iv. Program-specific marketing and outreach efforts**

In addition to the statewide marketing efforts outlined above in Section 6.a.iv, the program may be utilized as an outreach mechanism in conjunction with CBOs, faith-based organizations, local community events, fairs, etc.
- v. Non-energy activities of program**

The Energy Advisor program is a successful effort to reach consumers through self, and in some cases direct, contact in ways that consumers prefer. The Energy Advisor Program will serve customers in multiple languages and through different delivery channels. Utilities will improve the Energy Advisor program prominence through creative initiatives such as: analyzing websites to insure high visibility of the Energy Advisor offerings; utilizing telephone representatives to explain and suggest Energy Advisor offerings to callers; describing Energy Advisor offerings in conservation literature; promoting Energy Advisor offerings in conjunction with community outreach efforts, etc., when applicable.
- vi. Non-IOU programs**

The program will promote non-utility programs (e.g. financing options, tax credits, and recycling) to further encourage customers to adopt energy efficiency measures when applicable.
- vii. CEC work on EPIC**

The Energy Advisor program will work with the statewide Emerging Technology Program, CEC and EPIC to take advantage of all new emerging technologies activities. The information may be shared in the customer energy report.
- viii. CEC work on C&S**

The Energy Advisor program will work with the statewide codes and standards to take advantage of new emerging technologies activities. The information may be shared in the customer energy report.
- ix. Non-utility market initiatives**

The Energy Advisor program will coordinate with non-utility energy resources (i.e. DOE's ENERGY STAR®, CEE, etc., if applicable) to provide customers with information on energy efficient lighting, appliances, and equipment.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**c) Best Practices**

Statewide best practices are outlined below:

- Customer Usage History: Because the program includes comprehensive usage and billing information, Energy Advisor will continue to promote the survey program as a way to educate customers on their potential energy savings opportunities;
- Targeted marketing: On a statewide level, the Energy Advisor program will continue to focus its marketing campaigns toward residential and multifamily households with higher usage. As mentioned, the program may also be utilized as an outreach mechanism in a variety of community organizations. This approach reduces overall marketing costs by maximizing the response rates generated from marketing efforts.

**d) Innovation**

The Energy Advisor program will integrate the on-line survey with "My Account" on-line customers to streamline the customer experience, making it more efficient and convenient. Software updates will take into account updates to climate zones, weather regions, demographics, and improved household comparison analysis. This information will also allow for the integration of gas- and water-related measures and information. The IOUs will integrate the on-line survey with customer historic data to streamline the customer experience, making it more efficient and convenient.

The current survey will be replaced by standardized Universal Audit Tools (UAT) developed by each IOU and coordinated at a statewide level to share best practices. The tools will incorporate electricity/gas, energy efficiency, water conservation, demand response and self-generation analysis and will provide tailored set of recommendations for each type of survey, as appropriate. The UAT incorporates applicable rate and bill analysis functionality, similar home comparison as well as IOUs' adopted and recommended emerging technologies, as appropriate.

The utilities projected schedules for implementation of their Residential Universal Audit Tools are as follows:

<b>Residential Universal Audit Tool Deployment Schedule</b>	
PG&E	March 2012
SCE	March 2012
SoCalGas	October 2012
SDG&E	May 2012

The utilities will continue to meet to share best practices for future UAT developments and enhancements where appropriate.

**e) Integrated/coordinated Demand Side Management**

The analysis portions of the residential survey programs will be expanded to include demand response and distributed generation. This would be accomplished by adding on

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

to the current survey formats. Customers will be provided recommendations for demand response and distributed generation opportunities for their residence in addition to Energy Efficiency and Behavior change opportunities. Customers will also be referred to information for these programs, when appropriate. Reports will be shared with demand response and distributed generation programs for additional action if needed.

**f) Integration Across Resource Types (energy, water, air quality, etc)**

The Energy Advisor Program will continue to include recommendations across resource types, as applicable.

**g) Pilots/Initiatives:**

Statewide Pilot – ESA program Initiative: Statewide, the Energy Advisor program will begin to encourage eligible customers to participate in the ESA programs and other programs that will help them lower their energy consumption.

Statewide Initiative – Online Buyers Guide: The Online Buyer’s Guide (released in 2012) web capability will assist consumers and program participants in making the best energy efficiency purchase decisions. The statewide IOUs will continue to collaborate and share best practices on the online buyers guide in 2013-2014.

PG&E/SDG&E Initiative – Home Energy Reports: PG&E and SDG&E will continue to evaluate (SCE and SCG may explore) the benefits of a behavior-based energy efficiency outreach utilizing a neighbor comparison approach as authorized by the CPUC in Decision D.09-09-047 (p. 304) for the 2013-2014 transition period. Known as the “home energy reports” initiative, it involves mailing selected residential customers customized reports at scheduled intervals that compare the energy use of a specific report recipient household to a similar set of households. The home energy report concept is aligned with the IOU’s energy efficiency education and outreach goals under the Energy Advisor (EA) program. The program is designed to increase customer awareness and understanding of their energy usage, and to provide beneficial information on how customers can reduce their energy usage. The demonstrated benefits associated with this behavioral paradigm may serve as an appropriate resource to influence customers to reduce their energy consumption and to increase participation in existing and future energy efficiency programs.

SCE/SoCalGas/SDG&E Pilot - Multi-Family Program: SCE, SoCalGas, and SDG&E intend to offer the Energy Advisor Program to the multifamily sector as a pilot program in 2012-2014. This will involve surveys targeted at the facility owners. The resulting recommendations for the owner will focus closely and specifically on overall property efficiency.

SCE/SoCalGas Pilot: SCE and SoCalGas will provide a quarterly, post-survey feedback mechanism (opt-in) for customers. The pilot initiative will provide customers with a comprehensive energy usage report and will contain historical usage data to reinforce positive trends towards sustainable energy conservation. The mechanism should also

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

increase customer actions in response to the survey, so that the Energy Advisor program continues to monitor its effectiveness in creating energy savings by behavioral change, as well as rebate program participation.

SCE/SoCalGas Pilot – Smart Meter/Web analytics – SCE and SoCalGas will track the customer’s My Account energy savings benefits from behavior based energy efficiency content through the Energy Advisor program.

**h) EM&V**

The program is meant to encourage action - to inform participants of opportunities to save money and provide resources to execute the recommendations. It will be important to know if the design of the survey is successfully imparting useful knowledge, referring participants to helpful resources, and if this coordinated effort is motivating participants to adopt more energy- and water-efficient behaviors.

The utilities plan to work together and with the Energy Division to develop a complete plan for 2013-2014 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval, together with the PIPs.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided here.

The Statewide Energy Advisor program has been continued from past program cycles but has a few new program elements. The Energy Advisor program has planned a preliminary process evaluation near the end of the first program year to address specifically how well the new program elements are operating, and to obtain recommendations on how to improve program operations. After the beginning of the last program year, a full process evaluation will address researchable issues based on the program theory and logic model. These issues will include the following as appropriate:

- How well the Energy Advisor program participants learned about advancing whole-house energy solutions;
- How well the Energy Advisor program participants learned behavioral solutions to plug-load energy consumption;
  
- Whether integration of water-related measures and information was useful to the customer; and
- Whether the individual IOU pilot programs were successful.

To address these issues, the following major evaluation tasks will be completed:

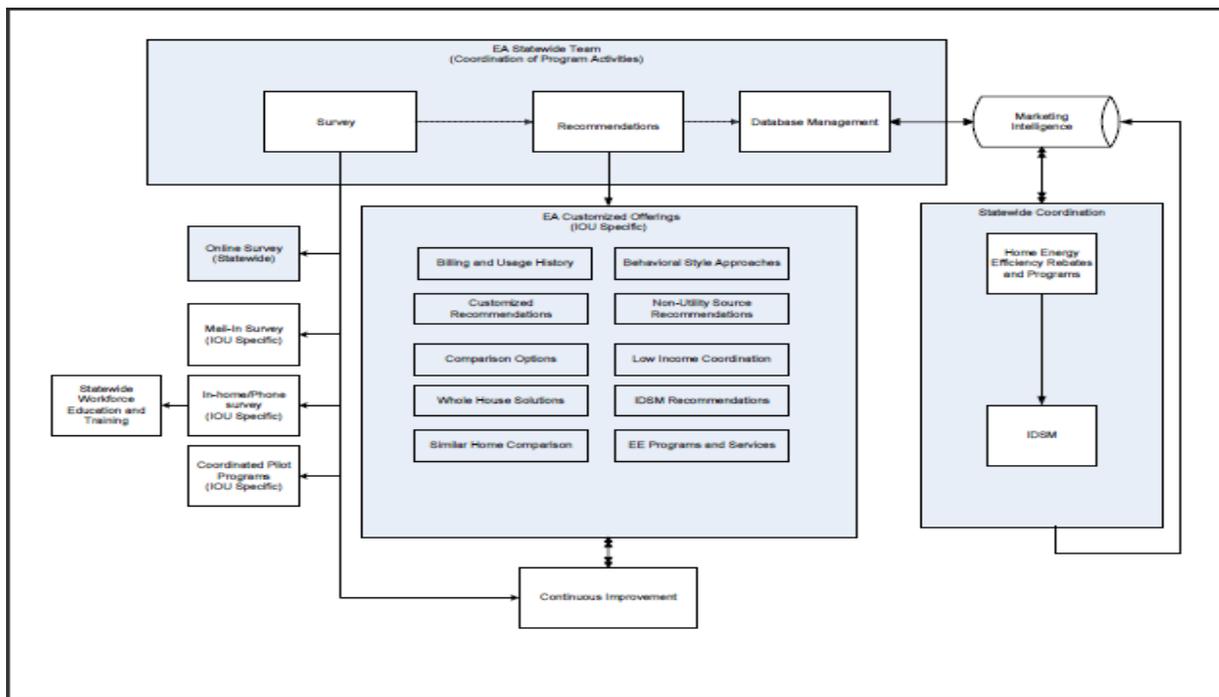

- *Logic model and program theory.* The logic model and program theory will establish a starting point for all evaluation activities. The structure of the logic

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

model, which links program activities and expected outcomes, will be a useful instrument for identifying specific program assumptions that can be tested using a survey or other primary data collection activities;

- *In-depth interviews.* In-depth interviews will be conducted with program managers and other key staff members. Program staff members will clarify program goals and gauge program progress, provide valuable insight into daily operations, and propose research topics to be addressed during the evaluation;
- *Participant survey.* The primary data collection instrument will be a customer post-participation survey, fielded over the phone and via mail. The survey will explore the participant's experience with the program's services and address the research issues identified by the logic model. When appropriate, results will be examined by offering to investigate how the various offerings compare with regard to the most effective marketing strategies, recommendation implementation rates, and measures of satisfaction; and
- *Program-specific data collection and review.* Another key evaluation activity will involve a comprehensive review of all program documents. In particular, this evaluation will identify which specific recommendations have been implemented.

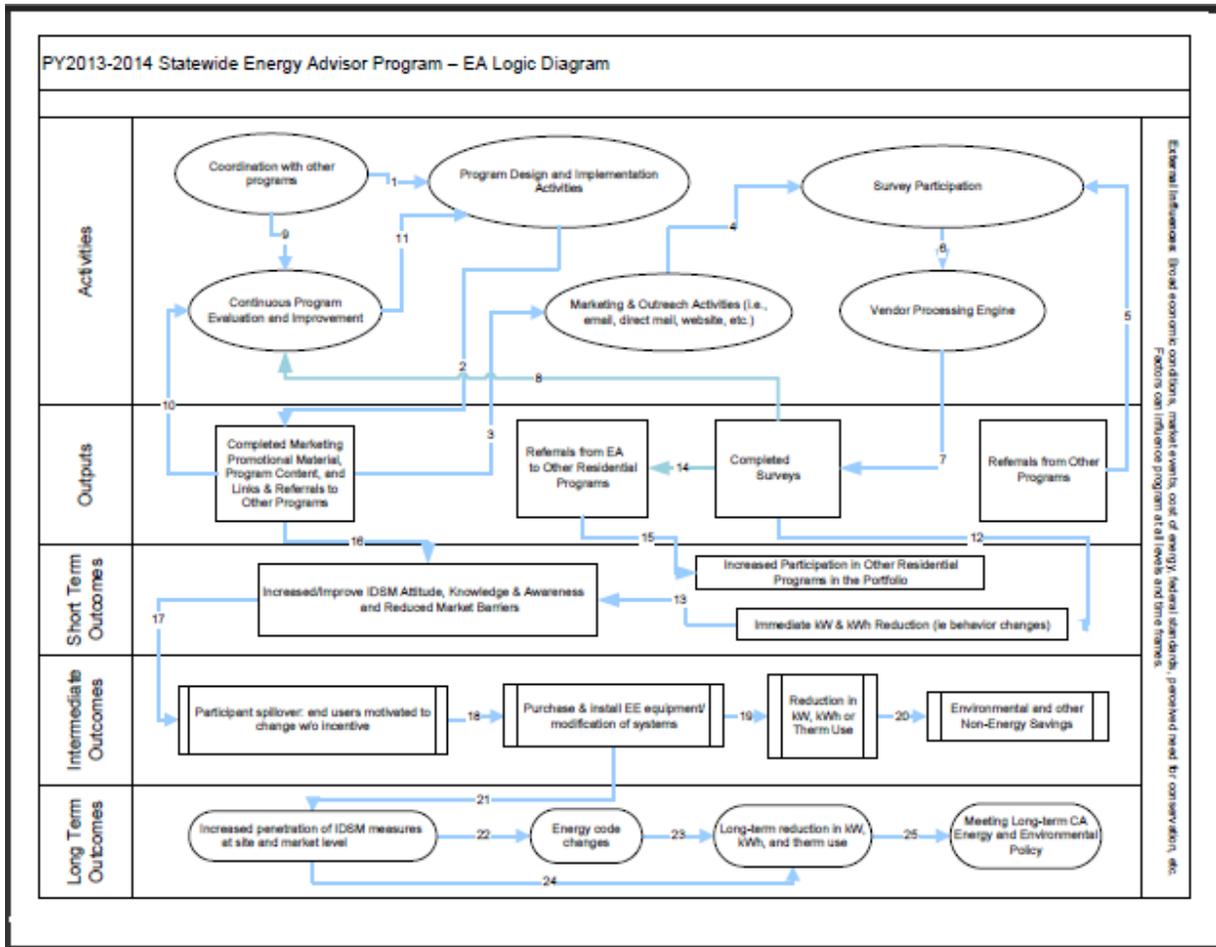

### Diagram of Program

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

## 7. Program Logic Model

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for Energy Advisor (EA) program.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 1) **Program Name:** Statewide Plug Load and Appliances  
**Program ID:** SCG3702  
**Program Type:** Statewide Core Program
- 2) **Program Description:** Refer to CalSPREE for description details
- 3) **Total Projected Program Budget and Savings**
  - a) **Table 1:** Refer to CalSPREE for budget details
  - b) **Table 2:** Refer to CalSPREE for projected gross impacts details

4) **Description of subprogram:**

In response to market trends, energy consumption data, customer needs and behaviors, and per the Final Decision’s guidance, the California IOUs jointly file this Statewide Plug-Load Appliance (PLA) Program Implementation Plan (PIP). With the aim of serving customers where they shop and reducing the complexity in IOUs’ portfolios while increasing customer participation, this PIP combines the 2010-12 Home Energy Efficiency Rebates (HEER), Business and Consumer Electronics (BCE) and Appliance Recycling (ARP) Program under a single program umbrella. This sub-program builds the foundation for a sustainable resource acquisition and market transformation that engages critical market actors: manufacturers, retailers, contractors, service providers and others. Additionally, the PLA sub-program will work with the Whole Home Upgrade Program (WHUP), Energy Saving Assistance (ESA) program and other programs to maximize its reach and effectiveness. This will be accomplished through coordinated cross-program initiatives to deliver a comprehensive package of cost-effective and energy efficiency measures to all customers. This PIP addresses appliances, plug loads, and appliance recycling for the residential and business sectors.

Home appliances, consumer electronics, and other miscellaneous plug loads, hereafter called “Plug-Load & Appliance” or “PLA”, consume about 66% of current California home electricity usage, with plug loads (televisions, personal computers and office equipment) accounting for about 20% of home electricity usage alone<sup>2</sup>. These PLA products comprise one of the largest and fastest growing end-uses of the residential sectors, significantly contributing to the growth in greenhouse gas emission. Clearly, the PLA markets cannot be left alone. The Big Bold Energy Efficiency Strategy (BBEES) efforts to achieve Zero Net Energy (ZNE) in new residential construction and the State’s Integrated Demand Side Management’s (IDSMD) goal of 40% energy purchase reduction from 2008 levels by 2020 will only be possible if the markets are influenced to increase the availability, awareness and adoption high efficient PLA products through strategic energy efficient program interventions.

*[Table-3 to be provided as an Excel Attachment to this PIP]*

**8) Sub-Program Description, Objectives and Theory**

---

<sup>3</sup> Check all that apply

<sup>4</sup> Individual utility specific information to be provided in this table

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- a) **Sub-Program Description and Theory:** Clearly describe the goals of the sub-program and the sub-program theory. As part of this, describe the market barriers, specific areas of concern and/or gaps that the sub-program is designed to address. Then describe the way the sub-program will seek to address each barrier, area of concern or gap<sup>5</sup>.

**1) Sub-program Goals**

- (i) The PLA sub-program aims to transform the market to achieve sustainable adoption of energy efficient PLA products where ongoing intervention would no longer be required. For the short to mid-term time frame where energy efficiency PLA products are still not the market's default choices, the program uses incentive mechanisms, Marketing Education & Outreach (ME&O), Worker Education & Training (WE&T), and strategic industry collaboration to increase availability, awareness, and adoption of energy efficient products. For the longer-term time frame, the PLA sub-program leverages Integrated Demand Side Management (IDSM) programs to influence the development of codes and standards in order to ensure the minimum required energy efficiency levels, promote "Energy Efficiency" as the preferred choice in life-style and new product purchases. The program's long-term strategy seeks to create ongoing demands for "Energy Efficiency" products and thus motivate the industry to produce and sell high efficient PLA products as the market standard offering.

**2) Sub-program Theory**

(i) **Key Program Drivers**

Some of the key market drivers that exert significant impacts to the PLA sub-program in the 2013-14 Transition Period:

1. PLA products comprise one of the largest and fastest growing end-uses, dwarfing electrical loads from traditional categories such as lighting and HVAC<sup>6</sup> – See Figure-1.
2. Customers tend to rank PLA's energy efficiency as low priority and some perceive that energy efficiency design compromises product performance and convenience.

---

<sup>5</sup> Through marketing, delivery mechanisms, information, incentives, etc. If barriers vary by market sub-sector, provide this information. As part of this, succinctly describe the role of any market actors upstream from the customer such as installers, vendors, architects, etc.; indicate if and why the program approach constitutes "best practice," is "innovative" or reflects "lessons learned" in market strategies, program design and/or implementation techniques.

<sup>6</sup> PIER's report "Tapping Into Plug-Load Savings Report", July 20, 2009, page 1

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

3. National market trends are the dominant drivers influencing manufacturers and retailers' offering of PLA products. Regional utility programs face challenges in attracting manufacturer and retailer participation due to the national scope of products<sup>7</sup>.
4. Online has a growing importance in the customer's product purchasing process. The customer toggles back and forth between the traditional brick-and-mortar retailers and e-commerce sites for product research, price shopping, purchases, and post-sales support.
5. The incremental energy savings from miscellaneous electronics are too small to motivate customer's behavior changes, and too costly for IOUs' current product-base program framework<sup>8</sup>.
6. The rapid product life cycle for consumer electronics of 6-12 months poses significant challenges in establishing saving baselines and work-paper development for individual measures<sup>9</sup>.
7. Growing trends of networking home electronics cause energy saving for products to be highly dependent on consumer behavior or usage settings. This isolation of energy savings and consumption on a product-by-product basis becomes challenging.
8. Codes and standards exert powerful pulls on the PLA markets toward higher energy efficiency baselines.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-1:** US Commercial & Residential Electricity Growth<sup>10</sup>

Energy Information Administration's 2008 Annual Energy Outlook forecasts plug loads to grow 94% from 2005 to 2030, dwarfing the contribution and growth of traditional categories, such as lighting and HVAC.

Key regulatory drivers that impact the 2013-2014 Transition Period are requirements found in the Final Decision<sup>11</sup>. These requirements and IOUs' responses are summarized in Table-D and Table-E of this PIP.

### PLA Sub-program Framework

The PLA sub-program is designed to support BBEES in advancing market transformation (MT) toward Title 20 codes and standards changes for realizing ZNE's vision and IDSM goals of reducing the energy purchase by 40% from 2008 levels for the residential sector by 2020. This will be achieved by working with manufacturers, sales channel partners, contractors, service providers, and other market actors in pushing the market toward the 2020 vision through accelerating market adoption of successive waves of advanced PLA technologies. In parallel, the utilities will work concurrently with Code & Standard bodies, ENERGY STAR®, local and federal government agencies, and other market actors to influence the development of codes and standards to support the 2020 goals.

This PIP concurs with the Final Decision that the PLA sub-program should institute a framework that provides a pathway of support for market transformation. Viewing the Final Decision's guidance for the Statewide Lighting Program as a fresh approach to program implementation for greater market transformation and deeper energy savings, the PLA sub-program

<sup>10</sup> PIER's report "Tapping Into Plug-Load Savings Report", July 20, 2009, page 1

<sup>11</sup> Final Decision for the 2013-14 Transition Period, pages 206-207, 357-358 and 411-412

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

adopts the Final Decision’s approach for the Statewide Lighting Program as the template for the PLA sub-program design in the 2013-14 Transition Period. The following paragraphs discuss the incorporation of the Final Decision’s program framework with the industry’s Product Life Cycle concept to develop maximum synergies between the manufacturers, sales channel partners and the PLA sub-program.

Figure-2 shows the combined "Bass Diffusion Theory"<sup>12</sup>, "Technology Adoption Life-Cycle model"<sup>13</sup> and "Concept of Marketing Mixes"<sup>14</sup> as a conceptual model, the Product Life Cycle (PLC) for commercializing new technologies and products. This model provides a high-level macro view of how the industry maximizes the sales of new technology through deploying appropriate marketing mix 4Ps (pricing, promotion, placement and product features) based on user’s needs/wants as the new technology progresses through various market adoption stages (introductory, growth, majority, and sun-setting stages). The PLC model proposes that a certain type of customer tends to cluster within a certain PLC phase, and tends to purchase certain type of products from a certain type of retailers. The industry recognizes this market characteristic and responds by formulating appropriate marketing mixes (product features, pricing, placement and promotion) to maximize sales to different customer groups. Figure-2 provides insights on how the PLC conceptual model might be adapted to guide the IOUs’ collaborations with manufacturers and sales channel efforts to deliver energy efficiency products to the markets.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-2:** Industry’s Product Life Cycle Concept

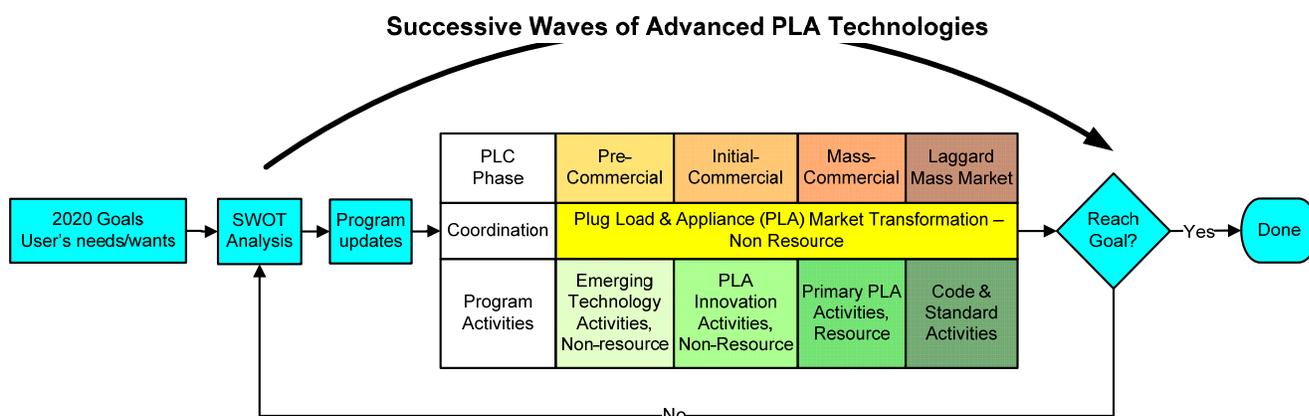

The IOUs could leverage the industry’s commercialization efforts to maximize the adoption of high energy efficient technologies by combining appropriate intervention mechanisms (incentive channels, ME&O, WE&T and Codes & Standards) to influence the industry’s marketing mix 4Ps. The diagram in Figure-3 shows the adaptation of the PLC conceptual model into the program framework for supporting the IOUs’ efforts in transforming California’s PLA markets.

The PLA sub-program framework envisions activities dedicated to support the PLA measures at various commercialization stages, including market transformation activities to provide the overall market transformation strategy and coordination of measures flowing through the PLA sub-program.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-3: PLA sub-program Framework**

In embracing the Final Decision’s guidance for the Statewide Lighting Program<sup>15</sup>, the PLA sub-program supports technology assessments of pre-commercialized PLA measures through Emerging Technology activities. The proposed PLA Innovation activities support advanced PLA technologies aimed at early adopters. The PLA Innovation activities should be heavily weighted and influenced by the user’s needs/wants and should focus on helping the innovative PLA technologies bridge the “chasm” between the early adopters and the early majority markets. From the early stages of product development, promising measures that exit the Emerging Technologies activities should transition to the PLA Innovation activities for further market development in accordance to the overall IDSM strategy and goals. The PLA Innovation activities would support demonstration and pilot projects of measures in the very early stages of commercialization, not pre-commercialization. Moreover, the scale of the demonstration and pilot projects in the PLA Innovation activities should be of a greater scale than those in the Emerging Technologies activities. This will help determine which measures should be eventually supported on a larger scale within the Primary PLA activities. Finally, the IOUs propose the Primary PLA activities in the Statewide PLA sub-program for the purpose of supporting PLA measures that have reached a greater level of commercialization. These activities should receive a majority of the PLA incentive funds and would facilitate rapid market adoption through cost-effective incentive delivery channels. The goal is to complete the pathway for market transformation, as measures transfer from the Emerging Technology activities to the PLA Innovation activities to the Primary PLA activities and then eventually exit from the program.

The PLA sub-program framework proposes Market Transformation activities within the Statewide PLA sub-program for developing and testing market

<sup>15</sup> Final Decision for the 2013-14 Transition Period at pages 227-243

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

transformation strategies. The objectives of the Market Transformation activities are to develop market transformation strategies and to oversee the progression of PLA measures from the Emerging Technology activities to PLA Innovation activities to Primary PLA activities and to the eventual transition to Codes & Standards. Additionally, the Market Transformation activities are to focus on ensuring PLA has adequate representation in the Emerging Technology activities to ensure technologies are being evaluated for potential inclusion in the PLA Innovation activities.

**Process for Managing Flow of Measures through Program**

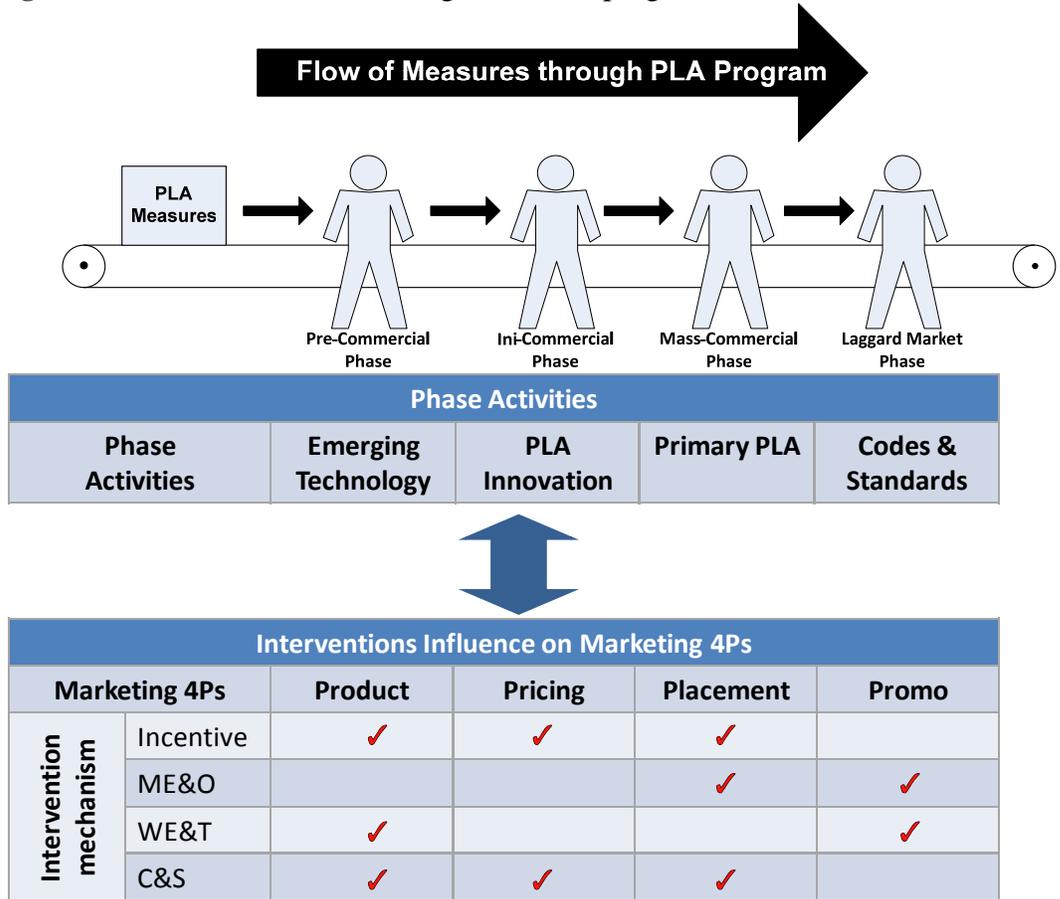

Decision 09-09-047 updated the definition of market transformation to include *“promoting one set of efficient technologies, processes or building design approaches until they are adopted into codes and standards (or otherwise substantially adopted by the market), while also moving forward to bring the next generation of even more efficient technologies, processes or design solutions to the market.”*<sup>16</sup> This definition depicts the flow of new measures through the energy efficiency programs as IOUs collaborate with the industry to launch successive waves of advanced and high efficiency technology into the markets. The PLA sub-program framework in Figure-3 supports the Commission’s position by continually assessing the overall environmental analysis and adjusting the intervention strategy to push new technologies through the program. Figure-4 conceptualizes how the flow of new PLA measures through the program would be influenced by program activities and intervention mechanisms.

---

<sup>16</sup> Decision 09-09-047 at pages 88-89

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-4:** Flow of Measures through PLA sub-program

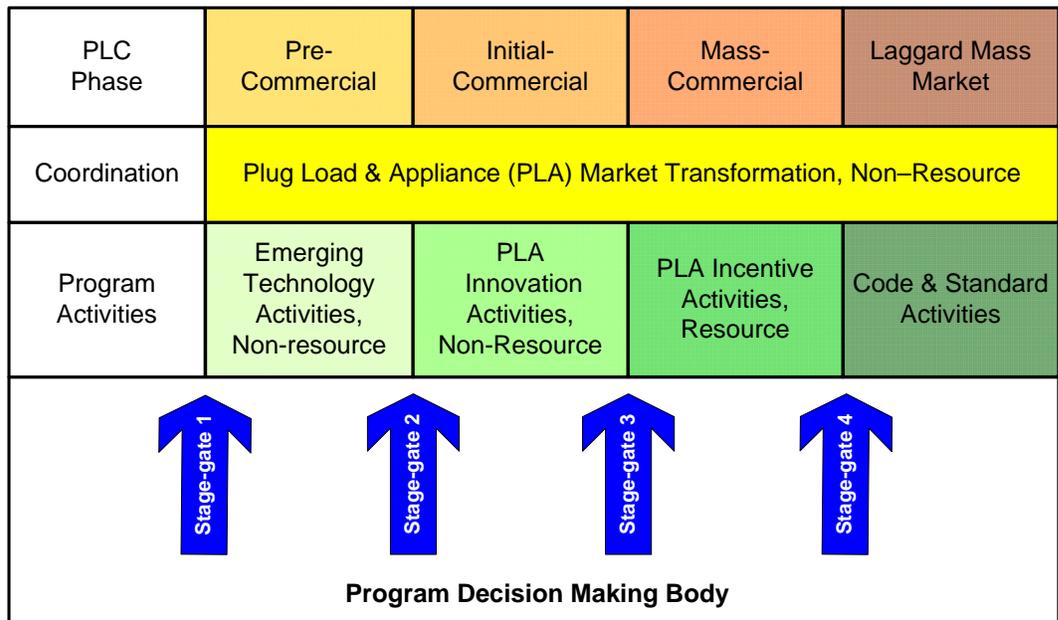

The PLA’s process for evaluating the measure’s commercialization stage and, formulating the right combination of intervention elements to exert the desired market influence, could be enhanced through a formal decision process for managing the flow of measures through the PLA sub-program. This enhancement could be satisfied by a stage-gate process as shown in Figure-5. In this diagram, the stage-gate design takes into account the unique requirements of each commercialization phase and provides criteria for the PLA measure entry into or exit from a subprogram. The explicit evaluation checkpoints would allow measures to move onto the next subprogram, reject measures from the portfolio at any point along the market transformation life cycle or return the measure back through the loop for further development based on to be established stage-gate criteria. Key criteria to be considered as part of this stage-gate process are as follows:

1. Saving potentials (technical, economic, market)
2. Cost effectiveness
3. User’s needs/wants

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

4. Market opportunities / risks
5. Technology's maturity stages
6. Industry's supports
7. Compliance to industry's standards
8. Cradle-to-grave's total environmental impacts
9. Code's saving baseline
10. Saving verifications

- iii. **Sub-Program Software and/or Additional Tools:**
- a. List all eligible software or similar tools required for sub-program participation.  
None
  - b. Indicate if pre and/or post implementation audits will be required for the sub-program.  
Pre-implementation audit required \_\_\_ Yes  No   
Post-implementation audit required \_\_\_ Yes  No
  - c. As applicable, indicate levels at which such audits shall be rebated or funded, and to whom such rebates/funding will be provided (i.e. to customer or contractor).

**Table 13: Post-implementation Audits**

N/A

- h) **Sub-Program Quality Assurance Provisions:**  
**Table 14: Quality Assurance Provisions**  
*[Table-14 to be provided as an Excel Attachment to this PIP]*
- i) **Sub-program Delivery Method and Measure Installation /Marketing or Training:** Briefly describe any additional sub-program delivery and measure installation and/or marketing & outreach, training and/or other services provided, if not yet described above.

**(i) Upstream Incentive Delivery Channel**

The PLA program uses “different incentive designs” to influence market actor behaviors. The upstream incentive is paid directly to the manufacturers for the purpose of influencing the manufacturer’s product offering in the distribution chain. The upstream incentive can potentially influence the retailer’s product assortments and impact the customer’s purchasing behaviors. This delivery

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

channel can be a cost effective means for supporting measures that have high sales volumes, produced by relatively few manufacturers that sell through a large number of independent retailer chains.

**(ii) Midstream Incentive Delivery Channel**

The midstream incentive is paid to the retailers, e-retailers, distributors, contractors or service providers and is typically used to influence the sales channels' decision on which products to stock and sell. The midstream incentive offers IOUs the advantage of applying the incentives across all brand offerings for a particular product category that a retailer carries without the additional effort of managing multiple manufacturer relationships. This enhances the customer's shopping experiences and allows retailers to offer wider product choices.

Continuing to cultivate strategic alliances to maximize the synergies with retailer partners is an effective strategy for increasing the program cost-effectiveness and efficiency. California IOUs will continue to develop strategic partnerships with the industry to be more effective in promoting energy efficient products and services, showcasing our energy expertise, branding our successes, and maintaining high levels of customer satisfaction. These strategic alliances include the contractors for roofs, pumps, and evaporative coolers in previous program cycles, as well as HVAC contractors from other residential programs.

The continued use of retailers as a go-to-market channel provides an excellent conduit for developing a "one-stop approach" for customers, as noted in the long-term Strategic Plan. By increasing the program participation with national chain mass market and regional vertical retailers, the program will provide the following benefits:

- Expanding network that increase customer convenience;
- Enhancing retail management support for energy efficiency;
- Establishing more opportunities for co-marketing and branding with retailers;
- Expanding cooperation between utilities, retailers and manufacturers to promote and stock high efficiency PLA products; and
- Providing market information for energy efficiency products.

As noted previously, the national trend by nation chain mass market retailers toward promoting "energy efficient" products within their stores provides IOUs the opportunity to reach end-users through a preferred method of communication— directly from the retailer. Beyond leveraging the ENERGY STAR brand, PLA will use its retail management support to develop bundled promotions, host events, train staff, and conduct promotional campaigns with retailers to directly influence consumers' choice for energy efficiency products.

**(iii) Downstream Incentive Delivery Channel**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The downstream incentive is paid directly to the end-customer and is typically used to directly influence the customer's purchasing decision. While the downstream incentive model has the advantage of capturing more customer information, the more lengthy incentive administrative process of rebates applications is disadvantageous. Additionally, the administrative efforts supporting downstream rebate applications are typically not cost effective for small rebate amounts.

A major implementation strategy for the program is to expand the downstream incentive delivery channel to include the point-of-sale (POS) "instant rebate". This implementation would allow retailers to instantly provide the customer the IOU rebate at the register, streamlining the rebate application payment process and integrating appliance incentives with appliance purchasing opportunities. This POS strategy seeks to include more retailers that sell high efficient refrigerators, whole house fans, pool pumps, home appliances and other gas appliances as applicable with each IOU. Retailers are key market actors in moving the energy-efficient PLA markets, thus the PLA sub-program design will be optimized to maximize the retailers' participation. The final implementation will be depending on the retailers' IT structure and capabilities in certain areas.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Table-A:** Incentive Delivery Channel Summary

<b>Incentive Delivery Channel</b>	<b>Primary Market Actors Affected</b>	<b>Criteria used to determine the best delivery channel for any PLA measure</b>
Upstream	Manufacturer	<ol style="list-style-type: none"> <li>1. High volume product</li> <li>2. More retailers selling product than number of manufacturers producing product</li> <li>3. Lower value product</li> <li>4. Low-mid incentive level</li> <li>5. Lower sales effort required</li> <li>6. Low promotion requirement</li> <li>7. Long product life cycle</li> </ol>
Midstream	Sales Channel Partners (retailers, contractors, etc.)	<ol style="list-style-type: none"> <li>1. Mid - High volume product</li> <li>2. More manufacturers producing product than number of retailers selling product</li> <li>3. High value products</li> <li>4. Mid-high incentive levels</li> <li>5. High sales efforts</li> <li>6. High promotion requirement</li> <li>7. Short product life cycle</li> </ol>
Downstream	End-customer	<ol style="list-style-type: none"> <li>1. Low volume product</li> <li>2. Targeted customer group</li> <li>3. Strong relationship with customer</li> <li>4. High value product</li> <li>5. High incentive level</li> </ol>

**(iv) Retailer based Appliance Recycling**

The PLA sub-program will work with Retailers to support responsible environmental stewardship by providing more comprehensive cradle-to-grave product life cycle management. The program supports the US EPA Responsible Appliance Disposal (RAD) program, which promotes the highest quality recycling, reducing greenhouse gas emissions and landfill waste. The IOUs appliance recycling activities support eliminating the current market practice of reselling old appliances removed from customer homes during the delivery of new ones. The IOUs recognize that customer-facing retail staff has effective point-of-influence to educate customers on the total environmental impacts

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

resulting from adoption of higher efficiency products and permanent removal of older and less efficient PLA products from the grid.

The benefits of reduced implementation costs and increased program simplicity that POS instant rebates provide, as discussed above, make it impractical for the IOU's to implement a Cash-4-Appliance rebate program design for refrigerators as suggested in the Final Decision's guidance for the appliance recycling activities. The IOUS will instead focus on implementing existing refrigerator rebates in combination with the new appliance recycling retailer strategy that has been piloted by SCE. This new strategy effectively promotes the purchase of a new efficient refrigerator and combines it with the convenience of allowing customers to recycle their own refrigerators in the new Refrigerator Deliver-N-Haul away process. This approach does not require customer to surrender their refrigerator as part of the rebate process but still allows IOU's to reduce implementation cost for both programs while providing options that improve the customer experience. By working with retailers to integrate appliance recycling to be an integral parts of the product ownership, from new product purchase to retiring old devices from the grid, would provide a simplified and cost-effective long-term solution for cradle-to-grave product life cycle management. And the retailer based appliance recycling solution, which the IOUs plan to expand in 2013-14, would be an ideal solution for realizing this vision. This does not apply to SoCalGas.

**(v) Statewide Appliance Recycling Channel**

The appliance recycling markets could be segmented into three primary customer groups; Group one would be the customers that retired their old appliances when the new ones are delivered; group two would be the customers that retired their secondary appliances (such as the secondary refrigerator or freezer); group three would be those customers and retailers that sell/buy the old working appliances to/from the second-hand appliance markets.

We believe the above retailer-based appliance recycling channel would be an effective intervention for group one. The current Statewide Appliance Recycling channel, which will be discussed in more detail in this section, could be an effective intervention for group two. The intervention for group three would require a long-term strategy through codes and standards, as well as collaborations with EPA RAD and other market actors to deplete old working appliance stocks that do not meet the 2020's energy efficiency requirements. The intervention for group three would need support from new codes and standards that eliminate the market practices of re-selling old appliances back to the second-hand appliance markets.

The estimated schedule to deplete the old working appliance stocks from the grid would primarily depend on the implementation date of the code and standards that

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

will mandate the 2020's energy efficiency levels and the average product life for that particular PLA product group. Thus, the Final Decision's request to transition the current appliance recycling program to market players by a specific date<sup>20</sup> cannot be answered with certainty at this point. The IOUs will continue to engage the Commission and appropriate market actors on this.

Currently, the Statewide Appliance Recycling picks up older but working appliances from single residential dwellings, multi-family complexes and businesses, and permanently disposes them in accordance to EPA's Responsible Appliance Disposal (RAD) guidance. The Statewide Appliance Recycling channel is designed to incentivize customers to permanently remove and recycle inefficient refrigerators and freezers from the electrical grid by:

- (1) Offering customers an incentive along with free pick-up as a convenient option to recycle their inefficient appliance.
- (2) Requiring Recycling Service partners to be in compliance with EPA RAD practice so all appliances could be decomposed and recycled in the most environmentally friendly manner possible.
- (3) Allowing commercial and multifamily owners/property managers to coordinate bulk pick-ups that simplify the participation process and allows IOU's to reduce program implementation costs.

During the 2013-2014 Transition Period, the PLA sub-program will focus on secondary refrigerators and stand-alone freezers. This initiative aims to stem the tide of the growing number of second refrigerators and freezers in California home. Additionally, the PLA sub-program looks into saving opportunities for both claimable and non-core, non-claimable to avoid lost opportunities for refrigerator and freezer recycling. Lastly, the program is evaluating additional cost-effectiveness and more comprehensive recycling solutions through inclusion of additional recycling of other types of household plug-loads, gas appliances, small business appliances and electronics devices. The team will leverage EPA RAD compliance Recycling Service Provider to provide environmentally safe and responsible recycling solutions.

**(vi) Marketing Education & Outreach (ME&O)**

IOUs will continue to develop targeted and highly relevant energy efficiency and IDSM marketing messages to encourage behavioral change/action. PLA intends to develop strategic collaboration with industry to motivate consumers to take action in embracing energy efficiency.

---

<sup>20</sup> Final Decision for the 2013-14 Transition Period at page 207

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

To facilitate retail relationships, IOUs will explore co-marketing opportunities with manufacturers and sales channel partners to implement website enhancements that facilitate ease of access to energy efficiency information; enabling customers to readily find information about energy efficient products and services, identify participating retailers in their neighborhoods, and complete on-line sign-ups to receive notification about special efficiency offerings, rebates, or incentives.

The IOUs focus on delivering products, services, and information through the most efficient delivery channel for every customer segment we serve. For PLA, the IOUs will continue to focus on the customer experience at retail, ensuring visibility of rebates and offers and streamlining the transaction and processing of rebates.

There is also opportunity for enhanced engagement with customers with respect to appliances and appliance recycling. With many appliances, customers wait until the appliance fails before considering replacement. Through impactful in-store marketing and clear communication of offers, the IOUs intend to increase customer awareness of rebates and incentives and focus customers on the benefits of upgrades as well as replacement of outdated technologies. In-store marketing will be augmented by promotion of PLA through other channels, such as online tools that create customer awareness of rebate offers and availability prior to the customer stepping into the store. With more online transactions happening each day, it is important that customers be educated about the potential energy savings and rebates for products they are considering should they choose to purchase through an online retailer.

The IOUs will look for opportunities to provide alternative strategies for marketing the programs in constrained areas. One example would be a neighborhood-based marketing campaign that targets older, master-planned communities in order to promote energy efficiency. Through this effort, local contractors will independently market and install cost-effective measures such as duct testing and sealing and other measures to help reduce energy loss in the home and increase overall efficiency. By working with the industry partners to cover energy efficiency measures in high volume, the effort will help to lower measures costs that are adopted by a large number of program participants. In addition to delivering energy savings, this approach will support the advancement of local community and city goals related to energy efficiency, as well as benefiting many neighborhoods and socio-economic groups.

Customers are often not aware of the true savings potential associated with energy efficient measures nor are they familiar with the many energy efficient products available that are not associated with appliances. Some IOUs may offer an "energy saving starter kit" to customers in order to introduce them to energy efficiency tips that can produce significant savings. This kit will provide

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

information about simple but comprehensive methods to reduce water, gas, and electricity use. By supplying the tools necessary to begin saving gas and water and thereby educating these customers on energy efficiency, the PLA sub-program should see an increase in participation and could include other customer segments that may have been excluded due to high product cost. This will help the PLA to grow as a comprehensive, inclusive residential program and thus maximize potential savings. As applicable, PLA participants will also be educated about additional opportunities for energy efficiency beyond the measures they are adopting.

The IOUs have developed the integrated energy audit tool for residential and small business customers that will assist customers with their energy management decisions. These information platforms are easily accessible to customer to provide immediate feedback, enable a more accurate assessment of program impacts, and empowered the customer to quickly and easily make energy efficiency decisions. In addition, the deployment of AMI provides additional opportunities to educate customers about their energy usage. The IOUs will explore opportunities to maximize energy efficiency and demand side management opportunities as the technology is developed and deployed to residential customers.

After the program is approved, each IOU will develop a market implementation plan that targets owners and renters of single family residences as well as apartments, townhouses, condominiums, and mobile homes and operates in parallel to the operation of the Multifamily Energy Efficiency Rebate (MFEER). This ME&O strategy aims to include coordinated statewide elements as well as elements specially targeted to the customers in each utility's service area. The program seeks to leverage relationships with local government partnerships, water agencies, air quality districts, trade allies, manufacturers, retailers, and distributors to deliver information, measures, and incentives.

Program campaign elements include:

- Statewide rebate promotions;
- Online/mail-in application processing;
- Integration of rebate offers and related content with online tools
- In-store POS instant rebate option where applicable through retailer POS capabilities;
- Whole house approach offering products that address all types of energy use;
- Home energy surveys;
- Energy efficiency customer education and outreach; and
- Other residential EE programs such as upstream lighting.

**(vii) Worker Education & Training (WE&T)**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

PLA sub-program will work with Energy Centers to design and develop training curriculums appropriate for retailers and contractors to develop skills and knowledge on energy efficiency products, codes and standards and IOU EE programs. Additionally, PLA will work with WE&T to identify training opportunities for: (1) the retail store, (2) the retailer corporate/headquarters decision makers, and (3) Original Equipment Manufacturers (OEMs).

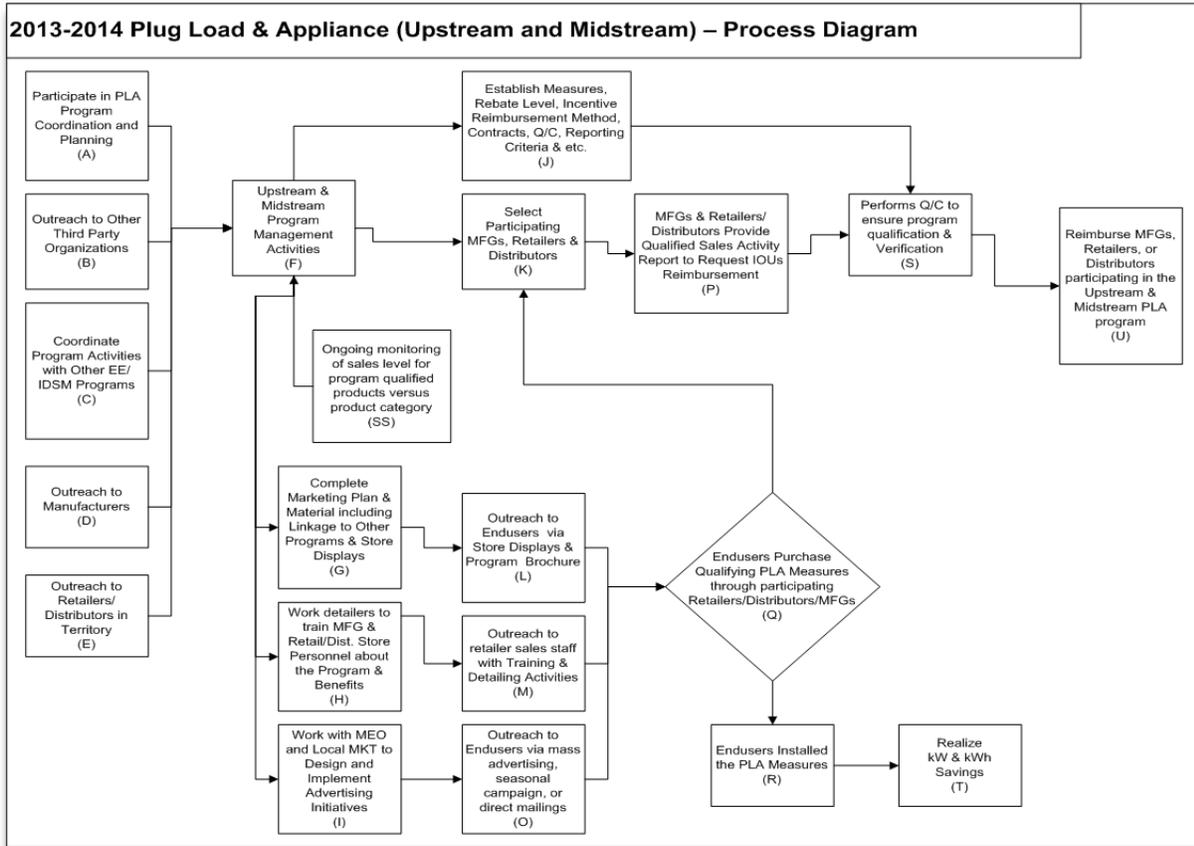

- For retail stores - Opportunities to provide training to store-level personnel at participating retailers. These training activities will be supported by regular surveys to determine the effectiveness of the training.
- For retailer headquarters decision makers - Opportunities to provide training to buyers and merchandisers at the headquarters of participating retailers to educate them about the availability, desirability, and benefits of PLA qualifying electronics.
- For OEMs - Opportunities to provide training to with OEM manufacturers to educate their product managers and marketing groups about the importance of designing ENERGY STAR qualified and beyond features into their products.

Finally, the IOUs seek to develop marketing programs to educate consumers and increase awareness about the benefits of PLA qualifying products. Various efforts to educate sales associates of user and environmental benefits of high efficient PLA products will be explore during the program cycle. PLA's WE&T initiatives may include activities such as site visits by program representatives, program participation agreements, and / or literature, as appropriate.

- j) **Sub-program Process Flow Chart:** Provide a sub-program process flow chart that describes the administrative and procedural components of the sub-program. For example, the flow chart might describe a customer's submittal of an application, the screening of the application, the approval/disapproval of an application, verification of purchase or installation, the processing and payment of incentives, and any quality control activities.

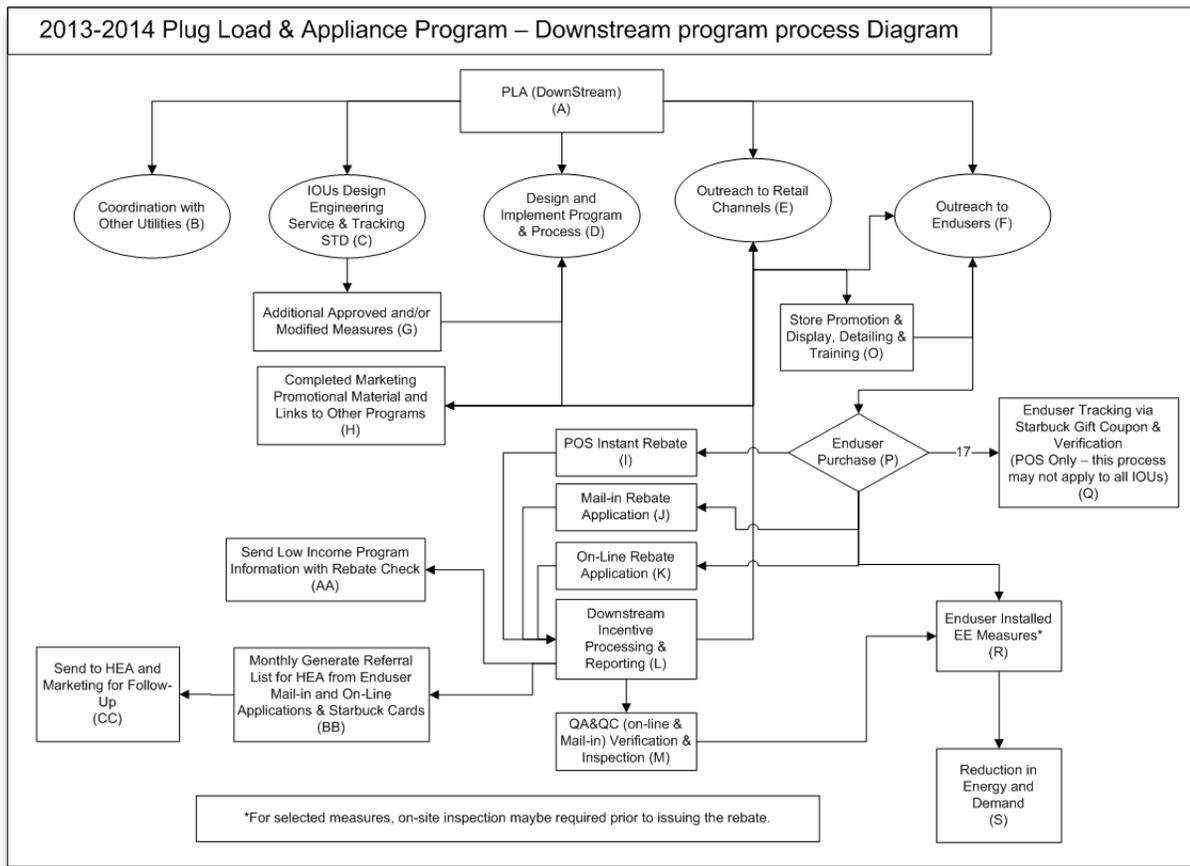

**Figure-5:** PLA Upstream & Midstream Incentive Process Diagram

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

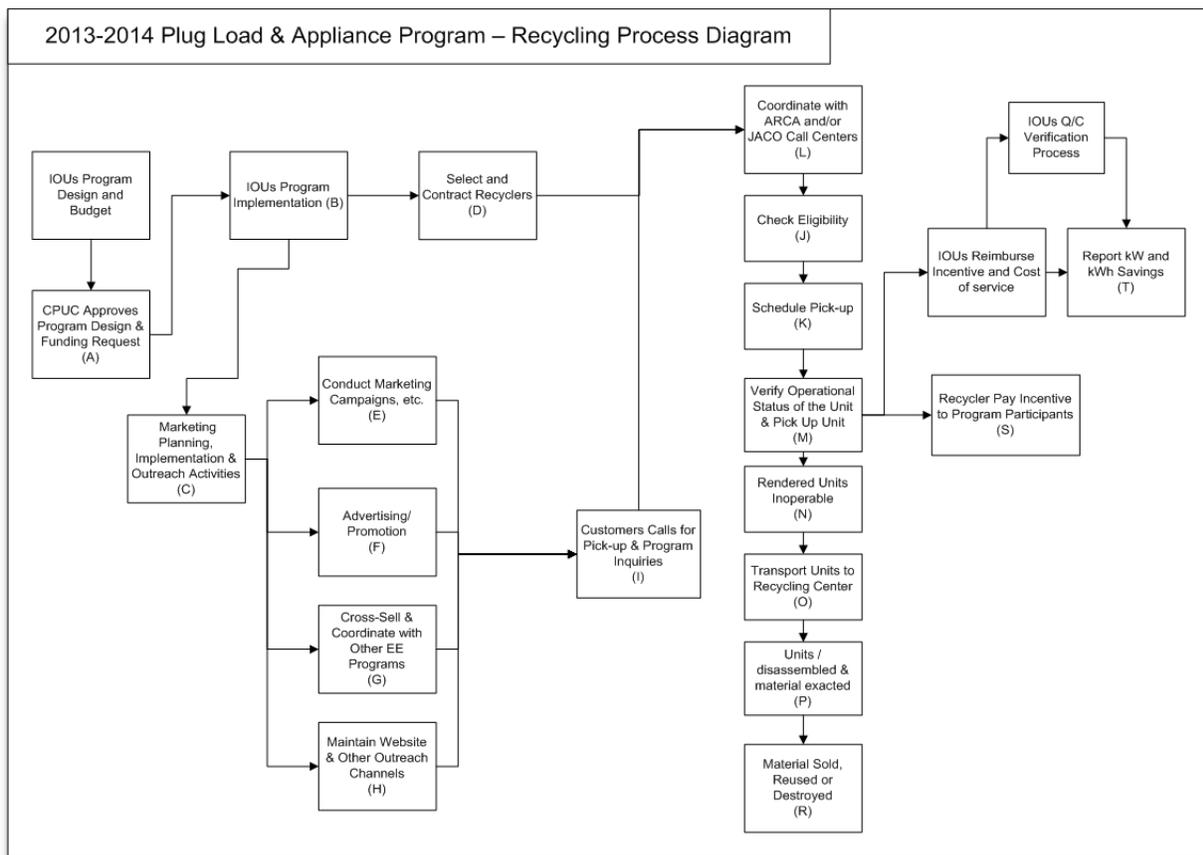

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-6:** PLA Downstream Incentive Process Diagram

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-7:** Statewide Appliance Recycling Process Flow Chart

- k) **Cross-cutting Sub-program and Non-IOU Partner Coordination:** Indicate other IOU EE, DR or DG sub-programs with which this sub-program will regularly coordinate. Indicate also key non-IOU coordination partners. Indicate expected coordination mechanisms<sup>21</sup> and frequency<sup>22</sup>:

With respect to low-income customers, each IOU seeks to integrate its ESA program into PLA by providing customers with information and marketing material on the ESA program, California Alternate Rates for Energy (CARE), and Family Electric Rate Assistance (FERA) discount programs. The strategy to integrate ESA, CARE and FERA activities into the PLA sub-program aims to ensure eligible low-income residential customers are aware of the availability of low-cost energy-efficient services through ESA, CARE or FERA. Additionally, IOUs seek to ensure that low-income customers are aware of rebates available for

<sup>21</sup> “Mechanisms” refers to communication methods (i.e. quarterly meetings; internal list serves; monthly calls, etc.) and/or any cross-program review methods (i.e., feedback on program plans; sign off on policies, etc.) or harmonization techniques (i.e. consistent certification requirements across programs, program participant required cross trainings, etc.).

<sup>22</sup> This does not mean there would be mutual understanding of the on the mechanism or a known frequency of coordination; rather, just provide enough information to give a general sense of the coordinate efforts.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

appliances through the PLA sub-program, which are not offered through any of the above mentioned programs.

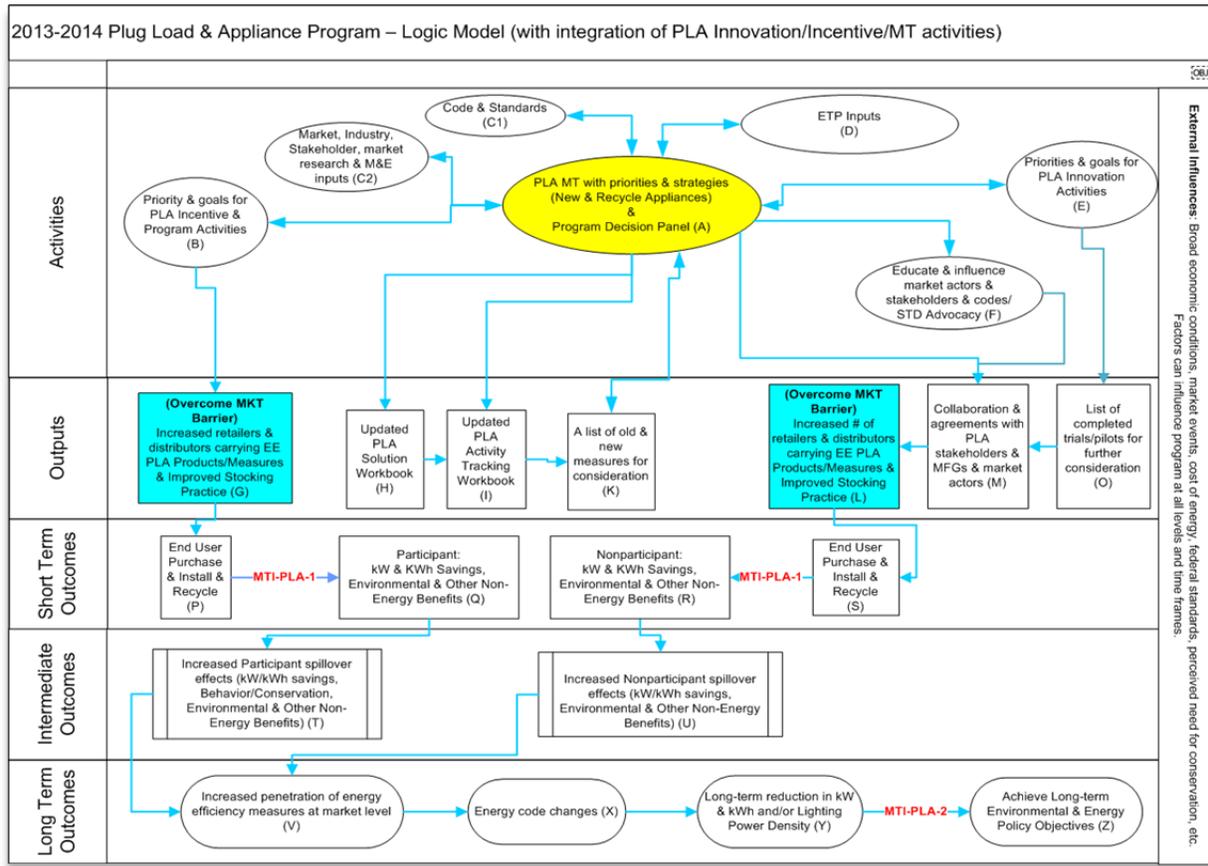

Regarding products that address all types of energy use, each IOU seeks to coordinate the delivery of its PLA sub-program, as well as the Lighting and EUC programs, to maximize the energy saving potentials in every home. Whether customers simply look for an energy efficient light bulb to replace their burnt-out incandescent bulb, or the ENERGY STAR's most efficient refrigerator to replace their old unit, or a comprehensive energy saving audit and installation service to support a deep retrofitting project of their home, the customer-facing staff must be able to guide the customer seamlessly to the appropriate programs. All of the program's ME&O and WE&T would be conducting coordinated initiatives to equip the customer-facing staff with the necessary knowledge to assist customers in maximizing their comfort, security and saving by helping them make the right choice in energy efficient solutions.

**Table 15:** Cross-cutting Sub-program and Non-IOU Partner Coordination  
*[Table-15 to be provided as an Excel Attachment to this PIP]*

- 1) **Logic Model:** Please append the logic model for this sub-program to the end of this PIP. Describe here any additional underlying theory supporting the sub-program intervention approach, referring as needed to the relevant literature (e.g., past evaluations, best practices documents, journal articles, books, etc.).

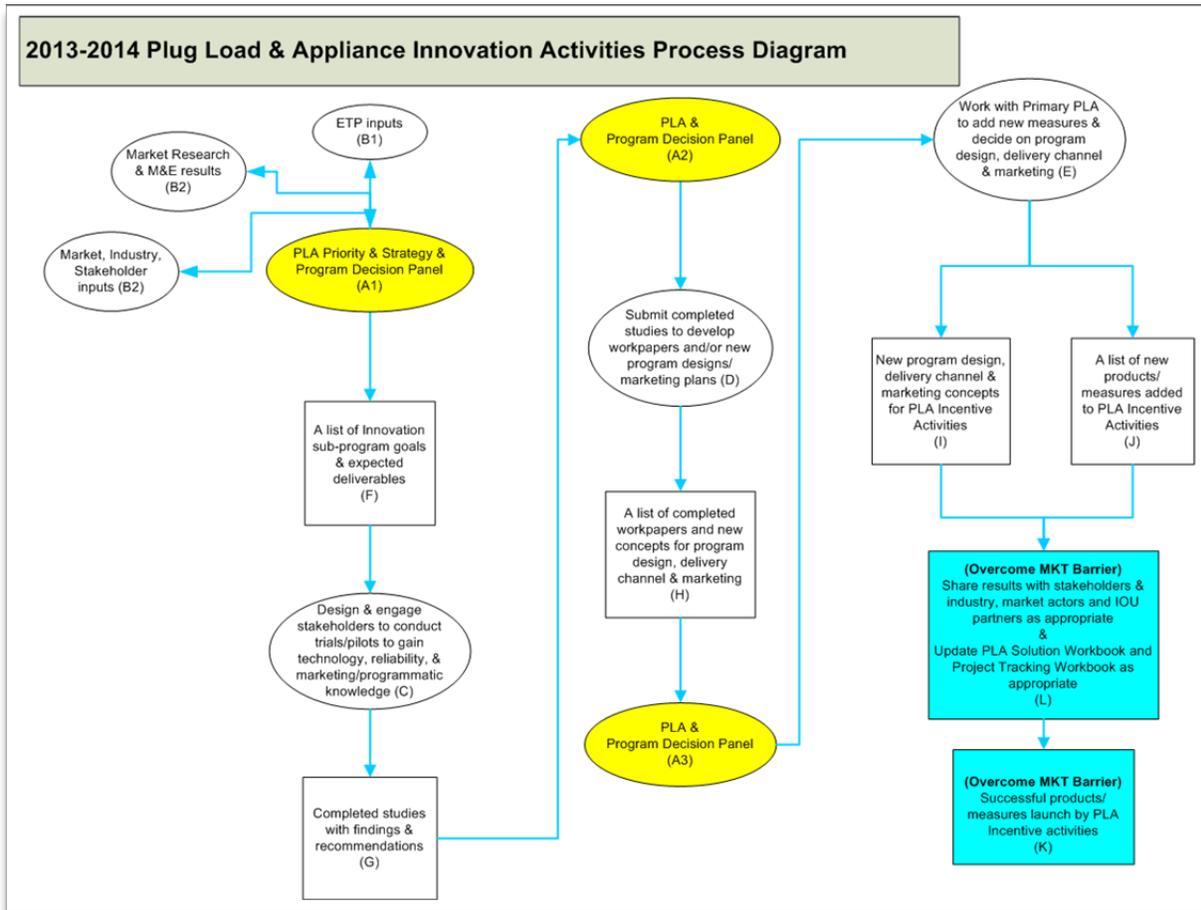

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-8: PLA sub-program Logic Model**

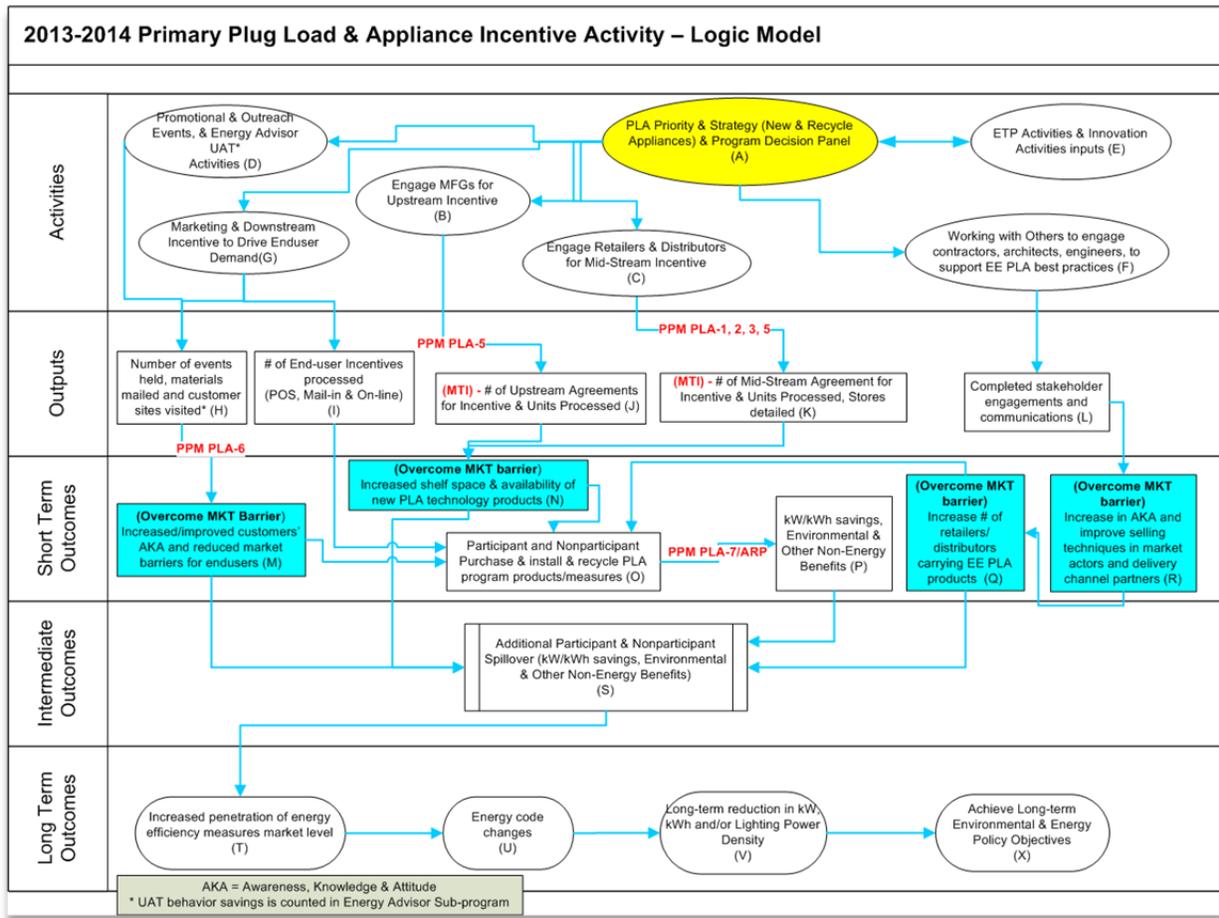

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-9: PLA innovation Process Diagram**

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-10:** Primary PLA Incentive Activities Logic Model

### 10) Additional Sub-Program Information

- a) Advancing Strategic Plan Goals and Objectives:** Describe how sub-program advances the goals, strategies and objectives of the California Long Term Energy Efficiency Strategic Plan

The PLA sub-program will help to achieve the goals identified in Chapter 2 of the Strategic Plan:

2-2: Promote effective decision-making to create wide-spread demand for energy efficiency measures. California IOUs will aggressively incorporate results from studies that determine homeowner “decision triggers” for improving home energy efficiency; and

2-3: Manage research into new and advanced cost-effective innovations to reduce energy use in existing homes. California IOUs will work collaboratively to

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

promote the commercialization of home energy management tools, including Advance Metering Infrastructure (AMI)-based monitoring and display tools.

The “Smart Meter” deployment provides the customer the opportunity to access near-real time monitoring of their energy usage patterns at home. The feedback on how a customer is consuming energy through access to hourly billing data will support long-term behavioral strategies to reduce consumption. Moreover, when combined with automated enabling system (e.g., more integrated home management system through In-Home devices/displays and systems, programmable controllable thermostats, load control devices, smart appliances, etc.), the Smart Meter technology will provide customers the energy management tools that report increased savings as energy-efficient measures are installed. At the same time, the Smart Meter will offer residential customers the unique opportunities to participate in demand response and AMI-enabled technologies services. These information feedback systems enable more accurate assessment of IDSM program impacts and guide the future energy management strategies for customers.

**b) Integration**

- i. **Integrated/coordinated Demand Side Management:** As applicable, describe how sub-program will promote customer education and sub-program participation across all DSM options. Provide budget information of non-EE sub-programs where applicable.

The IOUs will coordinate program efforts with the local utility integration teams and the Statewide Integration Task Force to identify successful integration approaches and offerings, potential pilot programs and metrics.

**Table 16:** Non-EE Sub-Program Information

*[Table-16 to be provided as an Excel Attachment to this PIP]*

- ii. **Integration across resource types** (energy, water, air quality, etc.): If sub-program aims to integrate across resources types, please provide rationale and general approach.

There are integration opportunities that work across resource types that can be further explored such as combining rebates with water utilities which have provided customers a more simplified process for submitting and receiving their energy and water rebates. The residual benefits of this process was the ability to leverage the larger combined rebate amount to significantly drive sales of qualifying models as well as providing a precedent for disparate water utilities to collaborate around a combined product specification and rebate methodology. IOUs will take these key findings and use them with water agencies and air quality districts when there is alignment around customer

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

offerings. Additionally, the retail channel offers significant integration opportunities for marketing DSM solutions. Through effective and engaging point of sale displays and interactive kiosks, the IOUs will co-market a variety of programs and services through a single point of customer engagement.

For example, PG&E begins its fifth year of a Cooperative High-Efficiency Clothes Washer rebate program with a number of water agencies in the Greater San Francisco Bay Area. 12 agencies together with their sub-agencies, constitute a total of 33 water agencies (wholesalers and retailers) participating on PG&E's program. PG&E processes the rebate applications (submitted via paper application or online), sends customer data to the respective water agencies through a secure swap drive, and then issues one check to the customer that combines PG&E's rebate of \$50 and the water agency rebate (either \$50 or \$75, depending on efficiency rating) for a check total of either \$100 or \$125.

SoCalGas will seek opportunities to partner with municipalities, governmental agencies, water agencies and other stakeholders if applicable to promote water and energy conservation via the Energy Advisor Program. Further integration strategies may also include IDSM, ESAP and other energy efficiency programs where pertinent to water and energy conservation.

- c) **Leveraging of Resources:** Please describe if the subprogram will leverage additional investments by market actors or other state, local or federal agencies.

N/A

- d) **Trials/ Pilots:** Please describe any trials or pilot projects planned for this sub-program

The PLA sub-program may include several additional pilots in the 2013-14 Transition Period to evaluate new program delivery methods:

- Market trials to explore sales uplift for PLA targeted products by inviting retailers and or manufacturers to submit proposal for energy efficient PLA sub-program promotion<sup>23</sup>.
- Collaborate with manufacturers to provide low-cost ENERGY STAR appliances for lower income customer segments but not qualified for the low-income program services<sup>24</sup>.
- Field Service teams to provide in-store training of retailer sales staff about energy efficient products; demonstrate energy efficient products to

---

<sup>23</sup> D&R International, "Massachusetts Market Lift Program - Summary Description and Methodology", April 17, 2012

<sup>24</sup> RIA/EMI's Plug Load Market Characterization study

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

customers; maintain point-of-purchase education materials and ongoing market surveys of energy efficient products.

- Updating sales channel strategy to respond to growing integration of traditional brick-and-mortar retailers and e-commerce marketing for product evaluation, purchases, and post sales supports.
  - Provide incentives to retrofit projects that used qualified contractors to ensure high quality retrofit and enhance code compliance such as pool pump retrofit projects in compliance with code T20.
  - Coordination with industry partners on an integrated strategy with Codes and Standards bodies around “Horizontal Standards” strategy to influence product standards that lead to energy savings across many product categories.
  - Pilots of Home Energy Centers or Power Management Umbrellas to influence the overall reduction of miscellaneous plug loads in California homes.
  - Coordination with industry partners around voluntary agreements for energy reductions, such as, discussions currently occurring in the Cable and Satellite set-top box space.
  - Technology evaluation and market acceptance testing of PLA emerging technologies, which may include set-top boxes, game consoles, servers, advanced power strips, imaging equipment, audio, video equipment’s and home energy management products and energy saving and demand respond capable appliances and plug-loads.
  - Unit Energy Consumption (UEC) as a long term market transformation indicator for monitoring program influence on overall PLA electricity usage in home instead of product-by-product attribution model.
- e) **Knowledge Transfer:** Describe the strategy that will be used to identify and disseminate best practices and lessons learned from this sub-program

**One-Stop-Shop Information Repository**

The PLA sub-program supports the Energy Upgrade California web portal to serve as a one-stop-shop for PLA sub-program information, as well as generalized energy education information for residential and small business consumers on efficient PLA products, while still continuing to prompt home and small business owners to immediately take action to participate in available PLA sub-program activities. It should also serve as a repository of information for the utilities,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

practitioners, the California Energy Commission, local government programs, and third-party programs participating in PLA sub-program.

**Conference, Seminars and Workshops**

Participation in conferences, seminars, and workshops are essential for the PLA market transformation efforts to remain up-to-date on key industry players, new technologies, and best practices to properly support PLA sub-program strategy planning. These events allow the PLA sub-program to expand the network of partners for future collaboration efforts within the energy efficiency and PLA industry. Below are few of the key conferences, seminars, workshops and meetings that PLA sub-program may participate:

- (1) CEE Program Meetings
- (2) EPA ENERGY STAR Products Partner Meeting
- (3) Consumer Electronics Show (CES)
- (4) ACEEE's National Symposium on Market Transformation
- (5) Western Regional Utilities Collaborative Quarterly Meetings

**11) Market Transformation Information:** For programs identified as market transformation programs, include the following:

**i. A summary of the market transformation objectives of the program.**

The PLA sub-program aims to transform the market to achieve sustainable adoption of energy efficient PLA products where ongoing intervention would no longer be required. For the short to mid-term time frame where energy efficiency PLA products are still not the market's default choices, the program uses incentive mechanisms, ME&O, WE&T, and strategic industry collaboration to increase availability, awareness, and adoptions of energy efficient products. For the longer-term time frame, the PLA sub-program leverages Integrated Demand Side Management (IDSM) programs to influence the development codes and standards in order to ensure the minimum required energy efficiency levels, promote "Energy Efficiency" as the preferred choice in life-style and new product purchases. The program's long-term strategy seeks to create ongoing demands for "Energy Efficiency" products and thus motivate the industry to produce and sell high energy efficient PLA products as the market standard offering.

**ii. A description of the market, including identification of the relevant market actors and the relationships among them;**

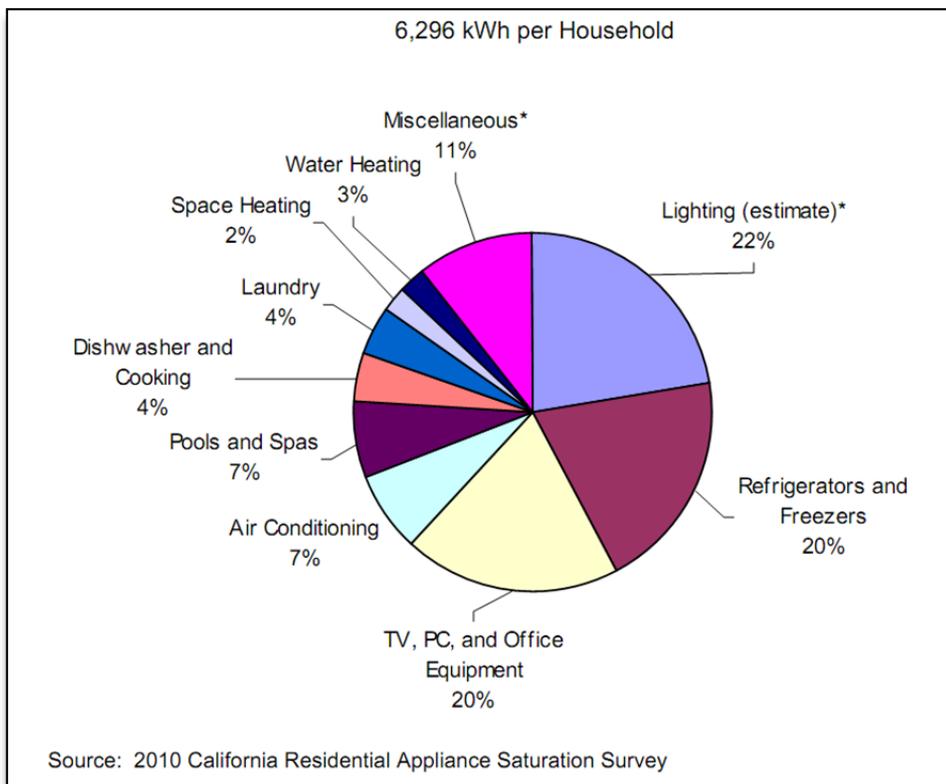

PLA markets comprise of traditional "white" goods or durable appliances such as refrigerators and washing machines, plus miscellaneous plug-load products such as consumer electronic, home office equipment and other small electronics devices requiring external power supply.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The PLA products consumes about 66% and miscellaneous plug loads (televisions, personal computers and office equipment) accounting for about 20%<sup>25</sup>. The PLA products comprise one of the largest and fastest growing end-uses of the residential sectors, dwarfing electrical loads from traditional categories such as lighting and HVAC. Clearly, these markets call for strategic interventions if we are to achieve BBEES’s 2020 vision of ZNE for new residential construction and reduction of 40% of residential purchase energy from the 2008 level.

The average annual electricity consumption in California was 6,296 kWh per household. This was an increase of approximately 6 percent compared to the 5,914 kWh per household reported in the 2003 RASS. Televisions, personal computers, and office equipment consume a 5 percent higher proportion of the total consumption compared with the results from the 2003 RASS<sup>26</sup>. Figure-3 details the breakdown of the 2009 annual household electricity consumption by end use.

**Figure-11:** 2009 annual household electricity consumption by end use

**The average annual natural gas consumption in California households was 354 therms per household based on billing data from PG&E, SDG&E, and SoCalGas.**

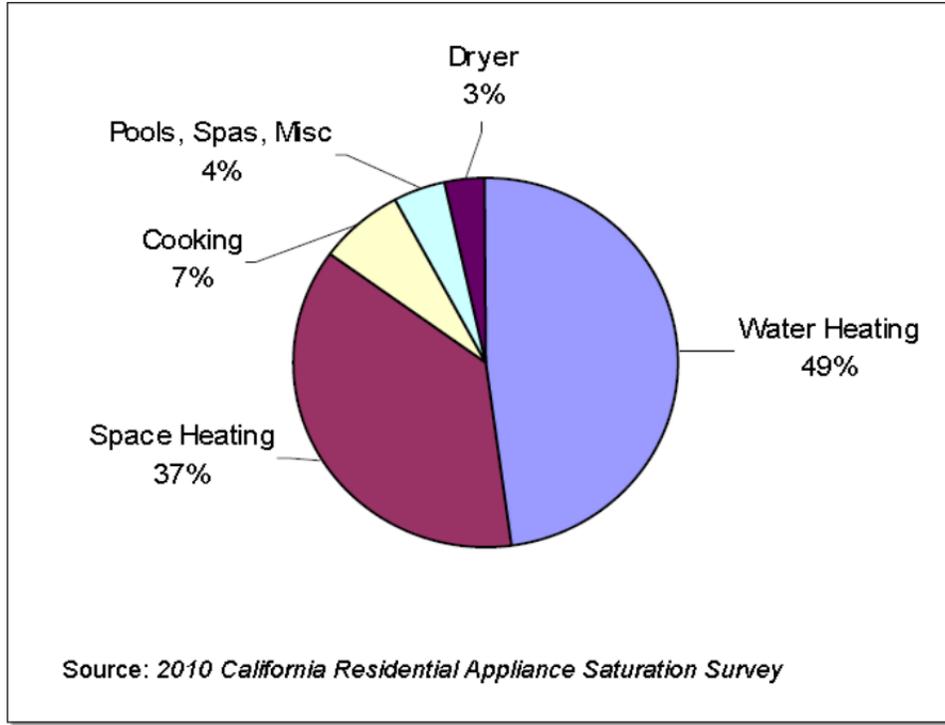

<sup>25</sup> Final Decision for the 2013-14 Transition Period at page 202

<sup>26</sup> 2009 California Residential Appliance Saturation Study at page 3

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The household natural gas UEC decreased by approximately 18 percent from the 431 therms per household reported in the 2003 RASS. Figure 3 details the breakdown of the 2009 annual household natural gas consumption by end-use. Compared to the 2003 RASS, consumption for water heating increased by 5 percent to 49 percent, whereas space heating decreased by 7 percent to 37 percent<sup>27</sup>.

**Figure-12:** 2009 Annual Household Natural Gas Consumption by End-use

**Table-B:** PLA Market Actors & Relationships

Relevant Actors	Relationships & Dynamics Among Market Actors
Product Manufacturers	<p>Develop and commercialize a family of technologies based on long-term roadmap planning. The products derived from the manufacturer’s technology roadmap are released to the markets on an annual basis with incremental new features for consumer electronics categories.</p> <p>The effective point-to-influence of manufacturers would be their technology development roadmap whereby IOUs have the opportunities to influence the manufacturers on a longer-term strategic basis.</p>

<sup>27</sup> KEMA, 2009 California Residential Appliance Saturation Study at page 9

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
Distributors	<p>Most of the appliance and electronic products reach the market through two distribution layers – manufacturers to regional distributor, and then regional distributor to local retailers. The distributor layer is an important layer that must be taken into account in the IOU’s program design.</p> <p>The distributor’s key value is to provide product inventory and logistics management on the behalf of the manufacturers and retailers. The manufacturer ideally benefits from working with a distributor as the manufacturer has fewer ship-to locations and fewer retailers to sell their product to. The distributor would break out bulk product packaging and do all the individual shipping and selling to retailers for the manufacturers.</p> <p>Similarly, the retailer ideally benefits from working with a distributor as the retailer has fewer manufacturers to work with in purchasing their products. The retailer would be able to purchase a wide range of products from different manufacturers which the distributor represents. Sometimes the distributor may even own the product inventory thus allowing the manufacturers and retailers to mitigate the financial risk of holding their own product inventories.</p> <p>The distributor has significant influences on the manufacturers and retailers. The distributor would be very selective in which manufacturers to represent, which products to carry in their inventories, and which retailers they would sell to. They look for assurance that the represented products would have high sales volume based on the evaluation of the brand’s marketing strength, brand advertising and other market data.</p> <p>The IOUs, representing large regional markets, could work together to exert coordinated influence on the distributor. This in turn would make it easier to the IOUs to convince the retailers to sell and manufacturers to produce products carried by their distributors.</p>
Retailer – National	Retailers serve their target customer bases with store outlets across the country. The national retailers make product purchasing decisions based on maximum sales potential to their target customer base and bulk discounts for those products.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
	<p>One of the retailer’s key objectives is to maximize the sales of their most profitable products. Therefore, the IOUs could influence the retailer’s ability to reach their key objectives through inventive program and joint promotions to generate sales uplifts.</p>
Retailer – Regional	<p>Similar to national retailer chain but operates on smaller geographical market foot print. The regional retailers sell products to their targeted customer base through store outlets located within the regional market. The regional retailers generally have less clout in influencing the manufacturers and distributors due to their lower sales volume.</p> <p>The regional retailers have similar business objectives as any other retailers, maximizing the sales by focusing on highly popular products in the markets. Therefore, the IOUs could influence the retailer’s ability to reach their key objectives through inventive program and join promotion to generate sales uplifts.</p>
Retailer – Small	<p>Most of the small retailers are privately owned and operate with one or two store outlets in local markets. Their small purchasing power does not allow them to purchase products from big distributors. As a result, the majority of small retailers join large buying groups so that they can leverage their collective buying power to compete with the larger retailers.</p> <p>Small retailers could be an effective channel for reaching small hard-to-reach markets for IOUs programs.</p>
E-commerce Retailer/Resellers	<p>E-commerce has a growing importance in the customer’s product purchasing process. The customer toggles back and forth between the traditional brick-and-mortar retailers and e-commerce sites for product research, price shopping, purchases, and post sales support.</p> <p>IOUs will explore new sales channel strategies that include the integration of traditional brick-and-mortar and e-commerce channels to facilitate ease of access to energy efficiency information; enabling customers to readily find information about energy efficient products and services, identify participating retailers in their neighborhoods, and complete on-line sign-ups to receive notification about special efficiency</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
	offerings, rebates, or incentives.
Recycle Service Provider	<p>At least 18 states have enacted landfill bans for appliances since 2000 to extend the life of the nation’s landfills, requiring private industry and public sector to implement recycling of these goods. The recycling service providers enable the customer to dispose unwanted appliances and turn recycled appliances into valuable resources manufacturing raw materials. Recycling appliances has positive impact on the environment, since some material takes four times as much energy to manufacture material from their virgin state as it does to make the same steel from recycled scraps.</p> <p>The typical services provided range from logistic arrangements to pick up of old appliances; tracking recycled items’ serial number, manufacturer, model; dismantling the appliances into various materials; glass recycling by removing all glass and create cullet to be used in remanufacturing; shredding the separated materials to reduce their size; sorting shredded material into non-ferrous metals, plastics and other distinct categories which are then bulk packed for transport; commodity sales of the recycled materials in a wide range of new products and keeping building block materials out of landfills.</p> <p>The recycle service provider works with the retailers for bulk pickup of collected turn-in old appliances from the retailers’ new appliance customers, collaborate with organization such as Utilities to pick up individual old appliances from the Utility’s customers. The bulk pickup from the retailer’s collection point is more cost effective as compare to individual pickup from multiple customer homes.</p>
Pay TV Service Providers	<p>There are nearly 22 million set-top boxes (STB) delivering paid television content to California residential markets. Nearly all of these STBs are owned and installed by approximately nine large Pay TV service providers. In 2009, set-top boxes in California homes consumed approximately 4.4 billion kilowatt-hours of electricity, which is a significant consumption load demanding a strategic approach to improving the efficiency and reducing the cost of operating these electronics relied upon by so many customers.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
	<p>These service providers have relatively strong marketing power with their customers. They have the opportunity to access a customer’s home, track STB inventory, device configuration and possibly power states of the installed devices. They would be in a unique position to provide home energy management systems through these ubiquitous set-top boxes.</p>
Contractors	<p>Contractors have significant influence on home owner’s purchase of low-touch appliances such as pool-pump/motor and water-heaters. IOUs could use midstream incentive to influence the products that the contractors carry and recommend to their customers.</p> <p>The IOUs have the opportunity to influence the contractors by providing:</p> <ol style="list-style-type: none"> <li>1. Incentives for projects installed by certified or qualified contractors would be an effective solution to ensure pool pump and motor retrofit projects be in compliance to code T20.</li> <li>2. Training either at the IOU’s Energy Centers or in conjunction within store retailer trainings on installing energy efficiency products and control system, IOUs energy efficiency programs and codes and standard relating to energy efficiency.</li> </ol>
ACEEE	<p>The American Council for an Energy-Efficient Economy (ACEEE) is a nonprofit organization founded in 1980 by researchers in the energy field that aims to advance energy efficiency policies, programs, technologies, investments, and behaviors. ACEEE carries out its mission by collaborating with government, private sectors, research institutions and other nonprofit organizations to cover energy efficiency policy and technology issues.</p>
CEE	<p>The Consortium for Energy Efficiency (CEE) is a consortium of efficiency whereby program administrators from across the U.S. and Canada who work together on common approaches to advancing efficiency. Through joining forces, the individual efficiency programs of CEE are able to partner not only with each other, but with other industries, trade associations, and government agencies. By working together with CEE, administrators leverage the effect of their funding dollars, exchange information on effective practices and, by doing so, and achieve greater energy efficiency for the public good.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
<p>Advocate Organizations</p>	<p>Non-profit organizations dedicated to advocates for various stake holder groups (end-customer, environment, manufacturers, etc.) and at time exert influences on California’s energy policies making process and California IOUs activities. Examples of such organizations in California would be Natural Resources Defense Council (NRDC) and Division of Ratepayer Advocates (DRA).</p> <p>NRDC is an effective environmental action group, combining the grassroots power of 1.3 million members and online activists with the courtroom clout and expertise of more than 350 lawyers, scientists and other professionals. NRDC staffs work with businesses, elected leaders, and community groups on the biggest issues we face today such as “Curbing Global Warming and Creating the Clean Energy Future”.</p> <p>The DRA is an independent consumer advocate within the California Public Utilities Commission (CPUC) that advocates solely on behalf of investor owned utility ratepayers. DRA plays a critical role in ensuring that the customers of California’s energy, water, and telecommunications utilities are represented at the CPUC and in other forums that affect how much consumers will pay for utility services and the reliability and safety of those services. Additionally, DRA supports environmental protections and seeks to ensure that utility actions comport with CPUC rules and California environmental laws. DRA actively participates in CPUC proceedings to aid the Commission in developing the record from which it will formulate its final decisions. DRA also actively lobbies decision-makers on behalf of ratepayers to ensure that the consumer perspective is heard.</p> <p>Both NRDC and DRC are active key players in California’s energy industry. They provide inputs into CPUC’s policy and rule making processes.</p>
<p>EPA ENERGY STAR</p>	<p>ENERGY STAR is a joint program of the U.S. Environmental Protection Agency and the U.S. Department of Energy helping the market to adopt energy efficient products and practices. ENERGY STAR helps customers make energy efficient choices by providing a market accepted energy performance rating system that is being used across the country</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
	<p>on hundreds of thousands of PLA products.</p> <p>ENERGY STAR works with the manufacturers, trade associations, government agencies and utilities to set energy performance rating system.</p>
EPA RAD	<p>EPA Responsible Appliance Disposal (RAD) is a voluntary partnership program that began in October 2006 by the U.S. Environmental Protection Agency to help protect the ozone layer and reduce emissions of greenhouse gases using best practices. As part of the RAD program, partners recover ozone-depleting chemicals from old refrigerators, freezers, window air conditioners, and dehumidifiers.</p> <p>EPA RAD serves as a technical clearinghouse on responsible appliance disposal program development and implementation; calculates annual and cumulative program benefits in terms of ozone-depleted savings and greenhouse gas emission savings and equivalents and, as available, potential cost savings; and provides partner recognition for achievement, such as through press releases, brochures, articles, and awards.</p> <p>EPA RAD partners include utilities, retailers, local governments, manufacturers, universities, and other interested organizations.</p>
CEC	<p>The California Energy Commission (CEC) is the state's primary energy policy and planning agency. It is responsible for promoting energy efficiency by setting the state's appliance and building efficiency standards Title-20 and Title-24 respectively. The CEC works with local government to enforce those standards. The IOUs work very closely with the CEC to develop energy efficient codes for appliances and plug-loads.</p>
Local Government	<p>In D.05-01-055, the Commission also directed the IOUs to initiate energy efficiency partnerships with local governments. Having continued this practice in the 2010-2012 portfolios, the IOUs now have two portfolio cycles and almost seven years of experience with increasing levels of local government. The IOUs continue to partner with local governments to increase the delivery of energy efficiency and enhance code compliance programs.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
Regional Utilities / IOUs	The IOUs collaborate with each other and other regional Municipality-Run-Utilities to share resources, information, and joint research projects. By working closely with each other, the IOUs seek to increase the collective negotiating power when working with PLA retailers.
Customers	End-user of residential energy efficient products and services that are provided by sales channels through IOUs' EE program intervention.  The IOUs may reference to the PLC framework to segment the customer bases for targeted intervention initiatives.

**iii. A market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies;**

Utilities face uphill battles in influencing the PLA markets due to powerful national market trends that dominate manufacturers and national retailers' choice of product offering. Other market characteristics that pose great challenges to the current product-by-product program design include: small incremental energy savings from many plug load devices resulting in product-based programs that are not cost effective for IOUs; the consumer electronics' rapid product life cycle of 6-12 months pose significant difficulties in establishing saving baselines and timely work-paper approval for individual measures; and growing trends of networked home electronics making energy savings attribution on a product-by-product basis problematic.

There are still specific product-based saving opportunities that address specific market barriers or conditions. However, the big market trends suggest a holistic market transformation approach that targets an overall reduction in plug loads and using Unit Energy Consumption (UEC) as a market transformation indicator (MTI) could be more effective in addressing the market long term barriers. In this approach, the program could rely on California Residential Appliance Saturation Survey or equivalent reports which provide forecast of plug load use in California as a basis for the measurement of program impacts. Once a forecast of plug load energy usage is established, the targets could be set for changing the UEC curve to slow its growth or even lower its intensity over time. This approach could improve flexibility in measure implementation by moving away from the work paper process and short-term cost-effectiveness requirements that hamper effective product based program design in fast-moving markets.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

The PLA sub-programs could evaluate current pilots, such as the PG&E Home Energy Centers that provide consumers with energy usage information from smart meters or SCE's proposed Power Management that provide an umbrella approach to influence the overall reduction in miscellaneous plug loads in California homes. By 2015, we expect smart chip-enabled and networked appliances to be available, and thus fueling the proliferation of more comprehensive home automation and energy management systems (i.e., Intelligent Home Network, comprehensive Home Automatic Network and etc.). These systems will help customers lower their overall energy consumption at home instead of focusing on savings per product basis. The Emerging Technology activities in the 2013-14 period will assess the enabling smart and connected PLA technologies that have the potentials to deliver not only hardware based energy savings, but also information feedback to enable broad customer's behavior savings opportunities.

On the state of recycling, the saturation level of second refrigerators and freezers has been slowly creeping up over the last decade. From the 2009 CEC Residential Appliance Saturation Study<sup>28</sup>, the second refrigerator and freezer saturation levels are up to 33% for second refrigerator and 23% for additional freezer for the statewide single family home. This is a marked increase of secondary refrigerators from the 2003 RASS results, which may have resulted from the popularity of large super-stores such as Costco and Super Wal-Mart stores in the past ten years. The large discount stores encourage large bulk food purchases, which in turn, generates the need for increased food cooling storage. The current Statewide Appliance Recycling channel offers customers the convenience of free-pickup plus small cash incentives for old working refrigerators to help minimize the return of units back to the used-appliance market as secondary refrigerators. Similarly, the IOUs work with the retailer based appliance recycling channel to offer customers the convenience of "deliver-and-haul" by hauling away the old appliance when the new one is delivered. Furthermore, the PLA sub-program supports the US EPA RAD, which eliminates the current market practice of reselling old appliances removed from customer homes during the delivery of new ones.

### **Market Actors and Their Relationship in the Markets**

Depending on the application and appliances, market actors within the supply chain may be involved in the delivery of products and services to the customers. The list of key market actors and the dynamic relationship among them is discussed in Table-B.

#### **iv. A description of the proposed intervention(s) and its/their intended results, and specify which barriers the intervention is intended to address;**

The PLA sub-program is designed with the overarching objectives of influencing the market to produce and sell high energy efficient products, customers to adopt

---

<sup>28</sup> KEMA, 2009 California Residential Appliance Saturation Study

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

energy efficient products and employ energy conservation usage behavior, and codes and standards to support minimum energy efficiency levels across all PLA product categories. The PPMs (Section 9, iv, (c)) are goal posts guiding the program’s efforts and MTIs (Section 12, vi) provide feedback on how the program progresses against the overarching objective stated above. Table-C below identifies key market barriers, and the intended market effects from the proposed intervention.

**Table-C:** Market Barriers and Market Affects from Proposed Intervention

#	Barrier	Interventions & Intended Results
1	High first cost	Applying appropriate incentive to influence the market or the customer through the appropriate stream (upstream, midstream or downstream) The intended results of this intervention are to help customers overcome the high first-cost barrier and encourage adoption of higher energy efficient products over standard offerings.
2	Lack of retailer sales staff knowledge on how to sell energy efficiency products	Providing in-store training for sales staff or associates on program guidelines and energy efficiency.  The intended results of this intervention are to increase sales sales staff’s or associates’ knowledge and increase accessibility to energy efficiency information thus enabling more effective sales efforts.
3	Lack of contractor’s awareness of energy efficiency products and code requirements	a) Providing training for contactors either at IOU’s Energy Centers or in conjunction with the in-store retailer trainings. b) Providing incentives to projects installed by certified or qualified contractors  The intended result of this intervention is to increase the contractor’s knowledge on energy efficiency. Thus enable more effective sales efforts and higher efficient installed projects.
4	Lack of customer’s knowledge on benefits of energy efficiency	a) Providing in-store demo to customers b) Enhancing in-store marketing and education materials c) Providing product information on websites and other communication channels d) Providing customer education at community out-reach events

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

#	Barrier	Interventions & Intended Results
		<p>The intended result of this intervention is to increase the customer’s knowledge on how energy efficiency benefits their lives and to impart “energy efficiency” as the preferred life style and choice in new product purchases.</p>
5	<p>Incremental savings too small to motivate customer’s behavior changes and not cost effective for IOU’s program</p>	<p>Create a holistic and flexible program to address residential plug loads as a category and develop intervention that targets an overall reduction in plug loads. It would also require an evaluation framework that assesses the overall reduction in plug loads due to multiple measures, instead of focusing on a per-product/per-measure evaluation framework.</p> <p>The intended results of this intervention is to move away from the short-term cost-effectiveness requirements and work paper process that hampers effective product based program design in fast-moving markets.</p>
6	<p>Short product life cycle for miscellaneous electronics make the establishment of baseline difficult and timely work-paper development and approval impractical</p>	<p>Same solution as above – moving toward comprehensive approach rather than focusing on per-product/per measure program.</p> <p>Targeting the same intended results as above.</p>
7	<p>Proliferation of interconnected electronics and small devices making intervention per products less efficient.</p>	<p>Same solution as above – moving toward comprehensive approach rather than focusing on per-product/per measure program.</p> <p>Targeting the same intended results as above.</p>
8	<p>National market trends dominate the PLA markets</p>	<p>Develop longer-term market transformation initiatives that seek to influence key market actors’ long-term technology development roadmap.</p> <p>This also calls for the program design and evaluation framework that address the residential plug loads as a category and develop programs that target an overall reduction in plug loads versus saving per-product/per-measure.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

#	Barrier	Interventions & Intended Results
		Targeting the same intended results as above.
9	The market is able to make more money by selling older but still working appliances to the second-hand markets as compared to permanently dispose them.	<p>Data suggests that around 11% of the customers prefer to sell their old appliances into the used appliance markets. Additionally, about 10% - 25% of old appliances picked up by the retailers are often reconditioned and put back into the used appliance market.</p> <p>Proposed Intervention to address customers that sell their old appliances to used appliance market - Provide free-pickup and downstream incentive and/or other strategies to customer who surrenders their old but still working appliances to IOUs. This strategy will win over customers who seek the most convenient way to dispose of their old appliance.</p> <p>Proposed Intervention to address retailers that sell the collected old appliance to used appliance markets:</p> <ul style="list-style-type: none"> <li>a) Provide higher midstream incentives to retailers that provide completed cradle-to-grave product life cycle management and compliance to EPA RAD</li> <li>b) Provide to customer down-stream incentives plus free-pickup of old but still working appliances</li> <li>c) Increase in-store marketing education's efforts to educate the customer about high operating cost from using old appliances.</li> </ul>
10	Customer's lack of awareness of the high energy cost in operating secondary and older appliances. This has led to the significant growth of secondary refrigerators and freezers found in homes over the last decade.	<ul style="list-style-type: none"> <li>a) Increase marketing education and outreach efforts on the high operating cost when using old and or refurbished/resold appliances.</li> <li>b) Provide free-pickup and downstream incentive and/or other incentives to customers who surrenders their secondary old but still working appliances to IOUs. This strategy will win over customers who seek the most convenient way to dispose of their old appliance.</li> </ul> <p>To reverse this trend, the IOUs are directing more focus toward retiring secondary units in the 2013-2014 Transition Period. And to better distinguish and track "primary" vs. "secondary" units, the IOUs will explore new program design logic to more clearly differentiate</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

#	Barrier	Interventions & Intended Results
		between a primary and a secondary unit. Also, this new process may require additional verification procedures to ensure the participants would demonstrate persistence of this removal and not replace the secondary unit at a later date.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- v. **A coherent program, or “market,” logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results<sup>29</sup>;**

Refer to Section 10(l) for detailed diagrams of PLA sub-program logic models that describe the relationship between the proposed interventions and their intended results.

The Principal logic model (PLA Program Logic) for the Plug Load and Appliance Program (PLA) is the governing model for the PLA program components. This program component is responsible for selecting and prioritizing new products to be introduced to incentive programs as well as for judging when markets for products currently in incentive programs have been transformed so that the products can be removed from incentive programs. The PLA Incentive logic model portrays the logic of the incentive program, i.e. the production aspect of the PLA program.

**PLA Program Logic**

Since the primary function of this program component is to make decisions about the entry and exit of products to and from the PLA Incentive programs, the central activity is represented in the model by the Program Decision Panel (A). The logic of the program component is that this decision panel takes information and research from many sources and makes its decisions, assures that programs are designed and tested and that they are ready as production programs. The sources that feed into and receive feedback from the Decision Panel are: Priority & goals for PLA incentive and program activities (B), market, industry, stakeholder inputs, market research, and M&E studies (C2), codes and standards (C1), and ETP inputs (D). With all of this information the decision panel facilitates solution workbooks, activity tracking workbook, and, of course, lists of new and old measures. More centrally, it oversees the education and influence of market actors and stakeholders (F), which produces collaboration and agreements (M), thus overcoming some market barriers at that level. It also causes trials and pilots to be completed (O), which also feeds into the agreements with PLA stakeholders and manufacturers. These agreements promote end user purchase and installations and recycling among participants and ultimately non-participants as well (spillover).

**PLA Incentive Program Logic**

The PLA Program Logic described above addresses the collaborations and agreements that the IOUs generate with various market actors and stakeholders, but the PLA Incentive program logic specifies these activities in more detail. The activities at this level include promotion, and outreach events, EA Universal Audit Tool (D), advertising and direct mailing and incentives (G), engaging manufacturers with upstream incentives (B), engaging retailers and distributors (C),

---

<sup>29</sup> If this logic model is the same as that requested in #10.(O), only provide once. As needed, provide a more detailed logic model emphasizing the market transformation elements of the program and/or how such elements integrate with resource acquisition elements.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

and working through professional and trade organizations to engage contractors, architects, and engineers to support best practices (F). These agreements and collaborations yield reductions in market barriers at the upstream and midstream levels so that program products will be stocked and available to customers. The direct mail, advertising, and EA UAT promote the products directly to consumers so that they will look for the products at stores, and purchase them, reflecting the overcoming of barriers sufficient to generate the initial purchase. After the initial purchase, further barriers are reduced and more purchases are envisioned, both under the program and outside of the program (spillover).

**vi. Appropriate evaluation plans and corresponding Market Transformation indicators and Program Performance Metrics based on the program logic model.**

Due to the need to comply with the Decision’s timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

**Summative evaluation - Market Effects:** The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

**Attribution:** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Prah (MT Workshop, Nov 2011) suggest that declaring the program’s strategic intent through the market transformation initiative’s theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg &Hoefgen (2009) for attributing market effects to

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual efforts, and we believe the market transformation evaluation discourse should be focused on collaboration. We will disregard MT attribution by realizing we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals and it doesn’t matter which entity contributed how much but whether, as a state with our numerous market actors, we were successful or not. The PLA sub-program’s MTI will be based on the Commission Staff’s recommendation as shown in Table-D below.

**Table-D:** PLA Market Transformation Indicators<sup>30</sup>

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

<b>Final Decision's Requirements</b>	<b>SW PLA PIP's Response</b>	<b>PLA PIP's Reference</b>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**1. Program Name: SW-CALS-MFEER**  
**Program ID: SCG 3704**  
**Program Type: Statewide Core Program**

**2. Projected Program Budget Table**

**Table 1** - reference the CalSPREE for budget details

**3. Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the CalSPREE for projected savings details

**4. Program Description**

**a) Describe program**

The Multifamily Energy Efficiency Rebate program (MFEER) is a continuation of the existing statewide program within the residential energy efficiency portfolios. In accordance with the Strategic Plan, this program advances comprehensive energy efficiency measures, including: whole house solutions, plug load efficiency, visual monitoring and displays, performance standards, local government opportunities, and DSM integration.

Historically, owners and managers of multifamily properties have been less responsive to energy efficiency efforts than other residential customers. As one of California’s largest segments, this unique market warrants additional attention and effort needed to motivate property owners and managers to actively participate in energy efficiency programs. The MFEER proposes a series of comprehensive measures designed to address systems within multifamily housing.

The MFEER offers a variety of incentives for energy efficient products and services to motivate the multifamily property owners/managers to install energy efficient products in both common and dwelling areas of multifamily complexes and common areas of mobile home parks and condominiums. An additional objective is to heighten the energy efficiency awareness of property owners/managers and tenants.

The creation of energy-efficient complexes provides benefits beyond the direct energy savings. Through the incorporation of energy efficient measures by multifamily property owners and managers, tenant behaviors can be influenced and comfort improved. The hope is that these behaviors can contribute to a virtual cycle of energy efficiency - as tenants receive upgrades that reduce their energy costs and improve comfort, they in turn recruit and mentor other tenants.

The MFEER addresses the ongoing concern with “split incentives”, where the residents are not the owners of the property, so they lack incentive to improve their energy usage.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Similarly, the property owners do not live on-site and pay higher utility expenses due to inefficient appliances, thus lack any incentive to upgrade. The MFEER is designed to drive this customer segment toward participation by offering property owners a variety of energy efficiency measures and services.

**Program Integration:** The MFEER marketing plans include print material, direct mail campaigns, print advertisement, trade show exhibitions, and presentations to related target market organizations.;

The program also links program incentives from the PLA and coordinates with the Energy Savings Assistance program Middle Income Direct Install (MIDI) Program, Multifamily Energy Upgrade California (MF EUC) Program, as well as other energy efficiency programs.

**Support for ESA Qualifying and Non-ESA- Qualifying Low Income Families:** To make property owners/managers aware of income-qualified services available to tenants, the MFEER promotes the ESA program within the customer application and outreach efforts. The MFEER will work with municipal entities to support AB811 to serve the needs of non-ESA qualifying low income families while still adhering to MFEER's program design.

**b) List measures**

Measures and services to reduce energy usage may include, but are not limited to, the following:

**Lighting**

- Screw-in CFL Reflector bulbs (ENERGY STAR-Qualified)
- Interior LED Lamps
- Interior CFL Fixtures (ENERGY STAR-Qualified)
- T5 or Lamps w/electronic ballasts
- Exterior CFL fixtures (ENERGY STAR-Qualified)
- Exterior LED lamps
- Exterior LED fixtures
- Occupancy sensors
- Photocells
- Ceiling Fans (ENERGY STAR-Qualified)
- LED Pool and Spa lighting
- Vending Machine Controls

**Building Envelope**

- High Performance Dual-Pane Windows
- Attic and/or wall insulation

**Water Heating**

- Electric storage water heaters
- Central system natural gas water heaters

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Natural gas water heater and/or boiler controllers
- Natural gas storage water heater
- Tankless water heaters

**HVAC**

- Package terminal air conditioners & heat pumps
- Unitary AC Units
- HVAC Quality Maintenance
- Brushless Fan Motor for Central AC
- Evaporative Coolers
- Programmable Thermostats
- Central natural gas furnace

**Appliances**

- Refrigerators (ENERGY STAR® Qualified)
- High-efficiency Clothes Washers
- High-efficiency Dishwasher (does not apply to SoCalGas)
- Cold Water Clothes Washers

**Pumping**

- Variable Speed Pool Pumps
- Programmable Thermostats (Common Areas only)
- Demand Control for Centralized Water Heater Recirculation Pump

Measures may be added or removed from the program as technologies evolve and market potential warrants.

**c) List Non-incentive Customer Services**

MFEER schedules training workshops to educate contractors about the benefits of the measures offered by this program and other energy efficiency programs, including the ESA program.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Multifamily Energy Efficiency Rebate Program (Resolution E-4385, Appendix A):

**Table 3 – MFEER PPM**

<b>Multifamily Energy Efficiency Rebate</b>	1. Percentage of non-lighting measure savings as compared to the total EE measures adopted in the MFEER program. (KWh for single-commodity IOU and BTU for mixed-commodity IOU.)	2a
---	--	----

**b) Market Transformation Indicators**

Resolution E-4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

**c) Program Design to Overcome Barriers**

Previous MFEER participants often state their intent to continue upgrading their complexes with energy-efficient products. Lowered energy bills and reduced maintenance efforts (e.g., changing out short-lived incandescent lamps) are economical. Below is a list of program barriers:

**Ongoing Concern with Split Incentives**

While some market barriers are the same as for other residential programs such as the HEER (described below), others are unique to the MFEER. For this program, which must deal with both owners/managers of multi-family buildings and with tenants, the split-incentive barrier is high. Any measure or appliance that is installed in the tenant dwelling area will provide benefits to the tenant while costs may go to the owner/manager. This fact implies an uphill effort to get owner/manager participation.

In alignment with California’s BBEES and EAP policy initiatives, and advanced by the Strategic Plan, the MFEER is in the unique position to overcome the split incentive barrier by serving two distinct beneficiaries of energy savings, the property owner and the tenant. MFEER design has been overcoming the split incentive barrier since the program's inception in 2002, as had its predecessor; the Residential Contractor Program did since 1999. Program design has been effective to such an extent that the majority of MFEER rebates paid were for products installed in tenant dwelling units.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**The diversity of multifamily building types makes it highly challenging to develop program delivery models, incentives and consistent packages of building upgrade measures that meet the needs of every situation.**

The multifamily sector encompasses a range of building sizes, system types and configurations of dwelling units and nonresidential areas. Because multifamily building types are so diverse, it is highly challenging to develop program delivery models, incentive programs and consistent packages of building upgrade measures that meet the needs of every situation.

In many cases, the property owner or manager's energy efficiency knowledge is limited. As such, deciphering through the variety of offered measures can prove to be challenging, and in some cases even discouraging. Additionally, in a multifamily building's lifecycle, there are specific times when it is most cost effective and convenient for the property owners/managers to make energy and green upgrades. The program needs to focus on these triggers or entry points to engage and educate customers on energy efficiency benefits.

MFEER has proven success developing an established network of professionals who are experienced in their specific trade and are effective at both marketing program availability to potential clients and installing the specific set of measures.

This network of professionals tailors their services (lighting, HVAC, appliances, etc.) to take advantage of these entry points.

**Difficult to reach due to property owners lack cohesiveness as a group and high turnover rate of property managers**

Further planning difficulties are generated by the fact that property owners/managers, in large part, are not a cohesive group. This leads to disparities and gaps in industry knowledge and poses a barrier to knowledge sharing. In addition, since on-site property managers tend to be somewhat transient, maintaining consistent contact is difficult.

The multifamily property sector consists of commercial enterprises that provide residential living spaces. In this quasi-commercial role, the property owner straddles the residential and commercial energy efficiency programs' definitions. The MFEER specifically addresses their often overlooked needs.

The desired outcome of MFEER implementation is to realize long-term energy savings through the installation of energy-efficient products in both the common areas and dwelling units of multifamily complexes and the common areas of condominium complexes and mobile home parks. Another objective is the inclusion of rented mobile homes when those park owners/managers are making replacements in common areas.

The creation of energy-efficient complexes provides benefits beyond the direct energy savings to common areas. Through the incorporation of energy efficiency measures by multifamily property owners and managers, the opinions and behaviors of tenants can be

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

influenced. These behaviors can contribute to a self-reinforcing cycle of energy efficiency responsibility throughout a complex as more knowledgeable customers install measures that can reduce the overall energy footprint, with no loss of safety or comfort.

**Issue of Affordability**

Out-of-pocket costs pose a significant participation barrier for the customer. With the exception of some of the larger property management firms, pay-back terms, no matter how favorable, are perceived as an unacceptable risk by the average customer.

**Program Integration to Overcome Barriers**

Multifamily building owners and managers find it daunting to sort through the various programs, funding and incentive options, and program requirements. To address the trend toward comprehensive solutions and to reduce the potential for lost opportunities, MFEER will integrate opportunities with other energy efficiency programs and services, such as the existing ESA program and ARP, Energy Advisor as well as the MF EUC and MIDI programs. While programs will be coordinated and integrated, their respective policies and procedures will be followed in the delivery of services. Operational efficiencies will be employed to streamline the application process and installation of measures. This unprecedented integrated approach combines market-rate and income-qualified energy efficiency measures that will benefit multifamily property owners and tenants; providing the opportunity to educate building owners on the benefits of energy efficiency and conservation efforts spanning the range of needs for the multifamily market.

This collaboration should increase participation levels for each respective program:

- The MFEER will continue to work with the ARP to promote the turn-in of inefficient (but functional) property owner-owned refrigerators. To generate interest and gain higher participation levels through joint marketing efforts, MFEER will also consider opportunities to cooperate with other energy efficiency programs or services.
- MFEER will promote the ESA program and the California Alternate Rates for Energy (CARE) program within the application by making the property owner/manager aware of the available income-qualified services for the tenants. Additional marketing efforts may include reaching tenants through direct-mail to promote services not offered under MFEER, such as the CARE electricity bill discount of 20% or more and the income-qualified refrigerator replacement.
- MFEER will coordinate with the Energy Advisor (“EA”) program to promote, and potentially develop, a survey specific to the multifamily segment that engages the property owners/managers by helping identify opportunities for saving energy and money by using MFEER and other energy efficiency programs.
- The MF EUC program seeks deeper energy savings through a comprehensive approach. The program targets property owners/managers with scheduled project

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

rehabilitation who are willing to invest in a performance-based whole-building approach. The incentives are designed to influence the implementation of comprehensive measures and therefore are based off of energy reduction achieved. As such, MFEER will guide property owners/managers with comprehensive project potential to the MF EUC program.

**d) Quantitative Program Targets**

The statewide MFEER is striving to meet the following program activity targets. The proposed targets may be modified due to funding restrictions, especially for the 2013-2014 year.

**Table 5: Proposed Program Activity Targets**

<b>Program Target</b>	<b>Program Target by 2013</b>	<b>Program Target by 2014</b>
<p>Target #1</p> <p>Direct mailing to reach 5,000 multifamily property owners/manager (SoCalGas)</p> <p>Advertising in trade journal (depended on approved marketing budget) (SoCalGas)</p> <p>Support outreach events such as trade shows (SoCalGas)</p>	<p>Complete 5,000 pieces of direct mailing,</p> <p>place monthly trade journal advertising,</p> <p>attend 2 trade shows per year</p>	<p>Same as 2013</p>
<p>Target #2</p> <p>Require 100% of program participating electrical contractors to meet licensing requirements</p>	<p>100% for 2013-2014 program cycle</p>	<p>Same as 2013</p>
<p>Target #3</p> <p>Deliver program specific communications to participating contractors</p>	<p>2 communications per year</p>	<p>Same as 2013</p>
<p>Target #4</p> <p>Continue to solicit participation from mega property management Company</p>	<p>3 per year</p>	<p>Same as 2013</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Note: The proposed activities above may be limited by program funding restrictions

**e) Advancing Strategic Plan Goals and Objectives**

In accordance with the Strategic Plan, this program advances comprehensive energy efficiency measures, including: whole-house solutions, plug-load efficiency, performance standards, leveraging of local government energy partnership opportunities, and DSM integration. As technology progresses, this program will adopt newer measures such as home energy monitoring and displays. Each of these measures works to reduce the energy and carbon footprint of multifamily dwellings and will create additional energy savings and integration opportunities through inter-program referral, data sharing, and bundling of DSM solutions across energy efficiency, DR, CSI, smart meter and other IDSM efforts.

The MFEER will support the following Strategic Plan as described below:

- 2.1.3.2. Home buyers, owners, and renovators will implement a whole-house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment, household appliances, lighting and “plug load” amenities;
- 2.1.3.3. Plug loads will be managed by developing consumer electronics and appliances that use less energy and provide tools to enable customers to understand and manage their demand; and
- 2.1.3.4. The residential lighting industry will undergo substantial transformation through the deployment of high-efficiency and high-performance lighting technologies, supported by state and national codes and standards.

The current program design does not specifically address the Energy Division's market transformation goal of having 100% of multifamily households achieve a 40% reduction in energy consumption from 2008 levels by 2020. However, the program is part of the solution to reach the multifamily transformation goal for California. A portion of the 2020 goals could be achieved through codes and standards ratcheting or by other local program's implementations. To become a market transformation program, MFEER will need to make significant changes to program design, program cost effectiveness, and many other economic feasibility issues. Furthermore, the MFEER program will need to be sensitive to the CPUC/CEC market potential studies.

## **5. Program Implementation**

**a) Statewide IOU coordination**

The MFEER offers a variety of incentives for installing qualified energy-efficiency products in existing apartment dwelling units and in the common areas of apartment and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

condominium complexes, and common areas of mobile home parks. Property owners and managers of existing residential multifamily complexes with two or more dwelling units may qualify.

**Table 6:** The MFEER offers incentives in the following forms:

- Prescribed rebates;
- Mid-stream incentives through retailers, distributors, and/or contractors; and
- Direct Installation of energy efficiency products

**i. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The MFEER statewide marketing plans include print collateral material, direct mail campaigns, print media advertisements, trade show exhibitions and presentations to related target market organizations, and leveraging with other IOU energy efficiency efforts and programs where feasible (see targets above, Table 5). The utilities may use a range of tactics such as; e-mails, flyers, on-Line marketing, direct mail, bill messaging, social media, local events, ethnic media, and other channels that suit the target audience, the message, and the resources. MFEER will also coordinate outreach activity with the ESA program, WHUP, PLA, and HVAC programs to maximize customer engagement and opportunities.

**ii. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The MFEER program will coordinate with CEC, ARB, AQMD, and other local agencies and municipalities to implement environmental programs in support of California's long term Strategic Plan and CPUC initiatives.

**iii. Similar IOU and POU programs**

The MFEER is a statewide program. Programs outside of California are implementing similar program designs (e.g., Austin Energy).

**b) Program delivery and coordination**

To motivate multifamily property owners/managers to install energy-efficient products in the common areas and dwelling units of multifamily complexes and common areas of mobile home parks and condominiums, the MFEER Program offers prescribed rebates for energy efficient products. An additional objective is to increase the energy efficiency awareness and knowledge of property owners/managers and tenants.

The program leverages an extensive network of contractors to reach property owners and property managers. In addition to these contractors, the program also makes direct outreach to larger property management companies. This network of contractors helps identify prospective properties and contact people. The contractors also help property managers develop lists of improvements that are eligible for utility incentives. When

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

ready, the contractors install the measures then often will assist the property owners/managers complete the incentive application paperwork. For marketing and outreach activities, the MFEER not only reaches out to the end users, but will also make special outreach and training sessions available to the specific trade contractors.

**i. Emerging Technologies (ET) Program**

The program collaborates with the Emerging Technologies Program in assessing energy efficiency technologies that are new and/or underutilized in the residential/multifamily market.

**ii. Codes & Standards Program**

The MFEER works with the codes and standards group to ensure that all the measures offered by the program are updated timely.

**iii. WE&T efforts**

The implementation of various training and coverage may differ for each IOU. For SCE, the energy centers traditionally did not offer classes specifically designed for the MFEER contractors and property owners. The MFEER will work with the energy centers to develop new and modify existing education and training classes for contractors and property owners, to assist in advancing the objectives of the Strategic Plan.

**iv. Program-specific marketing and outreach efforts**

The MFEER marketing plans consist of print collateral material, direct mail campaigns, print advertisement, trade show exhibitions and presentations to related target market organizations, and leveraging other IOU energy efficiency efforts and programs where feasible. Additionally, program-specific marketing and outreach activities are necessary to drive participation and attain program goals.

**v. Non-energy activities of program**

Training of contractors and outreach to large property owners are part of the program's non-energy activities.

**vi. Non-IOU programs**

The program allows cross promotion of other applicable programs, such as those of water agencies that offer rebates for clothes washers and dishwashers. Program staff will work with other utilities and groups, as appropriate, to increase program participation and savings levels.

**vii. CEC work on EPIC**

The MFEER will work with the residential program team to track the latest developments from CEC and EPIC.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

viii. **CEC work on C&S**

MFEER is very sensitive to the codes and standards that the IOUs and CEC are working on. The program will monitor these activities and incorporate any standards ratcheting as appropriate.

ix. **Non-utility market initiatives**

Along with the HEER program, MFEER supports all ENERGY STAR activities. In addition, MFEER also participates in activities with the local and national housing authorities.

c) **Best Practices**

Given the difficulty of reaching potential customers, the MFEER is designed to leverage the knowledge and contacts of its network of contractors. Given the limited marketing budget, this targeted outreach method has yielded fruitful results for the program. It also consistently helped the program in overcoming the split-incentive barrier within this segment.

This program also drives permanent change in California and achieves market transformation through the installation of ENERGY STAR qualified products, thereby reducing tenants' energy usage in apartments and also reducing property owners' energy usage in common areas.

d) **Innovation**

A key program innovation is the customer referral process, which was developed to assist property owners who own apartment buildings served by different IOUs. In this process, a property owner who is working with an IOU and owns properties served by other IOUs is automatically referred to the appropriate program managers at those IOUs. Confusion and barriers that can result when working with multiple entities is reduced since the IOUs operate identical rebate programs and use similar rebate applications.

As one of the few programs in the nation that specifically address this hard-to-serve market segment, this unique and innovative program has developed a model approach for other utilities to emulate. In addition, the program represents an innovative partnership among California utilities, demonstrating the great potential of a statewide energy efficiency program and creating processes, upon which other partnerships can build.

This program is especially innovative since multifamily property owners/managers and tenants have traditionally been unable to receive energy efficiency rebates. Some tenants qualified for the low-income programs, and before 2002, under the RCP program, a few multifamily properties received installation of CFLs, water heater controllers, and duct test and sealing. The development and implementation of the statewide MFEER has increased the participation of not only property owners/managers (for the common area energy efficient measures), but also of tenants who use approximately 80% of the energy

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

in multifamily buildings. Traditionally, this has been an untapped market. Each year that rebate funding has been available, energy savings have increased exponentially.

**e) Integrated/coordinated Demand Side Management (ISDM)**

To identify successful integration approaches and offerings, potential pilot programs and metrics, the IOUs will coordinate program efforts with the local utility integration teams and the Statewide Integration Task Force.

The MFEER program will work with ISDM initiatives to identify the best possible collaboration. The potential offer could include smart metering, load management and other services, as appropriate. The details of this collaboration will be better defined in the 2013-2014 program cycle.

**f) Integration Across Resource Types (energy, water, air quality, etc)**

The program allows for cross-promotion of other available programs, such as water companies that offer rebates for clothes washers and dishwashers. SCE agrees to investigate and implement a similar market program to make multiple resource offerings in MFEER consistent statewide. SCE and SoCalGas will identify areas of opportunity to collaborate to create a pilot program specifically for the multifamily market segment.

**g) Pilots**

**MF Audit Tool** - Pilot to target other mixed use property types such as: SF HOA common areas, Senior Living facilities and SROs (i.e. dorms), would like to consider including common areas of HOA for single-family home communities, and Single-room occupancy (SRO) facilities, such as dormitories and assisted living facilities; these are not segments currently targeted by other efforts.

**SoCalGas– MF Audit Tool:** SoCalGas will offer in coordination with the Energy Advisor Program a multi-family survey as a pilot program in 2012. This involves surveys targeted at the facility owners of apartment buildings that will focus closely and specifically on overall property efficiency. SCG will expand the survey in 2013-2014 to mixed use property types such as SF HOA common areas of condominiums and motor home parks in order to assist those hard-to-reach segments in reaching greater energy savings potential.

**h) EM&V**

The utilities plan to work with each other and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the PIPs.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

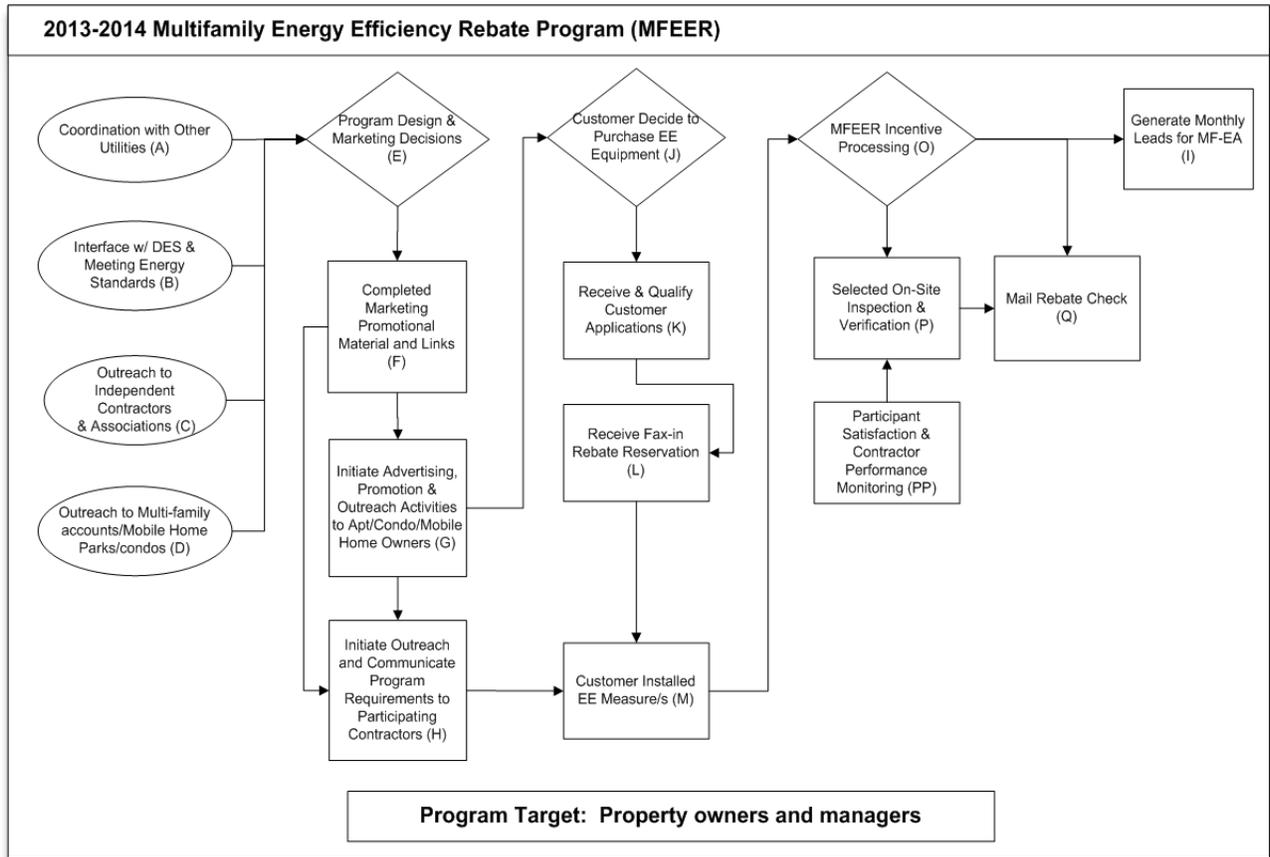

design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided below:

- Work with Energy Division to resolve market baseline and transformation issues;
- Update and repeat CLASS and RASS/RMST Appliance Tracking & Saturation studies, as appropriate;
- Conduct statewide process evaluation to assess the following:
  - i. Track the all proposed key metrics;
- Conduct SCE specific process evaluation to improve program design, implementation and market effectiveness; and
- Design an M&E study to monitor the pilot program mentioned above, especially to examine the conversion rate from multifamily EA to MFEER program participation and assess the level of participation relative to the scope of EA recommendations.

As indicated by the Itron Final Report: Scenario Analysis to Support Updates to the CPUC Savings Goals, 3/2007, the residential sector (single family and multifamily) will be expected to deliver a significant portion of California's energy savings in nearly all scenarios. The statewide MFEER program delivers a portion of the required savings and is part of the total energy efficiency strategy.

California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**8) Sub-Program Description, Objectives and Theory**

**a) Sub-Program Description and Theory:**

According to a report released by the Office of the Vice President, “homes in the United States generate more than 20 percent of our nation’s carbon dioxide emissions, making them a significant contributor to global climate change.”<sup>33</sup> The challenge of addressing residential emissions has been a significant topic for California stakeholders and was addressed when D.09-09-047 acknowledged, “Improving the energy efficiency of all households is necessary to achieve the target outcome for the 2020 existing residential *Strategic Plan* goals.”<sup>34</sup>

The Office of the Vice President report also identifies three market barriers to comprehensive residential retrofits:

- 1) Lack of customer and contractor awareness and access to information;
- 2) Lack of access to financing; and
- 3) Lack of access to skilled workers.

A shift in market perception, both for contractors and customers, towards a whole house approach must take place to drive customer action. WHUP is designed to offer a one-stop approach to whole-house energy efficient improvements that recognize the need for customers to participate over varied timelines. To assist in the effort to overcome these problems and market barriers, WHUP for single family residences will:

- 1) Offer a statewide entry level pre-set measures based approach (*Basic Path*) and a comprehensive and flexible performance based approach (*Advanced Path*) whole house incentives to help build the home performance contracting industry and offer customers and building owners and managers an easy entry point on the path to home performance (barrier 1);
- 2) Educate customers on the house-as-a-system concept and to encourage behavior changes that increase residential energy efficiency (barrier 1);
- 3) Educate contractors on the benefits of learning how to properly sell and install whole house measures as part of coordinated WE&T efforts (barrier 1 & 3);
- 4) Offer incentives that influence customers to undertake comprehensive residential retrofits (barrier 1); and
- 5) Coordinate with relevant utility financing programs and external funding and financing mechanisms at the county, state and federal levels (barrier 2).

In addition, energy efficiency efforts for the multifamily (MF) segment must overcome a number of barriers, primarily:

- 1) Lack of knowledge regarding energy efficiency, as well as the comprehensive energy efficiency EE programs offered by IOUs;

---

<sup>33</sup> Middle Class Task Force. Council on Environmental Quality. “*Recovery Through Retrofit*.” October, 2009. Page 1.

<sup>34</sup> D. 09-09-047. Page 110.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 2) The economics of “split-incentives” where the building owner invests capital but the savings primarily benefit the tenants;
- 3) Access to investment capital and insufficient return on investment (ROI). Up-front out-of-pocket costs and extended payback periods required pose a significant participation barrier for property owners and managers;
- 4) Hassle of dealing with multiple contractors and visits required;
- 5) Time burden for tenants and owners;
- 6) Impact on rental income; and
- 7) Business policy/ profit incentive from replacing equipment on burn-out and unwillingness to negate remaining life in building components requiring capital outlay.

The *Multifamily Path* is envisioned to include a number of tactics to overcome these barriers, primarily:

- 1) To improve a property owner or manager’s energy efficiency knowledge, the *Multifamily Path* would seek to leverage comprehensive investment grade building assessments to identify potential energy efficiency opportunities. (barrier 1).
- 2) To address split incentives and cost of upgrades, the *Multifamily Path* would integrate with the existing Energy Savings Assistance Program (“ESAP”) and the Multifamily Energy Efficiency Rebate (“MFEER”) Program. This would provide comprehensive services to the building, including “low cost” or “no cost” tenant measures in conjunction with the WHUP *Multifamily Path* whole building incentives in order to maximize energy savings for the up-front investment. (barrier 2).
- 3) Incentives would assist property owners or managers with overcoming a wide array of market and financial barriers which may otherwise prevent energy efficiency upgrades (barrier 1 and 5).
- 4) Create a single point of contact that would assist the property owner or manager navigate through the incentive and retrofitting process. This approach would provide support in understanding the various program rules and assistance in determining eligibility. The property owner or manager would be guided through an easy and streamlined preliminary assessment to establish feasibility and estimate project cost for the *Multifamily Path*, with an eye toward leveraging all eligible programs. (barrier 4).
- 5) Target buildings planning on or undergoing renovation projects to limit customer time burden and lost rental income. (barrier 4 and 5).
- 6) Multifamily sector is comprised of a wide diversity of properties which can be segmented by: 1.) rental rate (low – medium – or high; and/or 2.) size of the building and also size of the company that owns or manages the building. Defining the unique concerns and needs of building owners and managers by these variables of tenant socio-economic status and ownership/management

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

structure will allow much more effective messaging and marketing communications. (barrier 1, 2, 3, 4, 7)

- 7) Statewide EE energy efficiency financing (SW Fin) which could be focused on the tenant or the common property energy agendas. This program will provide access to capital to fund investments in energy efficiency upgrades for buildings at an attractive interest rate. (barrier 2, 3, 7).

Other considerations to meet all income strata and address split incentives for property owners and tenants may include a direct install strategy, as well as prescriptive rebates through the existing MFEER Program. While programs will be coordinated and integrated, their respective policies, and procedures will be followed in the delivery of services. Efforts at operational efficiencies would be made to streamline eligibility, income verification, and installation of measures. Despite the noted barriers, the multifamily sector presents a significant opportunity for whole building energy efficiency programs with a deep energy reduction approach. A whole building offering has the potential to achieve deep energy savings because:

- 1) Building owners can leverage incentives to address common areas and systems as well as individual unit upgrades to make more cost effective improvements.
- 2) Major rehabilitation projects are common in the multifamily sector. It is theoretically more cost effective to include energy efficiency upgrades at the time of these renovation projects. These projects typically have well-financed construction budgets and broad scopes that could include energy efficiency measures.
- 3) Multifamily properties tend to be operated and maintained by professional building staff. Providing resources to building staff would theoretically would increase the odds that the building will be operated efficiently after energy upgrades are installed, perpetuating savings benefits.
- 4) Within the tenant units, the energy efficiency upgrades will often be duplicated – allowing for efficiency in bulk purchases of supplies and equipment, as well as hiring of specialized workers with less non-productive set-up/break-down and travel time.

The WHUP is a Market Transformation orientated program and is a continuing program which began in the 2010-2012 residential energy efficiency portfolio of the four California Investor Owned Utilities (IOUs) – Pacific Gas & Electric Company (PG&E), Southern California Edison (SCE), San Diego Gas & Electric Company (SDG&E) and Southern California Gas Company (SoCalGas).

As a recognized market transformation program only halfway through its second full year of statewide rollout, the WHUP is expected to be a major contributor to achieving the goals of the California Long Term Energy Efficiency Strategic Plan (*Strategic Plan*) as it relates to existing residential homes, and it faces significant

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

hurdles in customer and contractor awareness, industry and workforce development, and traditional cost effective metrics towards measuring effectiveness and success.

This Program Implementation Plan (PIP) is for the statewide WHUP that will be offered consistently across the IOU service territories. The PIP is intended to align with the goals established in the *Strategic Plan* and is a culmination of ongoing statewide efforts to design WHUP.

WHUP is designed to build customer and contractor<sup>35</sup> awareness of the house-as-a-system approach to residential retrofits and the many corresponding benefits of improving the energy savings potential and comfort of their dwelling. It promotes the idea that energy efficiency measures are most effective when taking into account interactive effects of measures.

The WHUP moves customers from a prescriptive, widget or single-measure based approach to energy efficiency to one of deeper, comprehensive energy retrofits that respect the energy efficiency loading order<sup>36</sup>, and which takes the approach that a house is a series of interdependent systems that must be considered holistically. In addition, this approach optimizes building shell (thermal boundary) provides increased comfort and indoor air quality while enabling smaller and more affordable space conditioning equipment and reduced energy use associated with space heating and cooling. The thermal boundary consists of two layers or components – air barrier and insulation – which should both be continuous as well as contiguous (in contact with each other) for optimum performance. Because of the interaction between the thermal boundary and space conditioning loads, heating or cooling system upgrades are ideally not to be performed until the building shell is optimized. Building shell and duct air sealing will be addressed in conjunction with combustion appliance safety and indoor air quality tests. Base load reduction measures involving major electrical appliances, lighting, plug loads, and demand response can be performed at any time without compromising the loading order.

Customer outreach and education efforts for the WHUP will be coordinated with other IOU Demand Side Management (DSM) program offerings (e.g. Energy Advisor, Plug Load and Appliance (PLA), Comprehensive HVAC, SmartAC and other Residential Demand Response programs, Energy Savings Assistance program, California Solar Initiative (CSI)) to leverage multiple customer touch points.

---

<sup>35</sup> A successful program recognizes the need to develop the pool of qualified home retrofit contractors (with the help of third party implementers) to engage in – and have the opportunity to profit from – performing quality work. Through comprehensive training curricula (currently available in the marketplace) broken into the key elements of a home: Building Envelope and Lighting, and Heating, Cooling and Hot Water delivery (major systems); skilled tradespersons will have the opportunity to enter the home retrofit market and grow their businesses.

<sup>36</sup> The loading order specifies improvements in the following sequence: (1) air sealing to obtain a tight building envelope; (2) insulation to complete the thermal boundary; (3) proper sizing, design, installation and commissioning of space heating and cooling systems; (4) proper sizing, design, installation, commissioning and insulation of the hot water system, including distribution; (5) efficient lighting and appliances, and demand response measures; and (6) renewables.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

For single family residences, the whole house approach of WHUP promotes two paths, a prescriptive based *Basic Path* and a comprehensive, measured *Advanced Path*. These complimentary paths will be presented to customers<sup>37</sup> as one comprehensive offering.

For multifamily buildings, building owners and managers will be able to participate in the WHUP *Multifamily Path*. WHUP will offer a consistent program model that can be contractor or rater driven and/or adopted by local governments for roll-out in their communities.

In sum, these paths will provide an ideal platform to utilize the concept of continuous energy improvement for residential customers; tracking and encouraging a logical sequence of energy improvements made by customers over time, creating an ongoing, actionable dialogue with each customer regarding their energy use.

### **WHUP *Advanced Path***

WHUP *Advanced Path* offers customers a customized path to comprehensive whole house energy efficiency that drives the customer to deep retrofits. *Advanced Path* solutions will require Participating Contractors to obtain higher levels of expertise than those who perform the *Basic Path* installations. Customers can also participate in *Advanced Path* by using a Participating Rater. The *Advanced Path* requires diagnostic “test-in” and “test-out” whole house assessments. The “test-in” assessments will generate a comprehensive work scope and the “test-out” assessments will be used to document that specified improvements have been properly sized and installed. The *Advanced Path* will build off of the pre-set measures of the *Basic Path* and:

The *Advanced Path* delivers comprehensive energy efficiency improvement packages tailored for both the home resale and home remodeling markets. The *Advanced Path* solicits, screens, and trains qualified residential repair and renovation contractors and HERS II Raters, to assemble capable contracting teams and perform whole-house diagnostics, propose a comprehensive energy efficiency improvement package, and install the improvements. The program also includes marketing activities to help educate customers on program services, and in some cases may provide additional customer leads to trained and experienced contractors. Incentives and resources for available financing options will be provided to help offset the initial homeowners cost for the energy efficiency improvements.

### **WHUP *Basic Path***

During the 2013-2014 transition cycle, the IOUs will convene interested stakeholders at the state and/or regional level to propose one or more statewide and/or regional pilot programs to explore potential changes to the *Basic Path* in order to make it more appealing to customers, particularly moderate income households.

---

<sup>37</sup> Residential customers including homeowners, renters, and multifamily properties when these services are available to them.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

WHUP *Basic Path* will offer customers and contractors an easy entry point on the path to home performance with a defined package of measures. Incentives will be available for customers to offset a portion of the cost of specific comprehensive retrofits. The *Basic Path* will allow customers to reduce their energy usage while increasing the energy performance of their existing homes and minimizing lost opportunities for future comprehensive retrofit options.

The *Basic Path* will also educate contractors and customers on the benefits of implementing comprehensive whole house retrofits on existing buildings that will provide systematic reductions in energy use. The *Basic Path* will help to:

- Utilize no-cost (to customer) surveys (Energy Advisor) as an entry point to identify opportunities for efficiency improvements<sup>38</sup>;
- Offer targeted marketing campaigns to engage participants that receive stand-alone EE rebates for completing qualified home improvement measures;
- Promote completion of retrofits based on preferred building science loading order;
- Offer incentives to encourage progression along a preferred approach towards comprehensive retrofits;
- Continuously engage customers over time as they progress toward a home performance approach;
- Leverage available opportunities to move customers to the *Advanced Path* by informing them about available local or third-party financing options and other complementary revitalization efforts that may be available within a particular jurisdiction;
- Offer a holistic path towards home performance by aggregating key elements of a dwelling into its core elements: building envelope and fixed lighting; heating, cooling and hot water, and appliances;
- Coordinate with communities, local governments, workforce education & training, industry organizations and allied third-parties for outreach on local retrofit and contractor training opportunities available.

---

<sup>38</sup> The Energy Advisor provides residential customers with entry-level energy surveys online, over the phone, or by mail. The surveys are not intended to serve as an audit but are meant to provide consistent messaging and an easy on-ramp to WHUP. The Energy Advisor surveys are also an ideal link between the California Solar Initiative (CSI) and EUC WHP. This synergy will be discussed later in the document.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

The WHUP *Basic Path* offers a comprehensive approach to delivering prescriptive pre-set retrofit solutions to Californians by recognizing the essential interplay and relationships between groups necessary in the delivery of a successful program.

### **SoCalGas Gas Only Whole House Retrofit Program 2013-2014**

SoCalGas will continue implementing a “gas only” Whole House Retrofit program that will service those customers that are in a municipal electric service provider territory. This enables SoCalGas to reach out to approximately 1.7 million customers who are not eligible for the joint SCE/SoCalGas Energy Upgrade California Whole House program. Due to our single fuel utility effort, we can only substantiate the therm savings for our program hence the difference in the incentive amounts from the other IOU incentives. SoCalGas will look for additional partnership opportunities with municipalities’ EE programs to maximum savings to shared customers.

SoCalGas will also continue its efforts to implement a joint program with SDG&E that would result in a shared application and single streamlined process for our contractors and the customers. Additionally, besides QA/QC shared costs, SoCalGas will look for other synergies between our programs in our joint PG&E/SoCalGas service territories (i.e.; one shared application, processing).

### ***WHUP Multifamily Path***

The vision of a WHUP *Multifamily Path* is to deliver comprehensive energy efficiency upgrades tailored to the needs of existing multifamily dwellings and their owners, tenants and management companies

The *Multifamily Path* will is envisioned to specifically target the multifamily housing (MF) retrofit market and would promote long-term energy benefits through comprehensive whole building energy efficiency retrofit measures—including building shell upgrades, high-efficiency HVAC units, central heating and cooling systems, central domestic hot water heating and other deep energy reduction opportunities. These energy efficiency measures would be identified through an investment grade assessment.

This performance-based approach would assist property owners and managers with making informed decisions, identify measures for energy savings, and to maximize energy reductions for each property owner, manager, and tenant, as applicable. The *Multifamily Path* is envisioned as a logical next step to the prescriptive based MFEER and would be coordinated with the ESA Program and MFEER to present a singular and streamlined approach for multifamily tenants, property owners and property managers, in accordance with the Strategic Plan. A key feature of the *Multifamily Path* would be a single point of contact to assist multifamily raters and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

customers and to streamline their experience. The single point of contact will recruit and assist multifamily owners and property managers to evaluate specific property and advise the program that best suits the needs of particular buildings.

This integrated approach combines market-rate and income-qualified energy efficiency measures and educates building owners on the benefits of energy efficiency and conservation efforts spanning the range of needs for the multifamily market. The *Multifamily Path* will leverage and integrate the MFEER resource components and ESA program offerings in a singular customer facing program that presents a simplified view from the customer perspective.

The *Multifamily Path* would guide multifamily customers towards deeper, comprehensive energy efficiency measures, including: whole house solutions, plug load efficiency, visual monitoring and displays, performance standards, local government opportunities, and IDSM integration. The *Multifamily Path* will support the strategies, where possible, in the Low Income Proposed Decision.

**b) Sub-Program Energy and Demand Objectives-**

**Table 6.** Projected Sub-Program Net Energy and Demand Impacts, by Calendar Year

*[Table-6 to be provided as an Excel Attachment to this PIP]*

**c) Program Non-Energy Objectives:**

**Table-16:** Non-Energy Objective

*[Table-16 to be provided as an Excel Attachment to this PIP]*

**d) Cost Effectiveness/Market Need:**

The California IOUs look forward to continue playing a leading role, in collaboration with local governments, in moving the existing residential homes market towards larger reductions in energy usage and towards the *Strategic Plan* goal of achieving 40% purchased energy reductions in all existing homes by 2020.

At this time, current market conditions and barriers are:

1. Relatively high cost of home assessments.
2. Relatively high gross costs of comprehensive energy upgrades.
3. Market unawareness of non-economic value to comprehensive energy upgrades.
4. Fledgling contracting and supporting industry for existing home energy upgrades.
5. Low consumer awareness of incentive programs and the concepts of comprehensive home energy assessments and upgrades.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

6. Lack of common home rating protocols and common vernacular for the market to assign value to homes which undergo comprehensive energy upgrades.

**The WHUP seeks to address these barriers through:**

1. Continued marketing of Energy Upgrade California and whole house concepts. (barrier 3, 5).
2. Continued contractor recruitment (at a pace aligned with demand), training and mentoring. (barrier 4, 5).
3. Continued customer uptake through WHUP incentives. (barrier 1, 2, 5).
4. Continued stakeholder outreach to address barriers. (barrier 1, 3, 4, 5,6).
5. Continued partnerships with local and state government to address barriers. (barrier 1, 2, 3, 4, 5, 6).

It will be critical to establish market transformation (MT) metrics and milestones that are in alignment with cost effective metrics that can more accurately assign cost effectiveness of resources expended towards MT goals. As the Value Proposition figure below represents, there currently is significant non-economic value being assigned by the marketplace towards whole house projects but which are not accounted for in cost effectiveness metrics currently used.

*Non-economic value can be assigned as:*

**Gross Cost – (annual savings x EUL) – (assigned increased market value of home)**

By this definition, and information regarding gross costs and savings to date, it would appear that the market currently is assigning significant non-economic value to WHUP projects. However, current cost effective metrics assign all value towards economic value related to energy savings only. Failure to align MT goals and cost effective metrics will result in inaccurate measurement of resource impacts on MT goals.

The IOUs during the 2013-2014 cycle recommend the Commission remove the WHUP from the EE portfolio cost effective analysis and to work with commission staff and relevant stakeholders to develop meaningful cost effective metrics during the 2013-2014 cycle that aligns MT goals of WHUP towards the *Strategic Plan*.

**VALUE PROPOSITION**

(Greater the Value Proposition = Faster Market Transformation and Consumer Uptake)

	Consumer Value	Consumer Costs
<b>Economic Value</b>	<ul style="list-style-type: none"> <li>• Monthly utility bill savings (kWh, kW, therm)</li> <li>• Recognized Market Value of EE home</li> </ul>	<ul style="list-style-type: none"> <li>• Gross Project Costs</li> </ul>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Non-Economic Value</b>	<ul style="list-style-type: none"> <li>• Health &amp; Comfort</li> <li>• Altruistic               <ul style="list-style-type: none"> <li>• Environment</li> <li>• National Security</li> <li>• Being part of Green Movement</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <b>Offsets:</b> <ul style="list-style-type: none"> <li>IOU Incentives</li> <li>Financing</li> </ul> </li> </ul>
	<b>Driving Up Value</b>	<b>Driving Down Costs</b>
	<ul style="list-style-type: none"> <li>• Standard Ratings where the Market can assign value</li> <li>• Higher monthly utility bills</li> </ul>	<ul style="list-style-type: none"> <li>• More Qualified Providers</li> <li>• Higher Demand</li> <li>• Streamlined Processes</li> <li>• Innovative Marketplace</li> </ul>

e) **Measure Savings/ Work Papers:**

- a. WHUP *Basic Path* utilizes deemed savings values by climate zone for building vintages pre-1979 and by climate zone post- 1979

WHUP *Advanced Path* utilizes CEC approved software (i.e. Energy Pro Res Module at the time of this PIP) for calculated project savings.

WHUP *Multifamily Path* envisions measured savings for all low-rise multi-family buildings utilizing the Energy Pro, Residential Performance Module (for Site savings calculations). For all high-rise buildings, would utilize the Non Res Module.

- b. Indicate work paper status for program measures:

**Table 4 – Work paper Status**

*[Table 4 Work paper Status to be provided as an Excel Attachment to this PIP]*

**9) Program Implementation Details**

In addition to traditional marketing efforts, the IOUs will work through service providers and vendors to engage qualified tradespersons in the crafts that they have chosen and will continue to invite input from stakeholders to further develop additional ways to meet program objectives.

One of the avenues that the IOUs plan to pursue to advance the program’s efforts to achieve deeper energy savings retrofits in homes is to build closer partnerships with

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

California's real estate industry, including via such activities such as voluntary training and outreach partnerships. Based on input already gathered from relevant stakeholder groups, experts, and Commission Staff, the IOUs plan to implement the following main areas of activities for this initiative to leverage partnerships with the real estate industry:

- 1) Training for all relevant aspects of the real estate industry and point of sale chain (real estate agents, lenders, inspectors, green/efficiency specialists, appraisers, rater's public agencies and contractors). An emphasis will be placed on training the cross-functional teams that already work together in the market, since all pieces of the process needs to be covered to be effective, especially on the financing side. The use of successful case studies will also be explored.
- 2) Driving customer demand for energy efficient homes via collaborative consumer education and outreach, using easy to understand messaging and including efforts such as the promotion of home energy improvements and "green" labeling around the time of purchase and sale of a home. This is a critical timing in the market that can be leveraged. The Joint Center for Housing Studies estimates that home buyers spend more than \$6,000 per year on home improvements in the first two years after buying homes. In subsequent years, the annual average outlay drops to \$2,500.<sup>39</sup>

A key to success for this initiative is properly aligning design with the personal and business interests of the stakeholders involved particularly the Realtors, home buyers, and sellers. While promotion of energy efficiency and green building practices is the paramount objective, the initiative would remain consistent with stakeholders' interests. By remaining stakeholder focused, the initiative aligns short-term private interests with long-term public interests.

Further details and continuous improvement of this plan will be developed by inviting additional input from an ongoing set of stakeholder collaboration discussions. Identification of appropriate regional differences and their implications to implementation will be incorporated into the plan. And short- and long-term success criteria and a periodic assessment timeline for evaluation of this initiative will be developed.

Also, during the transition cycle the IOUs will explore potential of offering pilot tests of expanding building science certifications and home evaluation and performance improvement processes beyond BPI to potentially include equivalent certifications, and home evaluation and performance improvement processes such as those through ACCA. To increase the number of qualified participating contractors and contribute to the creation of a sustainable workforce, third party program implementers will solicit and

---

<sup>39</sup> Joint Center for Housing Studies of Harvard University (2011), *The State of the Nation's Housing: 2011*, [http://www.jchs.harvard.edu/research/state\\_nations\\_housing](http://www.jchs.harvard.edu/research/state_nations_housing)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

screen qualified contractors. The program will also include marketing activities to help educate customers on program services and other activities to provide additional customer leads to trained contractors.

The program will employ a number of integrated delivery strategies:

- 1) Educate contractors and residential customers on the concept of home performance;
- 2) Coordinate with existing residential program offerings (e.g. ESA, HVAC, HEER, Energy Advisor and MFEER) within the utility portfolios;
- 3) Provide robust quality assurance and quality control protocols that encourage quality installation and drive contractors to obtain additional training and qualifications;
- 4) Provide robust EM&V feedback loops to inform program enhancements;
- 5) Integrate with marketing efforts of the broadened statewide “Energy Upgrade California” brand, when launched, and deliver complementary marketing messaging to drive customer demand and contractor participation;
- 6) Coordinate contractor training, marketing and outreach efforts with local governments, as appropriate; and
- 7) Develop an incentive structure that drives customers to undertake comprehensive residential retrofits.

**Statewide Steering Committee**

Given the ambitious market transformation goals of WHUP, it’s relatively new entrance into the IOU EE portfolio, and its challenges during the first two years of rollout, the IOUs during the 2013-2014 transition cycle are committed to providing the leadership and working with CPUC, CEC, local government staff, as well as relevant stakeholders to convene a statewide WHUP steering committee to address relevant and significant issues for adoption in the 2015 IOU program cycle.

Where feasible, necessary and relevant, the IOUs will retain the services of qualified consultants or other entities with experience in the whole house retrofit industry to assist in these efforts in the areas of research, facilitation, or other assistance as may be required. IOUs will also engage utilities, non-profits and other stakeholders who may have experience in other parts of the country in deploying whole house programs. The steering committee will as necessary to focus on the following issues on a statewide level for consideration in the 2015 program cycle:

1. Role of local governments
2. Software standards
3. Data collection standards
4. Home Assessment standards
5. Home Assessment reporting standards
6. HERS II Ratings and alignment with WHUP EE Programs

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

7. Contractor certification standards
8. QA/QC standards
9. Streamlined project reporting and programmatic best practices
10. Integration of HVAC programs
11. Engagement of California Real Estate Market
12. Future of Basic Path
13. Identification of Market Transformation Milestones and Metrics
14. Cost effectiveness metrics aligned with Market Transformation goals.
15. Long term incentive structure

a) **Timelines:**

**Table 5:** Sub-Program Milestones

*[Table-5 to be provided as an Excel Attachment to this PIP]*

b) **Geographic Scope:**

**Table 6:** Geographic Regions Where the Program Will Operate

*[Table 6 Geographic Regions to be provided as an Excel Attachment to this PIP]*

c) **Program Administration**

**Table 7:** Program Administration of Program Components

*[Table 7 to be provided as an Excel Attachment to this PIP]*

d) **Program Eligibility Requirements:**

**i. Customers:**

Single family or multi-family building customers with an active IOU account OR owners or property management firms who own or operate single family or multifamily buildings that are served by an active IOU account, may participate in WHUP provided they utilize a Participating Contractor or a Participating Rater per program guidelines.

Participating Contractors or Participating Raters shall be the single point of contact for customers and are responsible for submission of all program requirements. Participating Contractors and Participating Raters will install or ensure installation of all measures in accordance with IOU QA/QC and Measures Installation Standards guidelines in accordance with applicable contractor/ rater participation agreements.

**Table 8:** Customer Eligibility Requirements (Joint Utility Table)

*[Table 8 to be provided as an Excel Attachment to this PIP]*

**ii. Contractors/Participants:**

**Participating Contractor Requirements for Basic Path and Advanced Path**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Participating WHUP Contractors must be certified and licensed according to all applicable federal, state and local laws. Participating Contractors shall meet, and provide sufficient evidence and supporting documentation for the following minimum requirements:

1. Contractor State Licensing Board (CSLB) license in the appropriate specialty;
2. Bonding and in good standing.
3. Insurance to IOU minimum insurance standard;
4. Execution of a contractor participation agreement;
5. Completion of all utility training course requirements, including Participation Workshop and a 3-Day Basic and/or Energy Upgrade Training, Workshop, if not BPI-certified Basic or Advanced Training, as appropriate;
6. BPI-certified Building Analyst (BA) to complete Combustion Safety and Carbon Monoxide Protection and all other minimum Health and Safety Requirements specified in the BPI Technical Standards for Building Analyst Professional;
7. Ensure HVAC permits will be pulled on all work that is appropriate per local jurisdiction requirements;
8. Participating Contractors who participate in *Advanced Path* projects, must employ at least one staff person who holds an active BPI Building Analyst certification. BPI accreditation is strongly encouraged and may be required of all participating contractors at some point during the program cycle;
9. Additional IOU requirements, as appropriate.

**Participating Rater Requirements for All WHRP Paths**

Participating Energy Upgrade Raters must meet all requirements as a Participating Contractor and must be both HERS II certified and hold an active BPI Building Analyst certification or BPI MF Building Analyst certification as may be applicable. WHUP *Basic Path* and *Advanced Path* projects submitted by a Participating Rater must utilize a WHUP Participating Contractor for installation of the measures specified by the Participating Rater.

**Table 9:** Contractor/Participant Eligibility Requirements (Joint Utility Table)  
*[Table 9 to be provided as an Excel Attachment to this PIP]*

e) **Program Partners:**

a. **Manufacturer/Retailer/Distributor partners:**

**Table 10:** Manufacturer/Retailer/Distributor Partners

*[Table 10 to be provided as an Excel Attachment to this PIP]*

b. **Other key program partners:**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Table 15:** Energy Division, California Energy Commission, local governments, BPI and other standards bodies, as well as other partners  
[Table 15 to be provided as an Excel Attachment to this PIP]

f) **Measures and incentive levels:**

***Advanced Path Incentives***

Incentives for the *Advanced Path* will be paid based upon modeled site savings energy utilizing any CEC approved simulation modeling software approved by IOUs. Incentives for *Advanced Path* are designed to encourage customers to reach for deep energy savings. *Advanced Path* incentives are for both gas and electric measures provided by the customers' participating utility program.<sup>40</sup> Currently, Energy Pro simulation modeling software is the only approved software for use with WHUP. During the 2013-2014 transition cycle, the IOUs will work collaboratively with the CEC and other stakeholders to identify potential approaches to adequately broaden the allowable software under the WHUP while containing costs required for needed Commission Staff reviews.

Savings/ Participation Level: % Reduction	Incentive Amount
<i>Basic Package: 10%</i>	<i>\$1,000</i>
<b>10%</b>	<b>\$1,000</b>
<b>15%</b>	<b>\$1,500</b>
<b>20%</b>	<b>\$2,000</b>
<b>25%</b>	<b>\$2,500</b>
<b>30%</b>	<b>\$3,000</b>
<b>35%</b>	<b>\$3,500</b>
<b>40%</b>	<b>\$4,000</b>
<b>45%+</b>	<b>\$4,500</b>

<sup>40</sup> In various service territory where one of the customer's utility service provider (municipality), is not a program participant adjustments may be necessary to the incentive.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

### ***Basic Path Incentives***

The *Basic Path* customer incentive is up to \$1,000. The customer will receive the entire rebate amount as a direct result of participating in *Basic Path*. Additionally, *Basic Path* incentives will be:

- Consistent statewide;
- Lower than the *Advanced Path* incentives;
- Compatible with municipal financing options; and
- Implemented so as to leverage external funding where appropriate.

### ***Multifamily Path Incentives***

Incentives for *Multifamily Path* will be paid based upon modeled site savings energy utilizing any CEC approved simulation software approved by IOUs. Incentives will be offered on a tiered structure, paid per building on a “per dwelling unit” basis according to the total building energy savings percentage. The tiered approach will reward participants for realizing deeper savings. While a “per unit” approach enables participants to experience economies of scale with larger multifamily buildings.

### **Ten Year Stepwise Incentive Structure**

During the 2013-2014 transition period the IOUs will meet not fewer than two times with statewide stakeholders to develop a 10 year stepwise incentive structure which will be triggered at defined market transformation milestones. It is anticipated that the plan will include a defined timeline, for incentive update decisions and that incentive level changes will be updated at defined market trigger metrics associated with the number of participating homes towards the *Strategic Plan* goals. As the number of participants increases over time, incentive levels will be lowered accordingly to reset the incentive amounts.

The IOUs will invite statewide stakeholder inputs to lock in these targets prior to the start of 2015, using every 20,000 homes/dwelling units treated and decreasing incentive levels in \$250 increments as a starting point for discussion. Once the statewide target is confirmed, the IOUs will notify contractors when the program has reached 75%, 90% and 95% of the goal so contractors can plan accordingly.

**Table 11:** Summary Table of Measures, Incentive Levels and Verification Rates  
*[Table 11 to be provided as an Excel Attachment to this PIP]*

### **Permitting Requirements**

No incentives for equipment requiring a building permit shall be provided any contractor or customer without that contractor or customer certifying that s/he has complied with all permit requirements and utilized a licensed contractor.

### **Qualified Measures**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

During the transition cycle, the IOUs will work to better leverage WHUP to achieve greater energy savings from plug loads, appliances and swimming pools through:

1. Greater cross marketing of HEER and WHUP customers.
2. Work with EnergySoft to find solutions to pool pump modeling.
3. Incorporate lighting and appliance options as a more predominate feature in standard assessment reports to customers.

**Required *Basic Path* Measures Installed Per Measures Installation Standards:**

- Whole House Air Sealing
- Attic Insulation
- Duct Test and Seal
- Domestic Hot Water Pipe Insulation
- Thermostatic Shut-Off Valve
- Low-Flow Shower Head

***Advanced Path* Measures Installed Per Measures Installation Standards:**

- Attic Insulation
- Cool Roof Installation (CRRC-certified)
- Cooling System Upgrade
- Domestic Hot Water Heater Upgrade (non-solar)
- Domestic Hot Water Pipe Insulation
- Duct Insulation
- Duct Test and Seal
- Exterior Lighting Upgrade – Permanently Installed High-Efficacy
- Floor Insulation
- Heating System Upgrade
- Interior Lighting Upgrade – Permanently Installed High-Efficacy
- Low-Flow Shower Head
- Radiant Barrier Installation
- Thermostatic Shut-Off Valve
- Wall Insulation
- Whole House Fan Installation
- Whole House Air Sealing
- Window Upgrade
- Other Measures as may be modeled and allowed by IOUs per regional market needs

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Ineligible Measures**

- Screw-In Lighting Fixtures and Lamps
- Solar Domestic Hot Water Heater System
- Distributed Generation Systems - Solar PV, Fuel Cell, Wind, etc.
- Pool Pump Upgrade
- Clothes Washer Upgrade
- Clothes Dryer Upgrade
- Dishwasher Upgrade

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Multifamily Building Eligible Measures**

- Attic insulation upgrade
- Wall Insulation upgrade
- Floor insulation upgrade
- Window replacements – 2008 T-24 standard or better
- Cool roof – CRRC rated product
- Radiant barrier
- Window shading – permanent, non-retractable
- Duct Sealing - with HERS test
- A/C equipment replacement – Must meet current T-20 standard
- Furnace replacement – Must meet current T-20 standard
- Premium efficiency motors (ECM included)
- VFD controls for CHW, HW, CW pumps
- VFD controls for cooling tower fans
- Pipe insulation – From ½ inch to 1-inch, or none to 1-inch
- Controls optimization (OA reset, zone reset)
- Boiler or DHW replacement – Must meet current T-20 standard
- Insulate hot water piping – From ½-inch to 1-inch, or none to 1-inch
- DHW tank insulation
- Add VFD to circulation pump
- Update central DHW pump to demand control – From no control to demand control
- Common area lighting fixtures – high efficacy hardwired fixtures
- Dwelling unit lighting fixtures – high efficacy hardwired fixtures
- Lighting controls – Occupancy sensor, photo sensor, or dimmer switch
- Outdoor lighting retrofits – high efficacy hardwired fixtures
- ENERGY STAR Refrigerator
- ENERGY STAR Dishwasher (if a dishwasher is installed in pre-retrofit condition)

**g) Additional Services:**

**Table 12:** Additional Service

*[Table 12 to be provided as an Excel Attachment to this PIP]*

**h) Sub-Program Specific Marketing and Outreach:**

IOUs will conduct integrated as well as program-specific marketing and outreach which will be coordinated with the statewide marketing and outreach program. The utilities may use a range of tactics such as; e-mails, flyers, on-Line marketing, direct mail, bill messaging, social media, local events, ethnic media, and other channels that suit the target audience, the message, and the resources.

**Marketing, Education and Outreach plans**

**1) Objectives**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Generate greater awareness, understanding and for the whole house system concept;
- Drive response amongst qualified customers to seek out whole house projects; and
- Build demand in the marketplace for home retrofit services.

**2) Target Audiences**

WHUP marketing and outreach aims to include all stakeholders in the retrofit process, throughout the life of the program. This will help to ensure that all audiences receive consistent information and will enable a more informed dialogue about program specifics, in an effort to continuously engage stakeholders in the energy efficiency retrofit process. The initial target group is comprised of the following audiences listed below. Based on the results of the statewide market survey research.

Target Group:

- Single family residential customers in proposed targeted segments
- Multifamily residential customers
- Residential customers with a history of prior EE engagement including, but not limited to: rebates, online tool enrollment and energy audits
- Local governments, community-based organizations and other stakeholders (i.e. the realtor community)
- Efforts may target select public events and work with local earned media to publicize the program's benefits.

**3) Keys to Success**

Execution of a successful campaign that introduces customers and contractors to the benefits of comprehensive home energy efficiency retrofits will largely be dependent on funding available to support outreach to all audiences. With that in mind, following is the proposed approach and specific tactical recommendations that the IOUs aim to pursue, funding permitting:

- Continue to utilize a statewide brand and message; and a creative envelope for WHUP marketing efforts to avoid market confusion;
- Co-brand where feasible;
- Coordinate with local governments;
- Engage contractors, stakeholders and local governments in generating customer demand; and
- Provide collateral pieces to participating contractors to assist in lead generation and education;
- Employ expanded community based marketing approach; and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Use a variety of innovative marketing strategies such as time of sale assessment vouchers.

**i) Sub-Program Specific Training:**

Specific workforce development efforts supporting WHUP include the following:

- CEC/EDD: California Clean Energy Workforce Training Program Community college programs;
- Third party programs; and
- IOU training offerings (IOU trainings will serve as backup if required. IOU courses do not duplicate modules available in the marketplace but will serve backup role in the event that a market need is identified and best served by the IOU Energy Training Centers).

WHUP will be coordinated with the statewide IOU WE&T program, local government residential retrofit and contractor training programs that are tied directly to workforce education and training efforts on a state and federal level. In addition, IOU WE&T programs will continue to offer both building-block house as a system courses that educate students on the concepts that form the foundation of home retrofit programs when a needs assessment determines that these areas require attention. Those concepts include:

- Advanced house-as-a-system concepts and issues;
- Combustion and other safety training updates;
- Green building techniques applicable to the program;
- Blower Door Based Air Sealing;
- Codes and standards (Title-24) implications;
- Advanced lighting, HVAC technologies and problem solving; and
- Business training (including the enhancement of sales, marketing, training, and accounting skills).

Contractor training requirements will be based WHUP requirements and will provide contractors necessary training without sacrificing any considerations for applicable safety requirements.

Contractor recruitment efforts will be conducted primarily by third party program implementers – a model that has proven successful in statewide IOU HVAC programs in the 2010-12 program cycle. Program implementers will continue to primarily recruit contractors through:

- The network of contractors already participating in IOU HVAC, insulation and weatherization programs;
- Direct outreach through trade groups with locally active memberships;

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Workforce development departments (to target unemployed general contractors)

Program implementers will verify and enroll Participating Contractors and Raters and provide required program participation related training. Once enrolled, the Participating Contractor and Rater lists will be posted in a centralized location for customers to view. IOUs will direct customers to appropriate websites for lists of eligible Participating Contractors and Raters.

Upon completion of 2012 Energy Upgrade California process evaluations, the IOUs will convene a workshop to review workforce training needs.

j) **Sub-Program Software and/or Additional Tools:**

a. List all eligible software or similar tools required for sub-program participation.

- Energy Pro energy simulation modeling software

b. Indicate if pre and/or post implementation audits will be required for the sub-program.

Pre-implementation audit required  Yes \_\_\_ No

Post-implementation audit required  Yes \_\_\_ No

c. As applicable, indicate levels at which such audits shall be rebated or funded, and to whom such rebates/funding will be provided (i.e. to customer or contractor).

**Table 13: Post-implementation Audits**

*[Table 13 Program to be provided as an Excel Attachment to this PIP]*

k) **Sub-Program Quality Assurance Provisions:**

Payment of customer incentives will be tied to the contractor's delivery of full job required program documentation. Program implementers will randomly select a minimum of 5 percent of each participating contractor's reported retrofits for onsite job verification and review 100 percent of the job data inputs from contractors. Verifications will include homeowner interviews, intensive visual checklist inspections, and selective retesting of key items. A subset of these energy savings estimates may later be validated against the first year's after-retrofit utility bills plus climate data and homeowner interviews as needed to identify changes in other factors affecting energy use. IOUs will collaborate to develop QA/QC plans and documents that reflect statewide uniformity to the greatest extent possible. QA/ QC documents and standards will be updated regularly with contractor input and will include:

1. QA/QC Process and Protocols

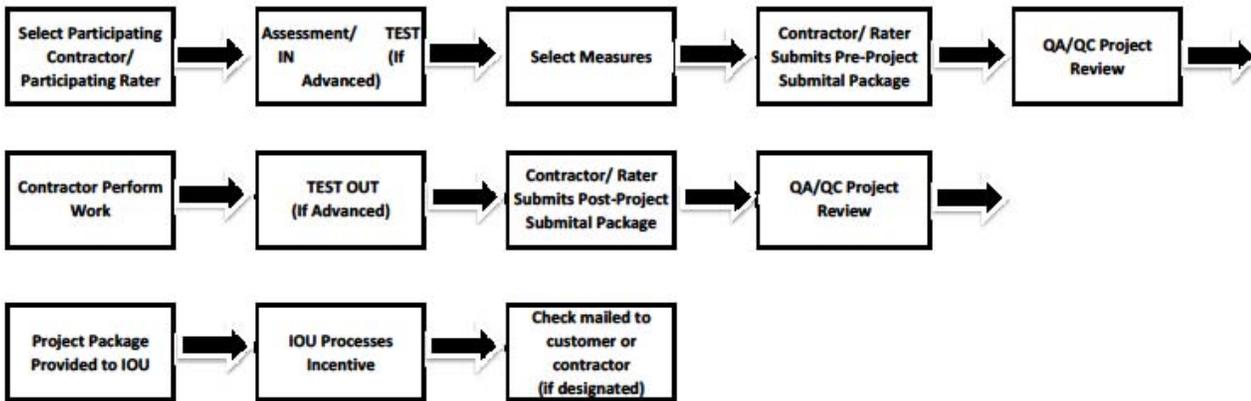

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

2. Minimum installation standards for all allowable measures
3. Emergency and Fast Track equipment replacement protocols.
  - a. Exhibit A attached includes existing and continuing IOU Emergency and Fast Track protocols.
4. Permitting requirements
  - a. WHUP shall support Heating Ventilation and Air Conditioning permit acquisition as a matter of course.
  - b. WHUP jobs involving HVAC replacement must include submittal of the HVAC permit number and a contractor certification that appropriate permits have been obtained, for inclusion in program records.

**Table 14:** Quality Assurance Provisions  
*[Table 14 to be provided as an Excel Attachment to this PIP]*

**Sub-program Process Flow Chart:**

**Whole Home Upgrade Program Process Flow**

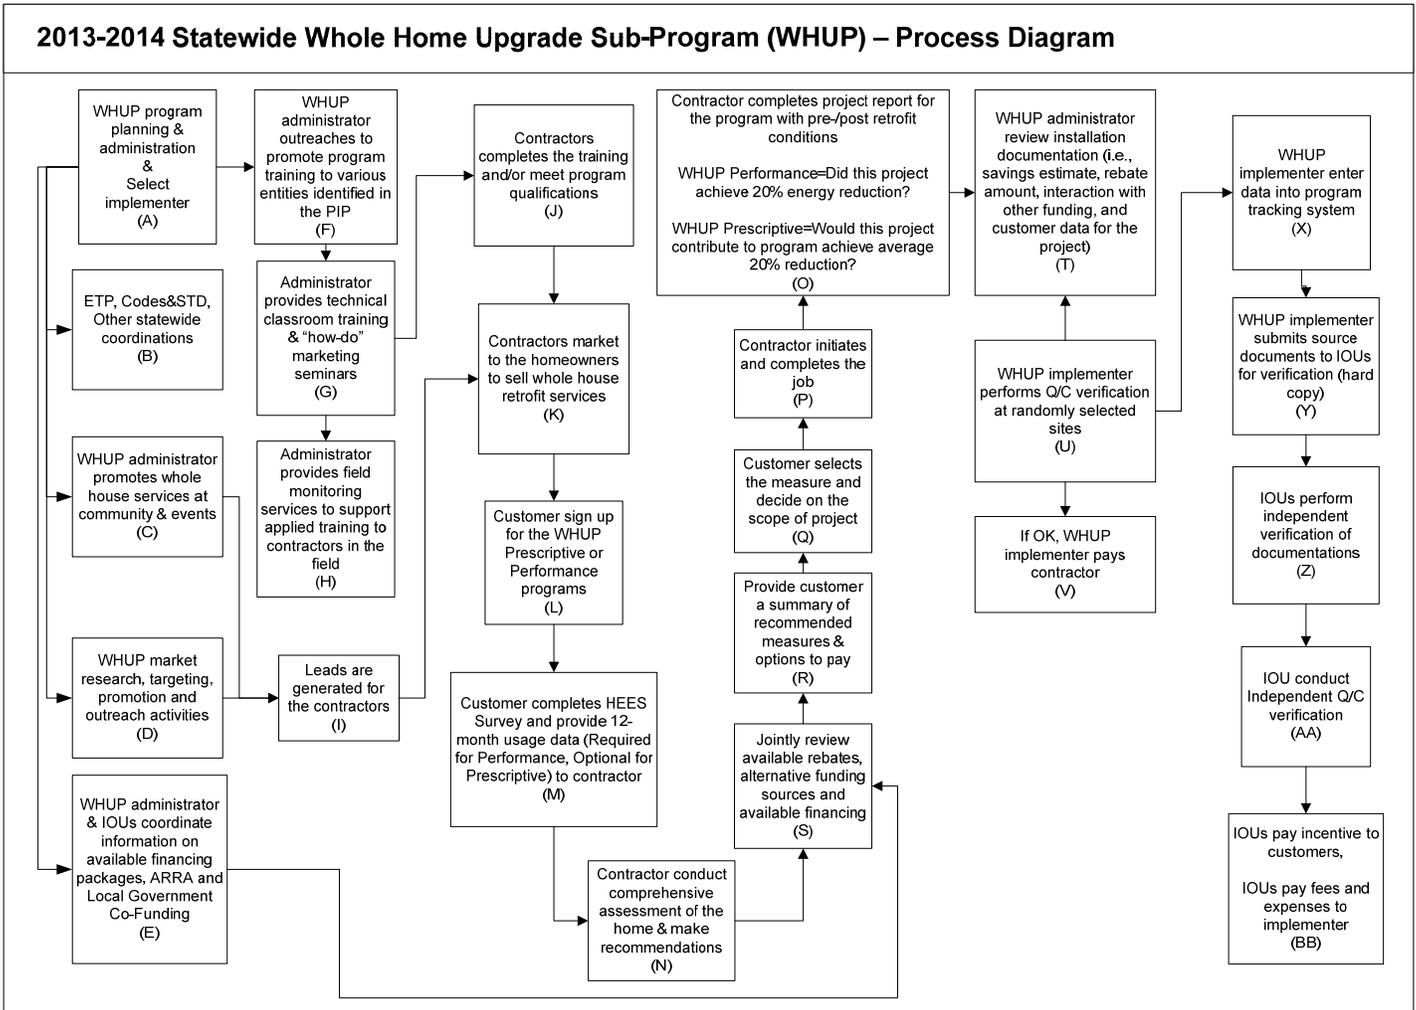

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

l) **Cross-cutting Sub-program and Non-IOU Partner Coordination:**

**Table 15:** Cross-cutting Sub-program and Non-IOU Partner Coordination  
[Table 15 to be provided as an Excel Attachment to this PIP]

m) **Logic Model:**

**10) Additional Sub-Program Information**

a) **Advancing Strategic Plan Goals and Objectives:**

The WHUP is consistent with the requirements of the *Strategic Plan*. The program addresses the Whole-House Strategy of the *Strategic Plan* by influencing contractors and customers to implement comprehensive home retrofit energy efficiency measures through either the *Basic Path* on-ramp, *Advanced Path* or *Multifamily Path*.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

WHUP responds to the need for much larger energy savings in existing homes and multifamily buildings than is possible with conventional checklist audits or single measure improvement (prescriptive) programs. WHUP addresses the key “whole house” strategy of the *Strategic Plan* by influencing “decision triggers” to improving energy efficiency and understand advantages to expand participation to reach savings goals. This program is also a vehicle to increase penetration of shell upgrades and cost effective, high efficiency appliances, water heaters and HVAC upgrades. The *Strategic Plan* further states that a similar approach must be developed for multifamily housing. The program will help to achieve the following goals identified in Section 2 of the *Strategic Plan*:

<b>Table 6. Whole House Alignment with California Long Term Energy Efficiency Strategic Plan</b>			
<b>Residential and Low Income Goal 2: Existing Homes</b>			
<b>Goal Number</b>	<b>Strategy</b>	<b>WHUP Strategy</b>	<b>Integrated Programs &amp; Activities</b>
2-1	Deploy full-scale Whole-House programs.	Monitor performance of selected lower energy homes. Design implement, monitor and continuously improve full-scale programs for whole-house energy efficiency and renewable energy retrofits.	Programs: WHUP, Solar, Demand Response, MFEER, Plug Loads, ESAP  Marketing: Customer segmentation and local coordination  EM&V: Studies to provide early feedback and establish baselines
2-2	Promote effective decision-making to create widespread demand for energy efficiency measures.	Continue to offer Energy Advisor programs online, by mail, and over-the-phone to provide customers with information to promote effective decision-making, in combination with other segment specific marketing outreach and educational activities.	Programs: Energy Advisor WHUP, MFEER  Marketing: Customer and contractor education to promote building efficiency and appropriate EE behaviors in a segmented manner
2-3	Manage research into new/advanced cost-effective innovations to reduce energy use in existing homes.	Coordinate with Emerging Technologies and other programs to integrate market-ready technologies into the Whole House offering when appropriate. Promote commercialization of home energy management tools including AMI-based	Programs: Emerging Technologies, Demand Response, Solar, and others

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

		monitoring and display tools	
2-4	Develop financial products and programs such as on-bill financing to encourage demand for energy efficiency building products, home systems, and appliances.	Ensure that customers are aware of the most effective and attractive financing packages that are available to them.	Programs: WHUP  Coordination: Local government partnerships and other state/federal financing entities
2-5	Increase Title 24 compliance through specific measures leading to aggressive statewide enforcement.	Partner with local governments to expedite the permitting process to decrease the barriers to entry in the home performance industry.	Coordination: Local government partnerships

**b) Integration**

- i. **Integrated/coordinated Demand Side Management:** As applicable, describe how sub-program will promote customer education and sub-program participation across all DSM options. Provide budget information of non-EE sub-programs where applicable.

The IOUs have identified IDSM as an important priority. The IOUs plan to monitor the progress of other IDSM efforts and to work closely to identify comprehensive integration approaches that feed into the overall statewide strategy and to implement best practices as rapidly as practical.

The statewide WHUP is a platform for integration of solutions to the residential customer and is intended to provide an easy entry point for customers and contractors that ultimately integrate other programs for whole house and customer solutions. As awareness of the cost-effective opportunities in whole house retrofits grows through training and education efforts, customers will be presented with the ability to integrate Demand Response and properly-sized onsite generation.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

With the inherent synergy that exists between the energy efficiency awareness efforts of CSI and the Whole House programs, WHUP information will be made available to IOU teams in call-centers with the intent of providing a WHUP introduction to customers or contractors interested in CSI.

Coordination with stakeholders who maintain approved solar contractor lists may also provide an opportunity to deliver the whole house message to parties interested in installing solar systems.

The statewide Energy Advisor program will also provide a unique nexus between CSI and WHUP. CSI customers are required to conduct an energy efficiency survey prior to installing solar, which presents a unique opportunity to educate customers on the benefits of improving the efficiency of their home prior to purchasing solar equipment. These efforts are expected to include, but will not be limited to:

- WHUP links and information on IOU CSI sites;
- Links to WHUP landing pages from Energy Advisor;
- Targeted messaging during and after each survey;
- Information about WHUP incentives; and
- Educational information that encourages customers to “reduce then produce.”

In addition, any contractors who work onsite with customers can provide delivery channels for DR programs information or installation of DR technology.

WHUP will also serve as a platform to integrate technology advancements in DR and Advanced Metering. IDSM efforts will be part of an ongoing conversation with customers to enhance program offerings and increase their participation in DSM efforts over time.

**Table 16:** Non-EE Sub-Program Information

*[Table 16 to be provided as an Excel Attachment to this PIP]*

- ii. **Integration across resource types** (energy, water, air quality, etc): If sub-program aims to integrate across resources types, please provide rationale and general approach.

WHUP is designed to deliver comprehensive solutions to customers while integrating across resource types to maximize customer benefits not only in terms of energy savings, but through improvements to occupant health, safety and comfort. Primarily, there are opportunities for water efficiency and indoor air quality improvements.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

One of the major benefits of comprehensive home retrofits is improved indoor air quality. Residents will notice more consistent temperatures throughout their home and in many cases, improved indoor air quality.

The embodied energy in water distribution will become an increasingly important part of utility programs. The consumer education process in the house-as-a-system approach will provide an opportunity for local governments to present customers with information on non-energy savings inherent in comprehensive retrofits.

*[This information can be found in Table 16 Non-EE Sub-Program Information to be provided as an Excel Attachment to this PIP]*

**c) Leveraging of Resources:**

Local Governments

**i. SDG&E**

Local Governments play a unique and important role in the promotion and advancement of Energy Upgrade California. Beginning in 2009, when the American Recovery and Reinvestment Act was passed and programs like the State Energy Program and the Energy Efficiency & Conservation Block Grant program, jurisdictions across the state were given the unique opportunity to make significant investments on energy programs. Because of the unique and collaborative relationship that exists among the local jurisdictions and SDG&E, and the existence of a non-resource local government partnership program, the San Diego region saw the development of a number of community focused residential retrofit programs including innovative marketing pilots, specialized workforce education & training programs, and a variety of rebate and loan programs that sought to incentivize residents to perform energy upgrades in their homes.

Over the course of the last few years, SDG&E has worked closely with each local government to ensure local programs are closely coordinated and achieve the highest level of collaboration and consistency across the region. Building off the lessons learned over the course of the last few years as well as the unique authorities afforded local governments, SDG&E and the local government program advisory group has developed the following list of key roles that local governments will play to advance Energy Upgrade California during the transition cycle.

1. Incorporate building retrofits & building occupant health and safety issues into Climate Action Plans, General Plans, and other relevant planning and long term strategy documents;

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

2. Leverage community relationships and resources to market Energy Upgrade California including targeted outreach and education to the community;
3. Provide targeted education on EUC and its benefits to key community stakeholders, business sectors and elected officials
4. Coordinate workforce education and training program activities;
5. Leverage building permit interactions to encourage WHUP enrollment and work to develop streamlined permitting process as it relates to WHUP;
6. Leverage unique authority to encourage/require building rating/audits to drive customers to EUC;
7. Pilot unique incentive programs such as point of sale audits, to encourage participation in Energy Upgrade California;
8. Work with the financing community to deploy innovative products and services to further enable residential and commercial energy upgrades throughout their jurisdictions.
9. Pilot incentives for Whole Home Energy Rating System II assessment as part of the WHUP.

Please refer to the Local Government Partnership Program PIP for budget details associated with these activities.

WHUP will coordinate IOU incentives and marketing outreach with local government efforts in neighborhood outreach and contractor recruitment. This effort allows for multiple levels of engagement that, through coordination with local entities, will reach to a neighborhood level that will drive awareness and market adoption.

**ii. PG&E**

During the development and implementation of the 2010-2012 Whole House Program PG&E partnered and coordinated closely with recipients of American Recovery Reinvestment Act (ARRA), State Energy Program (SEP), and Energy Efficiency & Conservation Block Grant (EECBG) statewide and within the PG&E service territory. In the 2013-2014 Transition Period, PG&E plans to continue to work with and leverage these partners as described in further detail in the Local Government PIP.

**iii. SoCalGas**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

SoCalGas has worked closely with local governments who received American Recovery Reinvestment Act (ARRA), State Energy Program (SEP), and Energy Efficiency & Conservation Block Grant (EECBG) in the last couple of years. This has allowed SoCalGas and local governments to achieve a high level of collaboration and consistency across the service territory. In conjunction with SCE, SoCalGas is in discussion with local governments who are interested in continuing collaboration post ARRA, SEP, and EECBG era. These discussions will determine key roles for local governments, based on lessons learned and their successful offerings from ARRA, SEP, and EECBG grants. Such activities may include:

1. Expanding existing outreach programs to the Real Estate Community
2. Leveraging existing low-interest financing
3. Drawing upon LA County's experience with FlexPath for modifications to meet the CPUC's goal for a more appealing approach.
4. Marketing and Workforce Development support for contractors

**iv. SCE**

SCE has worked closely with local governments who received American Recovery Reinvestment Act (ARRA), State Energy Program (SEP), and Energy Efficiency & Conservation Block Grant (EECBG) in the last couple of years. This has allowed SCE and local governments to achieve a high level of collaboration and consistency across the service territory. SCE is in discussion with local governments who are interested in continuing collaboration post ARRA, SEP, and EECBG era. These discussions will determine key roles for local governments, based on lessons learned and their successful offerings from ARRA, SEP, and EECBG grants. Such activities may include:

1. Expanding existing outreach programs to the Real Estate Community
2. Leveraging existing low-interest financing
3. Drawing upon LA County's experience with FlexPath for modifications to meet the CPUC's goal for a more appealing approach.
4. Marketing and Workforce Development support for contractors

**d) Trials/ Pilots:**

**1) SCE/ SoCalGas Moderate Income Direct Install-MIDI**

The Local MIDI Program will be offered by SCE and SoCalGas to eligible customers residing in single family and multifamily properties (multifamily common areas excluded) served by SCE and SoCalGas. The MIDI Program will coordinate with SCE and SoCalGas' Energy Savings Assistance program (ESAP) to deliver MIDI measures through select ESAP Contractors. ESA Program infrastructure will be used to administer the MIDI Program. When working in joint SCE/SoCalGas territory, shared contractors will offer both

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

IOU's Program measures. The MIDI Program will encourage residential owners/property managers of single family and multifamily properties to install comprehensive energy efficiency improvements.

The EUC Program traditionally requires significant financial contributions by customers who wish to participate. The MIDI Program closes the financial gap by installing no-cost measures thereby reducing the total amount of money a customer would need to invest in their property in order to participate in the SF or MF EUC Program.

SCE and SoCalGas propose:

- To implement a MIDI trial with a set goal of 1,000 units served
- Develop a scalable program design for larger rollout in future cycles.
- Evaluate delivery of MIDI Program utilizing existing ESA program infrastructure.

**a) Customer/Living Unit Eligibility**

To participate, the following guidelines must be met:

- i. participants must be income eligible (between 201% and 250% of FPG)
- ii. living unit must not have received ESAP services after January 1<sup>st</sup>, 2002
- iii. living unit must meet the current ESAP/MIDI minimum measure requirements

**b) Measures**

ESA program approved measures excluding appliances

**c) Contractors**

SCE and SoCalGas will coordinate with select experienced joint ESAP contractors to perform an assessment of the living unit, complete customer enrollment, and install measures as applicable in the MIDI Program trial.

**2) SDG&E Trial Incentives**

SDG&E may explore additional incentive trial offerings for customers who perform an HVAC QI installation as part of a scope of work. Additional trial integration offerings may include offering IHDs, PCTs, or other enabling technologies for advance path customers who achieve certain saving levels.

**11) Market Transformation Information:**

**1) Summary of the market transformation objectives of the program.**

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

The WHUP program is designed to fulfill the goals of the *Strategic Plan* by guiding and incenting home and building buyers, owners and renovators to implement a whole house approach in energy consumption undertaken in their purchase and use of existing and new homes and buildings, home and building equipment (e.g. HVAC systems), household appliances, lighting and “plug load” amenities. The target is all existing homes in an effort to realize the maximum energy efficiency potential via the delivery of a comprehensive package of cost-effective whole-house and whole-building energy efficiency retrofit measures. These programs will include building shell upgrades, high-efficiency HVAC systems – appropriately sized for the building structure, and emerging deep energy reductions in the lighting, appliance, plug-load and other residential oriented sectors. This initiative will be structured around a comprehensive audit, installation of the variety of retrofits required across the entire building structure, and access to attractive financing programs. The WHUP effort will be achieved via the parallel and coordinated efforts of the utility programs, partners and other private market actors, and the State and local government policies and programs made available. As IOUs implement a system of automatic meters and wide-area network to enable data transport, the IOUs and customers will have the opportunity to integrate additional home automatic systems and integrated energy management features into the home (i.e., interim Intelligent Home Network, comprehensive Home Automatic Network and etc.) to support IDSM integration and deployment. The Plug Load and Appliance Program will have the potential to offer not only hardware based energy savings, but also comprehensive behavior savings opportunities.

**2) Identification of the relevant market actors and the relationships among them.**

The Whole Home Upgrade program is designed to serve residential homeowners, moderate income households and property owners and managers. For the 2013-2014, the program consists of the following paths:

- *Basic Path,*
- *Advanced Path*
- *Multifamily Path*

The Whole Home Upgrade Program is a contractor lead program in that it is the local contractor who interfaces with the customer, markets and sells the concept of Whole House Retrofits, and completes the actual work. The Statewide Process Evaluation (5/1/12) revealed that 32% of participants first heard about the EUC program from a contractor. A number of Local Governments, most initially supported by CEC/ARRA funding during the 2010-12 time frame, also support the program via local marketing and incentive offerings. Coordinated on a Statewide basis – the IOUs offer consistency in program scope (to the degree possible) and a consistent marketing message.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**3) A market characterization and identification of key barriers and opportunities to advance demand-side management technologies and strategies**

**Market Characterization**

The IOUs statewide Whole House Program has initially focused on training a pool of qualified contractors available to perform these comprehensive retrofits. The number of individuals with active BPI certifications grew dramatically between January 1, 2010 and November 1, 2011. Total active certified individuals grew from 65 to 1,596. The number of certifications (individuals may have more than one type of BPI certification) grew from 88 to 2,349. The 2010-2012 PG&E and SCE Whole-House process evaluation study by SBW/ODC/ASW, produced a number of findings, including:

**Overarching program participant profile**

- The program participation is primary through the *Advanced Path* and there is little engagement in the *Basic Path* service.
- *Advanced Path* jobs report energy savings of 30% average in this first program phase.
- The average cost per job ranges from \$13,000 to \$16,000
- The utility incentives covered typically 23% to 27% of the project costs.
- Despite the large supply of program contractors, only a limited pool of larger contractors complete the majority of the projects
- Many – 44% of participants – used financing to pay for their projects.

**Contractor recruiting/training/mentoring—from SCE’s in-depth assessment**

- There are widespread contractor performance gaps despite a certification requirement (i.e., BPI).
- The current contractors’ participation training does not adequately prepare them for job processing expectations and the rigor of the QA/QC process,
- BPI certification does not guarantee a standardized job performance level
- Since the requirements for certification often vary (i.e., (1) on-line training versus in-person classes, (2) different region may place different emphasis, i.e., Vermont may focus more on heating, while California may focus more on HVAC).

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**For the targeted population—from PG&E’s in-depth market effectiveness assessment**

- 29% of the targeted population are aware of Energy Upgrade California (EUC),
- 13% of the targeted population reported seeing logo displayed,
- 3% of the targeted population have visited the website,
- 43% of the targeted population has been exposed to at least one marketing treatment from EUC.
- Among those “aware” in the targeted population, 27% first heard of the program from radio, (PG&E did not do radio ads but the local governments did), 18% from direct mail, 11% Newspaper, and 10% each for Word-of-Mouth, Internet and Television.
- Among workshop participants, word-of-mouth and events are the most effective communication channels.
- Program homeowner participants ranked “comfort”, “reduced energy bill”, “benefits of the incentive” and “home energy assessments” as important reasons for why they participated.
- Contractors report the most effective messaging in their opinion are the messages of: Comfort, Incentives, Lowering energy bills

**Market Actors:**

- Homeowners/renters & property owners/managers
- Contractors
- Realtors
- Financial Institutions
- Property Appraisers
- Local governments

**Relationship Among the Market Actors:**

The contractor community is the key actor with the WHUP. They are the program actor who outreaches personally to the owner of the building and home and communicates the concepts of approaching a building on an entire whole basis. And it is the contractor who proposes the appropriate work and completes the retrofit. The contractor provides the linkage between the WHUP and the customer who receives the rebate.

Working together, the realtor, appraisal and financial communities are market actors that can help push energy efficiency in the home resale market. Realtors can be educated to differentiate the advantages of purchasing energy efficient existing residential structures to prospective home buyers. Working with the appraisal community to perceive installed energy efficient measure in a home as monetary assets to a structure thus increasing the property’s value can be a significant push to the acceptance and importance of energy efficiency and financial institutions

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

recognizing this effort to provide exceptional financing opportunities to prospective home buyers for their investment in an energy efficient home.

Many local governments were very active in the EUC sector in the prior 2010-12 cycle as supported by ARRA funding. Some of those local government programs will be continuing on into the 2013-14 program cycle. The IOUs will continue to provide WHUP as a foundation offering to our customers, and local governments can continue to build upon these (with additional rebates) or support these with customized marketing programs. The IOUs will coordinate and partner with local governments in an effort to achieve the synergy possible between these aligned efforts.

**Opportunities to advance demand side management technologies and strategies:**

Building owners who have committed to a WHUP retrofit solution will have taken the ultimate step in applying energy efficiency technology to minimize their energy usage. They have evidenced their willingness to pursue minimizing energy usage, and are therefore self-identified as highly likely to embrace the next step(s) of demand side technologies and strategies to further minimize energy usage. So the next phase of energy reduction for the EUC retrofit customers will be the variety of demand side reduction programs that the IOUs can make available.

**Key Barriers & Opportunity for Intervention:**

The barriers for this program for the homeowner sector are the:

- (1) Relatively high cost of home assessments,
- (2) Relatively high gross costs of comprehensive energy upgrades,
- (3) Market not aware of additional non-economic values resulting from comprehensive energy upgrades,
- (4) Fledgling contracting and supporting industry for existing home energy upgrades,
- (5) Low consumer awareness of incentive subprograms and the concepts of comprehensive home energy assessments and upgrades,
- (6) Lack of common home rating protocols and common vernacular for the market to assign value to homes which undergo comprehensive energy upgrades,
- (7) The economic downturn and its impact on the residential housing sector.
- (8) Contractor awareness and access to information,
- (9) Access to financing,
- (10) Lack of access to skilled labor.

Note: Potential participants who have attended a workshop (PG&E) also explain their lack of participation in that they haven't been able to contact/find a contractor yet.

For the owners and/or managers of multifamily buildings, there are another set of barriers, closely aligned to those for private single-family homes, but different in some very important dimensions:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- (1) Lack of knowledge regarding energy efficiency as well as the comprehensive programs that are offered by the IOUs,
- (2) Challenge of the “split incentive” where it is the building owner/manager who must pay for all building improvements, including those inside of the individual rental units. But it is the tenants of the unit that pay the energy bills and therefore receive the immediate benefits of the energy efficient investment (by the landlord),
- (3) Multifamily buildings are managed as businesses, where capital for major improvements must be borrowed. But the extended ROI for most energy efficiency projects is longer than the few years that most business allow for recouping their investments,
- (4) To implement a “whole building” retrofit, the apartment owner/manager must typically bring in several specialty contractors for multiple visits, which in tenant occupied units is a very challenging task,
- (5) Tenants having to out of the rental units during retrofit work, as well as the management time required on behalf of the building owner/manager – is a costly investment of resources,
- (6) Major retrofit often can only happen when the rental unit(s) is unoccupied – which is a significant loss of income for the owner/manager,
- (7) Managed as a business – multifamily building owners/managers are not inclined to replace any major building component or energy system prior to its actual wear-out/break-down. Building retrofits usually take place toward the “end-of-life” of key components (HVAC – for example) – but not when they break-down. Building owners/managers cannot afford the impact on tenants of having key systems not functioning for any length of time.

**4) A description of proposed intervention(s) and its/their intended results**

The WHUP seeks to address these barriers for private single-family homes through:

- Continued marketing of Energy Upgrade California and whole house concepts. (Barrier 3, 5, 8)
- *Intended Results:* Increase awareness
  
- Continued contractor recruitment, training and mentoring. (Barrier 4, 5, 8, 10)
- *Intended Results:* Continue to maintain and improve the supply and quality of the contractors serving the program
  
- Expanded customer uptake through WHUP incentives. (Barrier 1, 2, 5)
- *Intended Results:* Use incentives to reduce the barrier of entry into the comprehensive retrofit projects
- Offering of Financing programs (by IOUs and/or other entities) (Barrier 1,2, 9)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- *Intended Results:* Provide building owners the upfront cash they need to borrow
- to invest in a retrofit project, and amenable loan terms by which to repay that loan (note: this program component will be particularly important in the multifamily sector).
  
- Continued stakeholder outreach to address barriers. (Barrier 1, 3, 4, 5, 6, 8, 10)
- *Intended Results:* Leverage resources outside the IOUs to address market needs
  
- Continued partnerships with local and state government to address barriers. (Barrier 1, 2, 3, 4, 5, 6, 8, 9, 10)
- *Intended Results:* Leverage local government resources to engage communities and targeted population to participate in the program

*The IOU's considered the following when determining the Program's low, medium and high scenarios for program*

<i>SoCalGas</i>					
Scenarios	2013		2014		Assumptions
	SF Homes	Budget	SF Homes	Budget	
<b>Low</b>	<b>508</b>		<b>508</b>		<ul style="list-style-type: none"> <li>· <i>ARRA sunset more challenging</i></li> <li>· <i>Competition from Local Government</i></li> <li>· <i>Further challenges with the economy</i></li> </ul>
<b>Medium</b>	725		725		<ul style="list-style-type: none"> <li>· <i>Expected program performance</i></li> </ul>
<b>High</b>	<b>870</b>		<b>870</b>		<ul style="list-style-type: none"> <li>· <i>Efficiencies and improvement in</i></li> </ul>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**5) A coherent program or “market” logic model**

The WHUP is designed to use a market transformation framework to pull in new measures and push out the mature measures. The diagram below describes this iterative process.

The Whole House Program will be serving both homeowners and property owners/managers, with the intent to coordinate its program activities with the low-income program to meet special needs. Like the other market transformation programs, the Whole House program, will work with Emerging Technology (I), Plug Load & Appliance, Residential HVAC Programs and other residential programs to leverage new and innovative technologies and applications, while pruning more mature technologies and applications from program offerings. These program interactions are described in the Whole House Program Key Support Activity Process Diagram below. These interaction and coordination decisions will be facilitated by IOUs' Decision Panel (A) as indicated in the logic model.

To reduce market barriers, the program’s activities are designed to “get the word” out about the benefits of comprehensive retrofits through both mass marketing (D) as well as ground-up individual outreach for neighborhoods and communities (C), by working with local governments and entities. To help property owners understand their energy consumption profile (E), the participants will be encouraged to use a Energy Advisor survey (E) to gauge the overall consumption profile prior to making retrofit decisions, thus respecting the load order of implementation cost effectiveness, and to engage and motivate additional behavior-oriented energy efficiency and conservation actions. To ease the financial burden of the project cost and investment, the program will make financing packages and information available to prospective participants (G).

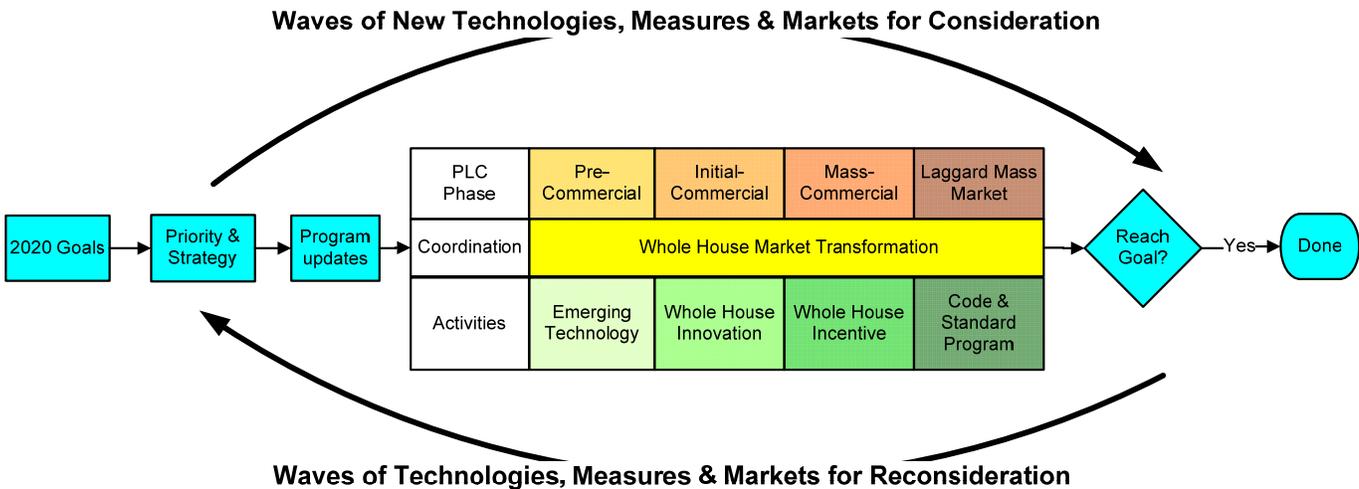

The program recognizes the importance of having a pool of qualified and competent contractors available to meet the market needs (J & O). The program offers BPI certification training as well as participating contractor ongoing training and mentoring to meet the needs of the workforce and program quality control requirements. This increase in the quality and the quantity of the labor pool, will contribute to contractors’ performing projects, outside of the program, to meet deep energy retrofit needs, leading to non-participant spillover effects (R, S & V).

The expected outcome of this program includes increased and improved awareness, knowledge and attitude (AKA) of homeowners and apartment owners towards understanding the benefits of deep energy retrofits (P). After realizing these benefits from program participation, the participant further enjoys other non-energy benefits such as improved comfort of the house and increased value of their properties. The increased value in the property will become more pronounced as the state finalizes its home rating system, so the home purchasers will be aware of the inherent value of properties complete with deep energy reduction retrofits (U). All of these benefits

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

will help the program participants to continue property improvements outside of the program and outside of the program offerings, leading to spillover effects (T). These participant and non-participant spillover effects will eventually change the overall composition of the housing stock at the market level, making housing and building code ratcheting possible for society (X & Y). These codes and standards changes will lead to further reduction of energy consumption at the market level leading to fulfilling the objectives of the California Long-Term energy and environmental policies (AA).

For the benefit of readers, the associated Program Performance Metrics (PPMs) and appropriate Market Transformation Indicators (MTIs) are identified in this logic model. Additional key program support activities are diagrammed as a process diagram for further illustration. The Whole House program will have the option to conduct additional pilots/trials to test technologies, applications or other programmatic design and marketing possibilities. The learning from those activities is expected to contribute to the program innovation and further learning.

Within this context, a decision making body, the IOUs Decision Panel, is formed to manage and guide this process. (Please refer to logic model & activities below)

**6) Appropriate evaluation plans, corresponding Market Transformation Indicators and Program Performance Metrics based on the program logic model**

Due to the need to comply with the Decision’s timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Summative evaluation:** Market Effects. The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program “spillover” and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

**Program Performance Metrics:**

*This information can be found in Table 3 PPM Information to be provided as an Excel Attachment to this PIP*

**Market Transformation Indicators:**

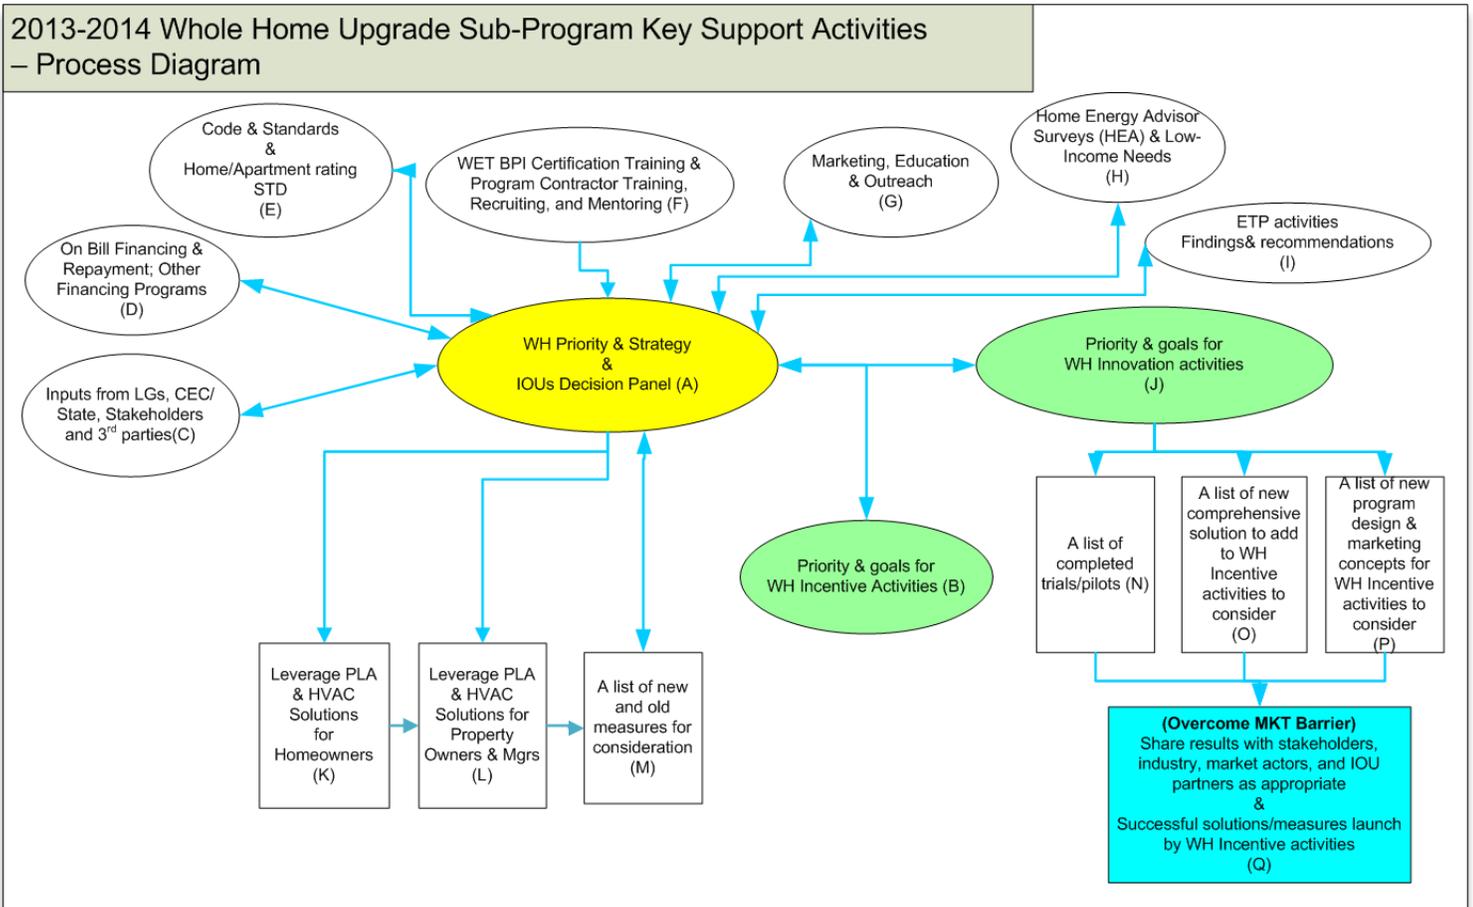

DeepRetrofit-2 The number of households that elect to perform comprehensive energy upgrades.

Market transformation indicator results shall be reported, as available, by Energy Division or the IOUs, depending upon who conducts the necessary market studies. (Res. 4385, 12/2/10)

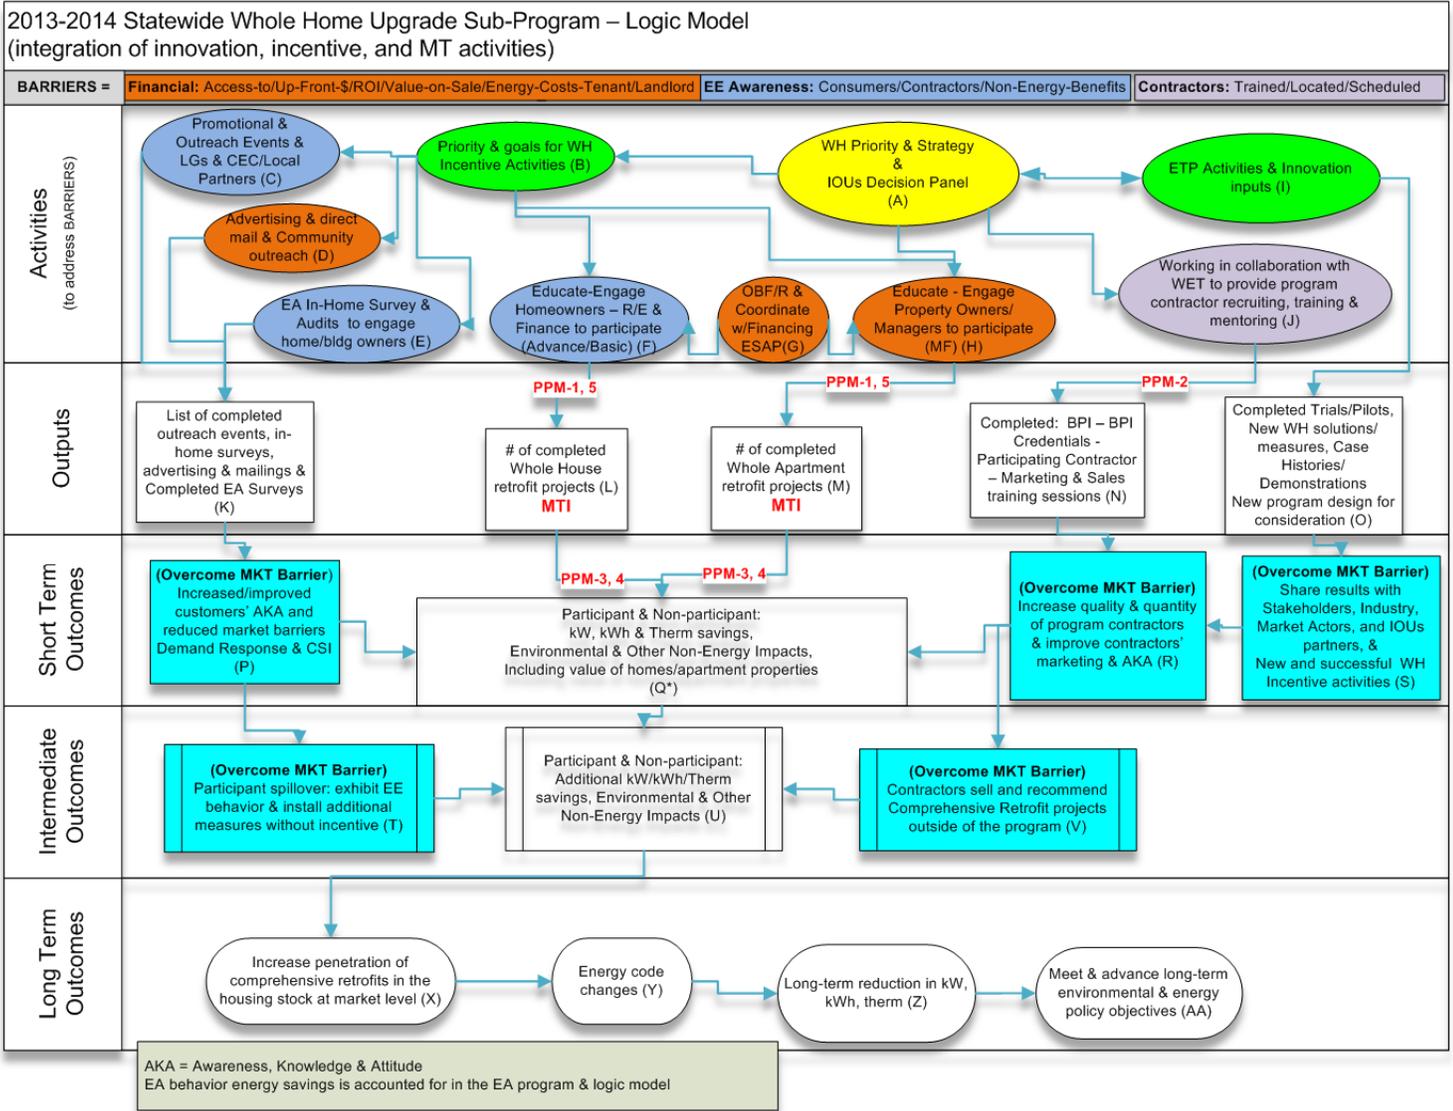

**Attribution.** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Pahl (MT Workshop, Nov 2011) suggest that declaring the program’s strategic intent through the market transformation initiative’s theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

**12) Additional information as required by Commission decision or ruling or as needed:**  
Include here additional information as required by Commission decision or ruling (As applicable. Indicate decision or ruling and page numbers):

## IOU Streamlined Emergency Replacement Protocol and Streamlined High Performing Contractor Protocol

### 1. SDG&E

#### a. Streamlined Emergency Replacement Protocol

**Per section 7 of SDG&E's QA/QC Quality Assurance and Quality Control Plan:**

7.0 Emergency Replacement of Major Systems

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 7.1 *It is recognized that there may be instances whereas immediate replacement of major systems is required due to health, safety and quality of life circumstances. In the event the customer has immediate need for equipment replacement, the QA/QC process will not interfere with a customer's ability to participate in the WHUP.*
- 7.1.1 Major systems that qualify under this provision are identified as:
- a. HVAC Systems or components
  - b. Hot water heater replacements
- 7.1.2 In the event that a contractor wishes to install a major system identified herein under the provisions of an emergency replacement, the contractor shall contact and notify the QA/QC vendor immediately of the customer's emergency situation and to request accommodation under this provision. The QA/QC provider will determine if the circumstances warrant this provision.
- a. The contractor will provide the QA/QC the customer contact information, make/model/serial numbers of existing equipment and date the replacement will be installed.
  - b. The QA/QC vendor may field-verify the equipment to be replaced.
  - c. The contractor can proceed with emergency work.
  - d. To include the emergency work as part of any WHUP project scope, contractors must follow all other procedures for participation in the WHUP program.
  - e. Any and all changes to the home prior to submitting a Pre-Retrofit Project Submittal Package shall be only for the immediate emergency need pre-approved by the QA/QC vendor and must be documented in the Pre-Retrofit Project Submittal Package.
  - f. All other project scope work outside of the approved emergency work must go through the standard QA/QC process as defined in this plan.

**b. Streamlined High Performing Contractor Protocol**

Per SDG&E's Quality Assurance and Quality Control Plan, SDG&E QA Review turnaround times are guaranteed to be 3 working days or less for both pre and post QA Review (desktop). This time period is consistent with state contracting laws concerning consumer's 72 hr. right to rescind.

Tier 3 contractors, meaning those contractors who have successfully completed a minimum of 30 projects are eligible for random QC Inspection sampling rate of 10% pre and 5% of post project submittals.

In essence this means that high performing contractors with at least 30 projects will have 90% of their pre project submittals and 95% of post project submittals reviewed within 3 working days.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**2. PG&E**

**a. Streamlined Emergency Replacement Protocol**

The following process that is already in place in 2012 serves the purpose of both an emergency replacement protocol, as well as a Fast Track process for all participating contractors in good standing.

The general policy for all equipment replacements performed within the PG&E program is that participating contractors and their subcontractors should wait for a Notice to Proceed to be issued before commencing work on a job for the program. However, in order to proceed with emergency replacements or expedited upgrades due to customer specific needs, contractors may proceed within the guidelines of this Fast Track Process. In order to be eligible for this Process, participating contractors must be active and in good standing under the PG&E program.

Upgrades may be started before the Notice to Proceed is issued if the participating contractor is confident that the job qualifies for the Program. Prior to adjusting or installing measures, the contractor must perform a comprehensive test-in, including combustion safety testing, to document the pre-existing conditions. The contractors should take pictures to document uncommon or unique situations.

Participating contractors that choose to perform work without the Notice to Proceed accept full liability that the rebate funds have not been reserved and that their customers may not be eligible.

In order to make the Fast Track Process work for participating contractors and their customers, the PG&E program recommends that the contractors do the following:

- Ask for a copy of recent PG&E bill to validate that the customer has an active account and have a clear understand the Program eligibility requirements.
- Make sure to understand how to use and model homes in EnergyPro proficiently to reduce the chance of error in rebate calculation or delayed application processing.
- If providing a rebate estimate, make it clear in the proposal that it is based on the un-validated energy model savings and may change after the quality control review process.
- Participate in the Process after completing at least 10 upgrades without desktop or field QA issues.
- Submit the application as soon as possible to ensure timely payment to the customer.

**3. SCE**

**a. Streamlined Emergency Replacement Protocol**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Southern California Edison & Southern California Gas Emergency Equipment Replacement Policy for HVAC/DHW System**

Due to the climate of Southern California, during the first few months of summer and winter there is a rise in the volume of HVAC emergency replacements driven by homeowners re-engaging their HVAC systems after periods of non-use. Participating Contractors will be involved in these replacements and they have the opportunity to inform homeowners of the additional benefits of the Program. The Emergency Equipment Replacement Policy for HVAC/DHW Systems allows homeowners to take credit for energy savings from emergency equipment replacement provided **all of the following conditions are met.**

**Eligibility**

1. The homeowner meets all mandatory *Advanced Path* program requirements as described in the Advanced Package Minimum Specifications and this Emergency Equipment Replacement Policy for HVAC/DHW Systems.
2. The space heating and/or domestic hot water system must have been 'red tagged' or deemed unsafe by the utility, service technician or building inspector; or the system has failed, cannot be repaired and must be replaced.
3. The contractor submits the completed Record of Emergency Equipment Replacement Form within the timelines indicated in the Notification/Authorization Requirements section.

**Note:** In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

**Notification/Authorization Requirements**

To submit notification and receive authorization to proceed for an eligible emergency equipment replacement, the following steps must be followed:

**Step 1: Submit for Pre-Replacement Approval**

1. The contractor is required to submit a Record of Emergency Equipment Replacement Form.
2. The contractor is required to complete Sections 1 – 4 of the Record of Emergency Equipment Replacement Form, sign and date the customer/contractor signature section, provide detailed photographic evidence of the existing equipment installed in the residence (clearly showing the area around the existing unit) to include nameplate information (make, model, serial number, etc) and then provide a scanned copy in .PDF format to [EUCA\\_Processing@icfi.com](mailto:EUCA_Processing@icfi.com).
3. Upon receipt of the completed form, ICF will provide written notification of Authorization to proceed via e-mail to the contractor within one business day (8-10 business hours).

**Step 2: Receive Authorization to Proceed**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Upon Authorization to proceed the contractor may commence installation of the new HVAC and/or DHW equipment.

**Step 3: Complete Emergency Replacement and Submit Final Paperwork**

1. Upon completion of the installation of the new equipment the contractor shall complete Section 5 of the Record of Emergency Equipment Replacement Form, sign and date the customer/contractor signature section, detailed installation invoice, and then provide a scanned copy in .PDF format to ICF ([EUCA\\_Processing@icfi.com](mailto:EUCA_Processing@icfi.com)) within five (5) business days of the new equipment installation. If measures installed exceed the scope of written authorization given, credit will not be given for those additional measures. If the paperwork is not received within those 5 business days, the final decision to allow the credit for the installed equipment will be at the sole discretion of Program Management and will not be able to be appealed.
2. The Incentive Reservation Form must be turned into the Program within 30 calendar days of Emergency Equipment Replacement Approval. Failure to do so will result in not receiving credit for installed equipment.

While age, size and efficiency of the existing system are a factor, it shall not be the sole determining factor for selection of equipment replacement. Best practices dictate that any replacement of central heating or cooling systems require submittal of a Manual J load calculation and must take into account all existing and/or proposed energy efficiency measures that will significantly impact load and allow for correct equipment sizing.

If HVAC re-ducting is required in this emergency, the pre-retrofit building simulation model will automatically use the default vintage default tables for total duct leakage. This percentage is not able to be contested, should an appeal situation arise.

**Mandatory Documentation for Emergency Space Heating Equipment Replacement**

The contractor shall provide information about the existing equipment being removed utilizing the Record of Emergency Equipment Replacement Form. At a minimum, the information collected regarding the existing space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of removal
- Reason for replacement (operational failure; health and safety)
- Manufacturer's name and model number of space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Type of venting (e.g. chimney, side vent, barometric damper)

The existing space heating equipment must be replaced with equipment meeting the Advanced Package Minimum Specifications. New gas-fired furnaces must have an Annual Fuel Utilization Efficiency (AFUE) of 92% or greater to qualify under the Emergency Replacement Policy for HVAC Equipment.

The contractor shall provide a copy of the invoice for the new space heating equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed with the new equipment installation. At a minimum, the invoice for the new space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of installation
- Manufacturer's name, model and serial number of new space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)
- Type of venting (e.g. chimney, side vent, barometric damper)

While replacing the space heating equipment, this may be an opportunity to also replace the central air conditioner with a higher efficiency model. The existing equipment must be replaced with equipment meeting the requirements listed in the Advanced Package Minimum Specifications. Contractor will need to supply the following information about both the new and existing air conditioning unit:

- Contractor's business name, address and phone number
- Date of installation
- Reason for replacement (operational failure; health and safety; Other, please explain)
- Manufacturer's name and model number of cooling equipment
- Type of system (central air, heat pump )
- Rated efficiency (SEER, HSPF), unit size, and cooling output from the nameplate

**Mandatory Documentation for Domestic Hot Water Equipment Replacement**

The existing domestic hot water system must be replaced with equipment meeting Advanced Package Minimum Specifications. In addition, new domestic hot water heaters must have an Energy Factor (EF) of 0.62 or greater, and new domestic tankless hot water heaters must have an Energy Factor (EF) of 0.82 or greater to qualify under the Emergency Equipment Replacement Policy.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The contractor shall provide a copy of the invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed with the new equipment installation. At a minimum, the invoice for the new domestic hot water equipment shall include the following:

- Manufacturer's name and model number of domestic hot water equipment
- Type of system (gas, electric )
- Rated efficiency (energy factor)
- Unit size (gallons)
- Input from the nameplate (Btu's)

**Mandatory Requirements for Emergency Equipment Replacement Approval**

Once administrative approval and written authorization to proceed is granted, the contractor may immediately install the individual measures if the following conditions are met:

1. Provide photographic evidence of the existing system installed in the residence clearly showing the area around the existing unit and detailed pictures of the existing equipment to include nameplate information (make, model, serial number, etc.).
2. The contractor shall provide a copy of the Invoice for the new space heating and/or cooling equipment and the completed Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).
3. The contractor shall provide a copy of the Invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).

In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

**b. Streamlined High Performing Contractor Protocol**

Contractors who have completed 10 Basic or 10 Advanced projects and have completed all of their field mentoring and online learning center modules with a passing score can be eligible for their projects to be sampled instead of being selected for 100% pre and post on-site inspection.

**4. SoCalGas**

**a. Streamlined Emergency Replacement Protocol**

- Contractor's business name, address and phone number
- Date of removal
- Reason for replacement (operational failure; health and safety)
- Manufacturer's name and model number of space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)
- Type of venting (e.g. chimney, side vent, barometric damper)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The existing space heating equipment must be replaced with equipment meeting the Advanced Package Minimum Specifications. New gas-fired furnaces must have an Annual Fuel Utilization Efficiency (AFUE) of 92% or greater to qualify under the Emergency Replacement Policy for HVAC Equipment.

The contractor shall provide a copy of the invoice for the new space heating equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed with the new equipment installation. At a minimum, the invoice for the new space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of installation
- Manufacturer's name, model and serial number of new space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)
- Type of venting (e.g. chimney, side vent, barometric damper)

While replacing the space heating equipment, this may be an opportunity to also replace the central air conditioner with a higher efficiency model. The existing equipment must be replaced with equipment meeting the requirements listed in the Advanced Package Minimum Specifications. Contractor will need to supply the following information about both the new and existing air conditioning unit:

- Contractor's business name, address and phone number
- Date of installation
- Reason for replacement (operational failure; health and safety; Other, please explain)
- Manufacturer's name and model number of cooling equipment
- Type of system (central air, heat pump )
- Rated efficiency (SEER, HSPF), unit size, and cooling output from the nameplate

**Mandatory Documentation for Domestic Hot Water Equipment Replacement**

The existing domestic hot water system must be replaced with equipment meeting Advanced Package Minimum Specifications. In addition, new domestic hot water heaters must have an Energy Factor (EF) of 0.62 or greater, and new domestic tankless hot water heaters must have an Energy Factor (EF) of 0.82 or greater to qualify under the Emergency Equipment Replacement Policy.

The contractor shall provide a copy of the invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

with the new equipment installation. At a minimum, the invoice for the new domestic hot water equipment shall include the following:

- Manufacturer's name and model number of domestic hot water equipment
- Type of system (gas, electric )
- Rated efficiency (energy factor)
- Unit size (gallons)
- Input from the nameplate (Btu's)

**Mandatory Requirements for Emergency Equipment Replacement Approval**

Once administrative approval and written authorization to proceed is granted, the contractor may immediately install the individual measures if the following conditions are met:

1. Provide photographic evidence of the existing system installed in the residence clearly showing the area around the existing unit and detailed pictures of the existing equipment to include nameplate information (make, model, serial number, etc.).
2. The contractor shall provide a copy of the Invoice for the new space heating and/or cooling equipment and the completed Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).
3. The contractor shall provide a copy of the Invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).

In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

**b. Streamlined High Performing Contractor Protocol**

SoCalGas follows the Home Performance with ENERGY STAR® guidelines for QA/QC protocols. Since the implementation of the SoCalGas EUC Program, SoCalGas has established an adjustable onsite inspection rate for contractors based on job experience and performance.

SoCalGas conducts onsite inspections, at set inspection rates, of the work of all participating contractors. This inspection rate is reduced as the contractor gains experience in the program and as onsite inspections show the contractor is performing at a satisfactory level per program requirements. See chart below

- a. Tier 1 Contractor- 60% onsite inspection of first five project
- b. Tier 2 Contractor- 27% onsite inspection of next 15 projects
- c. Tier 3 Contractor- 5% onsite inspection after 20th project

**4. Program Description**

a) Describe Program

The Residential HVAC Program is a Statewide program that will continue the transformation process of California’s HVAC market to ensure that:

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- The above changes lead to sustained profitability for HVAC trade allies as the business model for installing and maintaining heating and cooling systems changes from a commodity-based to a value-added service business.

The IOUs propose building towards this vision for HVAC by implementing a comprehensive set of downstream and midstream strategies that builds on existing program, education, and marketing efforts and leverages relationships within the HVAC industry to transform the market towards a sustainable, quality driven market. Through this Statewide HVAC Program and a Statewide HVAC Industry Leadership Task Force (Western HVAC Performance Alliance), we will gain a better understanding of the market response to our programs, as well as the behavioral implications of the various market participants, and then actively revise/update strategies and programs accordingly, as guided by the California Long-term Energy Efficiency Strategic Plan (Strategic Plan).

The IOUs cross-sector collaborative activities and information-sharing tools that have been developed through the 2010-2012 Statewide HVAC programs will be discontinued. These programs were distributed in the Residential, Commercial, WE&T and Emerging Technologies Statewide programs. The Quality Maintenance, Quality Installation Development, and HVAC Core (Western HVAC Performance Alliance) programs will be implemented under this Residential HVAC Subprogram.

Market transformation and direct energy savings and demand reductions will be achieved through a series of sub-programs that are described in detail and summarized below:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Residential HVAC Quality Maintenance**

Residential HVAC Quality Maintenance program represents one of the more creative aspects of the HVAC “Big Bold Energy Efficiency Strategy.” It is based on the assumption that there are energy and demand savings achievable through the regular application of quality maintenance (QM) procedures applied to existing residential HVAC equipment. This program intends to (1) quantify those potential savings and (2) develop and implement a residential maintenance program. This program will be focused on comprehensive, continuously improving O&M activities that capture energy savings and provide a high value to the end-user thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan.

**Residential HVAC Quality Installation Development**

Residential Quality Installation Development is applicable to quality installation (QI) of split or packaged HVAC systems, with a rated capacity up to 65,000 BTU/H. This Residential sub-program element is based on the assumption that energy and demand savings are achievable through the application of QI in accordance with appropriate industry standards (e.g., ACCA, SMACNA and ASHRAE) applied to new HVAC equipment.

This sub-program intends to:

- Collaborate with EM&V efforts to quantify those potential savings;
- Develop and implement a sub-program focused on comprehensive, continuously improving installation activities that capture those savings and provide a high return on investment to the end-user, thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan;
- IOU’s will continue to development in 2013. The sub-program will be developed in collaboration through stakeholder input from the HVAC industry.

For SDG&E the Quality Maintenance and Quality Installation program may be implemented by a third party through a competitive bid process for the purpose of soliciting innovative ideas and proposals for improved portfolio performance.

b) List of Measures

To achieve the market transformation desired by the Strategic Plan, a variety of appropriate financial and non-financial incentives is required to influence specific market actions. Incentives will be targeted to services including Quality Maintenance and Quality Installation Development.

**Residential HVAC Quality Maintenance**

In support of both the market transformation and the energy resource savings goals of the program, rebates are available for specific measures. The intention of these rebates is to

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

help offset the extra cost of providing a higher quality comprehensive service performed in accordance with the ACCA 4 industry standard for Quality Maintenance. Additionally, in coordination with the Emerging Technologies Program, the Residential HVAC QM program will continue to consider higher initial incentives for any HVAC emerging technologies that may be newly introduced to the market place via this program. Once the new products have taken hold in the market place, such incentives would be adjusted to reflect market conditions. The current set of measures is as follows:

**Table A – List of Residential Quality Maintenance Measures**

<b>Measure</b>	<b>Prerequisite</b>	<b>Measure Requirements</b>	<b>Range</b>
<b>QM-Standard Basic Assessment</b>	No prerequisite measures.	Must cover all the steps included in the Assessment Process, including a conversation with customer about their goals and concerns.	<b>\$50</b>
	All measures must be performed by a participating contractor’s qualified technician.	Must include a report with a written estimate for work required to meet standard.	
<b>Advanced Air Flow Correction</b>	Completion of the Assessment	Must address any deficiencies in air flow per the standards identified in the Assessment process.	<b>\$250</b>
<b>Blower Motor Retrofit</b>	Completion of the Assessment	The installed motor model must be a direct drive, permanent magnet, and constant speed motor.	<b>\$150</b>
<b>Refrigerant System Service</b>	Completion of the Assessment and Air Flow Correction	Work must meet the protocols covered in training and is expected to be incorporated into a software tool.	<b>\$50 to \$100</b>
		Must be done when weather conditions will support accurate results.	
		Must be done within eight months of completion of Air Flow Correction work (the delay is allow time for proper weather conditions to resume).	
<b>QM-Standard Preventive Maintenance Agreement</b>	Completion of the Assessment • Completion of either Air Flow Correction or Blower Motor Retrofit	The optional standard service agreement must include the provided Service Agreement QM Addendum. • The optional agreement must cover at least one year of service with two seasonal visits.	<b>\$50</b>

**Residential HVAC Quality Installation Development**

At this point, providing a list of measures and incentive levels is premature, as a valid quality installation based sub-program must be well planned and vetted through the Western HVAC Performance Alliance (WHPA). This sub-program will be designed

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

during 2012 and 2013 for the 2013-2014 program cycle and therefore will not be providing incentives, at least not initially.

c) List Non-incentive Customer Services

**Residential HVAC Quality Maintenance**

- Education of the market on the value of selecting high-efficiency systems.
- Reports for customers of estimated energy savings, cost savings and carbon reductions for their HVAC systems treated under the program.
- Training for contractors on HVAC industry standards, sales and marketing of the value of those standards, and their implementation in the field.
- Education for customers on how HVAC industry standards can help them compare bids of contractor services and select those with high-road skills.
- Customer education about the benefits of establishing a long-term trust relationship with a qualified contractor, which can lead to future energy and cost savings, such as from better planning for future HVAC system replacements and the quality installation of those systems when replaced.
- Improved comfort and indoor air quality for customers.

**Residential HVAC Quality Installation Development**

This sub-program development process will be performed with HVAC industry involvement to ensure that:

- The measures eventually included in the program can be reasonably assured to save energy and lower peak demand;
- A clear value proposition can be demonstrated so that contractors will see the path for a profitable business opportunity based on QI and customers will understand the benefits of equipment maintained at a higher level of quality;
- An effective training program will be put in place to ensure that technicians can properly implement QI services;
- The processes employed will document that work performed in the field meets minimum program quality control standards and can be validated.
- The initial QI efforts will focus on uncovering the root causes, rectifying design and implementation shortcomings, determine realistic energy savings estimates, and then launch program incentives.

The following non-incentive services will be offered through this sub-program:

- Active enrollment and promotion of qualified contractors
- IOU promotion of QI through the Whole-Home Upgrade subprogram and other customer marketing.
- Contractor training on quality installation practices, selling and marketing QI, service management of QI, etc.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- If incentives are offered for energy savings and the measures are cost effective, the program will comply with Senate Bill 454 on HVAC permit acquisitions with the work completed by a licensed contractor.
- The program will retain appropriate combustion safety testing and other procedures to ensure customer safety.

**Western HVAC Performance Alliance Activities**

The program will be active in a number of additional non-resource activities. These activities are required to ensure that the HVAC industry is fully involved in the development and implementation of the many tactics required to address the short and long-term goals of the Strategic Plan. One such non-resource activity is an Western HVAC Performance Alliance that will be initially chartered and funded by the IOUs. The Western HVAC Performance Alliance is necessary to keep the industry engaged in the Strategic Plan process and to provide guidance and support for the implementation of the various tactics required to transform the industry. Mindful that HVAC industry organizations are not traditionally structured or staffed, and have not traditionally allocated enough resources to achieve the level of involvement envisioned by the Strategic Plan, the HVAC Convener’s Report concluded that: *“The agencies and utilities should work together to ensure the working group is adequately funded to meet its responsibilities.”*<sup>41</sup>

It is envisioned that this Western HVAC Performance Alliance will involve high-level HVAC industry stakeholders, such as manufacturers, distributors, contractors, associations, organized labor and influential end-user customers—to coordinate industry sponsorship of and participation in HVAC strategies. Membership should also include other key players, including the CPUC, the California Energy Commission (CEC), utilities, building owners/managers, university researchers, consumers, and the Federal Government. The Western HVAC Performance Alliance will be charged with establishing and prioritizing a substantial IOU-funded response (recognizing the roles of other appropriate organizations including CEC, the publicly-owned utilities, and local governments) to the activities described in the suite of IOU-proposed HVAC Programs — both utility administered programs and third-party administered programs which focus on HVAC efficiency — resulting in a structured roadmap with specific actions, schedules, and the technical and financial resources identified to initiate near-term, mid-term and long-term issue resolution.

The Western HVAC Performance Alliance will provide the necessary guidance to both California and the western U.S. so that the many issues required to transform the industry can be prioritized and facilitated by the IOUs and the WCEC (as described in the HVAC Technologies and System Diagnostics Advocacy sub-program).

Some of the actions of the Western HVAC Performance Alliance may include:

---

<sup>41</sup> HVAC Convener's Report, Appendix B.5, Pg 10.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Recommending guidelines that would make it possible for IOUs to directly contract with existing HVAC industry institutions (e.g., associations, societies, conference hosts, and the trade press) through a rigorous Request For Quotation (RFQ) or similar processes to implement specific aspects of IOU-administered energy efficiency programs.
- Making recommendations for standards and qualification guidelines for trainers and educators who receive funding from the IOUs.
- Update the “HVAC Action Plan” that prioritizes specific actions required to address the Strategic Plan.
- Formally reaching out to utilities in neighboring states, including Arizona, Colorado, Nevada, New Mexico, and Utah, and energy organizations in the Pacific Northwest, to involve them in the overall planning and implementation processes.
- Identifying for inclusion in the HVAC Action Plan other HVAC technical work underway through the existing IOU programs, CEC/EPIC-BERG, LBNL, HVAC industry vendors, and others inside and outside California. Much of this work is continuing in a fragmented way. A cohesive planned and prioritized framework and action is needed.
- Channeling appropriate HVAC work through the existing IOU program framework, on a fully-planned basis, not on an *ad hoc* basis.
- Integrating all efforts as appropriate with the current and out year work plans of the WCEC.
- Integrating the suite of demand response/demand side management (DR/DSM) options that are already considered in utility DR/DSM programs as well as additional solutions that are emerging for residential and small commercial markets.
- Create a sustainable governance of the Western HVAC Performance Alliance to assist in meeting the deliverables of the CLTEESP and HVAC Action Plan.

**5) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Quality Maintenance Program (Resolution E-4385, Appendix A, pp 35-36):

**Table 3 – Residential HVAC Quality Maintenance**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Program</b>	<b>Metric</b>	<b>Metric Type</b>
<i>Residential Quality Maintenance</i>	1. Measured progress towards specific milestones provided in the project GANTT chart indicating the development/finalization of this IOU program based on Quality Maintenance standards.	2a

**Residential HVAC Quality Installation Development**

<b>Program</b>	<b>Metric</b>	<b>Metric Type</b>
<i>Residential Quality Installation Development</i>	1. Percentage of HVAC contracting companies that are participating in statewide residential QI program as a share of the targeted market*  * "Target market" defined as C20 licensed HVAC contracting companies in CA.	2a

**b) Market Transformation Information**

MTI Language – Based on the email received from Carmen Best on 6/19, we have updated the language for all PIPs with MTIs as follows:

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

Market Transformation metrics should neither be used for short-term analyses nor for specific program analyses; rather, should focus on broad market segments. Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>42</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>43</sup>.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>44</sup>. Markets are social institutions<sup>45</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>46</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>47</sup>. According to York<sup>48</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>49</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

Market transformation draws heavily upon diffusion of innovation theory<sup>50</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>51</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>52</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>53</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>54</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>55</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>56</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Historically, the nonresidential retrofit programs have had very low uptake rates on high-efficiency HVAC systems. Consequently, a first step towards market transformation is to do what it takes to achieve a high level of program participation, thereby increasing market share of high-efficiency equipment sales and quality installations. An initial increase in market share allows for increased levels of customer, installer, and distributor/manufacturer knowledge and interest in these systems, which should make further increases easier. In addition, tracking the ratio of certified HVAC technicians in the field, over time, can provide a gauge of the likelihood for quality installations and maintenance.

**c) Program Design to Overcome Barriers**

**Residential HVAC Quality Maintenance and Residential HVAC Quality Installation Development**

The program addresses the following barriers:

Recent data available from AHRI indicates that as a result of the 2006 increase in federal residential equipment efficiency standards, which increased equipment costs significantly, unitary equipment sales have dropped while repairs to existing systems (low efficiency compressor replacement) have increased nationwide by more than 25 percent and window unit sales have increased by a similar amount. A similar trend occurred in 2002 when ENERGY STAR® increased its qualifying efficiency level to Seasonal Energy Efficiency Rating (SEER) 13. Prior to the change, ENERGY STAR® Central Air Conditioner (CAC) sales had an average market share of 33 percent<sup>57</sup>. After the change, the average market share of ENERGY STAR® units fell to 7 percent. Additionally, recent studies indicate that 30 to 50 percent of existing systems have not been installed properly. Further, Title 24 compliance rates for replacement systems are approximately 10 percent<sup>58</sup>. The net effect of this market failure is a 20 to 30 percent increase in space energy use<sup>59</sup>.

- **Lack of awareness:** By demonstrating the energy efficiency benefits of QI/QM, the benefits of QI/QM will be better understood by program participants. It is our goal to discover the evidence, and expected return on

---

<sup>57</sup> Itron, "California Residential Efficiency Market Share Tracking," 2006, pp.3-6.

<sup>58</sup> Quantec LLC, "Statewide Codes and Standards Market Adoption and Noncompliance Rates," pp. 4

<sup>59</sup> Strategic Plan, Appendix A, HVAC Convener Report, pp. 38-39

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

investment, that customers will require to authorize payment for these measures (and those premium measures that prove to outperform the QI/QM ANSI standards) when subsidies are removed.

- **Performance uncertainties:** Much research has been conducted on the energy savings achievable through HVAC system maintenance measures such as RCA and Duct Sealing, but despite all this research many performance uncertainties still exist. The implementation of this program with an increasing set of customers and the corresponding EM&V efforts shall be coordinated through the HVAC EM&V Project Coordination Group (PCG).
- **Asymmetric Information:** Delivering QI/QM training opportunities through existing industry channels (e.g., distributors, trade associations) will provide a higher level of credibility for QI/QM training rather than offering exclusively through IOUs.
- **Bounded rationality:** It is logical to assume that the HVAC industry would want to deliver quality service; however, market dynamics have not supported such logic as the industry has largely become commoditized and low price/low quality typically wins out. The program supports HVAC contractors that perform quality work. This helps to build momentum towards market transformation.
- **Hidden costs:** By promoting the concepts and value of quality maintenance at the time of system installation, the customer is assured that the energy efficiency performance benefits of their new system will continue throughout the life of their system.
- **Organizational customs:** The HVAC industry has largely become commoditized into an industry driven by low costs and quality, where quality is assumed but not understood or valued by the customer. This is a result, in part, by contractors having minimal success in communicating the value of QI/QM to consumers and consumers not understanding the linkages between comfort and energy use. The HVAC QI/QM Program demonstrates the value proposition of a high quality contracting business and educating consumers on the energy benefits of QI/QM.
- **Product cost:** Substantial incentives for equipment and QI will offset a substantial percentage of product costs. Customers will be encouraged to participate in the program and use one of the qualified program contractors to install their new HVAC system.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Lack of awareness: Focused marketing and training on QI and code compliance for consumers, contractors, and building inspectors<sup>60</sup> will ensure that the importance of complying with Title 24 will be better understood by program participants. Additionally, requiring demonstrated code compliance (e.g., CF-6R) in order to qualify for program rebates will further reinforce the importance of permitted installations.
- Information or search costs: Active support of qualified program contractors and listing them on IOU websites will increase consumer confidence in having a reliable source of quality contractors. Moreover, satisfied customers will recommend these contractors to friends and neighbors and thus create additional momentum for using contractors with a reputation for high-quality work.
- Transaction costs: Potential for streamlined incentive application processes that require the same information required for Title 24 compliance (e.g., CF-6R) will reduce the difficulty of participating in the program and complying with permit requirements. Furthermore, the high incentive levels offered by the program will reduce the likelihood that customers will choose not to participate in the QI activity.
- Hidden costs: Promoting the concepts of QI at the time of system installation will increase the likelihood that customers will understand the energy efficiency performance benefits resulting from maintenance, and will continue such periodic maintenance over the life of their system.

Additionally, several other issues could potentially influence sub-program design, including:

- Other organizations have established processes and procedures for QI. These processes should be evaluated to determine how well they perform in comparison to minimum QI standards.
- Lack of industry consensus on QI standards and technical protocols
- Overcoming market barriers to exceeding Title 24 Standards
- Cost-effective constraints arising from limited savings for QI measures exceeding Title 24.
- Forging sustainable HVAC industry and market actor support.
- Addressing challenges in standard applicability across a range of commercial building types and HVAC systems.
- True energy savings measurement procedures.

**d) Quantitative Program Targets**

---

<sup>60</sup> See the HVAC WE&T Sub-program PIP, below, for more information.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The program will achieve the following program targets:  
**See Table 5 above.**

**e) Advancing Strategic Plan goals and objectives**

The Residential HVAC Quality Maintenance and Residential HVAC Quality Installation Development program helps to achieve the following near-term strategic goals as identified in Chapter 6 of the Strategic Plan:

- 2-1: Create a Statewide QI/QM Brand – In addition to promoting the industry standards for QI and QM, leveraging the program statewide Energy Upgrade California (EUC) brand for all IDSM efforts is a cost effective approach to branding QI/QM. In order to help residential consumers more clearly recognize contractors and technicians who can truly deliver QI/QM, the program also aggressively helps the HVAC industry to more firmly establish the higher value/consumer benefit of its own industry standards and credentials. This program is based on and promotes the use of ACCA Standard 4 for Quality Maintenance and examples of consensus HVAC credentials are the Industry Competency Exam (ICE), technician certification by North American Technician Excellence (NATE), a variety of union “Journeyman” designations, TABB, NEBB, AABC, NBC and STAR® certifications.
- 2-2: Launch Statewide Brand – The Energy Upgrade California IDSM umbrella brand will be expanded via the statewide ME&O program efforts and the Residential HVAC QM program will make corresponding adjustments accordingly to leverage that brand within a reasonable time during 2013-14. This branding activity will help participating contractors to promote the QI/QM effort. The program will continue to communicate information about the QI/QM branding effort to contractors, technicians and other HVAC industry stakeholders via such means as inserts in trade journals such as Indoor Comfort News, The ACHR News, and Contracting Business.
- 2-3: Provide expanded QI/QM training – The program continues to ensure that HVAC service technicians of participating contractors are fully trained on the delivery of the measures promoted by the Program. Furthermore, feedback mechanisms will be utilized to continually evaluate technician performance to ensure that they are applying the information they are being taught in the QI/QM training. As part of the program’s market transformation efforts and to ensure quality services are provided to customers, the program will continue to work with the HVAC industry to reduce (and wherever possible eliminate) the direct costs of this transformative training to technicians and contractors willing and able to apply their skills and new tools to delivering industry standard and energy saving Quality Maintenance services.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 2-4: Implement contractor accreditation program – Additional consideration will be made for program efforts to promote NATE and any other certifications that the consensus of the HVAC industry determines to be appropriate.
- 3-3: Accelerate whole-building educational opportunities - Create pathways for HVAC contractors to evolve into whole building contractors by partnering with private and public community colleges and/or universities to develop the appropriate curriculum on whole building design practices.
- 4-1: Pursue regional climate-optimized equipment standards - IOU staff, in close consultation with WCEC/CEC and other appropriate parties, will continue to stay attentive to and engaged in the federal proceeding as it continues into 2011
- 4-3: Accelerate market penetration of advanced technologies - Partnering with manufacturers through activities such as the WCEC's Western Cooling Challenge will increase their dedication to developing climate-appropriate equipment that delivers energy savings and peak load reduction.
- 4-4: Adopt a progressive set of building codes that support peak-efficient equipment - Through the efforts proposed by the Statewide Codes and Standards Program, the IOUs will continue to work with the CEC to advance current building codes.
- 4-5: Develop standards for on-board diagnostic functionality – In coordination with HVAC efforts within the Emerging Technologies program, the program leverages the use of hand held and other types of systems in the field to assist in determining viable protocols for residential applications.
- 4-6: Prioritize in-field diagnostic approaches – Through coordination with the Emerging Technologies program, the program leverages the use of hand held and other types of systems in the field to assist in determining viable protocols for residential applications and contributes information to the HVAC industry that is expected to be helpful in targeting future efforts based on quantifiable energy efficiency benefits.

**6) Program Implementation**

**a) Statewide IOU Coordination**

The IOUs will jointly participate in California's residential HVAC efforts to achieve real-market transformation. In order to accomplish this task, the IOUs will use the principles of adaptive management and follow a structured process to continuously

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

update and enhance the program throughout the 2013-2014 Transition Period. The process will continue as follows:

**IOU Program Lead** – The process for adaptive management will begin with each IOU designating an HVAC Program Lead. The lead will be the conduit through which information between IOUs will flow and will investigate new innovations, special accomplishments and challenges faced by sub-program managers and the managers of cross-cutting Statewide programs within their own IOU. Where such innovations or challenges intersect HVAC and show potential for improving the HVAC program, the Program Lead will present such information to a quarterly HVAC Program Management Team meeting.

**Hold Quarterly HVAC Program Management Team Meetings** – At this quarterly meeting, individual innovations and accomplishments experienced in one IOU will be transmitted to all IOUs. The HVAC Program Management Team will evaluate the innovations and accomplishments of the individual IOUs, hear ideas for course corrections and overcoming challenges, measure the HVAC program’s progress against Statewide metrics and goals, and prepare summations for presentation to the Western HVAC Performance Alliance at its semi-annual meeting.

**Adopt Program Enhancements** – Once the HVAC Program Management Team agrees that a particular idea or innovation has merit on a Statewide-level, each IOU Program Lead will distribute the information to their sub-program managers for adoption and integration as appropriate. In some cases, it may be necessary to invite the sub-program managers to the HVAC Program Management Team to get their feedback and ensure they receive the same message.

**Evaluate Program Enhancements Against Statewide Targets** – To complete the adaptive management loop, the HVAC Program Management Team will track the program’s accomplishment of Statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The HVAC Program Management Team will determine whether future course corrections are needed, and if so, will activate a fresh start of the adaptive management cycle to generate the improvements necessary to stay on track.

All California IOUs continue to work together and jointly with the HVAC industry to lead efforts to implement and explore design enhancements for a viable residential HVAC program. Specific areas of coordination include:

- **Program delivery mechanisms  
Residential Quality Maintenance**

The program is delivered to customers via qualified participating contractors. Training of participating contractors and management of the program includes a combination of third-party implementers and internal administrative staff. This follows the adaptive management process. The

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

program is targeted to consumers and contractors to create a push/pull dynamic that influences the achievement over time of sustained market transformation.

**Residential Quality Installation Development**

The IOUs will jointly coordinate and work with industry groups to prepare a design for a statewide-consistent program design that is cost effective and meets California’s market transformation objectives.

After the new program design is launched, the IOUs will manage the program through a combination of third-party programs and internal administrative staff, and will follow the adaptive management process. The program will be targeted to consumers and contractors to create a push/pull dynamic that influences sustained market changes.

**Western HVAC Performance Alliance**

The IOUs will deliver the program through a combination of third-party vendors and internal administrative staff. The program will be delivered in collaboration with existing industry infrastructures in order to increase its overall effectiveness. Program guidance will be provided to the CPUC/IOUs through the Western HVAC Performance Alliance as described above.

- **Incentive levels**  
See Section 4.b above.

- **Marketing and outreach plans**  
**Residential Quality Maintenance**

Program marketing includes common outreach materials shall be developed by the IOU’s in partnership with HVAC industry, including feedback from HVAC contractors. This QI/QM branding shall be under the statewide Energy Upgrade California brand efforts after the expansion of that brand. The program will continue to work with industry and participating contractors for additional methods to promote the program and the value of QI. If warranted by such feedback, the program may explore providing additional point-of-purchase information on QI that would be made available for equipment dealer locations and building departments (where residential customers may be receptive to “neutral” public service messages).

**Residential Quality Installation Development**

Common outreach materials will only be available to participating contractors. Additional point-of-sale information on QI will be made available for equipment dealer locations and building departments.

**Western HVAC Performance Alliance**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Specific outreach efforts are currently being facilitated to the industry to keep it engaged in the Strategic Plan process (both updates to and implementation of). On a macro level, this outreach is occurring through the Western HVAC Performance Alliance and any subcommittees established by this group. On a micro level, each sub-program has specific tactics in place to engage the industry in its own particular demand reduction, energy savings and market transformation objectives.

Utilities will conduct integrated as well as program-specific marketing and outreach which will be coordinated with the statewide marketing and outreach program. The utilities may use a range of tactics such as; e-mails, flyers, on-Line marketing, direct mail, bill messaging, social media, local events, ethnic media, and other channels that suit the target audience, the message, and the resources.

- **IOU program interactions**

- **Residential Quality Maintenance**

One of the strategies outlined in the Strategic Plan HVAC chapter is to create a better linkage between the CEC's Title 24 compliance efforts with the IOUs energy efficiency programs. Previous efforts have been managed with different yet consistent purposes. The IOU's will continue the market transformation goals of the Strategic Plan; the IOUs will support CEC and CPUC efforts to develop one common effort.

- **Residential Quality Installation Development**

In order to support the need for increased code compliance, the program will cooperate with CEC training and enforcement activities targeted at local building departments. Such activities will also be used to promote the economic and performance benefits of QI/QM. The program will also coordinate its activities with IOU local government partnerships and third-party programs, to ensure that code compliance could become integrated into these programs.

- **Western HVAC Performance Alliance**

One of the strategies outlined in the Strategic Plan HVAC chapter is to create a better linkage between the CEC's Title 24 compliance efforts with the IOU energy efficiency programs. Previous efforts have been managed with different, yet consistent purposes. In order to achieve the market transformation goals of the Strategic Plan, the IOUs will support CEC and CPUC attempts to develop one common effort. Interaction with other IOU programs will be coordinated through the adaptive management process described above. Within this process, a Joint HVAC/Emerging Technologies/Codes and Standards Program Management Team ("Joint Program Management Team") will be established to ensure that the

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

individual program efforts are aligned and progressing towards the same near and long-term goals.

- **Similar IOU and POU programs  
Residential Quality Maintenance**

As a result of increased federal equipment efficiency standards, many utilities across the country have begun to offer service-based programs that independently offer measures such as RCA and Duct Sealing. It is expected that the HVAC QM Program could stimulate a paradigm shift through its delivery of a comprehensive suite of maintenance services that comply with or exceed ACCA industry standards (premium maintenance) designed to address the full range of efficiency measures available for residential HVAC systems.

**Residential Quality Installation Development**

The ENERGY STAR Residential QI program was introduced in early 2008. Several utilities, including Oncor, National Grid, Nstar, and Puget Sound Energy, are either offering or planning to offer this program. Both PG&E and SCE piloted the program in 2006 and 2007 respectively, and the program continued in SCE's territory from 2009 to 2012. SDG&E launched the program in 2010. Such program design, however, was found to be non cost ineffective, prompting a need to arrive at a new program design that can be cost effective and meet market transformation objectives at the same time. In order to promote the holistic approach proposed herein, the California IOUs propose to initiate a Statewide IOU/POU coordinating group — perhaps under the auspices of CEE or some other umbrella organization — to discuss and implement HVAC program best practices that advance the goals of the Strategic Plan throughout California.

**Western HVAC Performance Alliance**

POUs manage many different types of HVAC programs. However, none of them seeks to accomplish the aggressive market transformation goals being proposed by the IOUs. During the 2010-2012 program cycle, the IOUs will seek to increase their interactions with the POUs to better align IOU and POU HVAC programs. This involved the creation of periodic Western HVAC Performance Alliance activities with POUs to increase awareness of the Strategic Plan and how programs could and should be designed to help meet its aggressive targets.

**b) Program delivery and coordination**

The program will be coordinated with the following activities:

- **Emerging Technologies program**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Residential Quality Maintenance**

The Residential HVAC QM Program is expected to interact with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment. Coordination activities will be realized through the Program ongoing statewide coordination among programs and across IOUs.

**Residential Quality Installation Development**

N/A (this program does not seek to influence emerging technologies).

**Western HVAC Performance Alliance**

The program is expected to interact with the Emerging Technologies Program to ensure the proper focus on remote and on-board diagnostic equipment. Coordination of HVAC, Codes and Standards and Emerging Technologies activities will be realized through an inter-utility program management team (consisting of the appropriate program managers from the four IOUs) that meets on a quarterly basis to discuss program integration and implementation issues.

- **Codes and Standards program**

**Residential Quality Maintenance**

This service-based program is not much affected or regulated by building codes, except in the possible case of a participating contractor installs 40 or more feet of new ducting as part of the Advanced Air Flow Correction measure. Program to help support proper permit compliance, the program requires the reporting of any applicable permit number in such cases or any other case that may require a permit as a result of work performed through the program. Additionally, to further support proper compliance with all permitting and licensing requirements, the program requires that both the customer and the contractor certify that all permitting and licensing requirements were followed before any program incentives would be paid.

**Residential Quality Installation Development**

Efforts will be coordinated to ensure that a consistent message is delivered regarding code compliance and QI. Codes and Standards will take the lead on compliance items, while the Residential Quality Installation Development will take the lead on QI efforts but will leverage similar delivery channels to increase effectiveness. Additionally, coordination activities will be realized through the Joint IOU Program Management Team.

**Western HVAC Performance Alliance**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This will ensure that the code-based solutions are consistent with that program's other activities. Section 6 of the Codes and Standards PIP describes the specific actions that the program will employ to address HVAC. HVAC, Codes and Standards, and Emerging Technologies activities will be coordinated through the Joint Program Management Team.

- **WE&T efforts**

**Residential Quality Maintenance**

Participating contractors are required to attend program-specific QM training in order to participate in the program.

**Residential Quality Installation Development**

Participating contractors are required to attend program-specific QI training in order to participate in the program.

**Western HVAC Performance Alliance**

WE&T needs for the HVAC industry are unique to the industry. Therefore, the IOUs have decided to place the responsibility of managing the effort under the Statewide IOU WE&T Program umbrella. However, the HVAC WE&T activity is coordinated with the Statewide activity to ensure that the individual efforts are complementary (e.g., HVAC training information is integrated in the WE&T web portal).

- **Program-specific marketing and outreach efforts**

**Residential Quality Maintenance and Residential Quality Installation Development**

Utility-branded marketing support for participating contractors is provided to advance statewide QM efforts. Such support may include exclusive promotion on IOU websites, brochures and other leave-behind materials that contractors can use to promote QM and their involvement with the program. As mentioned above, the program will continue to work with industry and participating contractors for additional methods to promote the program and the value of QM, and if warranted by such feedback, the program may explore providing additional general promotional materials such as point-of-purchase displays for equipment dealers. Additional supporting outreach will include QM and QI content on IOU websites and the statewide ME&O program, which will build general awareness and educate customers about energy management and provide a touch point for local marketing efforts related to QM and QI. (Specific IOU budget information for program-specific marketing activity is provided in Table 1).

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Targeted campaigns use segmentation analyses, self-selection activities, and event-based knowledge of customer actions to provide residential customers and small businesses with integrated and program-specific solutions that are relevant to their needs. Additionally, program-specific marketing and outreach activities are necessary to drive participation and attain program goals.

**Western HVAC Performance Alliance**

Such support may include exclusive promotion on IOU websites, brochures, and other leave-behind materials that contractors can use to promote QI/QM and their involvement with the program. Additional general promotional materials such as point-of-sale displays for equipment dealers will also be developed. (Specific IOU budget information for this marketing activity is provided in Table 1, above.)

- **Non-energy activities of program**

**Residential Quality Maintenance**

The direct energy benefits of the program result from the quality maintenance of HVAC systems. Other activities will be required to support these energy savings goals, as well as the program's market transformation goals. These activities include significant efforts in program design, systems development, contractor training and consumer marketing. Additionally, some incentive measures within the program, such as the QM-standard Basic Assessment and QM-standard optional Preventive Maintenance Service Agreement, have been specifically designed to support market transformation. Finally, by implementing combustion appliance safety evaluation and testing, the program improves customer health and safety.

**Residential Quality Installation Development**

The direct energy benefits of the program result from the quality installation of central air conditioning systems. Other activities will be required to support these energy savings goals. These activities include significant efforts in contractor training and consumer marketing.

**Western HVAC Performance Alliance**

The direct energy benefits of the program result from the quality installation and maintenance of HVAC systems. Other activities will be required to support these energy savings goals. These activities include significant efforts in program design and coordination, technology evaluation and integration, contractor training and consumer marketing.

- **Non-IOU Programs**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Residential Quality Maintenance**

The program interacts with the HVAC industry to continue to develop and introduce increasingly stronger QM standards that ensure systems are operating in their most efficient state.

**Residential Quality Installation Development**

Collaboration with local programs will synergize the program delivery.

**Western HVAC Performance Alliance**

The program will remain engaged with CEC, the California Air Resources Board (CARB), DOE, and other government agencies responsible for regulating various aspects of HVAC equipment, HVAC industry-driven initiatives such as NATE and the HVACR & Plumbing Instructors Workshop, and private/public partnerships such as Skills U.S.A.

- **CEC work on EPIC**

**Residential Quality Maintenance**

The program continues to coordinate with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment program

**Residential Quality Installation Development**

N/A (this program does not seek to influence emerging technologies.)

**Western HVAC Performance Alliance**

The program will interact with the Emerging Technologies Program to ensure the proper focus on remote and on-board diagnostic equipment. Such efforts are already underway with the EPIC Program. This activity will primarily be managed under the Technology and System Diagnostics Advocacy Program (see the sub-program PIP for more details).

- **CEC work on codes and standards**

**Residential Quality Maintenance**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This will ensure that the code-based solutions are consistent with that program's other activities. Section 6 of the Codes and Standards PIP describes the specific actions that the program will employ to address HVAC. HVAC, Codes and Standards, and Emerging Technologies activities will be coordinated through the Joint Program Management Team.

**Residential Quality Installation Development**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

In a similar manner as with the Codes and Standards Program, the Residential QI Program will work in cooperation with CEC training and compliance efforts targeted at local building departments. The Codes and Standards Program will take the lead on this effort.<sup>61</sup>

**Western HVAC Performance Alliance**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This will ensure that the code-based solutions are consistent with that program's other activities. Section 6 of the Codes and Standards PIP describes the specific actions that the program will employ to address HVAC. HVAC, Codes and Standards, and Emerging Technologies activities will be coordinated through the Joint Program Management Team.

- **Non-utility market initiatives**

**Residential Quality Maintenance**

The tenets of QM are being actively pursued by the HVAC industry itself. ACCA has taken the lead in this national effort by developing various ANSI recognized QM standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR, Utilities). Other organizations have also developed processes designed to improve the operating efficiency of HVAC systems (e.g., NCI). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**Residential Quality Installation Development**

The tenets of QI are being actively pursued through the HVAC industry. The Air Conditioning Contractors of America (ACCA) has taken the lead in this national effort by developing various ANSI recognized QI standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR®, utilities, etc.) The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**Western HVAC Performance Alliance**

The tenets of QI/QM are being actively pursued by leaders in the HVAC industry itself. ACCA has taken the lead in this national effort by developing various ANSI-recognized QI/QM standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE,

---

<sup>61</sup> For additional information about Codes and Standards HVAC activities, see Section 6 of the Codes and Standards PIP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

CEE, ENERGY STAR®®, Utilities, etc.) Other organizations have also developed processes designed to improve the operating efficiency of HVAC systems (e.g., SMACNA, NCI). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**a) Best Practices**

As described in Section 5.a, the IOUs had been managing RCA and Duct Sealing programs for several years and have seen that the results they delivered were uncertain. This Program has created a new standard for HVAC service-based programs through offering a more comprehensive approach that delivers reliable energy savings. This program was developed with full industry involvement to ensure that it (1) is accepted by the industry, to ensure it meets its market transformation objectives program; (2) effectively trains service technicians to provide QM services; (3) provides the necessary quality control processes to ensure that the appropriate service measures are performed; (4) delivers reliable energy savings; and (5) demonstrates a clear value proposition for contractors and customers.

**b) Innovation**

The innovation of this program exists through the adoption of a comprehensive maintenance approach based on industry-accepted standards. Traditional utility programs have delivered individual service measures such as RCA and Duct Sealing. The delivery of these measures has generated questions about their energy savings. A more comprehensive maintenance effort through this Residential HVAC QM program delivers well-documented energy savings and sets the standard for HVAC efficiency programs. Furthermore, delivering this program through active partnership with the industry increases the likelihood of its success. Finally, innovation results through a continuous improvement process to evaluate the viability of offering additional incentives for services and other offerings that exceed established program standards (e.g., TABB, NEBB, and NCI).

**c) Integrated/coordinated Demand Side Management**

As with most HVAC oriented programs, the primary source of integration exists between energy efficiency and demand response activities. At a minimum, all marketing materials developed to support QM will cross promote DR to educate customers on the availability of IOU DR Programs. The required contractor training will be designed to include a discussion on DR programs and participating contractors will be required to deliver DR information as part of their customer sales efforts. The program will continue to explore closer linkages between EE and DR.

**d) Integration across resource types**

The program may support CARB's efforts to regulate GHGs by providing consumer information on the phase-out of existing refrigerants and the move to zero-ODP refrigerants with the customer's maintenance invoice. Such information would seek to

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

influence the customer's adoption of newer equipment by explaining the likelihood of increased maintenance costs as existing refrigerants become less available.

e) **Pilots**

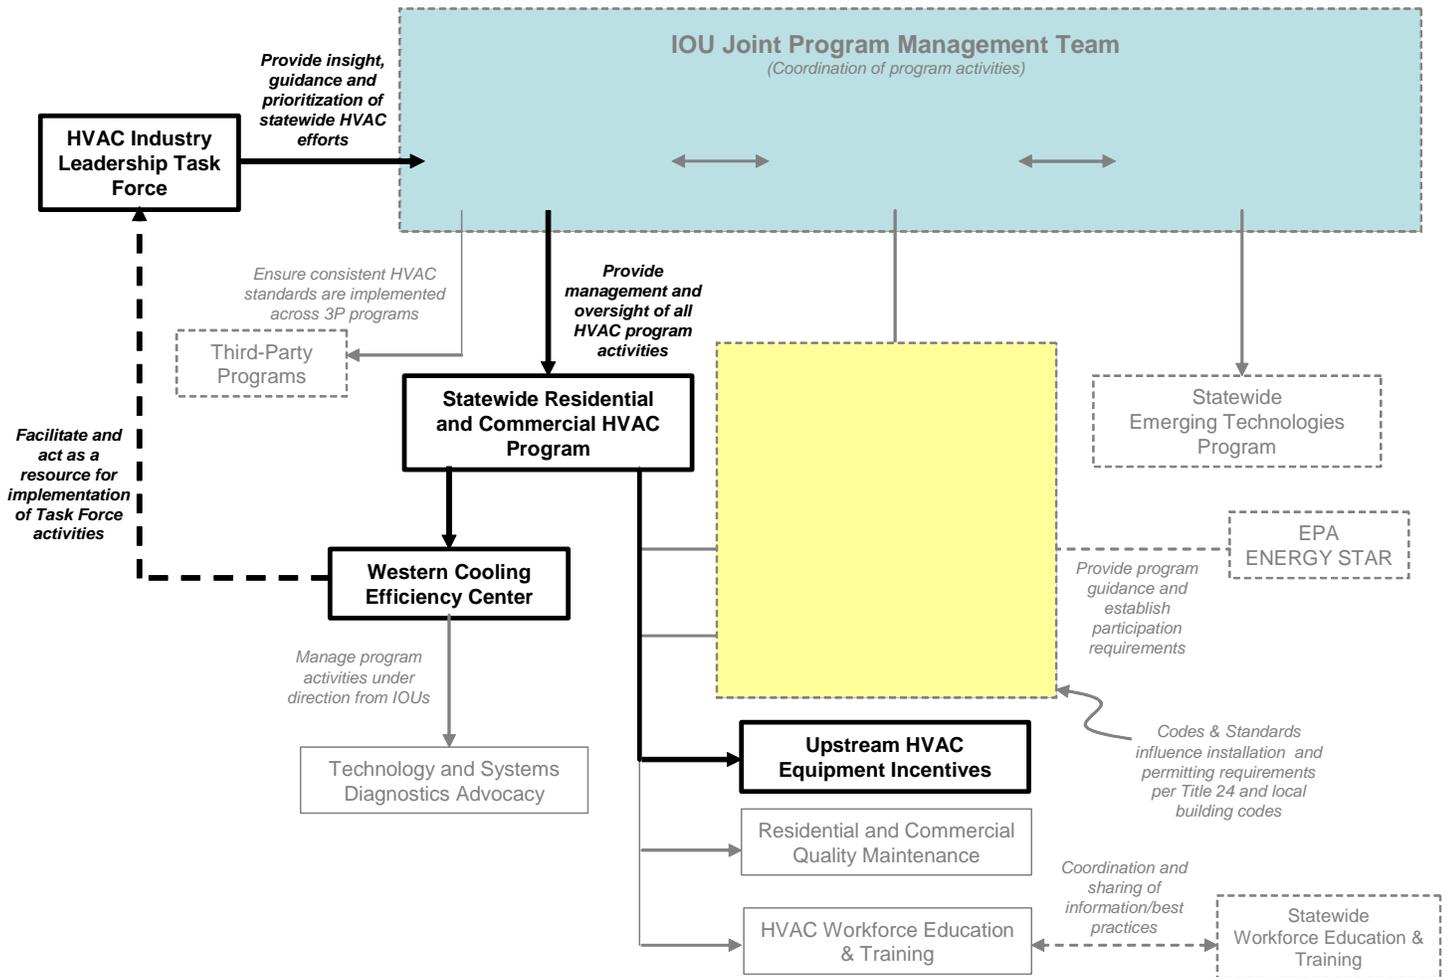

As with any good product/program design, pilots may be needed to test program enhancement concepts prior to full-scale launch of any enhancement. The HVAC QM Program may utilize pilots to test the implementation of program concepts, processes and the integration of ever increasing QM standards.

f) **EM&V**

EM&V for the Residential HVAC program will be managed via the EM&V program. Appropriate EM&V activities and detailed plans will be conducted as coordinated by the HVAC EM&V Project Coordination Group (PCG) and overseen by the CPUC.

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

## 7) Diagram of Program

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**8) Program Logic Model**

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs.

**Market Transformation Information**

**a. Summary of the market transformation objectives of the program:**

The Residential HVAC Program is a Statewide program that will continue the transformation process of California's HVAC market to ensure that:

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- The above changes lead to sustained profitability for HVAC trade allies as the business model for installing and maintaining heating and cooling systems changes from a commodity-based to a value-added service business.

Description of the market, including identification of the relevant market actors and the relationships among them:

The Residential HVAC market for maintenance and installation is largely a market designed to offer these services at the lowest price to meet acute needs, rather than one with product differentiation by quality that is designed to meet the long-term needs of customers in terms of thermal comfort, indoor air quality, and thermal comfort.

The primary market actors are contractors, technicians, and property owners/managers. Contractors manage the firms that provide installation and maintenance. They set the direction for their firms in terms of what services to provide, how to provide them, and how to price them. Technicians actually provide those services. Thus the successful provision of the services depends on the technicians' skill levels as well as how they respond to the constraints imposed on them by contractors. Property owners and managers constitute the demand side of the market. They request and pay for the services provided by the contractors' firms. Renters do not tend to participate in this market.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**b. Market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies:**

Property owners and managers often lack important information about the cost and value implications of their HVAC decisions, as well about the quality of the work that contractors' firms can perform. That is, there are not clear indicators of quality by which consumers can judge providers, and consumers do not have a well-defined set of goals by which to evaluate the quality of work after the fact. This facilitates a commoditization of HVAC services whereby firms compete based on price and not on quality, which can lead to a "race to the bottom" mentality in certain segments of the market. This lack of information is exacerbated by the highly technical nature of HVAC maintenance and installation that can confound the efforts of contractors and technicians who are attempting to do high quality work, leading to sub-optimal HVAC system performance in terms of thermal comfort, indoor air quality, and energy efficiency.

These barriers provide an important opportunity for energy efficiency programs to intervene in the market in a number of ways to facilitate high-quality work. The first is providing a definition of quality through the promotion of standards for installation and maintenance. Second is facilitating a business relationship between contractors and customers to promote high quality, and not just low price. Third, the program can build the skills of technicians who perform maintenance and installation so they are able to implement those services at a high level of quality.

**c. Description of the proposed intervention(s) and its/their intended results, including which barriers the intervention is intended to address:**

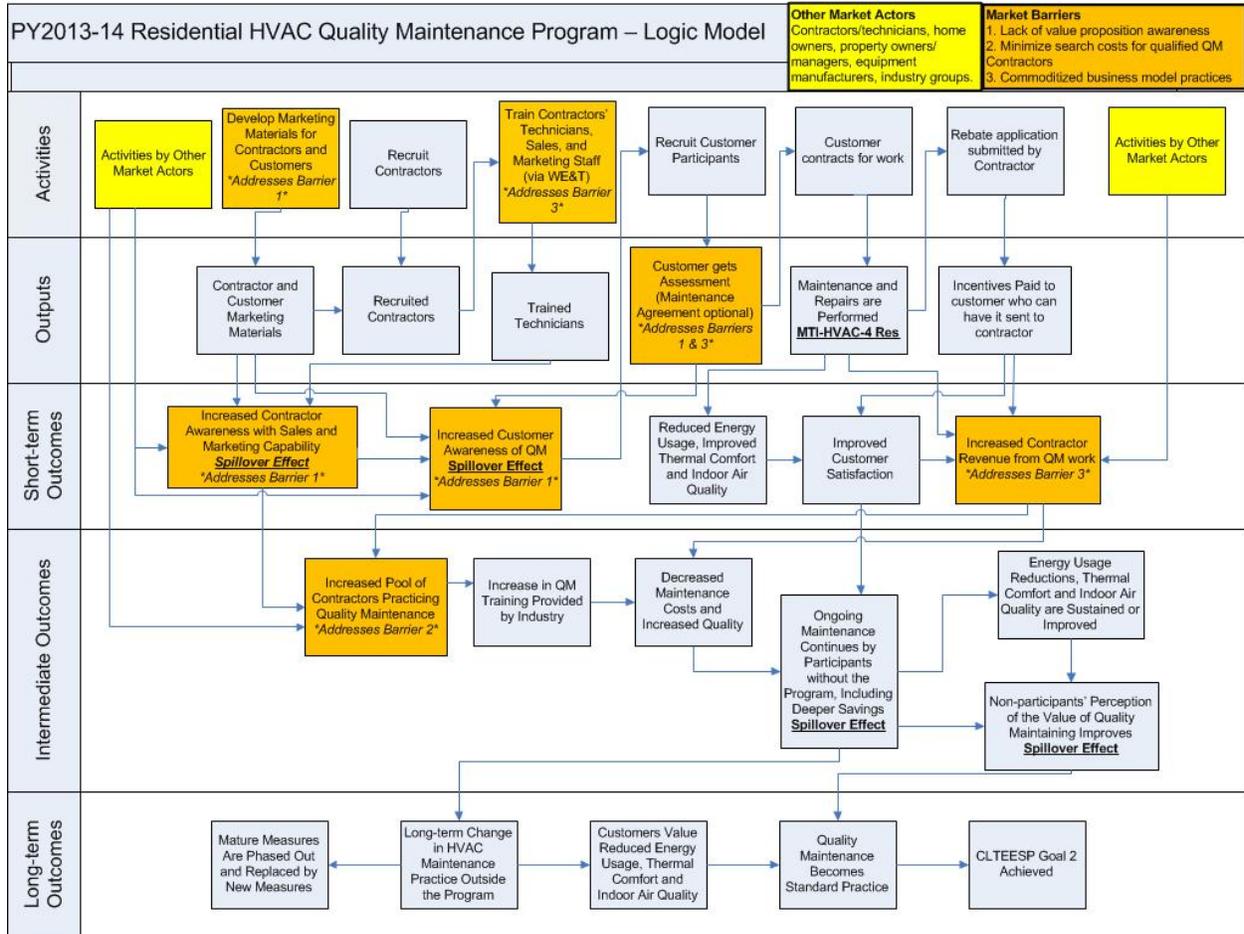

By promoting industry standards for maintenance and installation, the program helps consumers know what the characteristics of a good contractor are. For maintenance, part of this standard is leads the customer and the contractor to define performance guidelines for thermal comfort, indoor air quality, and energy efficiency, helping make clear what the level of quality of work was after the fact. For installation, the standards provide clear performance characteristics through such elements as load calculations.

The programs facilitate the creation of an ongoing business relationship between the contractor and the customer. This provides an inducement to the contractors' firms to provide a high-quality service that will bring long-term value to the customer, and thus long-term value to the contractor, rather than rely on winning bids with a lowest price under the assumption that there would be no more business dealings with a customer and so high quality would bring a low return.

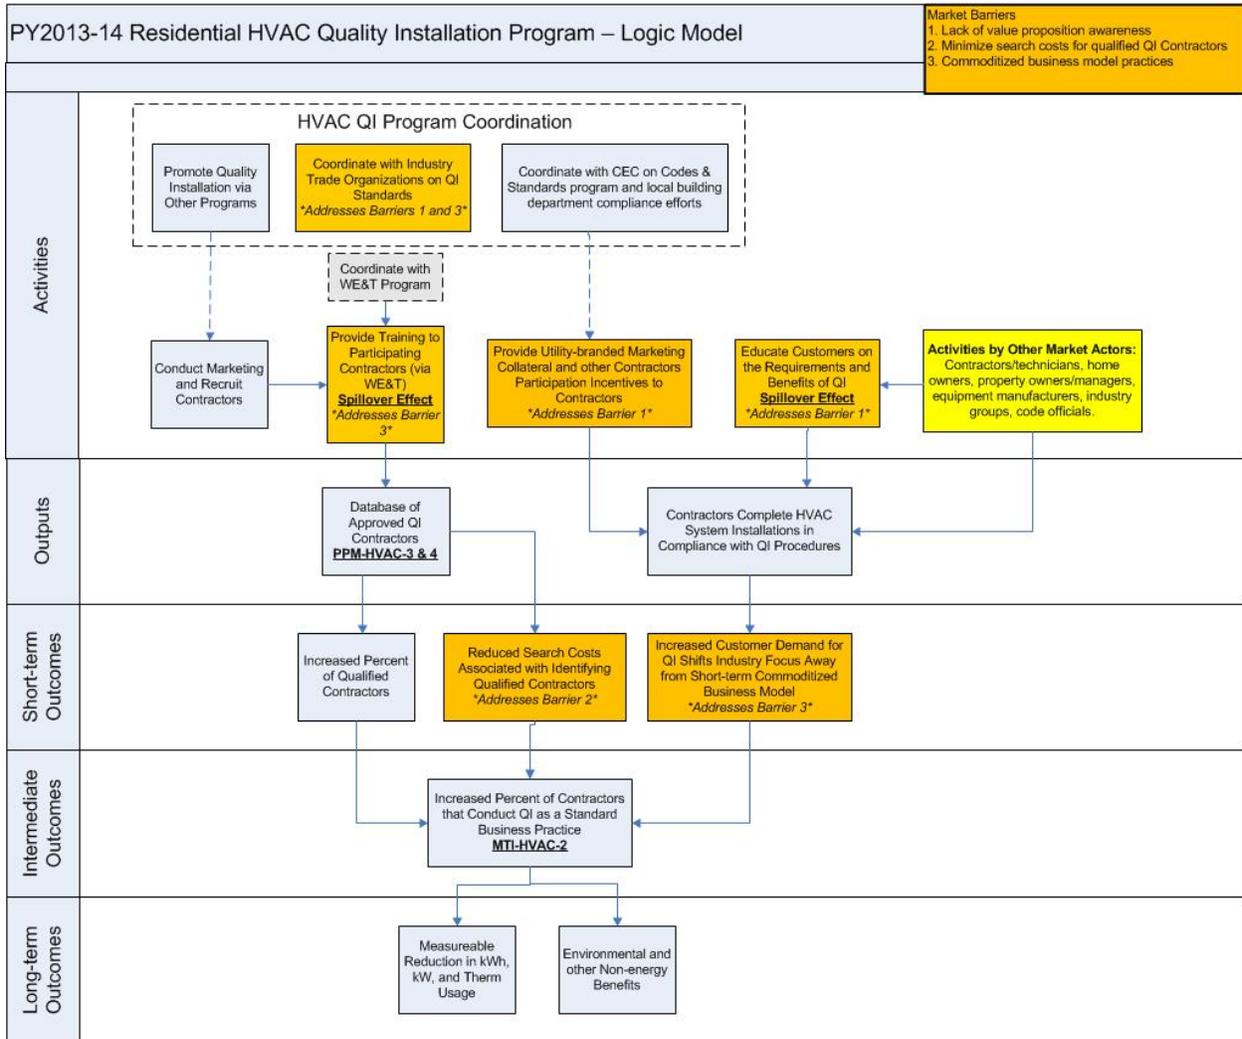

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

Finally, the programs build the skills of technicians. This enables continuing improvement in the quality of work over time. It also provides for spillover as those contractors and technicians can provide higher quality service to their customers even outside the program to reduce energy usage.

**d. Program or market logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results:**

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 1. Program Name:** Statewide Residential New Construction (RNC)  
**Program ID:** SCG 3707  
**Program Type:** Statewide Core Program

**2. Projected Program Budget Table**

**Table 1** – Reference CalSPREE program for budget details.

**3. Projected Program Gross Impacts Table – by calendar year**

**Table 2** - Reference core program for projected savings detail.

**4. Program Description**

**a. Describe program**

CAHP is part of the statewide Residential New Construction (RNC) sub-program offering. The RNC sub-program represents one-sixth of the CalSPREE core offering. CAHP encourages single and multi-family builders of all production volumes to construct homes that exceed California's Title 24 energy efficiency standards by a minimum of 15 percent. Through this plan, multi-family and single-family projects are approached identically for program purposes except where explicitly noted. The ENERGY STAR Manufactured Homes program, offered by Sempra and Southern California Edison, addresses new factory-built housing. The structure of the relevant Residential New Construction program elements is as follows:

CalSPREE Program (Core)

1. RNC Sub-Program

2.1 Single-family/Multi-family Sub-Program (CAHP)

2.1.1 ZNE Homes Sub-Program

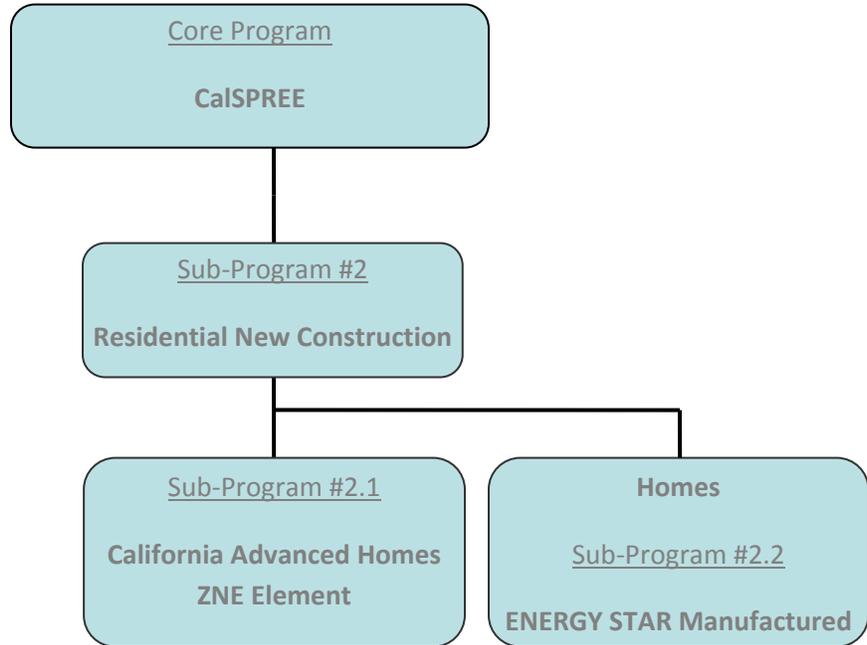

2.2 Manufactured Homes Sub-Program for SDG&E, SoCalGas and Southern California Edison

For the convenience of the reader, two other programs related to New Construction are also called out:

1. Sustainable Communities Program (Name/location differs by IOU) (Third party)  
Covering Master-planned communities, mixed-use projects, campuses, and commercial projects pursuing advanced energy efficiency and green targets.
2. Partnership Programs (Core)
  - a. Strategic Planning Sub-Program (Energy Leader Partnership Strategic Support)  
Trains cities and counties to procure city projects to meet energy efficiency

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

standards, to identify funding sources, to share best practices, and recognize them for their achievements.

The goal of energy-efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan), and works in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the New Solar Homes Partnership (NSHP).

As explored in greater detail below, CAHP will incorporate a ZNE sub-element to adopt the following strategies toward achieving the Strategic Plan goals. As program technologies and approaches are developed and demonstrated in ZNE, they will be incorporated into the CAHP.

- Raise plug load efficiency (ZNE)
- Promote Whole House solutions, with a particular focus on zero peak homes as an interim step toward zero net homes (CAHP)
- Encourage In-home Monitoring and visual display tools (ZNE)
- Encourage incorporation of Green Building Standards (ZNE)
- Coordinate CAHP with demand response programs (CAHP) specific strategies for achieving net zero homes will be reviewed in more detail below. Moreover, as

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

outlined above, where strategies enter the market more rapidly than anticipated, they will be rolled into the core CAHP.

To further help make ZNE a reality in the residential sector, utilities will:

1. Integrate successful ZNE strategies and activities proven through program and/or pilot projects during the 2013-2014 Transition Period. The residential new construction program will absorb and enhance existing residential programmatic elements aimed at delivering ZNE best practices to the marketplace, potentially including but not limited to:
2. Project consultations that pair projects with experts capable of driving unique designs to ZNE;
3. Provide education opportunities to key architectural, engineering, and other design professionals (see WE&T plans); and
4. Explore cost effective ZNE solutions that consider the intersection of building and community energy use

**b. List measures**

CAHP Program measures, known savings. All IOUs<sup>62</sup>.

- Marketing assistance as feasible and appropriate for builders who achieve ENERGY STAR certification.
- Calculated incentives.

**c. List non-incentive customer services**

- Technical support to Energy Analysts and Design Teams<sup>63</sup>
- Economic modeling/measure selection support to builder/construction managers
- Marketing support to builders (sales agent training, marketing materials)
- DSM coordination (PV, DR, AMI, ET) for builders

The program will coordinate with the statewide Codes & Standards team to ensure that the impacts of any code changes are incorporated into program design and implementation and will also tie into the Strategic Plan Codes and Standards strategy and support the ZNE goals.

Coordination activities include:

- Builders often set-aside a certain number of units for various income classifications to meet low and moderate income housing goals. Builders must

---

<sup>62</sup> Savings per appliance will be consistent across all IOUs.

<sup>63</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes/workshops for design teams.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

meet state-mandated housing goals in the housing elements of local city and county strategic plans.<sup>64</sup>

- CAHP would treat market-rate units using the standard calculated approach and claim all energy savings.

**Zero Net Energy (ZNE)**

The ZNE program element recognizes that critical to achieving zero net new construction is the integration of DSM approaches and truly integrated design. This can only be done when the entire suite of DSM offerings is at the table (electric transportation, demand response, energy efficiency, smart meters, and distributed generation). These will be maximally effective when they are part of a truly integrated design. To that end, ZNE will help educate the industry on how to achieve energy-efficient, green homes.

The ZNE program element will consist of projects that have used advanced modeling techniques to project total kBtu usage and demonstrates a plan to offset said usage with onsite generation over the course of 12 months. This portion of the program will provide customized financial incentives that intend to cover a portion of the verified incremental cost for a portion of the homes, at levels that may vary. This incentive will only apply to the energy efficiency measures of the home and will explicitly exclude the cost of renewable energy generation. The Emerging Technology program may also fund the purchase, installation, and monitoring of candidate technologies. The ZNE program element will also provide support in the form of soft-cost design support to help design teams meet their energy and environmental objectives. This portion of the program works closely with home builders seeking assistance in the development of sustainable design and construction, green building practices and emerging technologies.

The ZNE program element, in conjunction with WE&T programs, offers educational opportunities to builders, architects and other Residential construction stakeholders. The program encourages single and multifamily architects and builders to design and construct dwelling units that exceed California's Title 24 standards, reduce greenhouse gas emissions, and provide a healthier and less resource-intensive environment. Such non-standard design elements may include optimization for solar orientation, design for comfort without traditional HVAC, or non-vapor compression cooling systems. It also is a priority goal of this element of the program to execute candidate technologies and integrated approaches to realize zero-peak homes, even if zero-net homes (site Btu's for both therms and kWhs) prove too costly.

**Design Assistance Options:**

- General Team Education: Give presentations, review rating system options, determine big picture green building goals.
- Energy Efficiency/Green Building Recommendations: Project specific recommendations report highlighting ways to incorporate energy efficiency,

---

<sup>64</sup> See, <http://www.hcd.ca.gov/hpd/hrc/plan/he/>, accessed 25 Apr 08.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

healthy materials, and other green building features into the unique parameters of the project. Specific product recommendations will not be provided.

- **Energy Modeling Support:** Provide support and recommendations for Title 24 energy performance modeling to estimate actual building usage and give the project credit for energy efficiency measures that are difficult or uncommon to model.
- **Plan and Specification Review:** Provide comments on the construction documents at various stages to give feedback on clarity of green building specifications.
- **Green Feature Cost Assessment:** Provide cost-benefit analyses or value engineering assistance to evaluate specific green building features under consideration for inclusion in the project.

**Rating System Documentation Support:** Assess and identify project credit/certification goals, identify and assign rating system tasks to members of the design team, guide the team in system process and timing, assist team in understanding and/or documenting credit achievement. This aid will enhance - but not supplant - participants' efforts to pursue project specifications, designs, calculations, modeling and other necessary services.

The minimum threshold for acceptance in the ZNE program element will be a whole building performance with advanced modeling showing the total kBtu usage of the home as well as the method of generating the offsetting kBtu's.

**CAHP Incentive Rationale**

The program's most ambitious goal for the 2013-2014 Transition Period is to promote the early adoption of reach as well as future code elements into the builders standard practices.

Getting the market to adopt these levels of efficiency will not be easy. The IOUs expect significant pushback from the building industry due to rising costs. This argument will become even more significant in 2014 when the 2013 Title 24 energy codes take effect. The projected increase in cost to comply with these new codes may be between \$3,000 and \$5,000. The program is considering the following changes to the current incentive structure:

- In 2013 the sliding scale will stay as it is currently. The IOUs plan to eliminate the kickers from the program to help streamline and lower administration costs. After providing the kickers for the past 3 years it is the program's determination the kickers are not influencing the decisions of the builders and as such have proved not to be essential incentives.

Once the 2013 Energy code becomes effective the program will adjust the incentives in a

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

way that will still cover a portion of the verified incremental cost for homes achieving high levels of efficiency above and beyond those required by code.

The program believes ENERGY STAR is an important and highly recognizable brand for energy efficiency. Focus group studies have shown that while the brand is known to be good the typical buyer does not understand the whole house can achieve the label as it is typically only associated with appliances. The program will therefore explore a marketing incentive for all homes that achieve the ENERGY STAR for Homes label.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Lighting Market Transformation Statewide Program (Resolution E-4385, Appendix. A).

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
<b>NEW CONSTRUCTION</b>		
<b>California Advanced Homes Program (CAHP)</b>	1. Number and percentage of committed CAHP participant homes (applied and accepted) with modeled, ex-ante savings exceeding 2008 T24 units (Single family (SF) and multifamily (MF)) by 15%-19%, by 20%-29%, 30%-39%, and 40+%.	2a
	2a. Percentage of (current year SF CAHP program paid units)/ (SF building permits within service territories from the previous year)	2a
	2b. Percentage of (current year MF CAHP program paid units)/ (MF building permits within service territories from the previous year)	2a
	3. Number and percentage of CAHP participant new homes verified* by IOUs' HERS which exceed Title 24 (T24) building standards (SF and MF) by 15%-19%, 20%-29%, 30%-39%, 40%+.	2b
* The IOUs use the existing HERS Rater infrastructure to verify HERS measures and other building characteristics as required by CA Title 24		

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
	and the CEC. The IOUs do not perform the verification inspections and do not certify HERS raters. Note: HERS inspection protocol for production builders does not require inspection of 100% of homes; there is a sampling protocol. For more information on HERS inspection please see <a href="http://www.energy.ca.gov/HERS/index.html">http://www.energy.ca.gov/HERS/index.html</a>	

**b) Market Transformation Information**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

**Bullet 1) A description of the market, including identification of the relevant market actors and the relationships among them;**

The MT elements described here follow guidelines and terminology explained in Rosenberg & Hoefgen’s (2009) *Market Effects and Market Transformation: Their Role in Energy Efficiency Program Design and Evaluation*.

<<paper is available here [http://uc-ciee.org/downloads/mrkt\\_effts\\_wp.pdf](http://uc-ciee.org/downloads/mrkt_effts_wp.pdf) >>

Ideally, information about a market would come from a variety of sources, including existing studies and newly-commissioned studies. Rosenberg & Hoefgen (2009) recommend that California should “Commission initial market characterization research for those products and services for which the structure of the market and the motivations of the market actors are not well understood or documented, at least in terms of their response to the product in question.” Due to a lack of time, the following market information draws heavily upon qualitative analyses made by the program managers based upon information they have obtained through experience in implementing the program. We look forward to an opportunity to develop a better understanding of these markets through future commissioned studies, in conjunction with ED and other market transformation stakeholders.

The RNC market consists of several key players including builders, designers, sub-contractors, HERS raters, local cities, manufacturers, real estate agents, financing agencies, and home buyers. The RNC sub-program is located upstream, targeting builders and subcontractors early in the design stage of the production process. Upstream of the IOU’s RNC influence are local cities’ permitting rules and associated costs. Downstream of the RNC sub-program are real estate agents, financing agencies, and home buyers. The RNC sub-program works directly with builders, designers, subcontractors, HERS raters,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

builder sales staffs, and manufacturers via equipment recommendations at the design stage.

**Bullet 2) Identification of the key barriers and opportunities to advancing demand-side management technologies and strategies;**

The key barriers and opportunities to be addressed through a market transformation initiative would ideally draw upon a market characterization study. Due to lack of planning time, the following market barriers and opportunities are drawn from qualitative analyses made by the program managers.

Key RNC market barriers include A) entrenched builder and subcontractor habits, B) a lack of buyer knowledge, interest, and demand, and C) an ensuing disconnect between the price buyers are willing to pay and the related increased builder costs of incorporating DSM technologies, energy efficient equipment, and advanced building practices. Opportunities to address these barriers include education and outreach to builders, subcontractors, and buyers to increase demand and alter builder habits; design assistance to improve builder knowledge and maximally cost-effective strategies; and incentives to bridge the gap of builder costs and buyer demand.

**Bullet 3) A description of the proposed intervention(s) and its/their intended results, and specify which barriers each intervention is intended to address;**

To address Barrier A, the following intervention is proposed:

Builders and sub-contractors will be offered training and design assistance to facilitate the acceptance and incorporation of new technologies and building practices including DSM.

To address Barrier B, the following intervention is proposed:

Builder sales staffs will be provided training and marketing support on the advantages of EE homes that incorporate DSM technologies. Financing mechanisms will be explored to reduce buyer costs and increase demand.

To address Barrier C, the following intervention is proposed:

Incentives will target a reduction in the cost to builders of incorporating EE measures and DSM technologies.

Market transformation interventions can be expected to take 2, 5 or even 10 yrs before effects can be quantified. We propose the following that these would be the results that can be seen in the market at various time intervals:

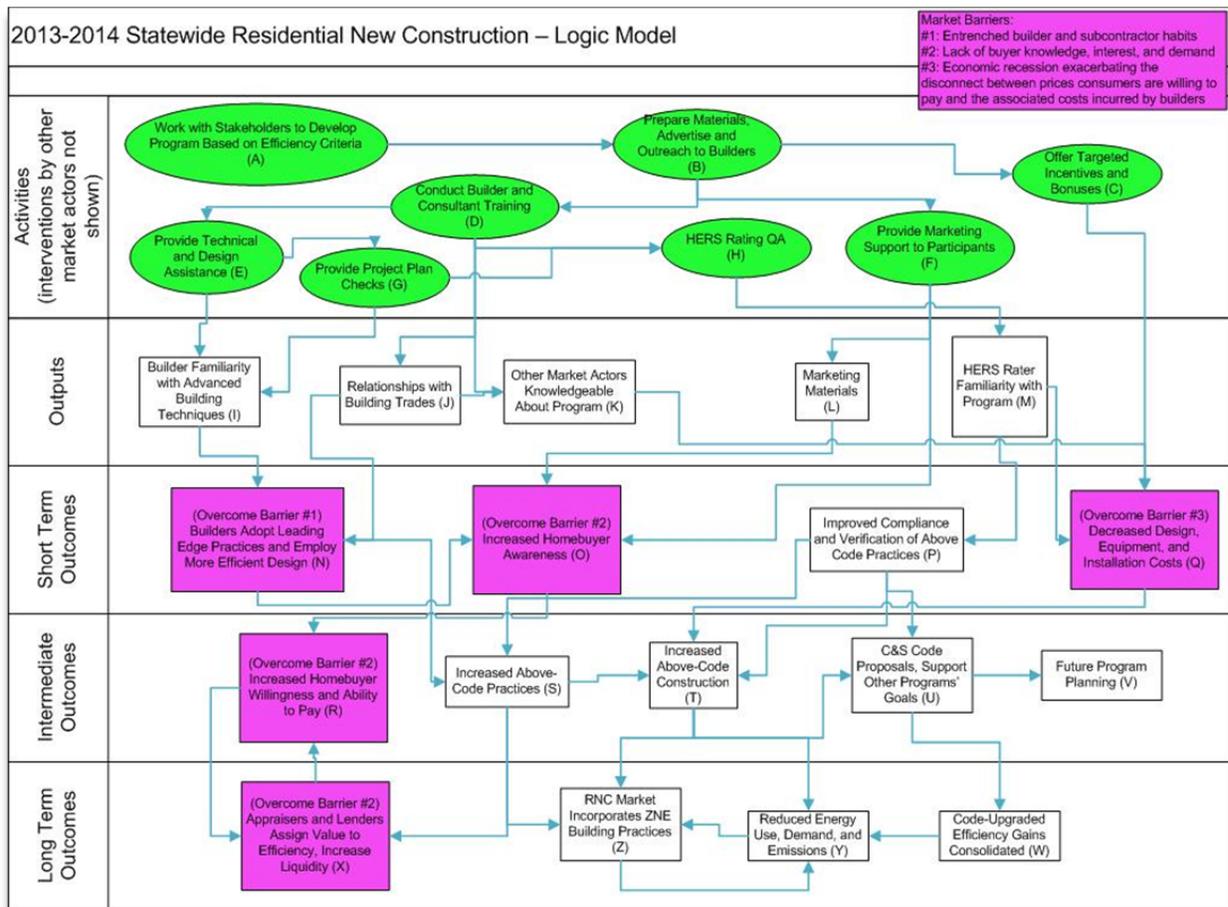

After 2 years of implementation builders and subcontractors should feel significantly more confident in accepting new technologies and advanced building practices. By this time they should be familiar with IOU design assistance procedures and how to maximize the incentives and minimize the increased costs. Sales staffs should be well-versed in the advantages of participant homes.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

After 5 years, builders and subcontractors should be very confident in advanced EE technologies, building practices, and DSM. At this time the market should be nearing ZNE building practices. Financing mechanisms should be in place to improve buyer demand.

After 10 years, the RNC market should be exclusively building ZNE developments. At this point the program focus will be devoted to education and outreach, helping the industry competes with the less efficient existing market. Financing mechanisms will continue to play a role.

**Bullet 4) A coherent program, or “market,” logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results; and** In this example below, “Portfolio Program Elements” are the market transformation interventions that are specifically directed to the market barriers. “Outcomes” are the outputs of the MT interventions, which are the market effects and reductions in market barriers that can be seen in the short-, mid-, and long-term. Please note that the long term outcomes are “sustainable,” which is what the market should look like after the market intervention has ended.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Bullet 5) Appropriate evaluation plans and corresponding Market Transformation Indicators and PPMs based on the program logic model. (The IOUs should be prepared to start tracking proposed Market Transformation Indicators immediately in order to establish a baseline, and in cases where the logic model calls for metrics to be differentiated in terms of the sequence and timeframe in which they are expected to be relevant – i.e., leading vs. intermediate vs. lagging indicators of change – each metric should be identified as such).**

Due to the need to comply with the Decision’s timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

**Summative evaluation - Market Effects**

The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program “spillover” and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

**Program Performance Metrics:** Please see Section 5, Table 3, above.

**Market Transformation Indicators:** Market transformation indicator results shall be reported, as available, by Energy Division or the IOUs, depending upon who conducts the necessary market studies. (Res. 4385, 12/2/10)

**Attribution:** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasizes that attribution of market effects to programs bears further research. Others (R&H, 2009; Keating & Prah (MT Workshop)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

suggest that declaring the program’s strategic intent through the market transformation initiative’s theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

In lieu of the above results and recommendations, the RNC sub-program will carry forward the PPMs and MTIs that were in place during the 2010-2012 cycle.

**c) Program Design to Overcome Barriers**

**Priority Barrier: Building Industry**

Effective January 1, 2014, California’s Title 24 standards will be revised and updated. Overall, Residential baseline energy performance requirements for heating, cooling, and hot water will be increased by approximately 25 to 30 percent, which implies marked increase in production costs for builders at a time when the industry and the economy at large are experiencing significant challenges.

**Priority Barrier: Homebuyers**

The energy used in the average home produces roughly twice the greenhouse gas emissions as the average automobile. In fact, 16% of U.S. greenhouse gas emissions result from the generation of energy used in houses nationwide (U.S. EPA). However, there is little consumer awareness of the impact that homes have on the environment. CAHP is working with IOU marketing efforts, statewide partners, ENERGY STAR campaigns, and builders’ own messaging to increase consumer awareness of this idea. Moreover, there is scant evidence that energy efficiency drives decision-making among homebuyers whose access to capital is more difficult in a constrained capital market.

**Overcoming Market Failure: CAHP**

In a buyer’s market, builders are looking to differentiate themselves from competition. This presents an opportunity for CAHP to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to meet the state’s and IOUs’ goals for the reduction of greenhouse gas emissions and utility source demand.

The RNC market without IOU intervention is a lost opportunity for long-term energy savings. However, with IOU intervention in the form of incentives and design support,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

the new construction market is well placed to demonstrate innovative approaches and cost-effective energy savings technologies.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

<b>California Advanced Homes</b>	<b>Program Target 2013</b>	<b>Program Target 2014</b>	<b>Total</b>
Single Family Units Paid	TBD	TBD	TBD
Multi-family Units Paid	TBD	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

Since its inception in 2002, CAHP has had a substantial impact on the homebuilding market. There is a significant opportunity to continue to influence builders, architects and other players in the RNC industry.

The RNC program is designed to enable the achievement of several goals and strategies identified in the Strategic Plan. The Strategic Plan envisions a transformation of the core Residential sector to ultra-high levels of energy efficiency, resulting in ZNE new construction standards by 2020. It spells out several goals and strategies to address energy reduction in RNC.

**Goal #1:** RNC will deliver ZNE performance for all new single and multi family homes by 2020. By 2011, 50% of New Homes will exceed 2005 Title 24 energy efficiency standards by 35%; 10% will surpass 2005 Title 24 standards by 55% (Strategy 1-1)

**Goal #2:** Home buyers, owners and renovators will implement a whole house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment household appliances, and plug load amenities

**Goal #3:** Plug load will grow at a slower rate and then decline through technological innovation spurred by market transformation and customer demand for energy-efficient products.

The goal of energy-efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan, and works in close coordination with the ZNE sub-element. Together these programs seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The ZNE program element is designed primarily with the focus of accelerating the achievement of the ZNE goals envisioned by the Strategic Plan. The purpose of the ZNE element is to examine a wide array of energy saving technologies, accelerate the market acceptance of new and emerging technologies, explore new solutions, and encourage distinctive approaches in demonstration projects. Each being distinctive, the case studies will be positioned to highlight the underutilized potential of sustainability in RNC, in a range of market segments and climate zones. The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other agencies to further assist the projects in advancing sustainability and achieving very high levels of energy efficiency.

Financial incentives and marketing support offered for the ZNE projects will be higher than those offered under the standard CAHP model. By providing strong encouragement for builders to move up on the energy efficiency scale with financial and non-financial incentives, the ZNE program element is uniquely positioned to support the Strategic Plan goal of ZNE by 2020.

CAHP will work closely with builders who seek assistance in the development of sustainable design and construction, green building practices and emerging technologies through the ZNE program element. ZNE is the place to demonstrate innovative technologies and to help drive the market for energy efficiency through the adoption and marketing of green standards. IOUs have already initiated preliminary research on policies and programs supporting residential ZNE programs in other states for potential new and innovative program design approaches to increase homeowner demand and marketplace change, consulting with relevant experts in this area. This research reveals a lack of other utility programs serving this market. Rather, ZNE currently exists in a piecemeal fashion throughout the country without a consolidated approach. IOUs will continue research in this area and report more complete findings by April 1, 2013.

## **6. Program Implementation**

### **a. Statewide IOU coordination**

Given the success of the collaborative process that led to the production of this PIP, the statewide RNC team plans to continue meeting on at least a quarterly basis going forward, in order to review progress toward the goals and make corrections needed to help achieve them.

#### **i. Program Name**

RNC falling under Title 24 is covered by the California Advanced Homes Program. Factory-built housing will be covered by the ENERGY STAR Manufactured Homes Program, where offered.

#### **ii. Program delivery mechanisms**

CAHP and ESMH are delivered via online program materials and dedicated account executives, supported by a dedicated team of program management staff.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Differences in Program Implementation**

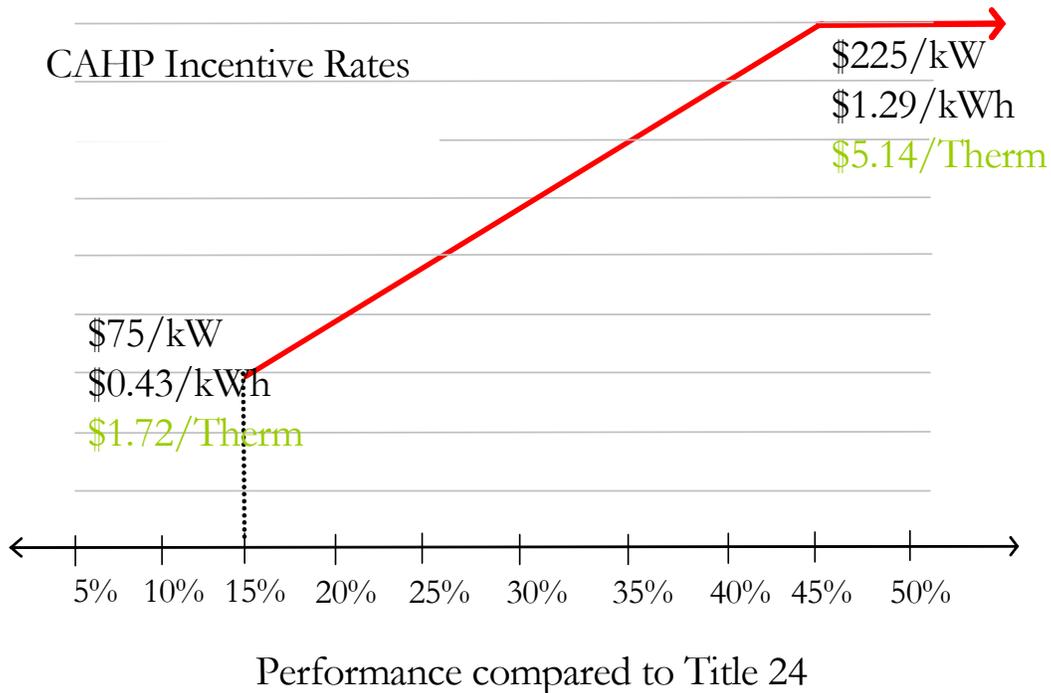

This section highlights the major areas where individual IOUs implementation of the program will differ from that of the others. While the incentive structure and other elements of the program will remain synchronized with the statewide nature of the program, each IOUs will leverage its unique strengths and structural differences to enhance the effectiveness of execution. This section highlights some of those differences.

**iii. Incentive levels**

**Incentive Structure**

The pay-for-performance incentive structure for the 2013 - 2014 CAHP will continue to be refined as the state approached implementation of the 2013 Title 24 code changes (see CAHP Incentive Rationale section above for additional detail).

The 2013-2014 calculated approach will be similar to the method used from 2010-2012:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

This approach rewards builders for achieving higher levels of energy efficiency and avoids the “clustering” problem in tiered programs. A tiered approach discourages builders from achieving incremental performance if they are unable to reach the next higher tier. In line with the elements of the strategic plan, the approach rewards builders for undertaking whole house solutions where the entire structure can be considered as an integrated system.

Moreover, executing a net zero home remains a financial and technical challenge, the program will have customized incentives for homes that achieve ZNE.

**Confidence that incentives will move the market**

The statewide team has a high degree of confidence that the revised program design is sufficient to realize substantial market movement. As discussed above, incentives alone are not enough to move the market. While more dollars are always preferred by any target industry, it has been the experience of the Southern California utilities that while incentives get one to the table with decision makers, it is the design, technical, and marketing support that makes the sale.

It is the belief of the IOUs that the proposed combination of performance-based incentives, increased incentives for targeted ZNE, marketing support, sales agent training, technical support, coordinated delivery through trade allies and ongoing cultivation of builder relationships provide an integrated solution to the priority market barriers builders face in delivering more efficient homes.

The IOUs support adjusting program incentive levels in conjunction with the more stringent Title 24 code taking effect in 2014. More efficient incentives will be critical in helping builders defray additional compliance costs associated with the stronger code. However, the IOUs believe there is a need to explore the deadline for incentive adjustments. A date after March 2013 may be appropriate for a number of reasons, including:

- Changing incentive levels *before* the new code takes effect may provide an added incentive for builders to rush to beat the code. Ideally, the incentive adjustments would be timed to coincide with the implementation of the new code so as to incentivize building under a more stringent Title 24. A fast turnaround would prevent the IOUs from determining the ideal incentive structure. Given uncertainty about the market’s response to the unprecedented updates to Title 24, extra care should be taken in calibrating incentive levels to their optimal value.

The IOUs will comply with the March 1, 2013 deadline for adjusting incentive levels, but propose January 1, 2014 as a preferred date.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**How CAHP supports CEC's NSHP, Tier II**

CAHP supports the revised NSHP Tier II (30% < T24 2008) and the goals of the CEC.

1. The IOUs are committed to partnering with the NSHP to streamline the solar application process and to make referrals between NSHP and CAHP. Indeed, the goals of ZNE appear impossible without the significant presence of solar.
2. The IOUs will leverage CEC NSHP material, marketing, and event support for opening events for those projects that commit to the platinum level: 100% penetration at the Tier II EE performance (30%).
3. The design of the graduated, performance-based incentive will tend to drive projects to the higher end of the performance curve, consistent with CEC goals.
4. The threshold efficiency (15%) is consistent with the Tier I minimum, and the top end (45%) was selected to support the CEC's desire to project out three code-cycles (Tier III) into the future.

The IOUs support the goals of the NSHP and the marketing synergies of PV and EE remain one of our best strategies for moving the market. Nevertheless, the IOUs position is that if 30% < T24 is very good, 31% is better, and 32% more so.

**iv. Marketing and outreach plans**

CAHP offers financial incentives, training opportunities, technical support, and marketing resources to single-family and multi-family Residential builders who construct homes that exceed California's energy efficiency standards for new construction. All types of Residential builders are welcome to participate.<sup>65</sup> For the multi-family segment of the program, qualifying homes include condominiums, townhomes, apartment buildings, and mixed-use projects.

There will be closer coordination of marketing efforts to synergize wherever possible. While each utility would like to leverage on their strengths and existing relationships within their service territories, certain marketing elements can be launched on a common localized platform. The common website will be maintained to provide builder information that will be commonly disseminated.

To reduce costs and increase participation, the IOUs plan to be actively engaged in the development and implementation of joint marketing, education and training efforts as described in detail in the common section of this PIP.

In 2013-2014, the program will expand its builder/contractor education and training certification courses to increase overall awareness and understanding of the CAHP and service offerings. The IOUs will continue to strengthen delivery channels of information by providing relevant information and support materials, reaching

---

<sup>65</sup> As discussed above, manufactured housing is not subject to Title 24 and uses the national HUD baseline.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

target audiences in key decision-making phases. The IOUs' innovative communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the Internet.

Additionally, CAHP will leverage its stellar relationships in partnering with trade organizations and other groups actively promoting the benefits of green, sustainable building practices. Such organizations include:

- California Energy Commission (CEC)
- National Association of Home Builders (NAHB)
- California Building Industry Association (CBIA)
- Green Building Consultants (that is, Build it Green, California Green Builder, Global Green)
- United States Green Building Council (USGBC)
- ULI
- LABC
- California Manufactured Housing Institute
- IES
- AEE
- IHACHI
- PHCC, and
- Others

Through an innovative, coordinated approach, we will maximize outreach opportunities that keep energy efficiency and CAHP's program benefits top-of-mind and maximize program participation.

Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

CAHP marketing efforts will be enhanced by leveraging IOU market studies and builder focus groups identifying consumers' decision triggers and the effect of GHG labeling on purchase decisions. The IOUs will pursue additional sources of research to determine the most cost-effective ways builders can meet program requirements; the results will be incorporated into marketing materials and/or communicated to builders as part of the design assistance recommendations.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Given consumers' interest in going green and the market's deficiency in driving energy efficiency sales, marketing the green features (one of which is EE) is the best way to increase consumer demand for more efficient homes. To that end, CAHP will help educate the industry on how to achieve energy-efficient, green homes. To increase participation in programs and the general understanding of sustainability, greater emphasis will be placed on education and outreach.

The precipitous decline in the building industry offers a great opportunity to improve education and training. Through their Education & Training programs offered at SoCalGas' Energy Resource Center, SDG&E's Energy Innovation Center, SCE's Energy Education Center, and PG&E's Pacific Energy Center, the statewide new construction team will work to expand course offerings, web cast seminars, and cost-benefit effectiveness training classes, thermal by-pass checklists compliance training, cost comparison of alternative measures, etc. In order to meet or exceed increased energy savings goals in an extremely difficult Residential construction market, the IOUs will utilize a broad range of marketing tactics and communications tools working in concert to expand program awareness and participation.

The IOUs will diligently explore other means of encouraging builder participation in the CAHP program:

- Developing a list of resources and contractors that could be used by builders
- Providing information on comparative costs and energy savings of alternative measures
- Exploring financing arrangements (green mortgages, energy-efficient mortgages, etc.), in consultation with the other IOUs and financial institutions
- Expedited permitting for high efficiency buildings
- Working with Municipalities to develop educational channels for codes and standards.

**v. IOU program interactions**

The plan addresses above, in the CAHP Incentive Rationale section, the ways CAHP is responding to current code changes and how it anticipates a leading role in code modifications requiring demand performance, in-home displays, on-site generation, square footage reductions, and green elements.

CAHP is particularly interested in promoting integrated thermal hot water system designs to displace therm demand with on-site renewable sources. In addition to cold water savings from embedded energy and the energy to heat water, longer term there may be GHG reductions that accrue either to the builder, the homeowner, or the utility associated with each demand side reduction as a result of AB 32 and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

pending national CO<sub>2</sub> legislation. SoCalGas works closely with builders to appropriately evaluate their options.

CAHP prides itself on its established close relationships and memberships with other groups involved with the building industry. These relationships make it possible to provide comprehensive services to our customers. CAHP will continue to seek out and coordinate synergies with, but not limited to, the following groups:

- California Energy Commission (CEC)
- Flex Your Power (FYP)
- National Association of Home Builders (NAHB)
- California Building Industry Association (CBIA)
- Green Building Consultants (e.g., Build it Green, California Green Builder, Global Green)
- National Association of Homebuilders (BIASC)
- United States Green Building Council (USGBC)
- Urban Land Institute (ULI)
- Los Angeles Business Council (LABC)
- California Manufactured Housing Institute
- Illuminating Engineering Society (IES)
- Association of Energy Engineers (AEE)
- Institute of Heating and Air Conditioning Industries (IHACHI)
- Plumbing-Heating-Cooling Contractors Association (PHCC)

The California Building Industry Association and the CEC continue to seek out partnerships and opportunities with the utilities to help educate builders and other industry participants in order to promote energy efficiency in new construction.

CAHP will continue its commitment to the EPA's ENERGY STAR program and will strive to support, partner and contribute to the success of the ENERGY STAR Homes label and branding. Numerous surveys and studies continue to show the ENERGY STAR label represents greater value to consumers and the environmental stewardship it represents.

Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR New Homes and has won ENERGY STAR Achievement awards for the last five consecutive years. In 2011 SCG was rewarded for "Sustained Excellence in Energy Efficiency Program Delivery."

The program will continue to offer comprehensive training courses and educational seminars relevant to building energy efficiency and green measures into new construction projects including Title 24 code training and ENERGY STAR requirements.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

In response to builder requests, CAHP will offer a new training workshop for 2013 - 2014 designed for builders' sales agents. Sales agents have direct contact with the homebuyer and have the greatest impact on selling homes. In order to help promote ENERGY STAR developments, CAHP will teach sales agents about energy efficiency. Topics will include what qualifies as an ENERGY STAR home and what is 'green'.

Other CAHP activities will include attendance at building industry trade conferences, outreach events and any necessary contractor/builder field visits. The target audience consists of builders, developers, energy consultants, architects, and other industry professionals.

Each IOU may pursue partnership efforts with local government entities to display leadership in the carbon arena by expediting plan check, waiving permit fees, or allowing builders to pay impact fees on the back end (instead of up-front) in exchange for higher levels of home performance documented by our CAHP program.

**Similar IOU and POU programs**

The statewide CAHP team will reach out to leading POU programs, such as those at SMUD to learn from their experience how best to deliver energy-efficient homes. In addition, the IOUs will work closely with the existing home remodeling programs (Home Performance with ENERGY STAR and the Comprehensive Mobile Home Program) to maintain a two-way communication of best practices and lessons learned between the new and existing sectors.

**b. Program delivery and coordination**

**i. Emerging Technologies (ET) program**

Coordination with Emerging Technologies will chiefly be handled within the ZNE sub-element of CAHP. The IOUs are looking to partner with our ET and EPIC-funded Testing Facilities to pilot zero-net energy approaches. The proposed incentive approach allows the IOUs the flexibility to include both deemed and calculated energy savings from new technologies as they become market ready.

The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

**ii. Codes and Standards program**

Codes and Standards is looking to draft pre-approved "drop-in" legislation that can be used by local municipalities looking to create reach codes. Such activities would all be eligible for utility incentives since IOUs are playing

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

such a critical role in drafting the language. See Codes and Standards PIP for more information.

**iii. WE&T efforts**

The RNC team is seeking ongoing support from the three energy and training centers for classes relevant to the building industry and training the next generation of trade allies, builders, contractors, and the like.

Specific workforce development efforts supporting RNC include training on topics including, but not limited to the following:

- Energy Pro
- Title-24
- Micropas

SoCalGas will explore voluntary incentive-based approaches to encourage contractors and other industry professionals to complete the full bundle of RNC workforce development training. For professionals who complete the pre-requisite courses and pass a high-road skill standards test, such approaches may include (as applicable):

- Allowing marketing or advertising differentiation;
- An incentive bonus; and/or
- Providing preference to these professionals during bid evaluation process.

RNC workforce development training will be coordinated with the statewide IOU WE&T program. In addition to the trainings described above, SW IOU WE&T programs will continue to offer building-block courses that educate professionals on the concepts that form the foundation of Residential New Construction programs. Those concepts include:

- Green building techniques;
- Codes and standards;
- Lighting and HVAC technologies;
- Energy cost management; and
- Food service equipment.

Contractor recruitment efforts will be conducted primarily by SW WE&T program implementers through:

- The network of contractors already participating in Residential EE programs;

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Direct outreach through industry organizations with locally active memberships (e.g. IHACI, USGBC, IFMA, AIA, BOMA, etc.);
- Workforce development departments (to target unemployed general contractors); and
- Community Based Organizations with a proven track-record of effective outreach to the hard-to-reach workforce.

**iv. Program-specific marketing and outreach efforts**

In 2013-2014, the program will expand its builder/contractor education and training materials to increase awareness of the CAHP and better communicate the advantages of participation. The IOUs will continue to strengthen delivery channels through improved information and support materials. The IOUs' communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the internet.

**v. Non-energy activities of program**

SoCalGas will continue to develop collaborative working relationships with the LADWP and other municipal utilities to offer comprehensive incentive packages to participating builders in territories served by SoCalGas and the municipalities. Where applicable, the ZNE program element will seek to identify new types of water savings technologies opportunities.

**vi. Non-IOU programs**

There may also be opportunities to partner with local AQMDs and County Integrated Waste Management Boards to encourage material recycling in ZNE and green programs.

**vii. CEC work on codes and standards**

The IOUs will continue to support code development work with the CEC and to test candidate technologies in the new construction programs.

**viii. Non-utility market initiatives**

The homebuilding industry is facing some of the worst times in its history<sup>66</sup>. In fact, new Residential single-family housing permits declined by 37.1% relative from 2006 and multi-family permits have declined by 21.2 percent<sup>67</sup>. As a result, builders are building fewer homes and releasing them more slowly to the market. The significant costs associated with carrying inventory coupled with declining prices of houses has created additional resistance in a building industry already

---

<sup>66</sup>Alan N. Nevin, CBIA Chief Economist and Principal, Market Pointe Realty Advisors, [California Builder Magazine](#), January/February 2008

<sup>67</sup> California Industry Research Board (CIRB) Report, January 24, 2008

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

averse to additional construction costs. In addition, the industry is consolidating operations and eliminating staff to reduce overhead costs and avoid bankruptcy. Homebuilding in California may be just beginning to show signs of revival, although growth in activity is likely to remain considerably slow.

The industry faces the burden of stringent California Title 24 building code standards. Each code is approximately 15% more stringent than the last, increasing costs and requiring additional efforts on the part of the builder. In California, homes built to current Title 24 standards are 35% more energy-efficient<sup>68</sup> than homes built to the federal government's standards. In addition, reducing greenhouse gas emissions will become mandatory, due to the adoption of AB 32 (Global Warming Solutions Act). Builders confirm that growing consumer awareness of "green" concerns will lead to greater demand for these advanced homes and builders will adapt to meet these demands at the least possible cost.

As alluded to above, buyers are increasingly asking for green and energy efficiency and may pay more (up to \$11,000) for such features.<sup>69</sup> For the first time, a majority of respondents in the National Association of Home Builders' survey are asking for efficiency first, likely in response to rising energy prices economy-wide. A majority of the same respondents also requested higher ceilings, more square footage, and were willing to trade a larger home for a longer commute, reflecting a "soft" commitment to green.

### **Energy Savings Assistance (ESA) Program**

CAHP is working with the ESA program to coordinate energy efficient new construction with low income housing development.

- For housing units designated by builders for low-income occupants, SoCalGas' ESA program will pay the full incremental cost of installing energy-efficient equipment, such as high SEER (Seasonal Energy Efficiency Rating) AC systems, and refrigerators. ESA will claim the savings from the measures funded by that program.
- CAHP will pay the standard calculated incentives for all other measures in low-income units (e.g. improved duct work and windows). CAHP will claim the energy savings resulting from EE measures other than high SEER A/C and refrigerators.
- CAHP would treat market-rate units using the standard calculated approach and claim all energy savings.

This collaboration will:

---

<sup>68</sup> Ray Becker, Chairman, CBIA, [Southern California Builder Magazine](#) Vol. 25. CAHP's internal research has shown typical 2005 T24 performance is 20% above IECC 2006

<sup>69</sup> Jan Dimeo, [Builder](http://www.builderonline.com/business/surveys-reveal-home-buyer-wishes-for-energy-efficiency-and-beyond.aspx). <http://www.builderonline.com/business/surveys-reveal-home-buyer-wishes-for-energy-efficiency-and-beyond.aspx>. Accessed 14 Mar 08

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Encourage the development of more below market rate low income units by developers,
- Increase participate in the RNC sub-program based on the combined higher incentives, and
- Benefit low income occupants over the life of the installed equipment.

The partnerships program will assist in gathering information to ensure that the units actually are occupied by low income qualified customers. Local governments typically track this information in order to show compliance with state mandates.

CAHP will be implemented by direct contact with the market actors: builders, architects, civil and mechanical engineers, energy analysts, HERS providers, HERS raters and other participants. Through design assistance and coordination with the builders and their consultants and contractors, projects will be evaluated for optimal approaches to increase energy savings and demonstrate green building concepts.

The program will target the Residential design and construction teams, architects, energy analysts, HERS raters, trade contractors, and builders. The target segment is low-rise and high-rise RNC with participation being open to all RNC including custom homes, single-family production housing, condominiums, town homes and rental apartments.

Builders may qualify to participate under one of the two sub-program categories: CAHP or ZNE. Through financial incentives, design assistance, education and training, the IOUs will aggressively support high performance single family and multifamily building designs that exceed Title 24 standards in an overall performance design of 15% or greater. Energy savings and incentives will be based upon a sliding scale from 15% to 45% reduction in energy usage from Title 24 budget. Program focus will be on increasing the participation to a 30% threshold.

**c. Best Practices**

The RNC team has gathered information and gained experience in successful low energy and ZNE projects to evaluate best practices. Thus far the research shows that while ZNE practices exist in piecemeal fashion throughout the state and nation, there are no other utility incentive programs specifically targeting ZNE. RNC will continue to conduct further research and will disseminate its finding by April of 2013 in accordance with the program guidance. This information will be used to develop pilot projects that will demonstrate low energy homes and include home performance monitoring.

**Processes**

- Improve marketing materials and improve participant recognition: Marketing materials and other collaterals will continue to be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- RNC has undertaken substantial marketing material revisions in the 2010-12 cycle, and will continue to improve the materials to enhance customer communication.

**Program Services: Training**

- Taking advantage of the slowdown in the industry, the utilities intend to ramp up the training for builders and other industry participants. Training is an area where significant synergies can be extracted and the IOUs will participate in developing and implementing common training modules and web based training tools. Training will focus particularly on cost / benefit evaluation of energy efficiency improvements and thermal bypass checklist compliance.

**Program Services: Information, Communication and resources**

- A web-based incentive calculation tool will be evaluated by the IOUs. This tool is intended to assist builders in comparing costs and energy savings of alternative measures and arriving at the most optimal approach for the builder.
- Currently, the technical staff provides preliminary evaluation, engineering review and recommendations for builders to move up on the efficiency scale. It is expected that builders will utilize the services of qualified Energy Analysts and designers in arriving at the final set of measures that should be included. The program will continue to work closely with these companies to promote continued improvement and a commitment to integrated design.
- The IOUs will explore the implementation of an enhanced set of communication tools that will serve to educate builders and enhance participation. As explained earlier, our communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns; all materials and communications will be made available in electronic file formats.

**d. Innovation**

SoCalGas' RNC program has gone through significant evolution over the years, constantly adopting innovative approaches and eliminating non-working elements. The current incentive design is based on a whole building performance. It appropriately rewards higher levels of building performance and is likely to motivate home builders to move towards higher efficiency buildings. This approach offers the builder adequate flexibility to choose the optimal combination of design features. It also enables the utilities to work together and support new construction projects with fuel neutrality.

By focusing on efficiencies beyond 35% better than Title 24, and encouraging ZNE projects, the IOUs hope to generate sufficient enthusiasm in the market place for very high efficiency homes. Wherever possible, the California utilities will continue to extract

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

synergies in marketing and program design by developing a truly statewide program with common features and coordinated efforts.

As a gas-only utility, SoCalGas has been consistently seeking innovative approaches in program implementation to enhance the cost effectiveness of CAHP. During the 2010-12 cycle, SoCalGas executed energy sharing agreements with SCE and PG&E to effectively address the program needs of builders in joint service territories. These agreements have enabled the utilities to offer the program benefits with a single point of contact for the builder, while reimbursing each other (incentives offered on the type of energy not provided by that utility) after completion of the projects.

**e. Integrated / coordinated Demand Side Management**

The ZNE element offers a great opportunity for savvy builders to demonstrate their commitment towards a truly integrated approach to DSM options. With design assistance, custom home builders are uniquely positioned to leverage the various tools available at their disposal. The program management teams will educate and strongly advocate these builders to serve as model designers and be recognized and rewarded in the builder community. ZNE homes offer an excellent opportunity for builders to install not just energy saving measures, but also renewable energy, in-home display, solar roofs, innovative water saving technologies and other state-of-the art appliances to demonstrate how sustainable design can be achieved.

**f. Integration across resource types**

As discussed above, the program is looking to partner with relevant stakeholders to identify water, air quality, and waste-diversion opportunities.

**g. Pilots**

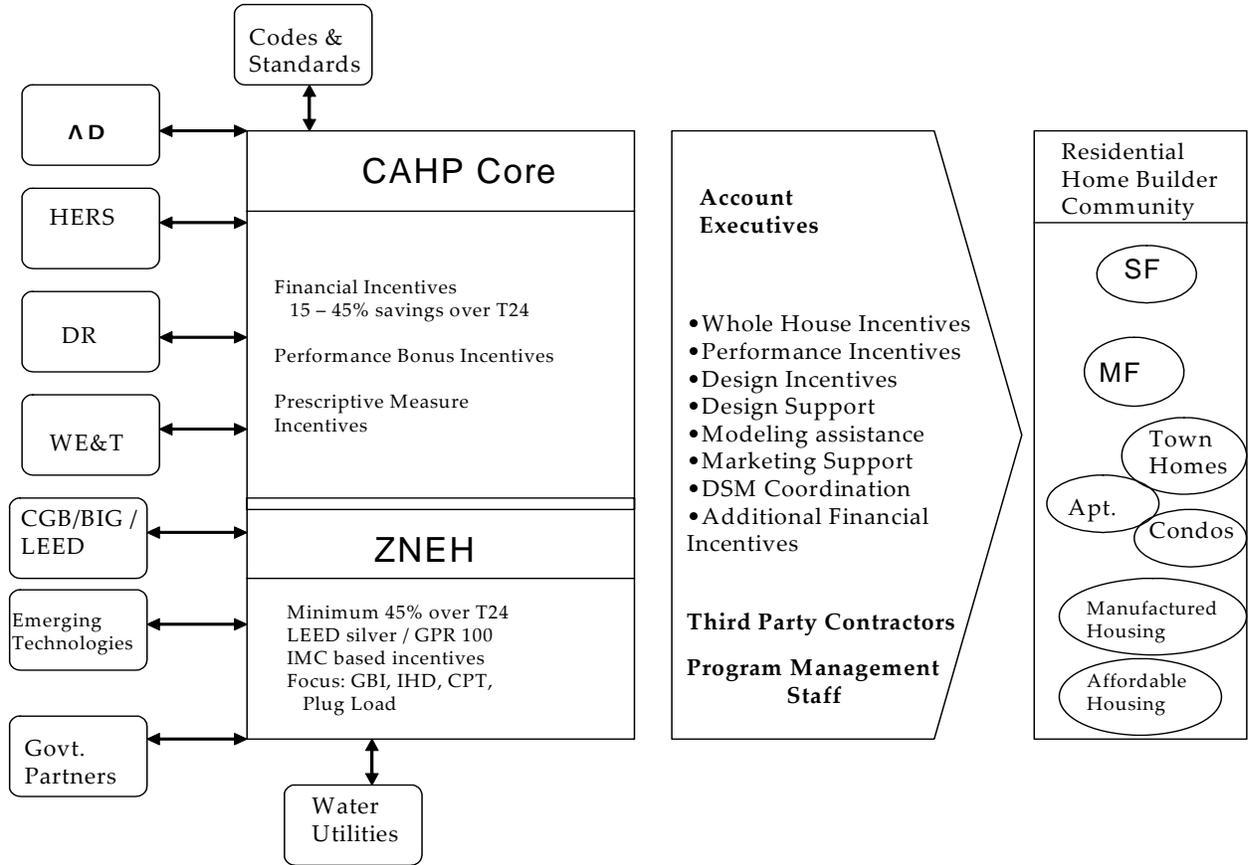

During the course of the program cycle the IOUs may encounter the need to run pilot programs before an idea is introduced to the core program offerings. At that time the utility will submit the plans for such pilots.

**h. EM&V**

The utilities are proposing to develop and submit a comprehensive EM&V plan for 2013-2014 after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader utility studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

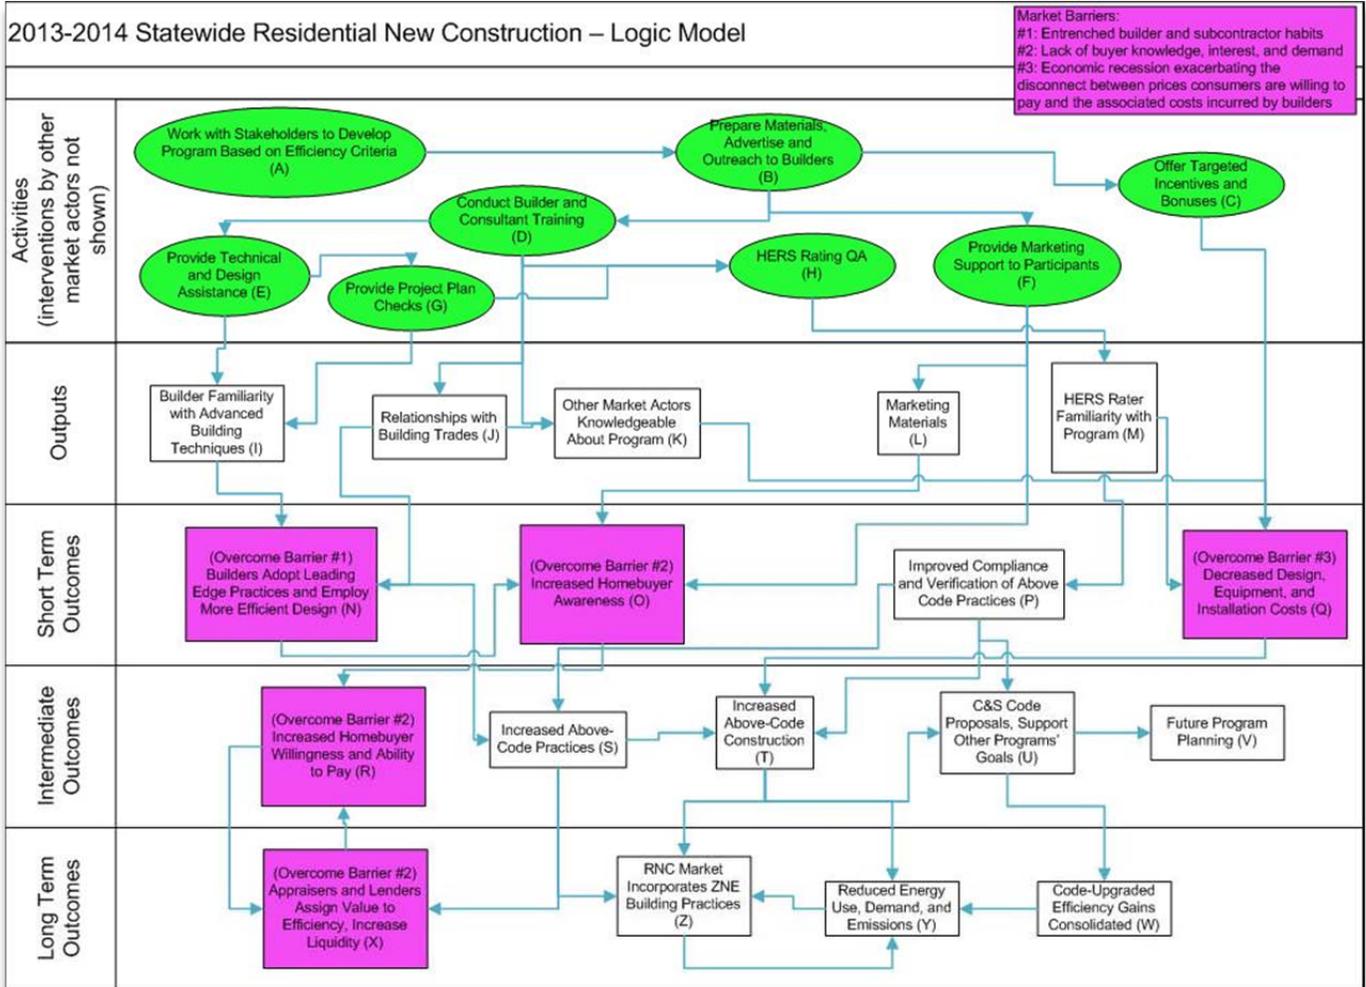

## Diagram of Program

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

### Program Logic Model

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the CAHP and ZNE.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**ENERGY STAR® Manufactured Homes Program (ESMH)**

The ENERGY STAR® Manufactured Homes Program is part of the statewide RNC program offering. The RNC program is itself one sixth of the CalSPREE core offering. ESMH addresses new factory-built housing, offered by SDG&E, SoCalGas and SCE. The structure of the relevant New Construction program elements is as follows:

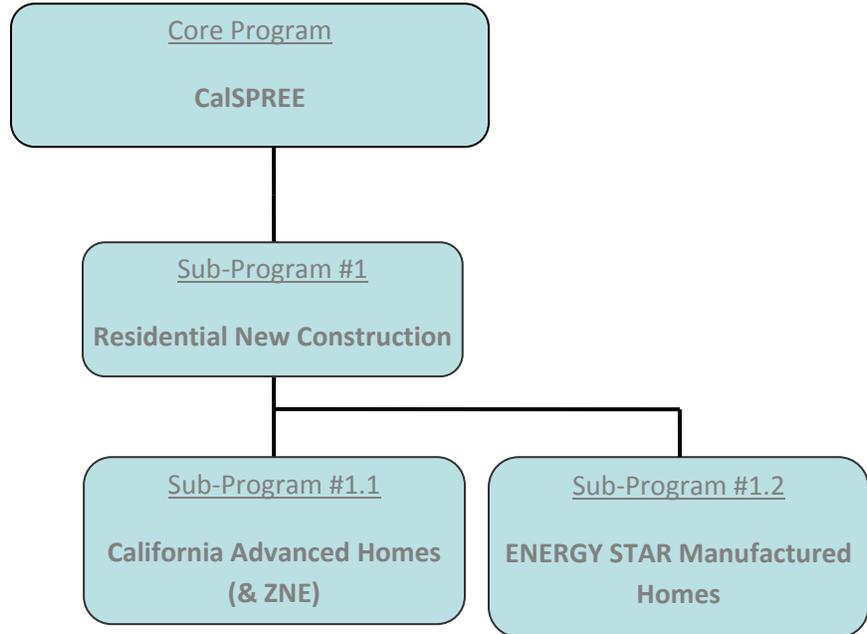

CalSPREE Program (Core)

1. Residential New Construction Sub-Program
  - 2.3 Single family/Multifamily Sub-Program (CAHP)
    - 2.3.1 ZNE Sub-Program
  - 2.4 Manufactured Homes Sub-Program for SoCalGas, SDG&E and SCE

For the convenience of the reader, two other programs relevant to New Construction are also called out:

1. Sustainable Communities Program (Name / location differs by IOU)  
Covering Master-planned communities, mixed-use projects, campuses, and commercial projects pursuing advanced energy efficiency and green targets.
2. Partnership Programs (Core)  
Strategic Planning Sub-Program (Energy Leader Partnership Strategic Support) -  
Trains cities and counties to procure city projects to meet energy efficiency standards, to identify funding sources, to share best practices, and recognizes them for their achievements.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The goal of energy-efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP and ESMH support the ambitious goals of the Strategic Plan, and work in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP.

As explored in greater detail below, CAHP and ESMH will work closely together with the ZNE sub-element to adopt the following strategies toward achieving the Strategic Plan goals. As program technologies and approaches are developed and demonstrated in ZNE, they will be incorporated into the CAHP. The lead program is listed in parentheses after each strategy.

- Raise plug load efficiency (ZNE)
- Promote whole house solutions, with a particular focus on zero peak homes as an interim step toward zero net homes (CAHP / ESMH)
- Encourage in-home monitoring and visual display tools (ZNE)
- Encourage incorporation of Green Building Standards (ZNE)
- Coordinate CAHP with demand response programs (CAHP)

Specific strategies for achieving net zero homes will be reviewed in more detail below. Moreover, as outlined above, where strategies enter the market more rapidly than anticipated, they will be rolled into the core CAHP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

a) **List measures**

- \$500 per gas heated home
- \$500 per electric heated home

b) **List non-incentive customer services**

- Technical support to Energy Analysts and Design Teams<sup>70</sup>
- Economic modeling/measure selection support to builder/construction managers
- Marketing support to builders (sales agent training, marketing materials)
- DSM coordination (PV, DR, AMI, ET) for builders to maximize demand-side reductions.

**ENERGY STAR Manufactured Homes**

In addition to the performance approach cited above, RNC will retain a deemed prescriptive approach for the manufactured home market segment. Homes will have the flexibility to include the entire ENERGY STAR package for manufactured housing or to incorporate elements within those standards, such as improved windows.

The ENERGY STAR Manufactured Homes sub-program is designed to promote the construction of new manufactured homes in SoCalGas' service territory that comply with ENERGY STAR energy efficiency standards. The program targets manufacturers, retailers, and homebuyers of new manufactured homes. The current baseline for manufactured homes is the HUD standard specification. The program encourages manufacturers to install "right-size" HVAC, install high-efficiency HVAC equipment, and evaluate homes on a whole-building basis covering windows, insulation levels, and quality installation inspections. The program works in coordination with the ZNE program element.

The program is a logical fit in the RNC portfolio of programs and will serve another market segment within CAHP, alongside single family and multi-family dwellings. Likewise, the ZNE element will also look to leverage consumer interest in green building in promoting zero peak homes and market transformation.

The objectives of the program are:

- To capture cost effective energy savings and demand reduction opportunities
- To move the industry toward coordinated demand side management (c-DSM), including self-generation and SCE's AMI (SmartConnect™)
- To move the industry toward zero-net energy as identified in the BBEES and advanced in the Strategic Plan
- To move the market segment from HUD compliant to ENERGY STAR and provide savings for customers purchasing energy-efficient, manufactured homes

---

<sup>70</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes for design teams.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The program encourages manufacturers to:

- Install “right-size” HVAC equipment
- Install high-efficiency HVAC equipment
- Evaluate homes on a whole-building basis covering windows, insulation levels, and quality installation inspections

The program will also include an education and outreach component as a means to promote awareness of energy-efficient practices in the construction of ENERGY STAR manufactured homes. All segments related to the sale and construction of a manufactured home, including retailers, customers and manufacturers will be engaged. The marketing plan will also target new retailers to inform them of the program benefits and encourage their participation in the program.

Market-actors include manufacturers, retailers and homebuyers. As the primary focus is on retailers, the program is considered a midstream program. Incentives are offered to help induce retailers to promote ENERGY STAR qualified manufactured homes.

<b>Program Criterion</b>	<b>Incentive</b>
Prescriptive elements, e.g. windows, add'l insulation	TBD, deemed rather than calculated per CZ
ENERGY STAR Manufactured Home – Gas Heat	\$500/Home (total of prescriptive elements)
ENERGY STAR Manufactured Home – Electric Heat	\$500/Home (total of prescriptive elements)
Zero-peak Home	\$75 for each peak kW reduction due to on-site photovoltaic system

Financial incentives will take the form of fixed rebates (deemed) or may be calculated on a project by project basis.

RNC will pursue zero-peak homes as a reasonable milestone on the way to achieving the Strategic Plan’s ZNE homes. The potential addition of a zero- peak photovoltaic kicker is part of the effort toward achieving zero-peak homes.

As part of the effort to address plug loads, ESMH is exploring such technologies as master plug shut-off switches (smart outlets that shut off when they detect only parasitic loads). Additionally, and as part of the integrated demand side management (DSM) approach recommended by the Strategic Plan, ESMH will reward builders for installing demand response offerings such as PCTs and A/C Cycling controllers. ESMH will deliver demand response measures paid for by the demand response programs, to reward builders for these items based on a deemed amount rather than a performance-based incentive.

CAHP will work with their AMI metering infrastructure teams to test and develop in-home displays to both drive plug load usage down and give customers both financial and social

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

reasons to conserve energy<sup>71</sup>. In addition to financial savings, the rationale is that customers will gain social status and personal satisfaction by being the most conserving, much as Prius current owners compete to outperform each other and the EPA's expected miles per gallon.

Marketing efforts will target manufactured home retailers as well as customers.

Desired program outcomes are:

- To achieve short and long term energy savings and demand reduction in the most cost effective manner possible.
- To increase the penetration of ENERGY STAR manufactured homes within California, and to make ENERGY STAR the customer's preferred choice.
- To transform the marketplace by promoting ENERGY STAR qualified manufactured homes the new standard choice instead of homes that merely meet the existing HUD standards.
- To establish a strong working relationship with manufactured home retailers.

A finished project is defined as the completion and assembly of a manufactured home. The process of purchasing and installing an ENERGY STAR qualified home can be lengthy, so projects need to be monitored closely throughout the program cycle.

The program will include a quality assurance plan with a field inspection component to verify that the manufactured home(s) meets ENERGY STAR and program's requirements. The program will also have a mechanism to verify that the assembly of the home is in accordance with these standards. This will include ducting work and installation of end-use equipment (for example, HVAC). Many ENERGY STAR components are assembled on-site and the compliance must be verified once assembled.

Customer information will be captured once a project is complete to allow the utility to integrate delivery of other program offerings to these customers as well as tracking any possible double-dipping. Information on parties receiving incentives will be tracked and reported.

---

<sup>71</sup> To the extent possible, CAHP intends to leverage AMI funding to incent IHDs in new construction projects. However, AMI has its own schedule and its own priorities for research projects. If DR/AMI is not ready for AMI-integrated IHDs, the ZNE program through its demonstration projects, working in concert with ET, seeks to demonstrate simpler IHD technologies perhaps without the full capabilities of an AMI-integrated device. As these technologies mature into the marketplace, the statewide IOUs will consider adopt them as additional measures into the core CAHP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Lighting Market Transformation Statewide Program (Resolution E-4385, Appendix A):

<b>SW PROGRAM / Sub-Program</b>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>
<b><i>Residential ENERGY STAR Manufactured Housing</i></b>	1. Number of manufactured housing units sold in IOU service territories (via retailers and/or manufacturers) participating in program	2a
	2. Number and percentage of participating projects utilizing: (a) whole house incentive for gas heat; (b) whole house incentive for electric heat	2a

**b) Market Transformation Information**

Resolution E-4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

**c) Program Design to Overcome Barriers (Priority Barrier: Homebuyers)**

The energy used in the average home produces roughly twice the greenhouse gas emissions as the average automobile. In fact, 16% of U.S. greenhouse gas emissions result from the generation of energy used in houses nationwide (U.S. EPA). However, there is little consumer awareness of the impact their homes have on the environment. CAHP is working with IOU marketing efforts, statewide partners (e.g. Flex Your Power), ENERGY STAR campaigns, and builder's own messaging to increase consumer awareness of this idea. Moreover, there is scant evidence that energy efficiency drives

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

decision- making among homebuyers, whose access to capital is more difficult in a constrained capital market.

**Manufactured Housing: a potential opportunity**

The current decline in the housing industry, the high cost of Residential housing, and increasing customer awareness of energy efficiency all make this a good time to address this underserved market segment. The manufactured housing industry is somewhat counter-cyclical to the site-built home market. As buyers are priced out of site-built homes, manufactured housing has become an affordable alternative.

Historically, manufactured housing has been considered a lost opportunity. Manufacturers recognize that ENERGY STAR manufactured homes address both the high cost of purchasing a traditional new home and the high cost of energy bills. However, without IOU intervention in the market, retailers are not pushing ENERGY STAR homes and there is not enough demand for manufacturers to justify building them.

**Overcoming Market Failure: CAHP**

In a buyer's market, builders are looking to differentiate themselves from competition. This presents a opportunity for ESMH to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to help meet the state's and IOUs' goals for the reduction of greenhouse gas emissions and utility source demand.

The RNC market without IOU intervention is a lost opportunity for long-term energy savings. However, with IOU intervention in the form of incentives and design support, the new construction market is well placed to demonstrate innovative approaches and cost-effective energy savings technologies.

**Overcoming Market Failure: Manufactured Housing**

The program provides an incentive to manufactured home retailers when they sell a manufactured home that meets or exceeds the current ENERGY STAR standards. These standards extend to the ducting and installation guidelines for heating/cooling equipment, be tracked and reported.

ENERGY STAR qualified manufactured homes will generate energy savings and demand reduction. In addition to leveraging retailers of manufactured homes, the program will leverage the Partnerships Program to reach out to local governments where the homes will be built.

Manufactured homes have a higher potential for market transformation than the site-built industry due to factory standardization, and the fact that recent research indicates that eight manufacturers control approximately 98%<sup>72</sup> of the manufactured housing market.

**Current Program Baseline: Manufactured Housing:**

---

<sup>72</sup> "Synopsis of manufacturer market share and status," Manufactured Research Association, communication, October 2007.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Prior to IOUs’ intervention in the market, there was no ENERGY STAR qualified manufactured homes sold in our service territory. The construction of manufactured homes that meet ENERGY STAR program standards, as opposed to the less stringent HUD standards, will result in demand reduction, energy savings, and the reduction of greenhouse gas emissions.

The energy savings will result from a combination of improved envelope efficiency (thermal and air tightness), use of high efficiency equipment, and the proper sizing (downsizing) of the cooling equipment. This program is statewide among the IOUs, to provide continuity and better service to the builder at reduced costs.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

<b>ENERGY STAR® Manufactured Homes</b>	<b>Program Target 2013</b>	<b>Program Target 2014</b>
Units Paid	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

Since its inception in 2002, CAHP has had a substantial impact on the homebuilding market. There is a significant opportunity to continue to influence builders, architects and other players in the Residential New Construction industry.

The RNC sub-program is designed to enable the achievement of several goals and strategies identified in the Strategic Plan. The Strategic Plan envisions a transformation of the core Residential sector to ultra-high levels of energy efficiency, resulting in ZNE new construction standards by 2020. It spells out several goals and strategies to address energy reduction in Residential New Construction.

**Goal #1:** New Construction will deliver “ZNE” performance for all new single and multi family homes by 2020.

- By 2012, 50% of New Homes will exceed 2008 Title 24 energy efficiency standards by 20%; 10% will surpass 2008 Title 24 standards by 40% (Strategy 1-1)<sup>73</sup>

**Goal #2:** Home buyers, owners and renovators will implement a whole house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment household appliances, and plug load amenities

**Goal #3:** Plug load will grow at a slower rate and then decline through technological innovation spurred by market transformation and customer demand for energy-efficient products.

---

<sup>73</sup> As modified in D.09-09-047

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The goal of energy-efficient Residential New Construction will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan, and works in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP. In fully aligning itself with the Strategic Plan, the CAHP targets an interim goal of 50% of RNC to Tier II (2005) by 2011, 10 per cent of RNC to 55% by 2011, and a final goal of 100% of Residential New Construction to be net zero by 2020. In fully aligning itself with the Strategic Plan, as modified by Decision 09-09-047, the CAHP targets an interim goal of 50 percent of RNC to be 20% better than the 2008 Title 24 Standards by 2012, and 10% of RNC to be 40% better than the 2008 Title 24 Standards by 2012, and a final goal of 100 percent of residential new construction to be net zero by 2020.

**6) Program Implementation IOU-specific elements**

**a) Statewide IOU coordination**

Given the success of the collaborative process that led to the production of this PIP, the statewide RNC team plans to meet on at least a quarterly basis going forward in order to review progress toward the goals and make corrections need to achieve them.

**i. Program name**

The single-family and multi-family programs will be implemented under the common name of CAHP. The zero peak pilots will be referred to as ZNE Homes, although the details differ somewhat by utility. Factory-built housing will be referred to as ENERGY STAR Manufactured Homes.

**ii. Program delivery mechanisms**

SoCalGas delivers the program primarily through in-house account executives with some outside technical support for specific analyses. SCE leverages third-party implementers and in-house account executives. For the 2013-2014 program period, SoCalGas and SCE will continue implementation of ESMH, as their service territories overlap significantly. This will ensure cost effective implementation as well as a consistent program delivery to the applicable customer base.

**iii. Incentive levels**

The IOUs have agreed upon a common incentive methodology that will be implemented throughout the service territories. The incentive levels are as indicated earlier.

**iv. Marketing and outreach plans**

ESMH will ensure closer coordination of marketing efforts to synergize wherever possible. While each utility would like to leverage on their strengths and existing

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

relationships within their service territories, certain marketing elements can be launched on a common platform. A common website will be created to provide builder information that will be commonly disseminated. Training and education is an area where pooling of resources is possible to reduce cost and increase participation.

The participating IOUs plan to be actively engaged in the development and implementation of joint marketing, education and training efforts as described in detail in the common section of this PIP.

In 2013-2014, the program will expand its builder/contractor education and training certification courses to increase overall awareness and understanding of CAHP and service offerings. We will continue to strengthen our delivery channels of information by providing relevant information and support materials, reaching target audiences in key decision-making phases. The IOUs' innovative communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, e-mail blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the Internet. Additionally, CAHP will leverage its excellent relationships in partnering with trade organizations and other groups actively promoting the benefits of green, sustainable building practices. Such organizations include: CEC, FYP, AIA, USGBC, ULI, California Manufactured Housing Institute, Build It Green, IES, AEE, IHACHI, PHCC and others. Through an innovative, coordinated approach, we will maximize outreach opportunities that keep energy efficiency and program benefits top-of-mind and maximize program participation.

Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

**v. IOU program interactions**

The plan addresses above, in the Incentive Rationale section, the ways CAHP is encouraging demand performance, in-home displays, on-site generation, square footage reductions and green elements.

CAHP is particularly interested in promoting integrated thermal hot water system designs to displace therm demand with on-site renewable sources. In addition to cold water savings from embedded energy and the energy to heat water, longer term there may be GHG reductions that accrue either to the builder, the homeowner, or the utility associated with each demand side reduction as a result of AB 32 and pending national CO<sub>2</sub> legislation.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

CAHP prides itself on its established close relationships and memberships with other groups involved with the building industry. These relationships make it possible to provide comprehensive services to our customers. Thus, CAHP will continue to seek out and coordinate synergies with, but not limited to, the following groups:

- NSHP
- EPA
- California IOUs
- Green Building Consultants (i.e. Build it Green, California Green Builder, Global Green)
- Rater Organizations (e.g. ResNet, CalCerts, CHEERS)

CAHP will continue its commitment to the EPA's ENERGY STAR program and will strive to support, partner and contribute to the success of the ENERGY STAR homes label and branding. Numerous surveys and studies continue to show the ENERGY STAR label represents greater value to consumers and the environmental stewardship it represents.

Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR New Homes and has won ENERGY STAR achievement awards for the last seven consecutive years. In 2011 SCE was rewarded for "Sustained Excellence in Energy Efficiency Program Delivery".

The program will continue to offer comprehensive training courses and educational seminars relevant to building energy efficiency and green measures into new construction projects including Title 24 code training and ENERGY STAR requirements. In response to builder requests, CAHP will offer a new training workshop during 2013 - 2014 designed for builders' sales agents. Sales agents have direct contact with the homebuyer and have the greatest impact on selling homes. In order to help promote ENERGY STAR developments, CAHP will teach sales agents about energy efficiency. Topics will include what qualifies as an ENERGY STAR home and what is 'green'. Other activities will include attendance at building industry trade conferences/ outreach events and any necessary contractor/builder field visits. The target audience consists of builders, developers, energy consultants, architects, and other industry professionals. IOUs may pursue partnership efforts with local government entities who are looking to display leadership in the carbon arena by expediting plan check, waiving permit fees, or allowing builders to pay impact fees on the back end (instead of up-front) in exchange for higher levels of home performance documented by our program.

**vi. Similar IOU and POU programs**

The statewide team will reach out to leading POU programs, such as those at SMUD to learn from their experience how best to deliver energy-efficient homes.

In addition, the IOUs will work closely with the existing home remodeling programs (Home Performance with ENERGY STAR and the Comprehensive Mobile Home

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Program) to maintain a two-way communication of best practices and lessons learned between the new and existing sectors.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) program**

Emerging technologies will chiefly be handled within the ZNE program. The IOUs are looking to partner with our ET and EPIC-funded Testing Facilities to pilot zero-net energy approaches, particularly in the manufactured home/prefabricated segment. However, the proposed incentive approach allows the IOUs the flexibility to include both deemed and calculated energy savings from new technologies as they become market ready.

The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

**ii. Codes and Standards program**

As mentioned above, manufactured housing is not subject to Title 24, although there are national efforts to improve the HUD code.

**iii. WE&T efforts**

The RNC team is seeking ongoing support from the three energy and training centers for classes relevant to the building industry and training the next generation of trade allies, builders, contractors, and the like.

**iv. Program-specific marketing and outreach efforts**

In 2013-2014, the program will expand its manufacturer and retailer outreach to increase overall awareness and understanding of ESMH. We will continue to strengthen our information and support materials, focusing on the value to the retailer of making the sale to the homebuyer. The IOUs' communication tools will include: account representative meetings/presentations, targeted customer mailings, trade organization affiliations, and builder award recognition. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the internet.

**v. Non-IOU Programs**

There may also be opportunities to partner with local AQMDs and County Integrated Waste Management Boards to encourage material recycling in ZNE and green programs.

**vi. CEC work on C&S**

The IOUs will continue to support Codes and Standards development work with the CEC and to test candidate technologies in the new construction programs.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**c) Best Practices**

The Residential New Construction team will gather information and past experience in successful low energy and ZNE existing projects to evaluate best practices. This information will be used to develop pilot projects that will demonstrate low energy homes and include home performance monitoring.

**d) Integrated/coordinated Demand Side Management**

The statewide RNC team is committed to a full integration of all resource types. A first step has been taken by way of a recent joint agreement between SoCalGas and SCE, which allows the two utilities to buy back therms and kWh. Water saving technologies and CO<sub>2</sub> reduction are strongly emphasized and tracked in ZNE projects. As these technologies get accepted and recognized, they will become integrated into the base CAHP projects.

**e) Integration across resource types (energy, water, air quality, etc)**

As discussed above, RNC is looking to partner with relevant stakeholders to identify water, air quality, and waste-diversion opportunities.

**f) Pilots**

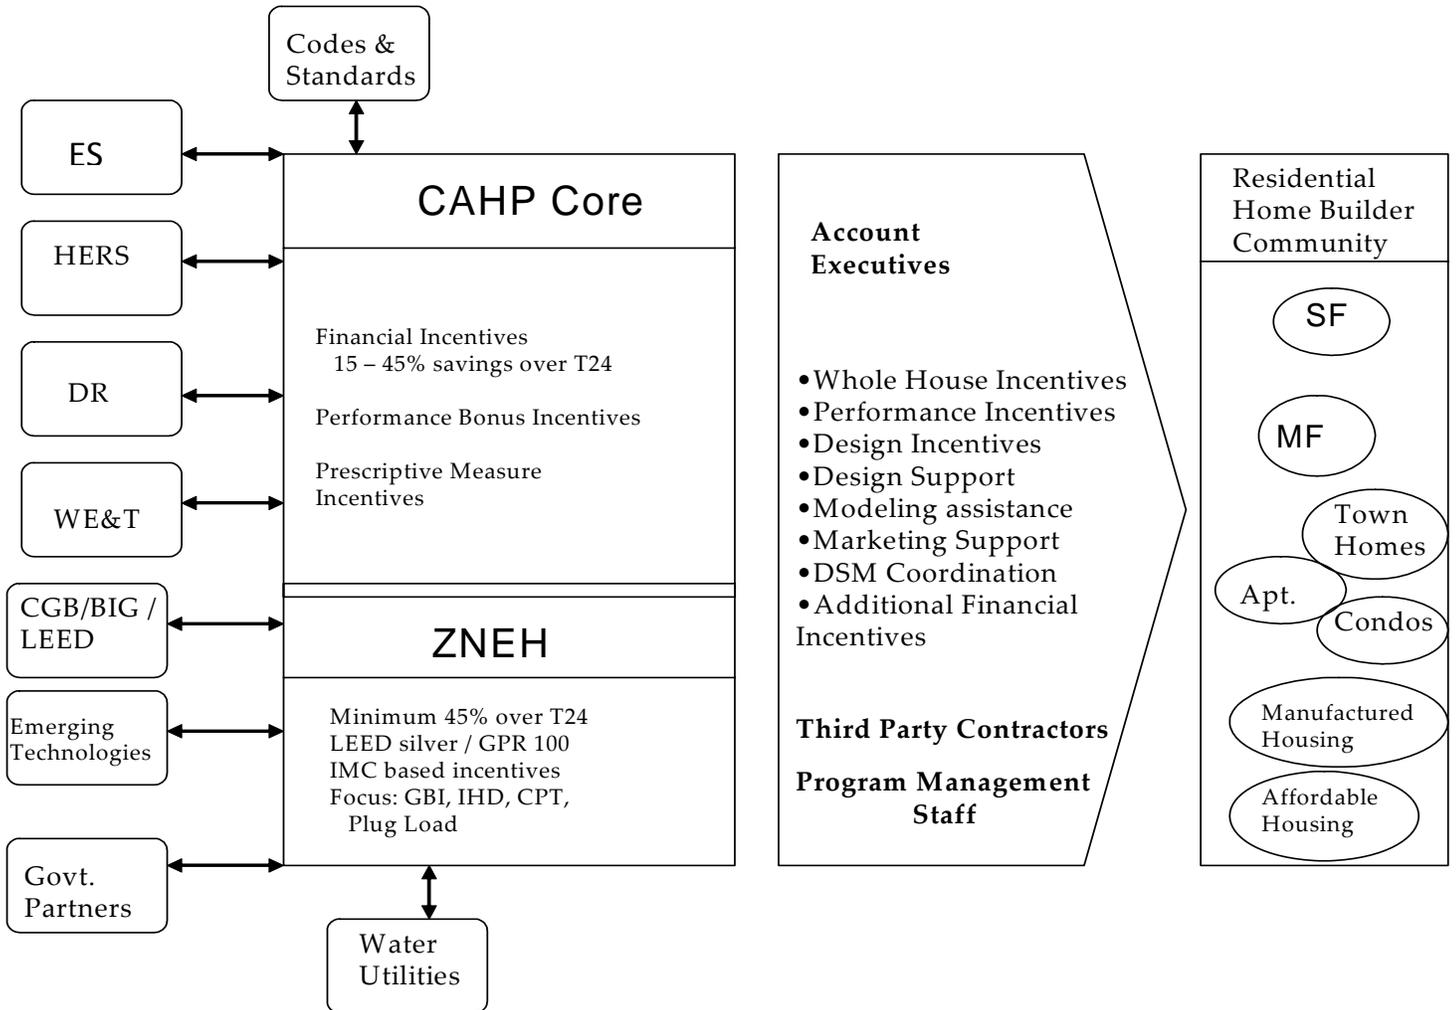

As discussed above, The IOUs may in the future need to create a pilot program to test the viability of an offering.

**g) EM&V**

The utilities are proposing to develop and submit a comprehensive EM&V plan for 2013-2014 after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader utility studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

**8. Program Logic Model**

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Energy Star Manufactured Homes Program.

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

# 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

<b>Program Outputs</b>	Market research and potential, understanding of market needs, program design	Develop marketing materials; Meet with manufactured housing and PV/manufactures and retailers to reach niche market	Submit articles to publications directed at consumers of manufactured homes; Host educational events	Present ENERGY STAR and program requirements to manufacturers; Offer design assistance for meeting requirements	Conduct training to retailers on selling ENERGY STAR manufactured homes	Provide incentives to retailers and consumers for the sale/purchase of an ENERGY STAR manufactured home and/or reduction by PV system	Leverage existing programs within SCE, CAN-P, AH-SCP, LEE; other low income programs) statewide coordination	Leverage external agencies (HUD, MWD, EPA)
<b>Short Term Outcomes</b>	Market research; Determine market potential and project types	Marketing materials distributed to retailers and consumers	Marketing and educational materials distributed to consumers	Increased knowledge about ENERGY STAR manufactured home requirements	Increased sales of ENERGY STAR manufactured homes and PV systems	Project participation goals	Leverage utility delivery channels; offer bundled package	Leverage external programs (ENERGY STAR, State GEI, GreenPoint Rated LEED tax credits)
<b>Intermediate Term Outcomes</b>	Self understanding and customer outreach completed to identified candidates and project types	Program awareness and utilization by targeted markets	Increased knowledge & tools for sustainable design	Increased market penetration and demand	Increased number of projects approaching net zero peak	Streamlined process and increased participation in multiple programs (deeper savings)	Utilization and leveraging of programs and cross promotions	
<b>Longterm Outcomes</b>	Program has well-developed and defined market strategy	High program awareness by targeted market, increased market saturation	Design community has internalized sust. design practices become common practice	Consumers expect manufactured homes to be sustainable	Increased market share and common practice; Coordinated demand side management	Fully integrated SCE programs, business units, and policies	Establish a network of programs and resources; External programs integrated with AH-SCP and CAN-P	
<b>Segment Theory</b>	Market research on the potential candidates and project types to include in the program will help to design the program to meet their specific needs	Marketing and outreach increases awareness and program leads	Offering design and technical assistance will increase manufacturer skills and resources for sustainable design and it will become standard practice for future projects	Training retailers in the features and benefits of efficient and sustainable homes will provide them with the tools needed to educate and sell to consumers	Offering financial incentives will catalyze the purchase and market penetration of ENERGY STAR manufactured homes	Leveraging external core/complementary programs who target the same market and provide energy efficiency incentives will increase participation	Leveraging external complementary programs who target the same market and provide a component of sustainable design will increase participation	
<b>Key Performance Indicators</b>	<p>Deep understanding of market needs and issues</p> <p>Number of potential participants</p>	<p>Type, quality, and quantity of marketing materials distributed</p> <p>Number of leads resulting from marketing and outreach efforts</p> <p>Number (net changes) of market developers who are aware of the program</p>	<p>Number and quality of design assistance provided</p> <p>Number of SCE core program projects upgraded to SCP</p> <p>Measured increase in skill and knowledge of sustainable design</p> <p>Number of participants that continue to design and sell energy efficient homes</p>	<p>Number and quality of trainings conducted</p> <p>Number of ENERGY STAR manufactured homes sold</p>	<p>Number of participating projects meeting ENERGY STAR requirements</p> <p>Measure (net changes) of increased knowledge of home energy efficiency/features and benefits</p> <p>Number of retailers that have adopted promotion of ENERGY STAR homes standard practice</p>	<p>Number and quality of core programs</p> <p>Assessment (consistency, accuracy, quantity, and effectiveness) of information flow and distribution channels through core programs</p> <p>Number of participants resulting from cross promotions from core programs</p> <p>Quality of experience of participants working with multiple programs</p>	<p>Number and quality of complimentary programs</p> <p>Assessment (consistency, accuracy, quantity, and effectiveness) of information flow and distribution channels through complementary programs</p> <p>Number of participants resulting from cross promotions from complementary programs</p> <p>Quality of experience of participants working with multiple programs</p>

**4. Program Description**

<sup>1</sup> D.09-09-047, p. 7, refers to the statewide residential energy efficiency subprograms as the California Statewide Subprograms for Residential Energy Efficiency ("CalSPREE")

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The 2013-2014 Residential Sector program, part of the overall Energy Upgrade California (EUC) program, is designated as the California Statewide Program for Residential Energy Efficiency (CalSPREE).

CalSPREE will offer and promote both specific and comprehensive energy solutions for residential customers. By encouraging adoption of economically viable energy efficiency technologies, practices, and services, CalSPREE will employ strategies and tactics to overcome market barriers while delivering services that support the CPUC's Long Term Energy Efficiency Strategic Plan.

The ultimate focus of CalSPREE is to:

- Facilitate, sustain, and transform the long-term delivery and adoption of energy-efficient products and services for single and multi-family dwellings;
- Cultivate, promote and sustain lasting energy-efficient behaviors by residential customers through a collaborative statewide education and outreach mechanism; and
- Meet customers' energy efficiency adoption preferences through a range of offerings including single-measure incentives and more comprehensive approaches.

To date, the California IOUs have employed a number of different residential energy efficiency subprograms that are in various stages of maturity and availability across the state. For 2013-2014 and beyond, the IOUs will integrate all of these subprograms to coordinate efforts and increase comprehensiveness of measure delivery.

CalSPREE will conduct a combination of integrated DSM and program specific marketing and outreach to drive ongoing customer participation and behavior change. Both integrated and program-specific marketing activities will work in coordination with the SW ME&O and will serve to complement those efforts.

Integrated marketing and outreach will gather, create, and deliver information to customers in a way that (1) bundles programs, products, and information and (2) customizes delivery for individual or groups of targeted customers based on market intelligence, segmentation analyses, self-selection activities, and event-based knowledge of customer's actions. To drive ongoing customer engagement, marketing and outreach will target customers with the right message, through the right channel, at the right time. Integrated marketing will cross-sell relevant DSM programs and services that emphasize the benefits of participation in multiple programs.

Additionally, program specific marketing and outreach will be conducted in order to increase participation and reach specific program goals. Program specific marketing and outreach will target customers with a high potential to participate in a specific programs or service.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

For example, through the Plug Load and Appliances program, customers identified as having a pool may receive a targeted direct mailer prior to summer encouraging them to take advantage of the pool pump and motor rebate. By motivating customers to take an initial action, it will enable the utilities to engage customers in an ongoing conversation about the next steps they can take towards becoming better energy managers. Additionally, program specific marketing and outreach enables the utilities to conduct activities necessary to support the measure, such as developing Point of Sale rebate stickers that are placed on select appliances to drive program participation. These efforts drive enrollments that enable the utilities to meet specific program goals.

A mix of communication channels and languages will be used to reach a diverse audience. Communication channels may include: web, call center, bill messaging, email, social media, direct mail, retail partnerships, community- and faith-based partnerships, outreach, events, local government partnerships, general and ethnic media.

CalSPREE is comprised of the Energy Advisor, Plug Load and Appliances (PLA), Multi-Family Energy Efficiency Rebates (MFEER), Whole Home Upgrade (WHU), Residential Heating, Ventilation, and Air Conditioning (HVAC), and Residential New Construction (RNC) subprograms. These subprograms are described in more detail below.

### **Short description of each sub-program**

The 2013-2014 CalSPREE includes the following six subprograms:

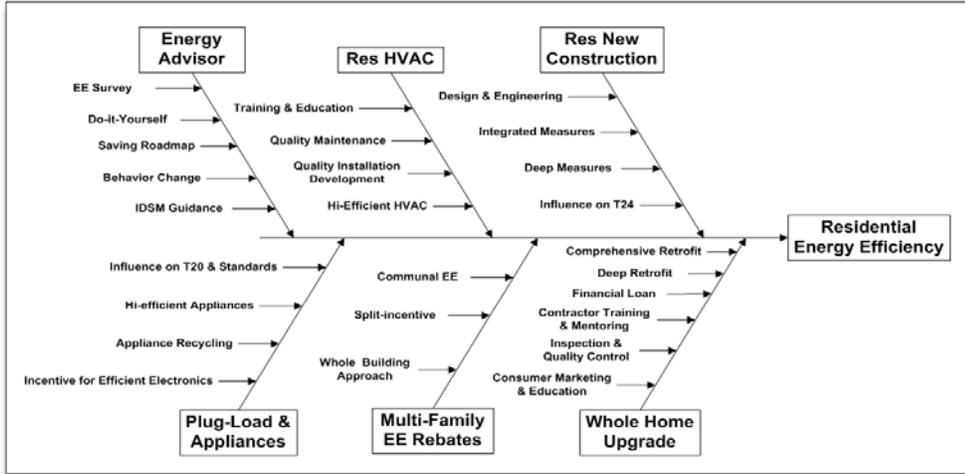

- a) Energy Advisor (EA).** The Energy Advisor subprogram will utilize interactive tools designed to engage customers and encourage participation in innovative initiatives. These initiatives are designed to help customers understand and empower them to manage their energy use, and will guide them, where appropriate, towards advancing whole-house energy solutions. Although the IOUs share similar Energy Advisor subprogram theory, design, and goals, they may implement subprogram logistics differently because of their different service territories.
  
- b) Plug Load and Appliances (PLA).** The Plug Load and Appliances subprogram merges the previous Home Energy Efficiency Rebate (HEER), Business Consumer Electronics (BCE) and Appliance Recycling subprograms. This subprogram will develop and build upon existing retailer relationships and will include recycling strategies and whole house solutions, plug load efficiency, performance standards, and opportunities for integration with local government, water agencies, Publically Owned Utilities (POUs), and the Demand Side Management (DSM) subprogram.
  
- c) Multi-Family Energy Efficiency Rebates (MFEER).** The MFEER subprogram is a continuing subprogram. This subprogram will promote energy efficiency by providing equipment rebates to owners and tenants of multifamily properties, including residential apartment buildings, condominium complexes, and mobile home parks. It will be coordinated with the Energy Savings Assistance (ESA) and the WHUP Programs.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

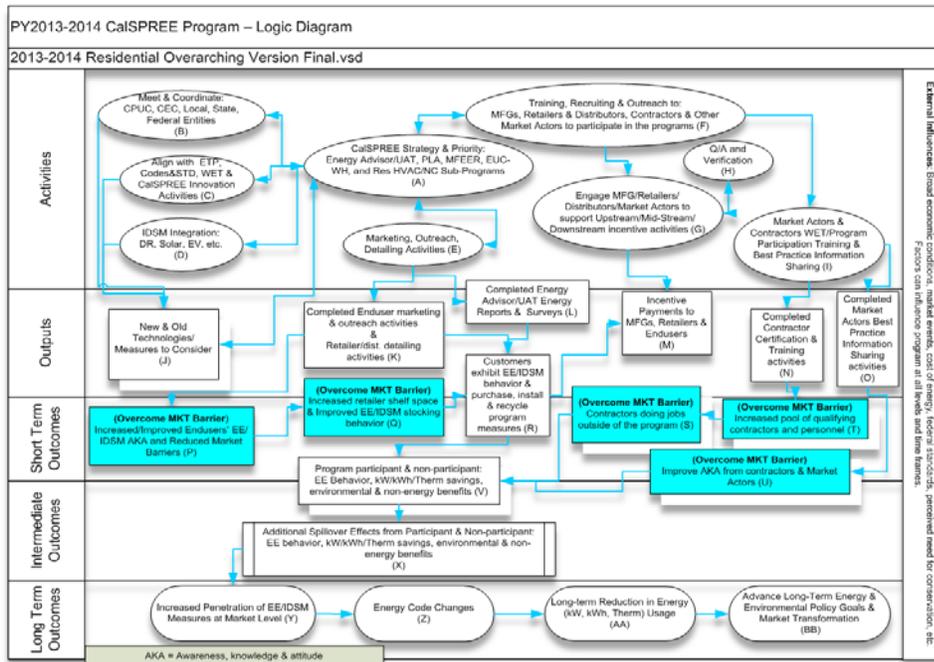

- d) Whole Home Upgrade Program (WHUP). The Whole Home Upgrade (WHUP) subprogram is a continuing program which began as Energy Upgrade California in the 2010-2012 residential energy efficiency portfolio of the four California Investor Owned Utilities (IOUs) – Pacific Gas & Electric Company (PG&E), Southern California Edison (SCE), San Diego Gas & Electric Company (SDG&E) and Southern California Gas Company (SoCalGas). For 2013-2014, the WHUP will consolidate the previously separate Prescriptive Whole House Retrofit (PWHRP) and Local Whole House Retrofit (WHRP) and the introduction of a Multi-family component. The WHUP sub-program is designed to build customer and contractor awareness of the house-as-a-system approach to residential retrofits and the many benefits of improving the comfort, safety, and energy savings potential of the house. The WHUP approach promotes both Basic and Advanced Paths to retrofitting; these complementary paths will be presented to customers as one comprehensive offering.**
- e) Residential Heating, Ventilation, and Air Conditioning (HVAC). The Residential HVAC subprogram is a continuing program with the primary objective of driving high quality levels in California's HVAC market for technology, equipment, installation, and maintenance. An additional objective is to increase customer awareness of the value of HVAC installation and maintenance practices toward driving energy efficiency and peak load reduction. The Residential HVAC subprogram will incorporate revised measures and incentives, policies and procedures, quality assurance, marketing materials, website, and contractor training in performing HVAC installation services for residential customers.**
- f) Residential New Construction (RNC). The RNC subprogram is a continuing statewide program that consists of the California Advanced Homes Program (CAHP) and, in Southern California, the Energy Star Manufactured Homes (ESMH) Program. The Program is designed to help guide builders to produce the most efficient homes in the most cost-effective manner, and will examine methodologies for supporting the Strategic Plan target of zero net energy (ZNE) by 2020.**

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

### CalSPREE Program Diagrams

### 5. Program Logic Model

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

1. **Program Name:** Energy Advisor Program  
**Program ID:** 3701  
**Program Type:** Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** - reference the CalSPREESPREE for budget details

2. **Projected Program Gross Impacts Table**

**Table 2** - reference the CalSPREESPREE for projected savings details

4. **Program Description**

- a) **Describe program**

This program is a continuation of the existing statewide Energy Advisor Program (formerly known as the Home Energy Efficiency Survey - (HEES) program) within the residential energy efficiency portfolio. Although SDG&E, SCE, PG&E and SoCalGasSDG&E share similar program theory, design and goals, each IOU may implement its program logistics differently.

In 2013-2014, the Energy Advisor program will continue to help customers understand and empower them to manage their energy use, and will guide them, where appropriate, towards advancing whole-house energy solutions. The subprogram utilizes behavioral outreach initiatives and interactive tools designed to engage customers and to encourage participation in innovative initiatives to reduce their energy consumption through behavioral solutions, program recommendations and, as warranted, IDSM opportunities.

b) The program provides customers with information to help them become familiar with ways to control and reduce energy and water usage in their homes by offering customers up to three options (mail-in survey, on-line survey, and phone survey) in multiple languages (English, Spanish, Vietnamese, Chinese, and Korean) including an action plan for implementation. The program also provides survey results to enable participants to understand how their energy use varies throughout the year and how their household compares with similar households. This multi-language approach enhances the program's ability to reach Southern California's diverse culture and provides efficiency recommendations based on a whole-house system approach.

c)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**d)b) List Offerings**

~~Offerings~~ Measures or offerings vary by IOU, as outlined below:

<b>Offerings</b>	<b>SCE</b>	<b>SoCalGas</b>	<b>PG&amp;E</b>	<b>SDG&amp;E</b>
Online Survey	X	X	X	X
Mail-in Survey	X	X	N/A	X
Telephone Survey	X	N/A	X	N/A
Multifamily Survey	X	X	N/A	X
In-home Survey	X	N/A	TBD	N/A
Home Energy Reports	TBD	TBD	X	X
Online Buyer's Guide	X	X	X	X
Energy Kits	N/A	X	N/A	X

~~Note: Consistent with Commission direction in D.09-09-047, P. 120 the IOUs were directed to eliminate the provision of on-site residential "audits" within the HEES (survey) program. Therefore in-home surveys and all references to in-home surveys have been removed from the HEES Program PIP.~~

**e)c) List Non-incentive Customer Services**

The ~~Energy Advisor~~ HEES Program offers customers with interactive engagement and detailed outputs ~~reports~~ on their actual energy usage, including:

- Rate and usage analysis, and
- Household usage data and comparison.

In addition, the program provides information and literature on energy efficiency and IDSM Programs:

- ~~Water conservation;~~
- ~~Energy efficiency and IDSM Programs:~~
  - Residential Energy Efficiency
  - ~~Summer Saver Plan (SDP)~~
- California Solar Initiative (CSI)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Peak Demand Initiatives (DR)
- ~~1. Low Income Energy Efficiency (LIEE).~~

The information provided ~~through~~ the Energy Advisor program~~comprehensive HEES report sent to customers~~ will be coordinated/developed on a statewide level. This information provided~~The report options~~ will include historical usage data for customers. The program/report options ~~may also~~ provide a platform to measure sustainable reductions in energy usage for the customer and the IOU's. In addition, data collected from the survey questionnaire will be utilized to provide targeted marketing and strategic planning opportunities for all Residential energy efficiency and demand response programs. The Energy Advisor program/report will be the primary mechanism to drive customers to save energy by educating the customer on their household usage impacts to the environment, while comparing household usage with similar households. Statewide coordination efforts may also afford the program/report to provide information promoting the whole-house approach with information leading customers to whole-house products and services, including financing options, energy efficiency product and service providers, rebate program applications and customer service touch points.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Program Performance Metrics (PPMs)**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Energy Advisor/HEES Program (Resolution E-4385, Appendix A, p 34).

<i>SW PROGRAM/</i>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<i>Sub-Program</i>		
<i>Home Energy Efficiency Survey (HEES)</i>	<del>1. Percentage of HEES participants that enroll in (a) whole house and (b) other resource programs</del>	<del>2b</del>

<u>SW PROGRAM/ Sub Program</u>	<u>PROGRAM PERFORMANCE METRIC (PPM)</u>	<u>Metric Type</u>
<u>Energy Advisor (EA)</u>	<u>Percentage of Energy Advisor participants that enroll in (a) whole house and (b) other resource programs</u>	<u>2b</u>

**b) Market Transformation Indicators (MTI)**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

**c) Program Design to Overcome Barriers**

Promoting energy and water efficiency to the residential customer provides opportunities to foster market transformation. The main barriers include:

- ~~Lack of current energy performance;~~
- Lack of energy efficiency information;
- Lack of awareness of specific measures and practices, ~~and~~
- ~~Inability to read or understand information when it is provided only in English.~~

To overcome these barriers, the Energy Advisor~~HEES~~ Program will provide accurate and comprehensive information about energy and water saving strategies, customized recommendations and suggestions for energy and water conservation and installation of energy-saving measures, and detailed analysis of energy billing, energy usage, and energy costs, based on actual household consumption. This information encourages permanent changes in customers’ attitudes and actions toward energy conservation by helping them understand their usage, as well as providing information on a wide variety of possible measures, practices, and actions. The program will also continue to provide information in multiple languages to overcome language barriers for non-English-speaking customers.

Marketing is a key component in the success of the Energy Advisor~~HEES~~ Program, first to generate awareness of the program, and second - and more important - to encourage

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

completion of a survey. Marketing plans will be discussed statewide to ensure consistency and sharing of best practices~~A statewide marketing campaign will be used to reduce overall implementation costs and to ensure uniformity throughout the state of California. In a further effort to reduce costs, the HEES Program will also partner with local municipalities and water agencies. Partnering with other entities will lower costs with cost sharing initiatives and will increase program awareness and effectiveness.~~

Statewide delivery mechanisms continue to include online tools~~the Online and Mail-In Surveys~~. The individual utilities may also provide other survey and engagement offerings~~telephone surveys~~, if they feel these types of ~~survey~~ are warranted. Online ~~tools~~ and ~~Mail-in surveys~~ will be coordinated with a statewide emphasis to share best practices. Each I/O survey will have a delivery method capable of serving customers~~be provided~~ in multiple languages to bridge language barriers among California's diverse population. ~~For all types of surveys, whether offered statewide or not, substantially the same questions and recommendations will be provided to ensure consistency statewide. The HEES report will provide participants with usage and comparison data among similar households.~~

It is necessary to persuade Californians to commit to energy conservation. For many, this will be a gradual process facilitated by readily available, well placed educational materials that help the customer understand their energy usage and encourage the customer to make the greater commitment to participate in behavior and equipment based IDSM improvements. ~~In accordance HEES. Without the commitment to change, either behaviorally or with material changes, there is no viable incentive to complete the driving behavior change elements of energy improvement, each utility will seek to reach at least 5% of their customers through a variety of behavior change inclusive offerings.~~

### SoCalGas Behavioral:

Behavioral savings are funded through SoCalGas Advanced Meter project, Decision 10-04-027, which found conservation estimates as reasonable and required SoCalGas to ensure that the estimated conservation savings are attained. SoCalGas will establish a system to track and attribute the conservation impacts of its AMI rollout. Every six months, SoCalGas shall file a report of measured savings. If the project is falling short of SoCalGas' projections the company will submit revisions to its outreach plan to increase awareness, participation, and durability of conservation actions among customers.

Upon completion of the Advanced Meter project, SoCalGas will incorporate successful behavioral programs and techniques into the energy efficiency portfolio.

~~survey~~—While the interactive survey and/or reports~~HEES report~~ and action plans~~plan~~ should result in changes in customer utilization, it ~~cannot~~can not be considered a conclusion of the process. Rather, once customers have been engaged through the Energy Advisor program, utilities may~~by HEES, companies will~~ motivate them to achieve even greater conservation savings through additional education on-line, by e-

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

mail, by mail, by telephone, ~~through CBOs, and~~ through any other appropriate mechanism.

**d) Quantitative Program Targets**

The proposed targets may be modified due to funding restrictions, especially for the ~~2013-2014 transition period (2009 bridge funding transition years).~~ year.

<u>IOU</u>	<u>Program Target by 2012</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>SDG&amp;E</u>	<u>3,000</u>	<u>5,000</u>	<u>5,000</u>
<u>SCE</u>	<u>21,875</u>	<u>26,000</u>	<u>26,000</u>
<u>SoCalGas</u>	<u>10,000</u>	<u>10,000</u>	<u>10,000</u>
<u>PG&amp;E</u>	<u>40,000</u>	<u>40,000</u>	<u>40,000</u>

**Table 5d**

	<u>Program Target By 2010</u>	<u>Program Target By 2011</u>	<u>Program Target By 2012</u>
<u>SDG&amp;E</u>			
<u>On-Line Survey</u>	<u>2,000</u>	<u>2,500</u>	<u>3,000</u>
<u>Mail In Survey</u>	<u>750</u>	<u>800</u>	<u>850</u>
<u>Telephone Survey</u>	<u>&lt;100*</u>	<u>&lt;100*</u>	<u>&lt;100*</u>
<u>*- exact historic records not available</u>			

**e) Advancing Strategic Plan goals and objectives**

The ~~Energy Advisor~~ HEES program will advance the strategic plan goals and objectives of the Strategic Plan as outlined:

- Goal 2.2: Residential Sector including Low-Income - Tracking Transform home improvement markets to apply whole-house energy solutions to existing homes - The ~~Energy Advisor~~ HEES Program will plan to deliver a new ~~survey~~ HEES Report which will strive to implement decision triggers and call to action to support advancement of whole-house energy solutions. The ~~surveys and/or~~ reports will also pursue initiatives to ~~reduce~~ reverse the growth of plug load energy

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

consumption through behavioral and technical solutions. ~~HEES will provide educational services to participants on plug-load measures such as “smart plug strips”, as appropriate.~~

- Goal 8.3: DSM Coordination and Integration - Deliver integrated DSM options that include efficiency, demand response, energy management and self generation measures, through coordinated marketing and regulatory integration - The Energy Advisor~~HEES~~ Program will seek opportunities to partner~~partnerships~~ with municipalities, governmental and local~~local~~ water agencies, ~~municipals~~ and other key stakeholders if applicable to develop and implement a comprehensive plan to promote water and energy conservation.- Further integration strategies may~~will~~ also include IDSM, Energy Savings Assistance (ESA) program ESAP and other DSM (CSI, SDP, Peak Demand, etc), LIEE and energy efficiency programs.
- Goal 9.2 - Workforce, Education and Training - Ensure that minority, low-income and disadvantaged communities fully participate in training and education programs at all levels of the DSM and energy efficiency industry - A comprehensive training curriculum will be implemented to formalize the knowledge base of the survey workforce. This strategy falls in line with a goal of the WE&T Strategic Plan intended to ensure that minority, low-income and disadvantaged individuals fully participate in training and education programs at all levels of demand-side management and energy efficiency.

~~6.~~

~~7.6.~~ **Program Implementation**

a) **Statewide IOU coordination**

~~Program name: Home Energy Advisor~~Efficiency Survey Program

i. **Program delivery mechanisms**

The Energy Advisor~~HEES~~ Program is delivered to customers through multiple offerings. See section 4) b) above for program offerings in three ways. Customers can complete the survey On-Line, by utility, mail, and by telephone (offered by PG&E, SDG&E and SCE only.

ii. **Incentive levels**

This program does not offer monetary incentives.

iii. **Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

Marketing efforts will be coordinated statewide to develop a portfolio of communication methods. The utilities can use these methods, including but not necessarily limited to, blast e-mails, flyers, on-line marketing, direct mail, trigger~~On-Line~~ marketing, and/or lifestyle packages~~direct mail~~, as suits the target audience, the message, and the resources.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**iv. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The Energy Advisor~~HEES~~ program does not interact, as such, with other programs or organizations. However, the program will maintain the flexibility to coordinate program services to support initiatives generated by agencies.

**v. Similar IOU and POU programs**

The Energy Advisor~~HEES~~ program provides a consistent and recognizable presence throughout the state and offers a menu of similar services and processes implemented statewide by PG&E, SDG&E, SCE and SoCalGas. The program will work with municipalities, when applicable such as LADWP, to offer this service and/or partner in the information provided. - Efforts will be made to provide consistent reporting of programs~~survey~~ results across the state where applicable.

The program also will be implemented in close association with other residential energy efficiency programs. The Energy Advisor program~~HEES~~ will be the starting point for residential customers to tap into the IOU's residential energy efficiency services. Through marketing, education and outreach, each program will encourage end-users to adopt multiple measures to gain the benefits associated with an integrated whole-house approach to energy efficiency.

The Energy Advisor program~~HEES~~ will leverage its survey information to provide information and referrals to other energy efficiency programs, such as HEER, ARP and others. ~~During the 2010-2012 program cycle, HEES will be working on a pilot program to test a multi-family energy survey service.~~ Aggregated data from on-line~~online~~ surveys and other program efforts will be examined to provide direct marketing opportunities ~~with water conservation efforts, demand response programs, and low income programs,~~ as applicable.

The Energy Advisor~~HEES~~ program collaborates with the Low Income Energy Savings Assistance~~Efficiency (LIEE) Program (ESAP) program~~ by making the service available to them and by providing customers with residential program information. Energy Advisor~~HEES~~ will coordinate with local and other outreach efforts, as appropriate.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) Program**

The Energy Advisor program~~HEES~~ will collaborate statewide with emerging technologies initiatives and incorporate other measures into the customer energy report, as warranted, to support the Strategic Plan.

**ii. Codes & Standards program**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Continuous improvements and enhancements will be coordinated statewide to ensure the Energy Advisor~~HEES~~ Program maintains consistency with updates to codes and standards. Additionally, whenever analysis of the Energy Advisor program ~~HEES~~-related data suggests an area that may be of interest to codes and standards, the program will proactively provide appropriate direction.

~~iii.—~~

~~iv.~~**iii. WE&T efforts**

The Energy Advisor program will collaborate with WE&T efforts where appropriate to share information and best practices.

~~v.— A comprehensive training curriculum will be implemented to formalize the knowledge base of the survey workforce. This strategy falls in line with a goal of the WE&T Strategic Plan intended to ensure that minority, low income and disadvantaged individuals fully participate in training and education programs at all levels of demand side management and energy efficiency.~~

~~vi.—~~

~~vii.—~~

~~viii.~~**iv. Program-specific marketing and outreach efforts**

In addition to the statewide marketing efforts outlined above in Section 6.a.iv, the program may be utilized as an outreach mechanism in conjunction with CBOs, faith-based organizations~~organization~~, local community events, fairs, etc.

~~ix.~~**v. Non-energy activities of program**

The Energy Advisor~~HEES~~ program is a successful effort to reach consumers through self, and in some cases direct, contact in ways that consumers prefer. The Energy Advisor~~HEES~~ Program will serve~~outreach to~~ customers in multiple languages and through different delivery channels, to perform a variety of energy surveys. ~~The delivery outreach and marketing efforts may include: direct mail, e-mail, online banner ads, and news media.~~ Utilities will improve the Energy Advisor program~~HEES~~ prominence through creative initiatives such as: analyzing websites to insure high visibility of the Energy Advisor offerings~~HEES~~; utilizing telephone representatives to explain and suggest Energy Advisor offerings~~HEES~~ to callers; describing Energy Advisor offerings~~HEES~~ in conservation literature; promoting Energy Advisor offerings~~HEES~~ in conjunction with community outreach efforts, etc., when applicable~~and so on.~~

~~x.~~**vi. Non-IOU programs**

The program will promote non-utility programs (e.g. financing options, tax credits, and recycling) to further encourage customers to adopt energy efficiency measures when applicable.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**xi.vii. CEC work on EPICPIER**

The Energy Advisor programHEES will work with the statewide Emerging Technology Program, CEC and EPICPIER to take advantage of all new emerging technologies activities. The information may be shared in the customer energy report.

**xii.viii. CEC work on C&S**

The Energy Advisor programHEES will work with the statewide codes and standards to take advantage of ~~all~~ new emerging technologies activities. The information may be shared in the customer energy report.

**xiii.ix. Non-utility market initiatives**

The Energy Advisor programHEES will coordinate with non-utility energy resources (i.e. DOE's ENERGY STAR®, CEE, etc., if applicable)® to provide customers with information on energy efficient lighting, appliances, and equipment.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**c) Best Practices**

Statewide best practices are outlined below:

- ~~While all California utilities have offered residential energy survey programs for some years, 2006-2008 was the first time surveys were offered statewide as a coordinated program with the same kinds of survey services everywhere. In addition, there was an initial emphasis on hard-to-reach customers which will be continue throughout the 2010-2012 program cycle by targeting and outreaching to in-language communities. Statewide best practices are outlined below:~~
- ~~HEES Report and~~ Customer Usage History: Because the program HEES Report includes comprehensive usage and billing information, ~~the Energy Advisor HEES Program~~ will continue to promote the survey program as a way to educate customers on their potential energy savings opportunities;
- ~~Ethnic communications: The program will continue to be offered to customers in several languages based upon IOU demographics to minimize the opportunities lost due to language barriers; and~~
- Targeted marketing: On a statewide level, the Energy Advisor HEES program will continue to focus its HEES marketing campaigns toward residential and multifamily households with higher usage. As mentioned, the program may also be utilized as an outreach mechanism in a variety of community organizations, conjunction with CBOs, faith-based organization, local community events, green initiatives, etc. This approach reduces overall marketing costs by maximizing the response rates generated from marketing efforts.

**d) Innovation**

~~The Energy Advisor program will integrate the on-line survey. Improvements will be made to the customized HEES Report recommendations and will include demographic data (income, household size, education, etc). This will enhance the reports, ensure consistency, and reflect EE strategic planning. Further, HEES will improve the customer experience by incorporating practical and credible information and relevant recommendations validated by Energy Engineering sources, such as providing the percentage of consumption reduction realized by implementing recommendations, providing a Carbon Foot Print Calculator, or providing similarly pertinent information.~~

**SCE**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- ~~1. The SCE HEES program will integrate the On-Line aspects of the program with the upcoming On-line Buyers' Guide Program. As overall concepts are developed, integration specifics will be determined as to ensure seamless integration to the customer.~~

**SCE/SCG**

- ~~1. The HEES program will integrate the On-Line HEES with "My Account" on-line customers to streamline the customer experience, making it more efficient and convenient.~~
- ~~2. The HEES Program will initiate new enhancements to the program for 2010-2012 to provide a quarterly follow up report to enable participants to understand how their energy use varies throughout the year and how their household compares with similar households, in multiple languages. This multi-language approach will enhance the program's ability to reach California's culturally diverse consumers and provide on-going efficiency recommendations based on a whole house system approach; and~~
- ~~3. Software updates will take into account updates to climate zones, weather regions, demographics, and improved household comparison analysis. This information will also allow for the integration of gas- and water-related measures and information. Updates to all energy savings assumptions will be reviewed and adjusted to reflect changes in usage patterns and energy savings values. Values used will be validated by the DEER Database, SCE Work Papers, or SCE's Engineering and Design Resources Team.~~

**SDG&E**

- ~~4. The IOU's SDG&E HEES program will partner with K-12 stakeholders to ensure that energy education is provided from kindergarten through high school;~~

~~SDG&E will integrate the on-line survey On-Line HEES with customer historic data to streamline the customer experience, making it more efficient and convenient; and~~

The current survey will be replaced by standardized Universal Audit Tools (UAT) developed by each IOU and coordinated at a statewide level to share best practices. The tools will incorporate electricity/gas, energy efficiency, water conservation, demand response and self-generation analysis and will provide tailored set of recommendations

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

for each type of survey, as appropriate. The UAT incorporates applicable rate and bill analysis functionality, similar home comparison as well as IOUs' adopted and recommended emerging technologies, as appropriate.

The utilities projected schedules for implementation of their Residential Universal Audit Tools are as follows:

<b>Residential Universal Audit Tool Deployment Schedule</b>	
<u>PG&amp;E</u>	<u>March 2012</u>
<u>SCE</u>	<u>March 2012</u>
<u>SoCalGas</u>	<u>October 2012</u>
<u>SDG&amp;E</u>	<u>May 2012</u>

The utilities will continue to meet to share best practices for future UAT developments and enhancements where appropriate.

- ~~5. SDG&E will manage all collateral and related outreach through the Residential Customer Education Information Program.~~

**PG&E**

- ~~6. PG&E's Universal Energy Audit Tool (currently in development) will centralize both residential and non-residential energy survey recommendations and calculations and customer survey information in a central database. This will provide uniformity of information and presentation, allow integration of energy conservation, energy efficiency, DR and SG, establishment of benchmarks, and use models, and improve data management and reporting.~~

**e) Integrated/coordinated Demand Side Management**

The analysis portions of the residential survey~~audit~~ programs will be expanded to include demand response and distributed generation. This would be accomplished by adding on to the current survey~~audit~~ formats. Customers will be provided ~~Current audits gather the information needed to calculate energy and demand savings and provide recommendations of the cost effectiveness of installing energy efficiency measures. Simplified algorithms will be designed to gather the necessary information to perform similar analyses for demand response and distributed generation opportunities applications. Customers will be provided immediate recommendations on the cost effectiveness of demand response and distributed generation applications for their residence in addition to Energy Efficiency and Behavior change opportunities. -~~ Customers will also be referred to information ~~receive applications~~ for these programs, when appropriate. ~~Residential tracking systems will be modified to record and track the~~

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

~~additional data.~~ Reports will be ~~shared with~~developed and forwarded demand response and distributed generation programs for additional action ~~if~~as needed.

**f) Integration Across Resource Types (energy, water, air quality, etc)**

The ~~Energy Advisor~~HEES Program will continue to ~~include recommendations across resource types~~pursue alliances with local municipalities and water agencies, as ~~applicable~~feasible.

**g) Pilots/Initiatives:**

Statewide Pilot – ESA program Initiative: Statewide, the ~~Energy Advisor~~HEES program will begin to encourage eligible customers to participate in the ESA programs and other programs that will help them lower their energy consumption.

Statewide Initiative – Online Buyers Guide: The Online Buyer’s Guide (released in 2012) web capability will assist consumers and program participants in making the best energy efficiency purchase decisions. The statewide IOUs will continue to collaborate and share best practices on the online buyers guide in 2013-2014.

PG&E/SDG&E Initiative – Home Energy Reports: PG&E and SDG&E will continue to evaluate (SCE and SCG may explore) the benefits of a behavior-based energy efficiency outreach utilizing a neighbor comparison approach as authorized by the CPUC in Decision D.09-09-047 (p. 304) for the 2013-2014 transition period. Known as the “home energy reports” initiative, it involves mailing selected residential customers customized reports at scheduled intervals that compare the energy use of a specific report recipient household to a similar set of households. The home energy report concept is aligned with the IOU’s energy efficiency education and outreach goals under the Energy Advisor (EA) program. The program is designed to increase customer awareness and understanding of their energy usage, and to provide beneficial information on how customers can reduce their energy usage. The demonstrated benefits associated with this behavioral paradigm may serve as an appropriate resource to influence customers to reduce their energy consumption and to increase participation in existing and future energy efficiency programs.

SCE/SoCalGas/SDG&E Pilot - Multi-Family Program: SCE, SoCalGas, and SDG&E intend to offer the ~~Energy Advisor~~HEES Program to the multifamily sector as a pilot program in ~~2010-2012-~~2014. This will involve ~~combined common area and individual renter occupied unit~~ surveys ~~targeted at the facility owners~~. The resulting ~~recommendations~~report for the ~~owner~~tenant will focus closely and specifically on overall property efficiency, lifestyle modifications and other tenant issues, including gathering information on tenant controlled systems and appliances, such as HVAC units, dishwashers, refrigerators, etc. ~~This information will then be exported for analysis with the information gathered in the common area survey and included with the results of the subsequent owner report.~~

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

SCE/SoCalGas Pilot: SCE and SoCalGas will provide a quarterly, post-survey feedback mechanism (opt-in) for customers. The pilot initiative will provide customers with a comprehensive energy usage report and will contain historical usage data to reinforce positive trends towards sustainable energy conservation. The mechanism should also increase customer actions in response to the survey, so that [the Energy Advisor program](#)HEES continues to monitor its effectiveness in creating energy savings by behavioral change, as well as rebate program participation.

SCE/SoCalGas Pilot – [Smart Meter/Web analytics – SCE and SoCalGas will track the customer’s My Account energy savings benefits from behavior based energy efficiency content through the Energy Advisor program.](#)

**h) EM&V**

The program is meant to encourage action - to inform participants of opportunities to save money and provide resources to execute the recommendations. It will be important to know if the design of the [survey](#)HEES report is successfully imparting useful knowledge, referring participants to helpful resources, and if this coordinated effort is motivating participants to adopt more energy- and water-efficient behaviors.

The utilities plan to work together and with the Energy Division to develop a complete plan for ~~2013-2014~~2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval, together with the PIPs.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided here.

The Statewide [Energy Advisor](#)HEES program has been continued from past program cycles but has a few new program elements. The [Energy Advisor](#)HEES program has planned a preliminary process evaluation near the end of the first program year to address specifically how well the new program elements are operating, and to obtain recommendations on how to improve program operations. After the beginning of the last program year, a full process evaluation will address researchable issues based on the program theory and logic model. These issues will include the following as appropriate:

- How well [the Energy Advisor program](#)HEES participants learned about advancing whole-house energy solutions;
- How well [the Energy Advisor program](#)HEES participants learned behavioral solutions to plug-load energy consumption;
- ~~How effective was the multi-language outreach;~~

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

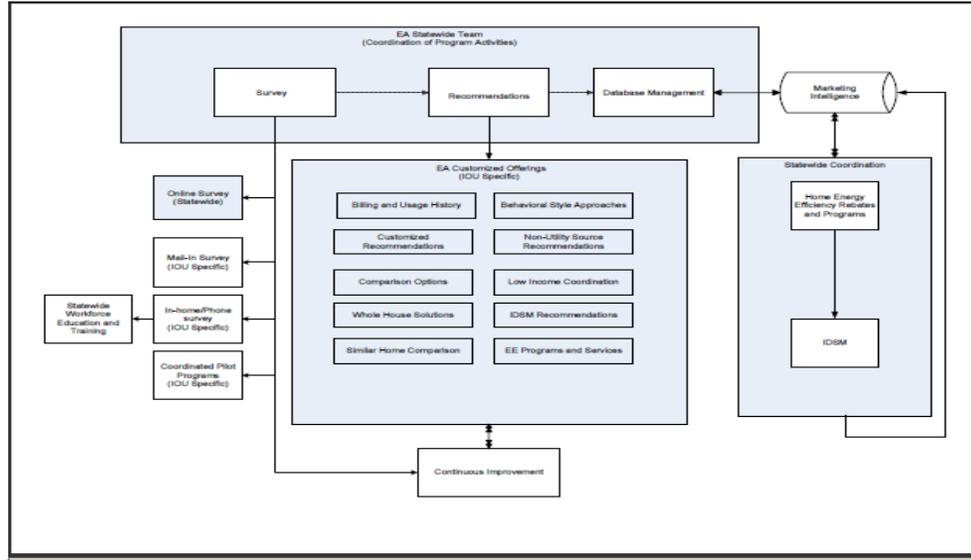

- Whether integration of water-related measures and information was useful to the customer;
- ~~Whether the pilot programs with the LIEE programs were effective;~~ and
- Whether the individual IOU pilot programs were successful.

To address these issues, the following major evaluation tasks will be completed:

- *Logic model and program theory.* The logic model and program theory will establish a starting point for all evaluation activities. The structure of the logic model, which links program activities and expected outcomes, will be a useful instrument for identifying specific program assumptions that can be tested using a survey or other primary data collection activities;
- *In-depth interviews.* In-depth interviews will be conducted with program managers and other key staff members. Program staff members will clarify program goals and gauge program progress, provide valuable insight into daily operations, and propose research topics to be addressed during the evaluation;
- *Participant survey.* The primary data collection instrument will be a customer post-participation survey, fielded over the phone and via mail. The survey will explore the participant's experience with the program's services and address the research issues identified by the logic model. When appropriate, results will be examined by ~~offering survey mode (Mail In, On Line, and Telephone)~~ to investigate how the various ~~offeringsmodes~~ compare with regard to the most effective marketing strategies, recommendation implementation rates, and measures of satisfaction; and
- *Program-specific data collection and review.* Another key evaluation activity will involve a comprehensive review of all program documents. In particular, this evaluation will ~~assess the effectiveness of the program's marketing materials and will~~ identify which specific recommendations have been implemented.

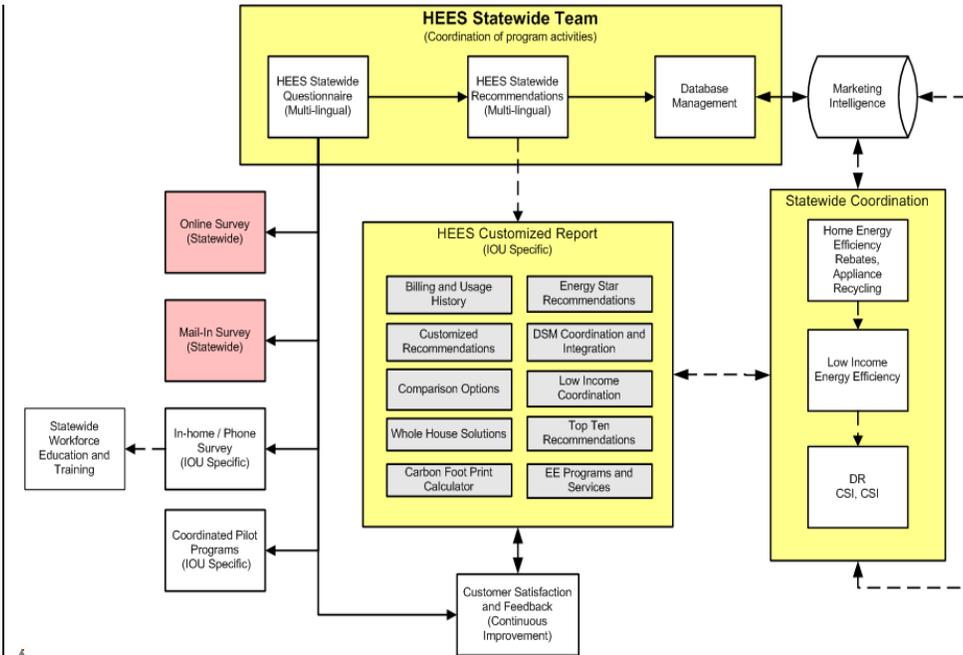

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

### 7. Program Logic Model

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for Home Energy Advisor (EA) Efficiency Survey program. (HEES).

Formatted: Font: Times New Roman, 12 pt

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

- 1) **Program Name:** Statewide Plug Load and Appliances  
**Program ID:** SCG3702  
**Program Type:** Statewide Core Program

2) **Program Description:** Refer to CalSPREE for description details

3) **Total Projected Program Budget and Savings**

- a) **Table 1:** Refer to CalSPREE for budget details
- b) **Table 2:** Refer to CalSPREE for projected gross impacts details

4) **Description of subprogram:**

In response to market trends, energy consumption data, customer needs and behaviors, and per the Final Decision’s guidance, the California IOUs jointly file this Statewide Plug-Load Appliance (PLA) Program Implementation Plan (PIP). With the aim of serving customers where they shop and reducing the complexity in IOUs’ portfolios while increasing customer participation, this PIP combines the 2010-12 Home Energy Efficiency Rebates (HEER), Business and Consumer Electronics (BCE) and Appliance

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Recycling (ARP) Program under a single program umbrella. This sub-program builds the foundation for a sustainable resource acquisition and market transformation that engages critical market actors: manufacturers, retailers, contractors, service providers and others. Additionally, the PLA sub-program will work with the Whole Home Upgrade Program (WHUP), Energy Saving Assistance (ESA) ~~Program (ESAP)~~ and other programs to maximize its reach and effectiveness. This will be accomplished through coordinated cross-program initiatives to deliver a comprehensive package of cost-effective and energy efficiency measures to all customers. This PIP addresses appliances, plug loads, and appliance recycling for the residential and business sectors.

Home appliances, consumer electronics, and other miscellaneous plug loads, hereafter called "Plug-Load & Appliance" or "PLA", consume about 66% of current California home electricity usage, with plug loads (televisions, personal computers and office equipment) accounting for about 20% of home electricity usage alone<sup>2</sup>. These PLA products comprise one of the largest and fastest growing end-uses of the residential sectors, significantly contributing to the growth in greenhouse gas emission. Clearly, the PLA markets cannot be left alone. The Big Bold Energy Efficiency Strategy (BBEES) efforts to achieve Zero Net Energy (ZNE) in new residential construction and the State's Integrated Demand Side Management's (IDSM) goal of 40% energy purchase reduction from 2008 levels by 2020 will only be possible if the markets are influenced to increase the availability, awareness and adoption high efficient PLA products through strategic energy efficient program interventions.

**PLA Sub-Program**

**Program Implementation Plan**

1) **Sub-Program Name:** Statewide Plug-Load ~~& and~~ Appliance (SW PLA)

**Sub-Program ID number:** 3702

2) **Type of Sub-Program:**  Core  Third Party  Partnership

3) **Market sector or segment that this sub-program is designed to serve<sup>3</sup>:**

- a.  Residential
  - i. Including Low Income?  Yes  No;
  - ii. Including Moderate Income?  Yes  No.

<sup>2</sup> Final Decision for the 2013-14 Transition Period at page 202

<sup>3</sup> Check all that apply

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- iii. Including or specifically Multifamily buildings  Yes \_\_\_ No.
- iv. Including or specifically Rental units?  Yes \_\_\_ No.
- b.  Commercial (List applicable NAIC codes: \_\_\_\_\_)
- c. \_\_\_ Industrial (List applicable NAIC codes: \_\_\_\_\_)
- d. \_\_\_ Agricultural (List applicable NAIC codes: \_\_\_\_\_)

**4) Is this sub-program primarily a:**

- a. Non-resource program \_\_\_ Yes \_\_\_ No
- b. Resource acquisition program \_\_\_ Yes \_\_\_ No
- c. Market Transformation Program  Yes \_\_\_ No

**5) Indicate the primary intervention strategies:**

- a. Upstream  Yes \_\_\_ No
- b. Midstream  Yes \_\_\_ No
- c. Downstream  Yes \_\_\_ No
- d. Direct Install \_\_\_ Yes  No
- e. Non Resource  Yes \_\_\_ No

**6) Projected Sub-program Total Resource Cost (TRC) and Program Administrator Cost (PAC) TRC \_\_\_ PAC \_\_\_**

**7) Projected Sub-Program Budget**

*[Table-3 to be provided as an Excel Attachment to this PIP]*

**8) Sub-Program Description, Objectives and Theory**

- a) **Sub-Program Description and Theory:** Clearly describe the goals of the sub-program and the sub-program theory. As part of this, describe the market barriers, specific areas of concern and/or gaps that the sub-program is designed to address. Then describe the way the sub-program will seek to address each barrier, area of concern or gap<sup>5</sup>.

**1) Sub-program Goals**

- (i) The PLA sub-program aims to transform the market to achieve sustainable adoption of energy efficient PLA products where ongoing intervention would

<sup>4</sup> Individual utility specific information to be provided in this table

<sup>5</sup> Through marketing, delivery mechanisms, information, incentives, etc. If barriers vary by market sub-sector, provide this information. As part of this, succinctly describe the role of any market actors upstream from the customer such as installers, vendors, architects, etc.; indicate if and why the program approach constitutes “best practice,” is “innovative” or reflects “lessons learned” in market strategies, program design and/or implementation techniques.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

no longer be required. For the short to mid-term time frame where energy efficiency PLA products are still not the market's default choices, the program uses incentive mechanisms, Marketing Education & Outreach (ME&O), Worker Education & Training (WE&T), and strategic industry collaboration to increase availability, awareness, and adoption of energy efficient products. For the longer-term time frame, the PLA sub-program leverages Integrated Demand Side Management (IDSM) programs to influence the development of codes and standards in order to ensure the minimum required energy efficiency levels, promote "Energy Efficiency" as the preferred choice in life-style and new product purchases. The program's long-term strategy seeks to create ongoing demands for "Energy Efficiency" products and thus motivate the industry to produce and sell high efficient PLA products as the market standard offering.

**2) Sub-program Theory**

**(i) Key Program Drivers**

Some of the key market drivers that exert significant impacts to the PLA sub-program in the 2013-14 Transition Period:

1. PLA products comprise one of the largest and fastest growing end-uses, dwarfing electrical loads from traditional categories such as lighting and HVAC<sup>6</sup> – See Figure-1.
2. Customers tend to rank PLA's energy efficiency as low priority and some perceive that energy efficiency design compromises product performance and convenience.
3. National market trends are the dominant drivers influencing manufacturers and retailers' offering of PLA products. Regional utility programs face challenges in attracting manufacturer and retailer participation due to the national scope of products<sup>7</sup>.
4. Online has a growing importance in the customer's product purchasing process. The customer toggles back and forth between the traditional brick-and-mortar retailers and e-commerce sites for product research, price shopping, purchases, and post-sales support.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

5. The incremental energy savings from miscellaneous electronics are too small to motivate customer's behavior changes, and too costly for IOUs' current product-base program framework<sup>8</sup>.
6. The rapid product life cycle for consumer electronics of 6-12 months poses significant challenges in establishing saving baselines and work-paper development for individual measures<sup>9</sup>.
7. Growing trends of networking home electronics cause energy saving for products to be highly dependent on consumer behavior or usage settings. This isolation of energy savings and consumption on a product-by-product basis becomes challenging.
8. Codes and standards exert powerful pulls on the PLA markets toward higher energy efficiency baselines.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-1:** US Commercial & Residential Electricity Growth<sup>10</sup>

Energy Information Administration's 2008 Annual Energy Outlook forecasts plug loads to grow 94% from 2005 to 2030, dwarfing the contribution and growth of traditional categories, such as lighting and HVAC.

Key regulatory drivers that impact the 2013-2014 Transition Period are requirements found in the Final Decision<sup>11</sup>. These requirements and IOUs' responses are summarized in Table-D and Table-E of this PIP.

**PLA Sub-program Framework**

The PLA sub-program is designed to support BBEES in advancing market transformation (MT) toward Title 20 codes and standards changes for realizing ZNE's vision and IDSMS goals of reducing the energy purchase by 40% from 2008 levels for the residential sector by 2020. This will be achieved by working with manufacturers, sales channel partners, contractors, service providers, and other market actors in pushing the market toward the 2020 vision through accelerating market adoption of successive waves of advanced PLA technologies. In parallel, the utilities will work concurrently with Code & Standard bodies, ENERGY STAR®, local and federal government agencies, and other market actors to influence the development of codes and standards to support the 2020 goals.

This PIP concurs with the Final Decision that the PLA sub-program should institute a framework that provides a pathway of support for market transformation. Viewing the Final Decision's guidance for the Statewide Lighting Program as a fresh approach to program implementation for greater market transformation and deeper energy savings, the PLA sub-program

<sup>10</sup> PIER's report "Tapping Into Plug-Load Savings Report", July 20, 2009, page 1

<sup>11</sup> Final Decision for the 2013-14 Transition Period, pages 206-207, 357-358 and 411-412

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

adopts the Final Decision’s approach for the Statewide Lighting Program as the template for the PLA sub-program design in the 2013-14 Transition Period. The following paragraphs discuss the incorporation of the Final Decision’s program framework with the industry’s Product Life Cycle concept to develop maximum synergies between the manufacturers, sales channel partners and the PLA sub-program.

Figure-2 shows the combined "Bass Diffusion Theory"<sup>12</sup>, "Technology Adoption Life-Cycle model"<sup>13</sup> and "Concept of Marketing Mixes"<sup>14</sup> as a conceptual model, the Product Life Cycle (PLC) for commercializing new technologies and products. This model provides a high-level macro view of how the industry maximizes the sales of new technology through deploying appropriate marketing mix 4Ps (pricing, promotion, placement and product features) based on user’s needs/wants as the new technology progresses through various market adoption stages (introductory, growth, majority, and sun-setting stages). The PLC model proposes that a certain type of customer tends to cluster within a certain PLC phase, and tends to purchase certain type of products from a certain type of retailers. The industry recognizes this market characteristic and responds by formulating appropriate marketing mixes (product features, pricing, placement and promotion) to maximize sales to different customer groups. Figure-2 provides insights on how the PLC conceptual model might be adapted to guide the IOUs’ collaborations with manufacturers and sales channel efforts to deliver energy efficiency products to the markets.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-2:** Industry’s Product Life Cycle Concept

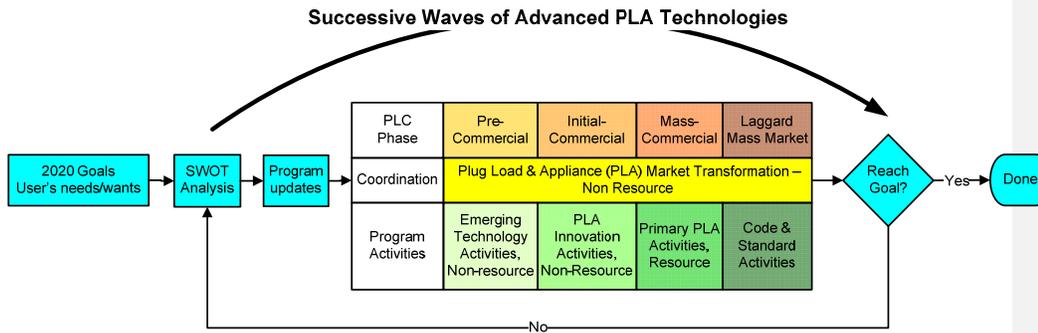

The IOUs could leverage the industry’s commercialization efforts to maximize the adoption of high energy efficient technologies by combining appropriate intervention mechanisms (incentive channels, ME&O, WE&T and Codes & Standards) to influence the industry’s marketing mix 4Ps. The diagram in Figure-3 shows the adaptation of the PLC conceptual model into the program framework for supporting the IOUs’ efforts in transforming California’s PLA markets.

The PLA sub-program framework envisions activities dedicated to support the PLA measures at various commercialization stages, including market transformation activities to provide the overall market transformation strategy and coordination of measures flowing through the PLA sub-program.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-3: PLA sub-program Framework**

In embracing the Final Decision’s guidance for the Statewide Lighting Program<sup>15</sup>, the PLA sub-program supports technology assessments of pre-commercialized PLA measures through Emerging Technology activities. The proposed PLA Innovation activities support advanced PLA technologies aimed at early adopters. The PLA Innovation activities should be heavily weighted and influenced by the user’s needs/wants and should focus on helping the innovative PLA technologies bridge the “chasm” between the early adopters and the early majority markets. From the early stages of product development, promising measures that exit the Emerging Technologies activities should transition to the PLA Innovation activities for further market development in accordance to the overall IDSM strategy and goals. The PLA Innovation activities would support demonstration and pilot projects of measures in the very early stages of commercialization, not pre-commercialization. Moreover, the scale of the demonstration and pilot projects in the PLA Innovation activities should be of a greater scale than those in the Emerging Technologies activities. This will help determine which measures should be eventually supported on a larger scale within the Primary PLA activities. Finally, the IOUs propose the Primary PLA activities in the Statewide PLA sub-program for the purpose of supporting PLA measures that have reached a greater level of commercialization. These activities should receive a majority of the PLA incentive funds and would facilitate rapid market adoption through cost-effective incentive delivery channels. The goal is to complete the pathway for market transformation, as measures transfer from the Emerging Technology activities to the PLA Innovation activities to the Primary PLA activities and then eventually exit from the program.

The PLA sub-program framework proposes Market Transformation activities within the Statewide PLA sub-program for developing and testing market

<sup>15</sup> Final Decision for the 2013-14 Transition Period at pages 227-243

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

transformation strategies. The objectives of the Market Transformation activities are to develop market transformation strategies and to oversee the progression of PLA measures from the Emerging Technology activities to PLA Innovation activities to Primary PLA activities and to the eventual transition to Codes & Standards. Additionally, the Market Transformation activities are to focus on ensuring PLA has adequate representation in the Emerging Technology activities to ensure technologies are being evaluated for potential inclusion in the PLA Innovation activities.

**Process for Managing Flow of Measures through Program**

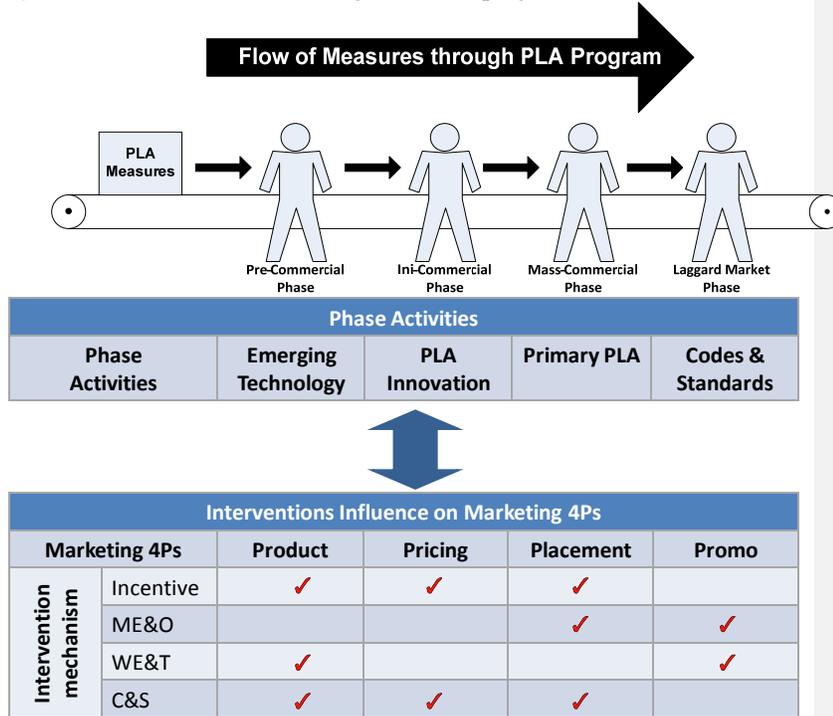

Decision 09-09-047 updated the definition of market transformation to include *“promoting one set of efficient technologies, processes or building design approaches until they are adopted into codes and standards (or otherwise substantially adopted by the market), while also moving forward to bring the next generation of even more efficient technologies, processes or design solutions to the market.”*<sup>16</sup> This definition depicts the flow of new measures through the energy efficiency programs as IOUs collaborate with the industry to launch successive waves of advanced and high efficiency technology into the markets. The PLA sub-program framework in Figure-3 supports the Commission’s position by continually assessing the overall environmental analysis and adjusting the intervention strategy to push new technologies through the program. Figure-4 conceptualizes how the flow of new PLA measures through the program would be influenced by program activities and intervention mechanisms.

---

<sup>16</sup> Decision 09-09-047 at pages 88-89

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-4:** Flow of Measures through PLA sub-program

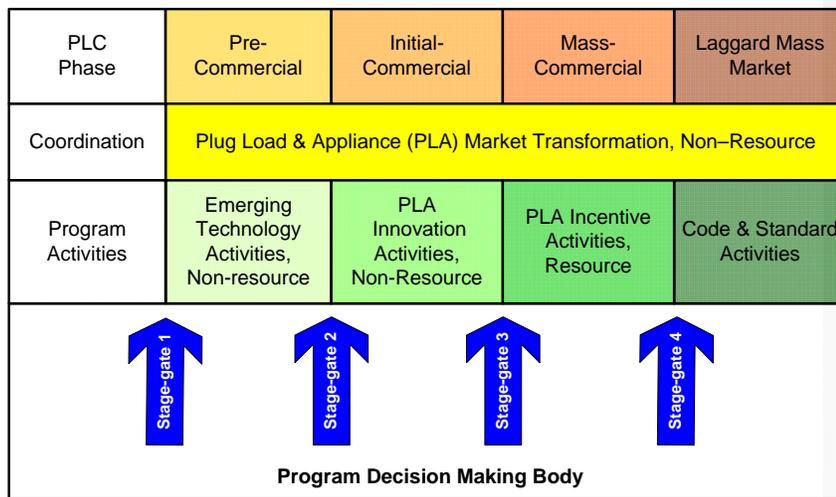

The PLA’s process for evaluating the measure’s commercialization stage and, formulating the right combination of intervention elements to exert the desired market influence, could be enhanced through a formal decision process for managing the flow of measures through the PLA sub-program. This enhancement could be satisfied by a stage-gate process as shown in Figure-5. In this diagram, the stage-gate design takes into account the unique requirements of each commercialization phase and provides criteria for the PLA measure entry into or exit from a subprogram. The explicit evaluation checkpoints would allow measures to move onto the next subprogram, reject measures from the portfolio at any point along the market transformation life cycle or return the measure back through the loop for further development based on to be established stage-gate criteria. Key criteria to be considered as part of this stage-gate process are as follows:

1. Saving potentials (technical, economic, market)
2. Cost effectiveness
3. User’s needs/wants

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

4. Market opportunities / risks
5. Technology's maturity stages
6. Industry's supports
7. Compliance to industry's standards
8. Cradle-to-grave's total environmental impacts
9. Code's saving baseline
10. Saving verifications

California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- g) **Additional Services:** List additional services that the sub-program will provide, to which market actors. For each service provided, indicate any expected charges to market actors of the services, and/or the level at which any such services will be incented or funded.

**Table 12:** Additional Services

*[Table-12 to be provided as an Excel Attachment to this PIP]*

- i. Sub-Program Specific Marketing and Outreach:  
Refer to Section 10(v) for details on Marketing Education & Outreach.
- ii. Sub-Program Specific Training:  
Refer to Section 10(v) for details on Worker Education & Training.
- iii. Sub-Program Software and/or Additional Tools:
- a. List all eligible software or similar tools required for sub-program participation.  
None
- b. Indicate if pre and/or post implementation audits will be required for the sub-program.  
Pre-implementation audit required \_\_\_ Yes  No  
Post-implementation audit required \_\_\_ Yes  No
- c. As applicable, indicate levels at which such audits shall be rebated or funded, and to whom such rebates/funding will be provided (i.e. to customer or contractor).

**Table 13:** *Post-implementation Audits*

N/A

- h) **Sub-Program Quality Assurance Provisions:**

**Table 14:** **Quality Assurance Provisions**

*[Table-14 to be provided as an Excel Attachment to this PIP]*

- i) **Sub-program Delivery Method and Measure Installation /Marketing or Training:** Briefly describe any additional sub-program delivery and measure installation and/or marketing & outreach, training and/or other services provided, if not yet described above.

**(i) Upstream Incentive Delivery Channel**

The PLA program uses “different incentive designs” to influence market actor behaviors. The upstream incentive is paid directly to the manufacturers for the purpose of influencing the manufacturer’s product offering in the distribution chain. The upstream incentive can potentially influence the retailer’s product assortments and impact the customer’s purchasing behaviors. This delivery

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

channel can be a cost effective means for supporting measures that have high sales volumes, produced by relatively few manufacturers that sell through a large number of independent retailer chains.

**(ii) Midstream Incentive Delivery Channel**

The midstream incentive is paid to the retailers, e-retailers, distributors, contractors or service providers and is typically used to influence the sales channels' decision on which products to stock and sell. The midstream incentive offers IOUs the advantage of applying the incentives across all brand offerings for a particular product category that a retailer carries without the additional effort of managing multiple manufacturer relationships. This enhances the customer's shopping experiences and allows retailers to offer wider product choices.

Continuing to cultivate strategic alliances to maximize the synergies with retailer partners is an effective strategy for increasing the program cost-effectiveness and efficiency. California IOUs will continue to develop strategic partnerships with the industry to be more effective in promoting energy efficient products and services, showcasing our energy expertise, branding our successes, and maintaining high levels of customer satisfaction. These strategic alliances include the contractors for roofs, pumps, and evaporative coolers in previous program cycles, as well as HVAC contractors from other residential programs.

The continued use of retailers as a go-to-market channel provides an excellent conduit for developing a "one-stop approach" for customers, as noted in the long-term Strategic Plan. By increasing the program participation with national chain mass market and regional vertical retailers, the program will provide the following benefits:

- Expanding network that increase customer convenience;
- Enhancing retail management support for energy efficiency;
- Establishing more opportunities for co-marketing and branding with retailers;
- Expanding cooperation between utilities, retailers and manufacturers to promote and stock high efficiency PLA products; and
- Providing market information for energy efficiency products.

As noted previously, the national trend by nation chain mass market retailers toward promoting "energy efficient" products within their stores provides IOUs the opportunity to reach end-users through a preferred method of communication— directly from the retailer. Beyond leveraging the ENERGY STAR brand, PLA will use its retail management support to develop bundled promotions, host events, train staff, and conduct promotional campaigns with retailers to directly influence consumers' choice for energy efficiency products.

**(iii) Downstream Incentive Delivery Channel**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The downstream incentive is paid directly to the end-customer and is typically used to directly influence the customer's purchasing decision. While the downstream incentive model has the advantage of capturing more customer information, the more lengthy incentive administrative process of rebates applications is disadvantageous. Additionally, the administrative efforts supporting downstream rebate applications are typically not cost effective for small rebate amounts.

A major implementation strategy for the program is to expand the downstream incentive delivery channel to include the point-of-sale (POS) "instant rebate". This implementation would allow retailers to instantly provide the customer the IOU rebate at the register, streamlining the rebate application payment process and integrating appliance incentives with appliance ~~recycling~~ purchasing opportunities. This POS strategy seeks to include more retailers that sell high efficient refrigerators, whole house fans, pool pumps, home appliances and other gas appliances as applicable with each IOU. Retailers are key market actors in moving the energy-efficient PLA markets, thus the PLA sub-program design will be optimized to maximize the retailers' participation. The final implementation will be depending on the retailers' IT structure and capabilities in certain areas.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Table-A:** Incentive Delivery Channel Summary

<b>Incentive Delivery Channel</b>	<b>Primary Market Actors Affected</b>	<b>Criteria used to determine the best delivery channel for any PLA measure</b>
Upstream	Manufacturer	<ol style="list-style-type: none"> <li>1. High volume product</li> <li>2. More retailers selling product than number of manufacturers producing product</li> <li>3. Lower value product</li> <li>4. Low-mid incentive level</li> <li>5. Lower sales effort required</li> <li>6. Low promotion requirement</li> <li>7. Long product life cycle</li> </ol>
Midstream	Sales Channel Partners (retailers, contractors, etc.)	<ol style="list-style-type: none"> <li>1. Mid - High volume product</li> <li>2. More manufacturers producing product than number of retailers selling product</li> <li>3. High value products</li> <li>4. Mid-high incentive levels</li> <li>5. High sales efforts</li> <li>6. High promotion requirement</li> <li>7. Short product life cycle</li> </ol>
Downstream	End-customer	<ol style="list-style-type: none"> <li>1. Low volume product</li> <li>2. Targeted customer group</li> <li>3. Strong relationship with customer</li> <li>4. High value product</li> <li>5. High incentive level</li> </ol>

**(iv) Retailer based Appliance Recycling**

The PLA sub-program will work with Retailers to support responsible environmental stewardship by providing more comprehensive cradle-to-grave product life cycle management. The program supports the US EPA Responsible Appliance Disposal (RAD) program, which promotes the highest quality recycling, reducing greenhouse gas emissions and landfill waste. The IOUs appliance recycling activities support eliminating the current market practice of reselling old appliances removed from customer homes during the delivery of new ones. The IOUs recognize that customer-facing retail staff has effective point-of-influence to educate customers on the total environmental impacts

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

resulting from adoption of higher efficiency products and permanent removal of older and less efficient PLA products from the grid.

~~In 2011, SCE and PG&E conducted a trial study on Retailer-based Appliance Recycling in which the retailer picked up old but still working refrigerators and freezers upon the delivery of new appliances. The Appliance Recycling vendors then collected these old appliances in bulk from the retailer's warehouse. This trial study showed that the retailer-based appliance recycling had generated a significant increases in the number of older but still working appliances recycled by the program. Based on the latest work papers which use the results from SCE's 2011 Retailer-based Appliance Recycling Trial Study, the results show that energy savings are estimated to be 9% higher than the latest DEER values. The Retailer-based Appliance Recycling channel is expected to significantly reduce the IOUs implementation costs as a result of the "bulk" pickups by the recycling services contractors from the retailer distribution centers.~~

~~Based on the success of SCE's and PG&E's 2011 Retailer-based Appliance Recycling trial, the IOUs are proposing to launch and expand this appliance recycling channel to more retailers in the 2013-14 transition period and explore ways to increase coordination of the appliance recycling with the retailer's appliance disposal activities. When possible, comprehensive education materials on cradle-to-grave product life cycle management will be posted on the retailer's website and at the point of purchase. Through targeted marketing, education and outreach, the IOUs seek to increase market awareness and enhance compliance to the codes and standards for appliances and electronics recycling.~~

The benefits of reduced implementation costs and increased program simplicity that POS instant rebates provide, as discussed above, make it impractical for the IOU's to implement a Cash-4-Appliance rebate program design for refrigerators as suggested in the Final Decision's guidance for the appliance recycling activities. The IOUS will instead focus on implementing existing refrigerator rebates in combination with the new appliance recycling retailer strategy that has been piloted by SCE. This new strategy effectively promotes the purchase of a new efficient refrigerator and combines it with the convenience of allowing customers to recycle their own refrigerators in the new Refrigerator Deliver-N-Haul away process. This approach does not require customer to surrender their refrigerator as part of the rebate process but still allows IOU's to reduce implementation cost for both programs while providing options that improve the customer experience. By working with retailers to integrate appliance recycling to be an integral parts of the product ownership, from new product purchase to retiring old devices from the grid, would provide a simplified and cost-effective long-term solution for cradle-to-grave product life cycle management. And the retailer based appliance recycling solution, which the IOUs plan to expand in 2013-14, would be an ideal solution for realizing this vision. [This does not apply to SoCalGas.](#)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**(v) Statewide Appliance Recycling Channel**

The appliance recycling markets could be segmented into three primary customer groups; Group one would be the customers that retired their old appliances when the new ones are delivered; group two would be the customers that retired their secondary appliances (such as the secondary refrigerator or freezer); group three would be those customers and retailers that sell/buy the old working appliances to/from the second-hand appliance markets.

We believe the above retailer-based appliance recycling channel would be an effective intervention for group one. The current Statewide Appliance Recycling channel, which will be discussed in more detail in this section, could be an effective intervention for group two. The intervention for group three would require a long-term strategy through codes and standards, as well as collaborations with EPA RAD and other market actors to deplete old working appliance stocks that do not meet the 2020's energy efficiency requirements. The intervention for group three would need support from new codes and standards that eliminate the market practices of re-selling old appliances back to the second-hand appliance markets.

The estimated schedule to deplete the old working appliance stocks from the grid would primarily depend on the implementation date of the code and standards that will mandate the 2020's energy efficiency levels and the average product life for that particular PLA product group. Thus, the Final Decision's request to transition the current appliance recycling program to market players by a specific date<sup>20</sup> cannot be answered with certainty at this point. The IOUs will continue to engage the Commission and appropriate market actors on this.

Currently, the Statewide Appliance Recycling picks up older but working appliances from single residential dwellings, multi-family complexes and businesses, and permanently disposes them in accordance to EPA's Responsible Appliance Disposal (RAD) guidance. The Statewide Appliance Recycling channel is designed to incentivize customers to permanently remove and recycle inefficient refrigerators and freezers from the electrical grid by:

- (1) Offering customers an incentive along with free pick-up as a convenient option to recycle their inefficient appliance.
- (2) Requiring Recycling Service partners to be in compliance with EPA RAD practice so all appliances could be decomposed and recycled in the most environmentally friendly manner possible.

---

<sup>20</sup> Final Decision for the 2013-14 Transition Period at page 207

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

- (3) Allowing commercial and multifamily owners/property managers to coordinate bulk pick-ups that simplify the participation process and allows IOU's to reduce program implementation costs.

During the 2013-2014 Transition Period, the PLA sub-program will focus on secondary refrigerators and stand-alone freezers. This initiative aims to stem the tide of the growing number of second refrigerators and freezers in California home. Additionally, the PLA sub-program looks into saving opportunities for both claimable and non-core, non-claimable to avoid lost opportunities for refrigerator and freezer recycling. Lastly, the program is evaluating additional cost-effectiveness and more comprehensive recycling solutions through inclusion of additional recycling of other types of household plug-loads, [gas appliances](#), small business appliances and electronics devices. The team will leverage EPA RAD compliance Recycling Service Provider to provide environmentally safe and responsible recycling solutions.

**(vi) Marketing Education & Outreach (ME&O)**

IOUs will continue to develop targeted and highly relevant energy efficiency and IDSM marketing messages to encourage behavioral change/action. PLA intends to develop strategic collaboration with industry to motivate consumers to take action in embracing energy efficiency.

To facilitate retail relationships, IOUs will explore co-marketing opportunities with manufacturers and sales channel partners to implement website enhancements that facilitate ease of access to energy efficiency information; enabling customers to readily find information about energy efficient products and services, identify participating retailers in their neighborhoods, and complete on-line sign-ups to receive notification about special efficiency offerings, rebates, or incentives.

The IOUs focus on delivering products, services, and information through the most efficient delivery channel for every customer segment we serve. For PLA, the IOUs will continue to focus on the customer experience at retail, ensuring visibility of rebates and offers and streamlining the transaction and processing of rebates.

There is also opportunity for enhanced engagement with customers with respect to appliances and appliance recycling. With many appliances, customers wait until the appliance fails before considering replacement. Through impactful in-store marketing and clear communication of offers, the IOUs intend to increase customer awareness of rebates and incentives and focus customers on the benefits of upgrades as well as replacement of outdated technologies. In-store marketing will be augmented by promotion of PLA through other channels, such as online tools that create customer awareness of rebate offers and availability prior to the customer stepping into the store. With more online transactions happening each

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

day, it is important that customers be educated about the potential energy savings and rebates for products they are considering should they choose to purchase through an online retailer.

The IOUs will look for opportunities to provide alternative strategies for marketing the programs in constrained areas. One example would be a neighborhood-based marketing campaign that targets older, master-planned communities in order to promote energy efficiency. Through this effort, local contractors will independently market and install cost-effective measures such as duct testing and sealing and other measures to help reduce energy loss in the home and increase overall efficiency. By working with the industry partners to cover energy efficiency measures in high volume, the effort will help to lower measures costs that are adopted by a large number of program participants. In addition to delivering energy savings, this approach will support the advancement of local community and city goals related to energy efficiency, as well as benefiting many neighborhoods and socio-economic groups.

Customers are often not aware of the true savings potential associated with energy efficient measures nor are they familiar with the many energy efficient products available that are not associated with appliances. Some IOUs may offer an "energy saving starter kit" to customers in order to introduce them to energy efficiency tips that can produce significant savings. This kit will provide information about simple but comprehensive methods to reduce water, gas, and electricity use. By supplying the tools necessary to begin saving gas and water and thereby educating these customers on energy efficiency, the PLA sub-program should see an increase in participation and could include other customer segments that may have been excluded due to high product cost. This will help the PLA to grow as a comprehensive, inclusive residential program and thus maximize potential savings. As applicable, PLA participants will also be educated about additional opportunities for energy efficiency beyond the measures they are adopting.

The IOUs have developed the integrated energy audit tool for residential and small business customers that will assist customers with their energy management decisions. These information platforms are easily accessible to customer to provide immediate feedback, enable a more accurate assessment of program impacts, and empowered the customer to quickly and easily make energy efficiency decisions. In addition, the deployment of AMI provides additional opportunities to educate customers about their energy usage. The IOUs will explore opportunities to maximize energy efficiency and demand side management opportunities as the technology is developed and deployed to residential customers.

After the program is approved, each IOU will develop a market implementation plan that targets owners and renters of single family residences as well as

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

apartments, townhouses, condominiums, and mobile homes and operates in parallel to the operation of the Multifamily Energy Efficiency Rebate (MFEER). This ME&O strategy aims to include coordinated statewide elements as well as elements specially targeted to the customers in each utility's service area. The program seeks to leverage relationships with local government partnerships, water agencies, air quality districts, trade allies, manufacturers, retailers, and distributors to deliver information, measures, and incentives.

Program campaign elements include:

- Statewide rebate promotions;
- Online/mail-in application processing;
- Integration of rebate offers and related content with online tools
- In-store POS instant rebate option where applicable through retailer POS capabilities;
- Whole house approach offering products that address all types of energy use;
- Home energy surveys;
- Energy efficiency customer education and outreach; and
- Other residential EE programs such as upstream lighting.

**(vii) Worker Education & Training (WE&T)**

PLA sub-program will work with Energy Centers to design and develop training curriculums appropriate for retailers and contractors to develop skills and knowledge on energy efficiency products, codes and standards and IOU EE programs. Additionally, PLA will work with WE&T to identify training opportunities for: (1) the retail store, (2) the retailer corporate/headquarters decision makers, and (3) Original Equipment Manufacturers (OEMs).

- For retail stores - Opportunities to provide training to store-level personnel at participating retailers. These training activities will be supported by regular surveys to determine the effectiveness of the training.
- For retailer headquarters decision makers - Opportunities to provide training to buyers and merchandisers at the headquarters of participating retailers to educate them about the availability, desirability, and benefits of PLA qualifying electronics.
- For OEMs - Opportunities to provide training to with OEM manufacturers to educate their product managers and marketing groups about the importance of designing ENERGY STAR qualified and beyond features into their products.

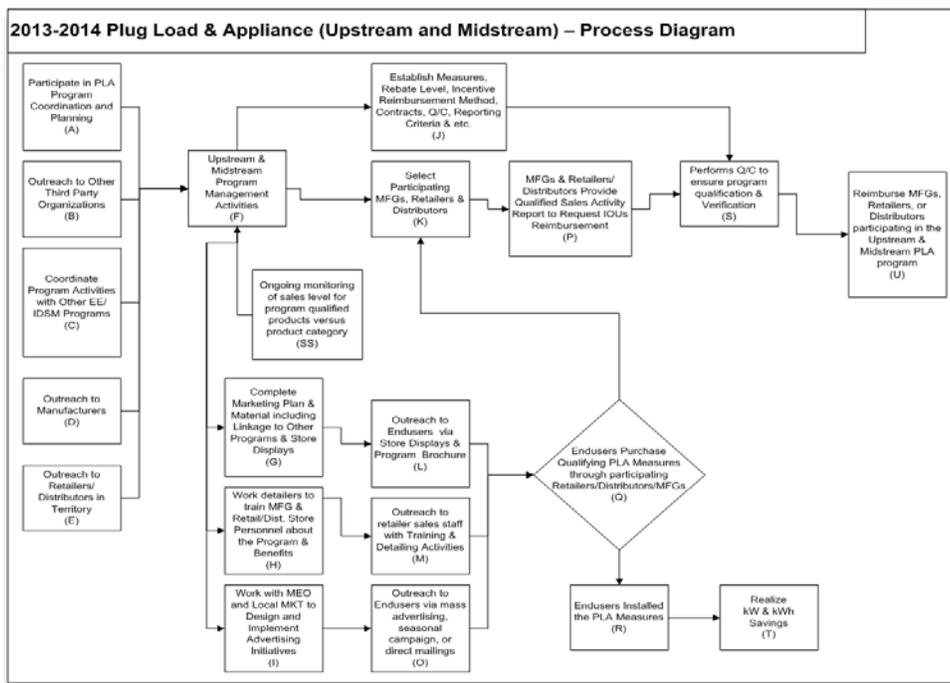

Finally, the IOUs seek to develop marketing programs to educate consumers and increase awareness about the benefits of PLA qualifying products. Various efforts to educate sales associates of user and environmental benefits of high efficient PLA products will be explore during the program cycle. PLA's WE&T initiatives may include activities such as site visits by program representatives, program

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

participation agreements, and / or literature, as appropriate.

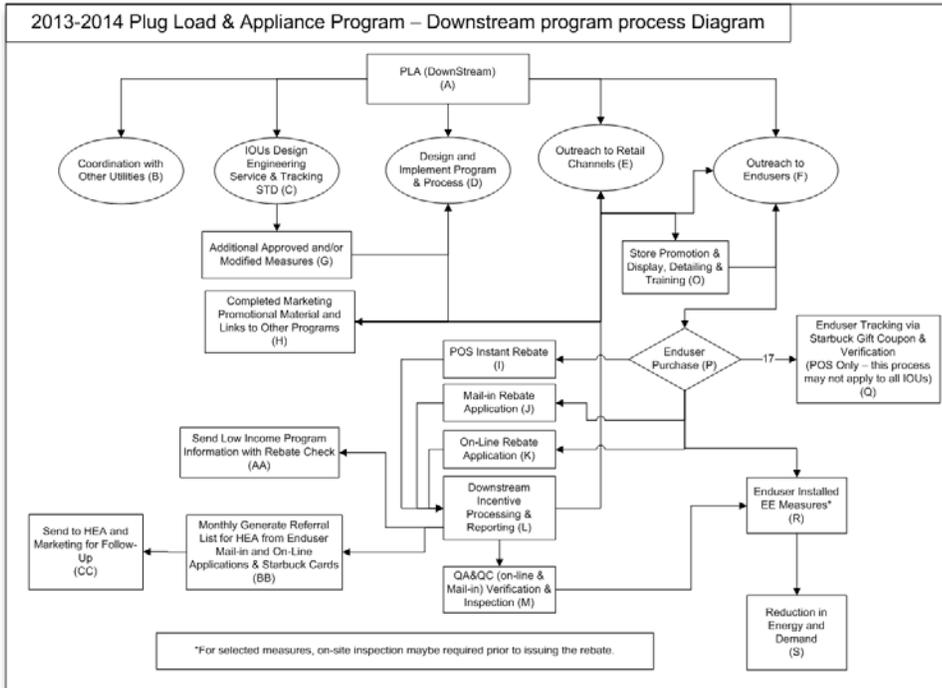

- j) **Sub-program Process Flow Chart:** Provide a sub-program process flow chart that describes the administrative and procedural components of the sub-program. For example, the flow chart might describe a customer's submittal of an application, the screening of the application, the approval/disapproval of an application, verification of purchase or installation, the processing and payment of incentives, and any quality control activities.

**Figure-5:** PLA Upstream & Midstream Incentive Process Diagram

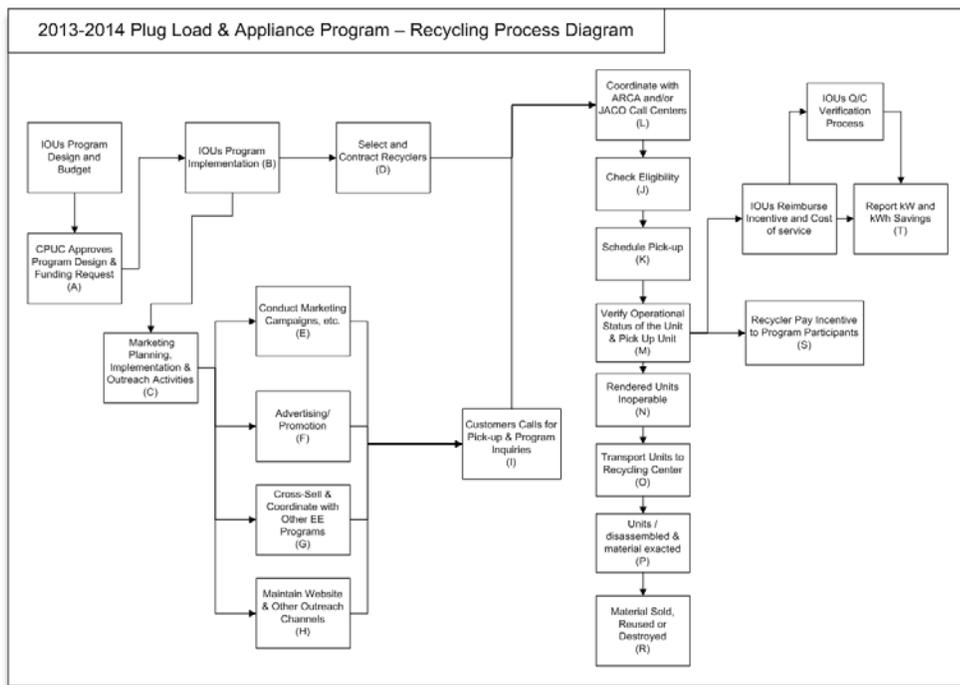

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-6:** PLA Downstream Incentive Process Diagram

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-7:** Statewide Appliance Recycling Process Flow Chart

- k) **Cross-cutting Sub-program and Non-IOU Partner Coordination:** Indicate other IOU EE, DR or DG sub-programs with which this sub-program will regularly coordinate. Indicate also key non-IOU coordination partners. Indicate expected coordination mechanisms<sup>21</sup> and frequency<sup>22</sup>:

With respect to low-income customers, each IOU seeks to integrate its Energy Saving Assistance Program (ESAP)- ESA program into PLA by providing customers with information and marketing material on the ESAPESA program, California Alternate Rates for Energy (CARE), and Family Electric Rate Assistance (FERA) discount programs. The strategy to integrate ESAP, CARE and FERA activities into the PLA sub-program aims to ensure eligible low-income residential customers are aware of the availability of low-cost energy-efficient services through ESAP, CARE or FERA. Additionally, IOUs seek to ensure that low-income customers are aware of rebates available for appliances

<sup>21</sup> “Mechanisms” refers to communication methods (i.e. quarterly meetings; internal list serves; monthly calls, etc.) and/or any cross-program review methods (i.e., feedback on program plans; sign off on policies, etc.) or harmonization techniques (i.e. consistent certification requirements across programs, program participant required cross trainings, etc.).

<sup>22</sup> This does not mean there would be mutual understanding of the on the mechanism or a known frequency of coordination; rather, just provide enough information to give a general sense of the coordinate efforts.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

through the PLA sub-program, which are not offered through any of the above mentioned programs.

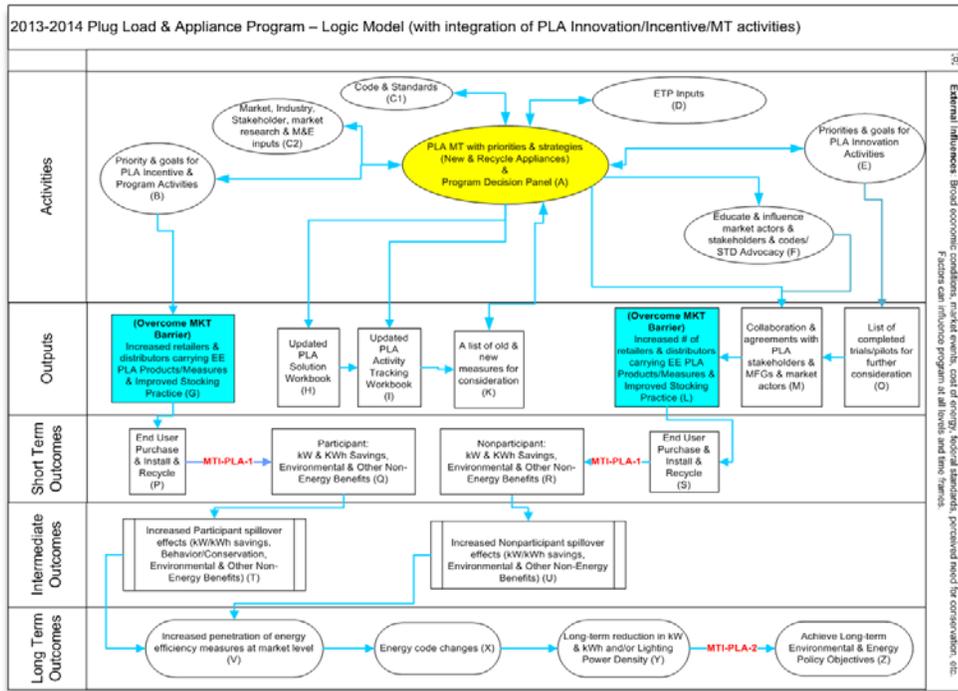

Regarding products that address all types of energy use, each IOU seeks to coordinate the delivery of its PLA sub-program, as well as the Lighting and EUC programs, to maximize the energy saving potentials in every home. Whether customers simply look for an energy efficient light bulb to replace their burnt-out incandescent bulb, or the ENERGY STAR's most efficient refrigerator to replace their old unit, or a comprehensive energy saving audit and installation service to support a deep retrofitting project of their home, the customer-facing staff must be able to guide the customer seamlessly to the appropriate programs. All of the program's ME&O and WE&T would be conducting coordinated initiatives to equip the customer-facing staff with the necessary knowledge to assist customers in maximizing their comfort, security and saving by helping them make the right choice in energy efficient solutions.

**Table 15:** Cross-cutting Sub-program and Non-IOU Partner Coordination  
*[Table-15 to be provided as an Excel Attachment to this PIP]*

- 1) **Logic Model:** Please append the logic model for this sub-program to the end of this PIP. Describe here any additional underlying theory supporting the sub-program intervention approach, referring as needed to the relevant literature (e.g., past evaluations, best practices documents, journal articles, books, etc.).

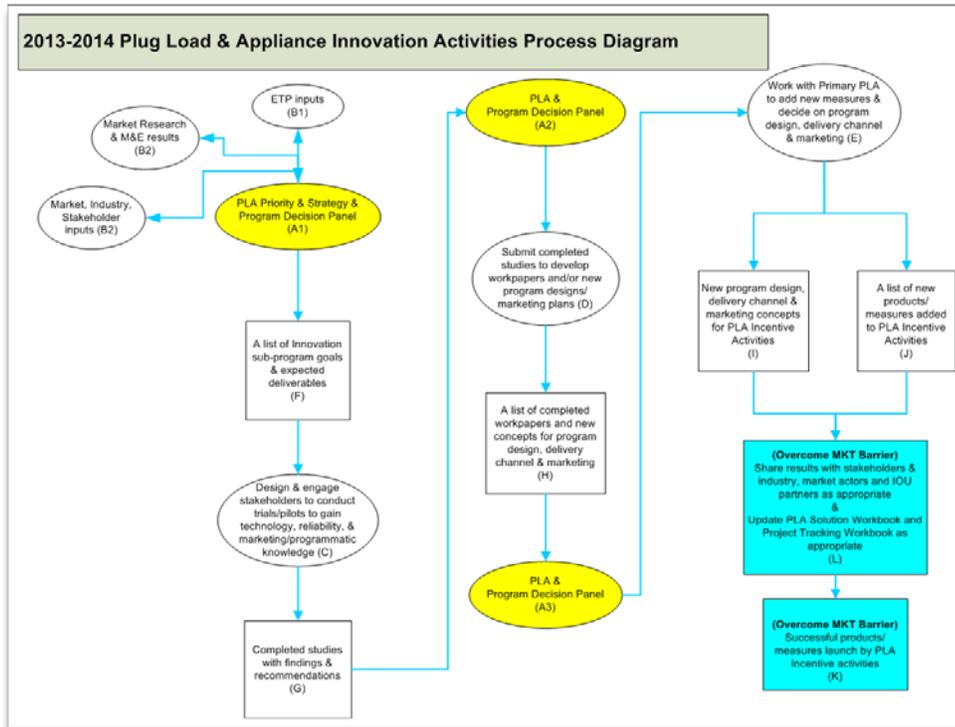

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-8:** PLA sub-program Logic Model

California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Figure-9: PLA innovation Process Diagram**

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**Figure-10: Primary PLA Incentive Activities Logic Model**

### 10) Additional Sub-Program Information

- a) Advancing Strategic Plan Goals and Objectives:** Describe how sub-program advances the goals, strategies and objectives of the California Long Term Energy Efficiency Strategic Plan

The PLA sub-program will help to achieve the goals identified in Chapter 2 of the Strategic Plan:

2-2: Promote effective decision-making to create wide-spread demand for energy efficiency measures. California IOUs will aggressively incorporate results from studies that determine homeowner “decision triggers” for improving home energy efficiency; and

2-3: Manage research into new and advanced cost-effective innovations to reduce energy use in existing homes. California IOUs will work collaboratively to

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

promote the commercialization of home energy management tools, including Advance Metering Infrastructure (AMI)-based monitoring and display tools.

The “Smart Meter” deployment provides the customer the opportunity to access near-real time monitoring of their energy usage patterns at home. The feedback on how a customer is consuming energy through access to hourly billing data will support long-term behavioral strategies to reduce consumption. Moreover, when combined with automated enabling system (e.g., more integrated home management system through In-Home devices/displays and systems, programmable controllable thermostats, load control devices, smart appliances, etc.), the Smart Meter technology will provide customers the energy management tools that report increased savings as energy-efficient measures are installed. At the same time, the Smart Meter will offer residential customers the unique opportunities to participate in demand response and AMI-enabled technologies services. These information feedback systems enable more accurate assessment of IDSM program impacts and guide the future energy management strategies for customers.

**b) Integration**

- i. **Integrated/coordinated Demand Side Management:** As applicable, describe how sub-program will promote customer education and sub-program participation across all DSM options. Provide budget information of non-EE sub-programs where applicable.

The IOUs will coordinate program efforts with the local utility integration teams and the Statewide Integration Task Force to identify successful integration approaches and offerings, potential pilot programs and metrics.

**Table 16:** Non-EE Sub-Program Information  
*[Table-16 to be provided as an Excel Attachment to this PIP]*

- ii. **Integration across resource types** (energy, water, air quality, etc.): If sub-program aims to integrate across resources types, please provide rationale and general approach.

There are integration opportunities that work across resource types that can be further explored such as combining rebates with water utilities which have provided customers a more simplified process for submitting and receiving their energy and water rebates. The residual benefits of this process was the ability to leverage the larger combined rebate amount to significantly drive sales of qualifying models as well as providing a precedent for disparate water utilities to collaborate around a combined product specification and rebate methodology. IOUs will take these key findings and use them with water agencies and air quality districts when there is alignment around customer

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

offerings. Additionally, the retail channel offers significant integration opportunities for marketing DSM solutions. Through effective and engaging point of sale displays and interactive kiosks, the IOUs will co-market a variety of programs and services through a single point of customer engagement.

For example, PG&E begins its fifth year of a Cooperative High-Efficiency Clothes Washer rebate program with a number of water agencies in the Greater San Francisco Bay Area. 12 agencies together with their sub-agencies, constitute a total of 33 water agencies (wholesalers and retailers) participating on PG&E's program. PG&E processes the rebate applications (submitted via paper application or online), sends customer data to the respective water agencies through a secure swap drive, and then issues one check to the customer that combines PG&E's rebate of \$50 and the water agency rebate (either \$50 or \$75, depending on efficiency rating) for a check total of either \$100 or \$125.

SoCalGas will seek opportunities to partner with municipalities, governmental agencies, water agencies and other stakeholders if applicable to promote water and energy conservation via the Energy Advisor Program. Further integration strategies may also include IDSM, ESAP and other energy efficiency programs where pertinent to water and energy conservation.

- c) **Leveraging of Resources:** Please describe if the subprogram will leverage additional investments by market actors or other state, local or federal agencies.

N/A

- d) **Trials/ Pilots:** Please describe any trials or pilot projects planned for this sub-program

The PLA sub-program may include several additional pilots in the 2013-14 Transition Period to evaluate new program delivery methods:

- Market trials to explore sales uplift for PLA targeted products by inviting retailers and or manufacturers to submit proposal for energy efficient PLA sub-program promotion<sup>23</sup>.
- Collaborate with manufacturers to provide low-cost ENERGY STAR appliances for lower income customer segments but not qualified for the low-income program services<sup>24</sup>.
- Field Service teams to provide in-store training of retailer sales staff about energy efficient products; demonstrate energy efficient products to

<sup>23</sup> D&R International, "Massachusetts Market Lift Program - Summary Description and Methodology", April 17, 2012

<sup>24</sup> RIA/EMI's Plug Load Market Characterization study

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

customers; maintain point-of-purchase education materials and ongoing market surveys of energy efficient products.

- Updating sales channel strategy to respond to growing integration of traditional brick-and-mortar retailers and e-commerce marketing for product evaluation, purchases, and post sales supports.
  - Provide incentives to retrofit projects that used qualified contractors to ensure high quality retrofit and enhance code compliance such as pool pump retrofit projects in compliance with code T20.
  - Coordination with industry partners on an integrated strategy with Codes and Standards bodies around “Horizontal Standards” strategy to influence product standards that lead to energy savings across many product categories.
  - Pilots of Home Energy Centers or Power Management Umbrellas to influence the overall reduction of miscellaneous plug loads in California homes.
  - Coordination with industry partners around voluntary agreements for energy reductions, such as, discussions currently occurring in the Cable and Satellite set-top box space.
  - Technology evaluation and market acceptance testing of PLA emerging technologies, which may include set-top boxes, game consoles, servers, advanced power strips, imaging equipment, audio, video equipment’s and home energy management products and energy saving and demand respond capable appliances and plug-loads.
  - Unit Energy Consumption (UEC) as a long term market transformation indicator for monitoring program influence on overall PLA electricity usage in home instead of product-by-product attribution model.
- e) **Knowledge Transfer:** Describe the strategy that will be used to identify and disseminate best practices and lessons learned from this sub-program

**One-Stop-Shop Information Repository**

The PLA sub-program supports the Energy Upgrade California web portal to serve as a one-stop-shop for PLA sub-program information, as well as generalized energy education information for residential and small business consumers on efficient PLA products, while still continuing to prompt home and small business owners to immediately take action to participate in available PLA sub-program activities. It should also serve as a repository of information for the utilities,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

practitioners, the California Energy Commission, local government programs, and third-party programs participating in PLA sub-program.

**Conference, Seminars and Workshops**

Participation in conferences, seminars, and workshops are essential for the PLA market transformation efforts to remain up-to-date on key industry players, new technologies, and best practices to properly support PLA sub-program strategy planning. These events allow the PLA sub-program to expand the network of partners for future collaboration efforts within the energy efficiency and PLA industry. Below are few of the key conferences, seminars, workshops and meetings that PLA sub-program may participate:

- (1) CEE Program Meetings
- (2) EPA ENERGY STAR Products Partner Meeting
- (3) Consumer Electronics Show (CES)
- (4) ACEEE's National Symposium on Market Transformation
- (5) Western [Regional](#) Utilities Collaborative Quarterly Meetings

**11) Market Transformation Information:** For programs identified as market transformation programs, include the following:

**i. A summary of the market transformation objectives of the program.**

The PLA sub-program aims to transform the market to achieve sustainable adoption of energy efficient PLA products where ongoing intervention would no longer be required. For the short to mid-term time frame where energy efficiency PLA products are still not the market's default choices, the program uses incentive mechanisms, ME&O, WE&T, and strategic industry collaboration to increase availability, awareness, and adoptions of energy efficient products. For the longer-term time frame, the PLA sub-program leverages Integrated Demand Side Management (IDSMS) programs to influence the development codes and standards in order to ensure the minimum required energy efficiency levels, promote "Energy Efficiency" as the preferred choice in life-style and new product purchases. The program's long-term strategy seeks to create ongoing demands for "Energy Efficiency" products and thus motivate the industry to produce and sell high energy efficient PLA products as the market standard offering.

**ii. A description of the market, including identification of the relevant market actors and the relationships among them;**

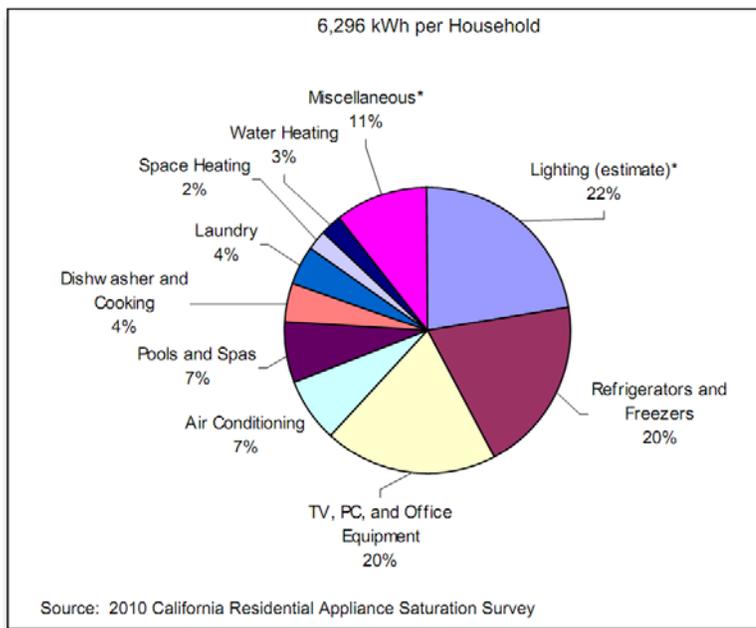

PLA markets comprise of traditional "white" goods or durable appliances such as refrigerators and washing machines, plus miscellaneous plug-load products such as consumer electronic, home office equipment and other small electronics devices requiring external power supply.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The PLA products consumes about 66% and miscellaneous plug loads (televisions, personal computers and office equipment) accounting for about 20%<sup>25</sup>. The PLA products comprise one of the largest and fastest growing end-uses of the residential sectors, dwarfing electrical loads from traditional categories such as lighting and HVAC. Clearly, these markets call for strategic interventions if we are to achieve BBEES’s 2020 vision of ZNE for new residential construction and reduction of 40% of residential purchase energy from the 2008 level.

The average annual electricity consumption in California was 6,296 kWh per household. This was an increase of approximately 6 percent compared to the 5,914 kWh per household reported in the 2003 RASS. Televisions, personal computers, and office equipment consume a 5 percent higher proportion of the total consumption compared with the results from the 2003 RASS<sup>26</sup>. Figure-3 details the breakdown of the 2009 annual household electricity consumption by end use.

**Figure-11:** 2009 annual household electricity consumption by end use

**The average annual natural gas consumption in California households was 354 therms per household based on billing data from PG&E, SDG&E, and SoCalGas.**

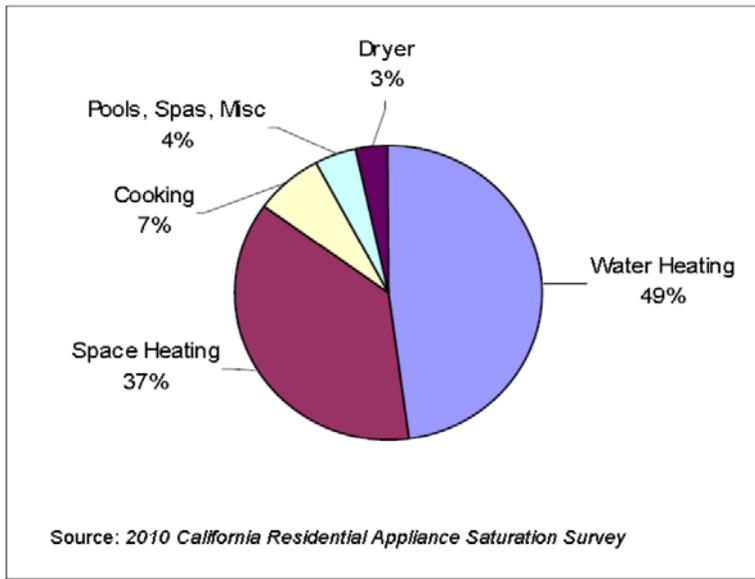

<sup>25</sup> Final Decision for the 2013-14 Transition Period at page 202

<sup>26</sup> 2009 California Residential Appliance Saturation Study at page 3

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The household natural gas UEC decreased by approximately 18 percent from the 431 therms per household reported in the 2003 RASS. Figure 3 details the breakdown of the 2009 annual household natural gas consumption by end-use. Compared to the 2003 RASS, consumption for water heating increased by 5 percent to 49 percent, whereas space heating decreased by 7 percent to 37 percent<sup>27</sup>.

**Figure-12:** 2009 Annual Household Natural Gas Consumption by End-use

**Table-B:** PLA Market Actors & Relationships

Relevant Actors	Relationships & Dynamics Among Market Actors
Product Manufacturers	<p>Develop and commercialize a family of technologies based on long-term roadmap planning. The products derived from the manufacturer’s technology roadmap are released to the markets on an annual basis with incremental new features for consumer electronics categories.</p> <p>The effective point-to-influence of manufacturers would be their technology development roadmap whereby IOUs have the opportunities to influence the manufacturers on a longer-term strategic basis.</p>

<sup>27</sup> KEMA, 2009 California Residential Appliance Saturation Study at page 9

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Relevant Actors</b>	<b>Relationships &amp; Dynamics Among Market Actors</b>
Distributors	<p>Most of the appliance and electronic products reach the market through two distribution layers – manufacturers to regional distributor, and then regional distributor to local retailers. The distributor layer is an important layer that must be taken into account in the IOU’s program design.</p> <p>The distributor’s key value is to provide product inventory and logistics management on the behalf of the manufacturers and retailers. The manufacturer ideally benefits from working with a distributor as the manufacturer has fewer ship-to locations and fewer retailers to sell their product to. The distributor would break out bulk product packaging and do all the individual shipping and selling to retailers for the manufacturers.</p> <p>Similarly, the retailer ideally benefits from working with a distributor as the retailer has fewer manufacturers to work with in purchasing their products. The retailer would be able to purchase a wide range of products from different manufacturers which the distributor represents. Sometimes the distributor may even own the product inventory thus allowing the manufacturers and retailers to mitigate the financial risk of holding their own product inventories.</p> <p>The distributor has significant influences on the manufacturers and retailers. The distributor would be very selective in which manufacturers to represent, which products to carry in their inventories, and which retailers they would sell to. They look for assurance that the represented products would have high sales volume based on the evaluation of the brand’s marketing strength, brand advertising and other market data.</p> <p>The IOUs, representing large regional markets, could work together to exert coordinated influence on the distributor. This in turn would make it easier to the IOUs to convince the retailers to sell and manufacturers to produce products carried by their distributors.</p>
Retailer – National	<p>Retailers serve their target customer bases with store outlets across the country. The national retailers make product purchasing decisions based on maximum sales potential to their target customer base and bulk discounts for those products.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Relevant Actors	Relationships & Dynamics Among Market Actors
	<p>One of the retailer’s key objectives is to maximize the sales of their most profitable products. Therefore, the IOUs could influence the retailer’s ability to reach their key objectives through inventive program and joint promotions to generate sales uplifts.</p>
Retailer – Regional	<p>Similar to national retailer chain but operates on smaller geographical market foot print. The regional retailers sell products to their targeted customer base through store outlets located within the regional market. The regional retailers generally have less clout in influencing the manufacturers and distributors due to their lower sales volume.</p> <p>The regional retailers have similar business objectives as any other retailers, maximizing the sales by focusing on highly popular products in the markets. Therefore, the IOUs could influence the retailer’s ability to reach their key objectives through inventive program and join promotion to generate sales uplifts.</p>
Retailer – Small	<p>Most of the small retailers are privately owned and operate with one or two store outlets in local markets. Their small purchasing power does not allow them to purchase products from big distributors. As a result, the majority of small retailers join large buying groups so that they can leverage their collective buying power to compete with the larger retailers.</p> <p>Small retailers could be an effective channel for reaching small hard-to-reach markets for IOUs programs.</p>
E-commerce Retailer/Resellers	<p>E-commerce has a growing importance in the customer’s product purchasing process. The customer toggles back and forth between the traditional brick-and-mortar retailers and e-commerce sites for product research, price shopping, purchases, and post sales support.</p> <p>IOUs will explore new sales channel strategies that include the integration of traditional brick-and-mortar and e-commerce channels to facilitate ease of access to energy efficiency information; enabling customers to readily find information about energy efficient products and services, identify participating retailers in their neighborhoods, and complete on-line sign-ups to receive notification about special efficiency</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Relevant Actors	Relationships & Dynamics Among Market Actors
	offerings, rebates, or incentives.
Recycle Service Provider	<p>At least 18 states have enacted landfill bans for appliances since 2000 to extend the life of the nation’s landfills, requiring private industry and public sector to implement recycling of these goods. The recycling service providers enable the customer to dispose unwanted appliances and turn recycled appliances into valuable resources manufacturing raw materials. Recycling appliances has positive impact on the environment, since some material takes four times as much energy to manufacture material from their virgin state as it does to make the same steel from recycled scraps.</p> <p>The typical services provided range from logistic arrangements to pick up of old appliances; tracking recycled items’ serial number, manufacturer, model; dismantling the appliances into various materials; glass recycling by removing all glass and create cullet to be used in remanufacturing; shredding the separated materials to reduce their size; sorting shredded material into non-ferrous metals, plastics and other distinct categories which are then bulk packed for transport; commodity sales of the recycled materials in a wide range of new products and keeping building block materials out of landfills.</p> <p>The recycle service provider works with the retailers for bulk pickup of collected turn-in old appliances from the retailers’ new appliance customers, collaborate with organization such as Utilities to pick up individual old appliances from the Utility’s customers. The bulk pickup from the retailer’s collection point is more cost effective as compare to individual pickup from multiple customer homes.</p>
Pay TV Service Providers	<p>There are nearly 22 million set-top boxes (STB) delivering paid television content to California residential markets. Nearly all of these STBs are owned and installed by approximately nine large Pay TV service providers. In 2009, set-top boxes in California homes consumed approximately 4.4 billion kilowatt-hours of electricity, which is a significant consumption load demanding a strategic approach to improving the efficiency and reducing the cost of operating these electronics relied upon by so many customers.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Relevant Actors	Relationships & Dynamics Among Market Actors
	<p>These service providers have relatively strong marketing power with their customers. They have the opportunity to access a customer’s home, track STB inventory, device configuration and possibly power states of the installed devices. They would be in a unique position to provide home energy management systems through these ubiquitous set-top boxes.</p>
Contractors	<p>Contractors have significant influence on home owner’s purchase of low-touch appliances such as pool-pump/motor and water-heaters. IOUs could use midstream incentive to influence the products that the contractors carry and recommend to their customers.</p> <p>The IOUs have the opportunity to influence the contractors by providing:</p> <ol style="list-style-type: none"> <li>1. Incentives for projects installed by certified or qualified contractors would be an effective solution to ensure pool pump and motor retrofit projects be in compliance to code T20.</li> <li>2. Training either at the IOU’s Energy Centers or in conjunction within store retailer trainings on installing energy efficiency products and control system, IOUs energy efficiency programs and codes and standard relating to energy efficiency.</li> </ol>
ACEEE	<p>The American Council for an Energy-Efficient Economy (ACEEE) is a nonprofit organization founded in 1980 by researchers in the energy field that aims to advance energy efficiency policies, programs, technologies, investments, and behaviors. ACEEE carries out its mission by collaborating with government, private sectors, research institutions and other nonprofit organizations to cover energy efficiency policy and technology issues.</p>
CEE	<p>The Consortium for Energy Efficiency (CEE) is a consortium of efficiency whereby program administrators from across the U.S. and Canada who work together on common approaches to advancing efficiency. Through joining forces, the individual efficiency programs of CEE are able to partner not only with each other, but with other industries, trade associations, and government agencies. By working together with CEE, administrators leverage the effect of their funding dollars, exchange information on effective practices and, by doing so, and achieve greater energy efficiency for the public good.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Relevant Actors	Relationships & Dynamics Among Market Actors
<p>Advocate Organizations</p>	<p>Non-profit organizations dedicated to advocates for various stake holder groups (end-customer, environment, manufacturers, etc.) and at time exert influences on California’s energy policies making process and California IOUs activities. Examples of such organizations in California would be Natural Resources Defense Council (NRDC) and Division of Ratepayer Advocates (DRA).</p> <p>NRDC is an effective environmental action group, combining the grassroots power of 1.3 million members and online activists with the courtroom clout and expertise of more than 350 lawyers, scientists and other professionals. NRDC staffs work with businesses, elected leaders, and community groups on the biggest issues we face today such as “Curbing Global Warming and Creating the Clean Energy Future”.</p> <p>The DRA is an independent consumer advocate within the California Public Utilities Commission (CPUC) that advocates solely on behalf of investor owned utility ratepayers. DRA plays a critical role in ensuring that the customers of California’s energy, water, and telecommunications utilities are represented at the CPUC and in other forums that affect how much consumers will pay for utility services and the reliability and safety of those services. Additionally, DRA supports environmental protections and seeks to ensure that utility actions comport with CPUC rules and California environmental laws. DRA actively participates in CPUC proceedings to aid the Commission in developing the record from which it will formulate its final decisions. DRA also actively lobbies decision-makers on behalf of ratepayers to ensure that the consumer perspective is heard.</p> <p>Both NRDC and DRC are active key players in California’s energy industry. They provide inputs into CPUC’s policy and rule making processes.</p>
<p>EPA ENERGY STAR</p>	<p>ENERGY STAR is a joint program of the U.S. Environmental Protection Agency and the U.S. Department of Energy helping the market to adopt energy efficient products and practices. ENERGY STAR helps customers make energy efficient choices by providing a market accepted energy performance rating system that is being used across the country</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Relevant Actors	Relationships & Dynamics Among Market Actors
	<p>on hundreds of thousands of PLA products.</p> <p>ENERGY STAR works with the manufacturers, trade associations, government agencies and utilities to set energy performance rating system.</p>
EPA RAD	<p>EPA Responsible Appliance Disposal (RAD) is a voluntary partnership program that began in October 2006 by the U.S. Environmental Protection Agency to help protect the ozone layer and reduce emissions of greenhouse gases using best practices. As part of the RAD program, partners recover ozone-depleting chemicals from old refrigerators, freezers, window air conditioners, and dehumidifiers.</p> <p>EPA RAD serves as a technical clearinghouse on responsible appliance disposal program development and implementation; calculates annual and cumulative program benefits in terms of ozone-depleted savings and greenhouse gas emission savings and equivalents and, as available, potential cost savings; and provides partner recognition for achievement, such as through press releases, brochures, articles, and awards.</p> <p>EPA RAD partners include utilities, retailers, local governments, manufacturers, universities, and other interested organizations.</p>
CEC	<p>The California Energy Commission (CEC) is the state's primary energy policy and planning agency. It is responsible for promoting energy efficiency by setting the state's appliance and building efficiency standards Title-20 and Title-24 respectively. The CEC works with local government to enforce those standards. The IOUs work very closely with the CEC to develop energy efficient codes for appliances and plug-loads.</p>
Local Government	<p>In D.05-01-055, the Commission also directed the IOUs to initiate energy efficiency partnerships with local governments. Having continued this practice in the 2010-2012 portfolios, the IOUs now have two portfolio cycles and almost seven years of experience with increasing levels of local government. The IOUs continue to partner with local governments to increase the delivery of energy efficiency and enhance code compliance programs.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Relevant Actors	Relationships & Dynamics Among Market Actors
Regional Utilities / IOUs	The IOUs collaborate with each other and other regional Municipality-Run-Utilities to share resources, information, and joint research projects. By working closely with each other, the IOUs seek to increase the collective negotiating power when working with PLA retailers.
Customers	End-user of residential energy efficient products and services that are provided by sales channels through IOUs' EE program intervention.  The IOUs may reference to the PLC framework to segment the customer bases for targeted intervention initiatives.

**iii. A market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies;**

Utilities face uphill battles in influencing the PLA markets due to powerful national market trends that dominate manufacturers and national retailers' choice of product offering. Other market characteristics that pose great challenges to the current product-by-product program design include: small incremental energy savings from many plug load devices resulting in product-based programs that are not cost effective for IOUs; the consumer electronics' rapid product life cycle of 6-12 months pose significant difficulties in establishing saving baselines and timely work-paper approval for individual measures; and growing trends of networked home electronics making energy savings attribution on a product-by-product basis problematic.

There are still specific product-based saving opportunities that address specific market barriers or conditions. However, the big market trends suggest a holistic market transformation approach that targets an overall reduction in plug loads and using Unit Energy Consumption (UEC) as a market transformation indicator (MTI) could be more effective in addressing the market long term barriers. In this approach, the program could rely on California Residential Appliance Saturation Survey or equivalent reports which provide forecast of plug load use in California as a basis for the measurement of program impacts. Once a forecast of plug load energy usage is established, the targets could be set for changing the UEC curve to slow its growth or even lower its intensity over time. This approach could improve flexibility in measure implementation by moving away from the work paper process and short-term cost-effectiveness requirements that hamper effective product based program design in fast-moving markets.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

The PLA sub-programs could evaluate current pilots, such as the PG&E Home Energy Centers that provide consumers with energy usage information from smart meters or SCE's proposed Power Management that provide an umbrella approach to influence the overall reduction in miscellaneous plug loads in California homes. By 2015, we expect smart chip-enabled and networked appliances to be available, and thus fueling the proliferation of more comprehensive home automation and energy management systems (i.e., Intelligent Home Network, comprehensive Home Automatic Network and etc.). These systems will help customers lower their overall energy consumption at home instead of focusing on savings per product basis. The Emerging Technology activities in the 2013-14 period will assess the enabling smart and connected PLA technologies that have the potentials to deliver not only hardware based energy savings, but also information feedback to enable broad customer's behavior savings opportunities.

On the state of recycling, the saturation level of second refrigerators and freezers has been slowly creeping up over the last decade. From the 2009 CEC Residential Appliance Saturation Study<sup>28</sup>, the second refrigerator and freezer saturation levels are up to 33% for second refrigerator and 23% for additional freezer for the statewide single family home. This is a marked increase of secondary refrigerators from the 2003 RASS results, which may have resulted from the popularity of large super-stores such as Costco and Super Wal-Mart stores in the past ten years. The large discount stores encourage large bulk food purchases, which in turn, generates the need for increased food cooling storage. The current Statewide Appliance Recycling channel offers customers the convenience of free-pickup plus small cash incentives for old working refrigerators to help minimize the return of units back to the used-appliance market as secondary refrigerators. Similarly, the IOUs work with the retailer based appliance recycling channel to offer customers the convenience of "deliver-and-haul" by hauling away the old appliance when the new one is delivered. Furthermore, the PLA sub-program supports the US EPA RAD, which eliminates the current market practice of reselling old appliances removed from customer homes during the delivery of new ones.

### **Market Actors and Their Relationship in the Markets**

Depending on the application and appliances, market actors within the supply chain may be involved in the delivery of products and services to the customers. The list of key market actors and the dynamic relationship among them is discussed in Table-B.

**iv. A description of the proposed intervention(s) and its/their intended results, and specify which barriers the intervention is intended to address;**

The PLA sub-program is designed with the overarching objectives of influencing the market to produce and sell high energy efficient products, customers to adopt

---

<sup>28</sup> KEMA, 2009 California Residential Appliance Saturation Study

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

energy efficient products and employ energy conservation usage behavior, and codes and standards to support minimum energy efficiency levels across all PLA product categories. The PPMs (Section 9, iv, (c)) are goal posts guiding the program's efforts and MTIs (Section 12, vi) provide feedback on how the program progresses against the overarching objective stated above. Table-C below identifies key market barriers, and the intended market effects from the proposed intervention.

**Table-C:** Market Barriers and Market Affects from Proposed Intervention

#	Barrier	Interventions & Intended Results
1	High first cost	Applying appropriate incentive to influence the market or the customer through the appropriate stream (upstream, midstream or downstream) The intended results of this intervention are to help customers overcome the high first-cost barrier and encourage adoption of higher energy efficient products over standard offerings.
2	Lack of retailer sales staff knowledge on how to sell energy efficiency products	Providing in-store training for sales staff or associates on program guidelines and energy efficiency.  The intended results of this intervention are to increase sales staff's or associates' knowledge and increase accessibility to energy efficiency information thus enabling more effective sales efforts.
3	Lack of contractor's awareness of energy efficiency products and code requirements	a) Providing training for contactors either at IOU's Energy Centers or in conjunction with the in-store retailer trainings. b) Providing incentives to projects installed by certified or qualified contractors  The intended result of this intervention is to increase the contractor's knowledge on energy efficiency. Thus enable more effective sales efforts and higher efficient installed projects.
4	Lack of customer's knowledge on benefits of energy efficiency	a) Providing in-store demo to customers b) Enhancing in-store marketing and education materials c) Providing product information on websites and other communication channels d) Providing customer education at community out-reach events

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

#	Barrier	Interventions & Intended Results
		<p>The intended result of this intervention is to increase the customer’s knowledge on how energy efficiency benefits their lives and to impart “energy efficiency” as the preferred life style and choice in new product purchases.</p>
5	<p>Incremental savings too small to motivate customer’s behavior changes and not cost effective for IOU’s program</p>	<p>Create a holistic and flexible program to address residential plug loads as a category and develop intervention that targets an overall reduction in plug loads. It would also require an evaluation framework that assesses the overall reduction in plug loads due to multiple measures, instead of focusing on a per-product/per-measure evaluation framework.</p> <p>The intended results of this intervention is to move away from the short-term cost-effectiveness requirements and work paper process that hampers effective product based program design in fast-moving markets.</p>
6	<p>Short product life cycle for miscellaneous electronics make the establishment of baseline difficult and timely work-paper development and approval impractical</p>	<p>Same solution as above – moving toward comprehensive approach rather than focusing on per-product/per measure program.</p> <p>Targeting the same intended results as above.</p>
7	<p>Proliferation of interconnected electronics and small devices making intervention per products less efficient.</p>	<p>Same solution as above – moving toward comprehensive approach rather than focusing on per-product/per measure program.</p> <p>Targeting the same intended results as above.</p>
8	<p>National market trends dominate the PLA markets</p>	<p>Develop longer-term market transformation initiatives that seek to influence key market actors’ long-term technology development roadmap.</p> <p>This also calls for the program design and evaluation framework that address the residential plug loads as a category and develop programs that target an overall reduction in plug loads versus saving per-product/per-measure.</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

#	Barrier	Interventions & Intended Results
		Targeting the same intended results as above.
9	The market is able to make more money by selling older but still working appliances to the second-hand markets as compared to permanently dispose them.	<p>Data suggests that around 11% of the customers prefer to sell their old appliances into the used appliance markets. Additionally, about 10% - 25% of old appliances picked up by the retailers are often reconditioned and put back into the used appliance market.</p> <p>Proposed Intervention to address customers that sell their old appliances to used appliance market - Provide free-pickup and downstream incentive and/or other strategies to customer who surrenders their old but still working appliances to IOUs. This strategy will win over customers who seek the most convenient way to dispose of their old appliance.</p> <p>Proposed Intervention to address retailers that sell the collected old appliance to used appliance markets:</p> <ul style="list-style-type: none"> <li>a) Provide higher midstream incentives to retailers that provide completed cradle-to-grave product life cycle management and compliance to EPA RAD</li> <li>b) Provide to customer down-stream incentives plus free-pickup of old but still working appliances</li> <li>c) Increase in-store marketing education's efforts to educate the customer about high operating cost from using old appliances.</li> </ul>
10	Customer's lack of awareness of the high energy cost in operating secondary and older appliances. This has led to the significant growth of secondary refrigerators and freezers found in homes over the last decade.	<ul style="list-style-type: none"> <li>a) Increase marketing education and outreach efforts on the high operating cost when using old and or refurbished/resold appliances.</li> <li>b) Provide free-pickup and downstream incentive and/or other incentives to customers who surrenders their secondary old but still working appliances to IOUs. This strategy will win over customers who seek the most convenient way to dispose of their old appliance.</li> </ul> <p>To reverse this trend, the IOUs are directing more focus toward retiring secondary units in the 2013-2014 Transition Period. And to better distinguish and track "primary" vs. "secondary" units, the IOUs will explore new program design logic to more clearly differentiate</p>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

#	Barrier	Interventions & Intended Results
		between a primary and a secondary unit. Also, this new process may require additional verification procedures to ensure the participants would demonstrate persistence of this removal and not replace the secondary unit at a later date.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- v. **A coherent program, or “market,” logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results<sup>29</sup>;**

Refer to Section 10(l) for detailed diagrams of PLA sub-program logic models that describe the relationship between the proposed interventions and their intended results.

The Principal logic model (PLA Program Logic) for the Plug Load and Appliance Program (PLA) is the governing model for the PLA program components. This program component is responsible for selecting and prioritizing new products to be introduced to incentive programs as well as for judging when markets for products currently in incentive programs have been transformed so that the products can be removed from incentive programs. The PLA Incentive logic model portrays the logic of the incentive program, i.e. the production aspect of the PLA program.

**PLA Program Logic**

Since the primary function of this program component is to make decisions about the entry and exit of products to and from the PLA Incentive programs, the central activity is represented in the model by the Program Decision Panel (A). The logic of the program component is that this decision panel takes information and research from many sources and makes its decisions, assures that programs are designed and tested and that they are ready as production programs. The sources that feed into and receive feedback from the Decision Panel are: Priority & goals for PLA incentive and program activities (B), market, industry, stakeholder inputs, market research, and M&E studies (C2), codes and standards (C1), and ETP inputs (D). With all of this information the decision panel facilitates solution workbooks, activity tracking workbook, and, of course, lists of new and old measures. More centrally, it oversees the education and influence of market actors and stakeholders (F), which produces collaboration and agreements (M), thus overcoming some market barriers at that level. It also causes trials and pilots to be completed (O), which also feeds into the agreements with PLA stakeholders and manufacturers. These agreements promote end user purchase and installations and recycling among participants and ultimately non-participants as well (spillover).

**PLA Incentive Program Logic**

The PLA Program Logic described above addresses the collaborations and agreements that the IOUs generate with various market actors and stakeholders, but the PLA Incentive program logic specifies these activities in more detail. The activities at this level include promotion, and outreach events, EA Universal Audit Tool (D), advertising and direct mailing and incentives (G), engaging manufacturers with upstream incentives (B), engaging retailers and distributors (C),

---

<sup>29</sup> If this logic model is the same as that requested in #10.(O), only provide once. As needed, provide a more detailed logic model emphasizing the market transformation elements of the program and/or how such elements integrate with resource acquisition elements.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

and working through professional and trade organizations to engage contractors, architects, and engineers to support best practices (F). These agreements and collaborations yield reductions in market barriers at the upstream and midstream levels so that program products will be stocked and available to customers. The direct mail, advertising, and EA UAT promote the products directly to consumers so that they will look for the products at stores, and purchase them, reflecting the overcoming of barriers sufficient to generate the initial purchase. After the initial purchase, further barriers are reduced and more purchases are envisioned, both under the program and outside of the program (spillover).

**vi. Appropriate evaluation plans and corresponding Market Transformation indicators and Program Performance Metrics based on the program logic model.**

Due to the need to comply with the Decision's timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section "18.1. Evaluation Budget" in Decision R.09-11-014. Until then, we suggest the following approach:

**Summative evaluation - Market Effects:** The market transformation program's theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program's scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program's direct outputs.

**Attribution:** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Prah (MT Workshop, Nov 2011) suggest that declaring the program's strategic intent through the market transformation initiative's theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual efforts, and we believe the market transformation evaluation discourse should be focused on collaboration. We will disregard MT attribution by realizing we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals and it doesn’t matter which entity contributed how much but whether, as a state with our numerous market actors, we were successful or not. The PLA sub-program’s MTI will be based on the Commission Staff’s recommendation as shown in Table-D below.

**Table-D:** PLA Market Transformation Indicators<sup>30</sup>

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

**Table 1** - reference the [CalSPREE](#) for budget details

**3. Projected Program Gross Impacts Table – by calendar year**

**Table 2** - reference the [CalSPREE](#) for projected savings details

**4. Program Description**

**a) Describe program**

The [Multifamily Energy Efficiency Rebate program \(MFEER\)](#) is a continuation of the existing statewide program within the residential energy efficiency portfolios. In accordance with the Strategic Plan, this program advances comprehensive energy efficiency measures, including: whole house solutions, plug load efficiency, visual monitoring and displays, performance standards, local government opportunities, and DSM integration.

Historically, owners and managers of multifamily properties have been less responsive to energy efficiency efforts than other residential customers. As one of California's largest segments, this unique market warrants additional attention and effort needed to motivate property owners and managers to actively participate in energy efficiency programs. The MFEER proposes a series of comprehensive measures designed to address systems within multifamily housing.

The MFEER offers ~~prescribed rebates~~ [a variety of incentives](#) for energy efficient products [and services](#) to motivate the multifamily property owners/managers to install energy efficient products in both common and dwelling areas of multifamily complexes and common areas of mobile home parks and condominiums. An additional objective is to heighten the energy efficiency awareness of property owners/managers and tenants.

[The creation of energy-efficient complexes provides benefits beyond the direct energy savings. Through the incorporation of energy efficient measures by multifamily property owners and managers, tenant behaviors can be influenced and comfort improved. The hope is that these behaviors can contribute to a virtual cycle of energy efficiency - as tenants receive upgrades that reduce their energy costs and improve comfort, they in turn recruit and mentor other tenants.](#)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The MFEER ~~must address~~addresses the ongoing concern with “split incentives”, where the residents are not the owners of the property, so they lack incentive to improve their energy usage. Similarly, the property owners do not live on-site and pay higher utility expenses due to inefficient appliances, thus lack any incentive to upgrade. The MFEER ~~was~~is designed to drive this customer segment toward participation by offering property owners a variety of energy efficiency measures and services.

**Program Integration:** The MFEER marketing plans include print material, direct mail campaigns, print advertisement, trade show exhibitions, and presentations, ~~and statewide advertising; the program also links program rebates for ENERGY STAR® refrigerators with incentives from the ARP and coordinates with the HBES Program. to related target market organizations.;~~

The program also links program incentives from the PLA and coordinates with the Energy Savings Assistance program Middle Income Direct Install (MIDI) Program, Multifamily Energy Upgrade California (MF EUC) Program, as well as other energy efficiency programs.

**Support for ~~LIEEESAP~~ Qualifying and Non-~~LIEEESAP~~ Qualifying Low Income Families:** To make property owners/managers aware of income-qualified services available to tenants, the MFEER promotes the ~~LIEE efforts~~ESA P program within the customer application and outreach efforts. The MFEER will work with municipal entities to support AB811 to serve the needs of non-~~LIEEESAP~~ qualifying low income families while still adhering to MFEER’s program design.

**b) List measures**

Measures and services to reduce energy usage may include, but are not limited to, the following:

Electrical measures:

Screw-in CFLs (ENERGY STAR® Qualified)

Lighting

- Screw-in CFL Reflector bulbs (ENERGY STAR-Qualified)
- ~~High Performance Dual Pane Windows~~
- ~~Ceiling Fans (ENERGY STAR® Qualified)~~
- Interior LED Lamps
  - Interior CFL Fixtures (ENERGY STAR-Qualified)
  - T5 or ~~T8~~-Lamps w/electronic ballasts
- ~~Attic and/or wall insulation~~
- ~~Electric storage water heaters~~
  - Exterior CFL fixtures (ENERGY STAR-Qualified)
- Exterior LED lamps
- Exterior LED fixtures
- Occupancy sensors

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Photocells
- ~~Exit Signs~~
- ~~Package terminal air conditioners & heat pumps~~
  - ~~Room air conditioners~~ Ceiling Fans (ENERGY STAR-Qualified)
- ~~Refrigerators (ENERGY STAR® Qualified)~~
- ~~\_\_\_\_\_~~
  
- ~~Gas measures:~~
  
- ~~High efficiency Dishwasher~~
- LED Pool and Spa lighting
- Vending Machine Controls

**Building Envelope**

- High Performance Dual-Pane Windows
- Attic and/or wall insulation

**Water Heating**

- Electric storage water heaters
- Central system natural gas water heaters
- Natural gas water heater and/or boiler controllers
  - Natural gas storage water heater
- Tankless water heaters

**HVAC**

- Package terminal air conditioners & heat pumps
- Unitary AC Units
- HVAC Quality Maintenance
- Brushless Fan Motor for Central AC
- Evaporative Coolers
- Programmable Thermostats
- Central natural gas furnace

**Appliances**

- Refrigerators (ENERGY STAR® Qualified)
- High-efficiency Clothes Washers
- High-efficiency Dishwasher (does not apply to SoCalGas)
- ~~Central natural gas furnace~~
- Cold Water Clothes Washers

**Pumping**

- Variable Speed Pool Pumps

Formatted: Indent: Hanging: 0.13", Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0.75" + Indent at: 1"

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- [Programmable Thermostats \(Common Areas only\)](#)
- [Demand Control for Centralized Water Heater Recirculation Pump](#)

Measures may be added or removed from the program as technologies evolve and market potential warrants.

**c) List Non-incentive Customer Services**

MFEER schedules training workshops to educate contractors about the benefits of the measures offered by this program and other energy efficiency programs, including the [low-incomeESA](#) program.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Multifamily Energy Efficiency Rebate Program (Resolution E-4385, Appendix A):

**Table 3 – [MFEER PPM](#)**

<b>Multifamily Energy Efficiency Rebate</b>	1. Percentage of non-lighting measure savings as compared to the total EE measures adopted in the MFEER program. (KWh for single-commodity IOU and BTU for mixed-commodity IOU.)	2a
---	--	----

**b) Market Transformation Indicators**

Resolution E-4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

PROGRAM

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**c) Program Design to Overcome Barriers**

Previous MFEER participants often state their intent to continue upgrading their complexes with energy-efficient products. Lowered energy bills and reduced maintenance efforts (e.g., changing out short-lived incandescent lamps) are economical. Below is a list of program barriers:

**Ongoing Concern with Split Incentives**

While some market barriers are the same as for other residential programs such as the HEER (described below), others are unique to the MFEER. For this program, which must deal with both owners/managers of multi-family buildings and with tenants, the split-incentive barrier is high. Any measure or appliance that is installed in the tenant dwelling area will provide benefits to the tenant while costs may go to the owner/manager. This fact implies an uphill effort to get owner/manager participation.

In alignment with California's BBES and EAP policy initiatives, and advanced by the Strategic Plan, the MFEER is in the unique position to overcome the split incentive barrier by serving two distinct beneficiaries of energy savings, the property owner and the tenant.

MFEER design has been overcoming the split incentive barrier since the program's inception in 2002, as had its predecessor; the Residential Contractor Program did since 1999. Program design has been effective to such an extent that the majority of MFEER rebates paid were for products installed in tenant dwelling units.

**The diversity of multifamily building types makes it highly challenging to develop program delivery models, incentives and consistent packages of building upgrade measures that meet the needs of every situation.**

The multifamily sector encompasses a range of building sizes, system types and configurations of dwelling units and nonresidential areas. Because multifamily building types are so diverse, it is highly challenging to develop program delivery models, incentive programs and consistent packages of building upgrade measures that meet the needs of every situation.

In many cases, the property owner or manager's energy efficiency knowledge is limited. As such, deciphering though the variety of offered measures can prove to be challenging, and in some cases even discouraging. Additionally, in a multifamily building's lifecycle, there are specific times when it is most cost effective and convenient for the property owners/managers to make energy and green upgrades. The program needs to focus on these triggers or entry points to engage and educate customers on energy efficiency benefits.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

MFEER has proven success developing an established network of professionals who are experienced in their specific trade and are effective at both marketing program availability to potential clients and installing the specific set of measures.

This network of professionals tailors their services (lighting, HVAC, appliances, etc.) to take advantage of these entry points.

**Difficult to reach due to property owners lack cohesiveness as a group and high turn-over rate of property managers**

Further planning difficulties are generated by the fact that property owners/managers, in large part, are not a cohesive group. This leads to disparities and gaps in industry knowledge and poses a barrier to knowledge sharing. In addition, since on-site property managers tend to be somewhat transient, maintaining consistent contact is difficult.

The multifamily property sector consists of commercial enterprises that provide residential living spaces. In this quasi-commercial role, the property owner straddles the residential and commercial energy efficiency programs' definitions. The MFEER specifically addresses their often overlooked needs.

The desired outcome of MFEER implementation is to realize long-term energy savings through the installation of energy-efficient products in both the common areas and dwelling units of multifamily complexes and the common areas of condominium complexes and mobile home parks. Another objective is the inclusion of rented mobile homes when those park owners/managers are making replacements in common areas.

The creation of energy-efficient complexes provides benefits beyond the direct energy savings to common areas. Through the incorporation of energy efficiency measures by multifamily property owners and managers, the opinions and behaviors of tenants can be influenced. These behaviors can contribute to a self-reinforcing cycle of energy efficiency responsibility throughout a complex as more knowledgeable customers install measures that can reduce the overall energy footprint, with no loss of safety or comfort.

**Issue of Affordability**

Out-of-pocket costs pose a significant participation barrier for the customer. With the exception of some of the larger property management firms, pay-back terms, no matter how favorable, are perceived as an unacceptable risk by the average customer.

**Selected Measures Account for Majority of Program Savings**

Although the MFEER offers a comprehensive list of measures for multifamily dwellings, most of the program results are provided by lighting-related measures. The cause of this is

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

~~under investigation in the 2006-2008 process evaluation report, which is expected to be completed in 2009.~~

### Program Integration to Overcome Barriers

~~Multifamily building owners and managers find it daunting to sort through the various programs, funding and incentive options, and program requirements.~~ To address the trend toward comprehensive solutions and to reduce the potential for lost opportunities, MFEER will integrate opportunities with other energy efficiency programs and services, such as the ~~existing~~ ESA program and ARP, HEES Energy Advisor as well as the MF EUC and income-qualified MIDI programs. ~~While programs will be coordinated and integrated, their respective policies and procedures will be followed in the delivery of services. Operational efficiencies will be employed to streamline the application process and installation of measures.~~ This unprecedented integrated approach combines market-rate and income-qualified energy efficiency measures that will benefit multifamily property owners and tenants; providing the opportunity to educate building owners on the benefits of energy efficiency and conservation efforts spanning the range of needs for the multifamily market.

This collaboration should increase participation levels for each respective program:

- The MFEER will continue to work with the ARP to promote the turn-in of inefficient (but functional) property owner-owned refrigerators. To generate interest and gain higher participation levels through joint marketing efforts, MFEER will also consider opportunities to cooperate with other energy efficiency programs or services.
- MFEER will promote the ~~LIEE program~~ ESA program and the California Alternate Rates for Energy (CARE) program within the application by making the property owner/manager aware of the available income-qualified services for the tenants. Additional marketing efforts may include reaching tenants through direct-mail to promote services not offered under MFEER, such as the CARE electricity bill discount of 20% or more and the income-qualified refrigerator replacement.
- MFEER will coordinate with the ~~HEES~~ Energy Advisor (“HEA”) program to promote, and potentially develop, a survey specific to the multifamily segment that engages the property owners/managers by helping identify opportunities for saving energy and money by using MFEER and other energy efficiency programs.
- The MF EUC program seeks deeper energy savings through a comprehensive approach. The program targets property owners/managers with scheduled project rehabilitation who are willing to invest in a performance-based whole-building approach. The incentives are designed to influence the implementation of comprehensive measures and therefore are based off of energy reduction

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

achieved. As such, MFEER will guide property owners/managers with comprehensive project potential to the MF EUC program.

**d) Quantitative Program Targets**

The statewide MFEER is striving to meet the following program activity targets. The proposed targets may be modified due to funding restrictions, especially for ~~the 2009 bridge funding~~ the 2013-2014 year.

**Table 5:** Proposed Program Activity Targets

<b>SCE Program Name</b>	<b>Program Target by 2010</b>	<b>Program Target by 2011</b>	<b>Program Target by 2012</b>
<p align="center">Target #1</p> <p>Direct mailing to reach 20,000 multifamily sites</p> <p>Advertising in trade journal (dependent on approved marketing budget)</p> <p>Support outreach events such as trade shows</p>	<p>Complete 20,000 pieces of direct mailing,</p> <p>place monthly trade journal advertising,</p> <p>attend 3 trade shows per year</p>	Same as 2010	Same as 2010
<p align="center">Target #2</p> <p>Require 100% of program participating electrical contractors to meet licensing requirements</p>		Same as 2010	Same as 2010

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

	100% for 2010-2012 program cycle		
Target #3  Deliver program specific communications to participating contractors	2 communications per year	Same as 2010	Same as 2010
Target #4  Continue to solicit participation from mega property management Company	3 per year	Same as 2010	Same as 2010
<b>SDGE Program Name</b>	<b>Program Target by 2010</b>	<b>Program Target by 2011</b>	<b>Program Target by 2012</b>
Target #1  Support outreach events	Participate in community outreach programs min one per quarter	Same as 2010	Same as 2010

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Target #2			
Require 100% of program participating electrical/gas contractors to meet licensing requirements	100% for 2010-2012 program cycle	Same as 2010	Same as 2010
Target #3			
Deliver program specific communications to participating contractors	2 communications per year	Same as 2010	Same as 2010

<u>Program Target</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>Target #1</u> <u>Direct mailing to reach 5,000 multifamily property owners/manager (SoCalGas)</u> <u>Advertising in trade journal (depended on approved marketing budget) (SoCalGas)</u> <u>Support outreach events such as trade shows (SoCalGas)</u>	<u>Complete 5,000 pieces of direct mailing,</u> <u>place monthly trade journal advertising,</u> <u>attend 2 trade shows per year</u>	<u>Same as 2013</u>
<u>Target #2</u>	<u>100% for 2013-2014 program cycle</u>	<u>Same as 2013</u>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<u>Program Target</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>Require 100% of program participating electrical contractors to meet licensing requirements</u>		
<u>Target #3</u> <u>Deliver program specific communications to participating contractors</u>	<u>2 communications per year</u>	<u>Same as 2013</u>
<u>Target #4</u> <u>Continue to solicit participation from mega property management Company</u>	<u>3 per year</u>	<u>Same as 2013</u>

Note: The proposed activities above may be limited by program funding restrictions, especially for 2009

**e) Advancing Strategic Plan Goals and Objectives**

In accordance with the Strategic Plan, this program advances comprehensive energy efficiency measures, including: whole-house solutions, plug-load efficiency, performance standards, leveraging of local government energy partnership opportunities, and DSM integration. As technology progresses, this program will adopt newer measures such as home energy monitoring and displays. Each of these measures works to reduce the energy and carbon footprint of multifamily dwellings and will create additional energy savings and integration opportunities through inter-program referral, data sharing, and bundling of DSM solutions across energy efficiency, DR, CSI, smart meter and other IDSM efforts.

The MFEER will support the following Strategic Plan as described below:

- 2.1.3.2. Home buyers, owners, and renovators will implement a whole-house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment, household appliances, lighting and “plug load” amenities;
- 2.1.3.3. Plug loads will be managed by developing consumer electronics and appliances that use less energy and provide tools to enable customers to understand and manage their demand; and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 2.1.3.4. The residential lighting industry will undergo substantial transformation through the deployment of high-efficiency and high-performance lighting technologies, supported by state and national codes and standards.

The current program design does not specifically address the Energy Division's market transformation goal of having 100% of multifamily households achieve a 40% reduction in energy consumption from 2008 levels by 2020. However, the program is part of the solution to reach the multifamily transformation goal for California. A portion of the 2020 goals could be achieved through codes and standards ratcheting or by other local program's implementations. To become a market transformation program, MFEER will need to make significant changes to program design, program cost effectiveness, and many other economic feasibility issues. Furthermore, the MFEER program will need to be sensitive to the CPUC/CEC market potential studies.

**5. Program Implementation**

**a) Statewide IOU coordination**

The MFEER ~~provides cash rebates~~ offers a variety of incentives for installing qualified energy-efficiency products in existing apartment dwelling units and in the common areas of apartment and condominium complexes, and common areas of mobile home parks. Property owners and managers of existing residential multifamily complexes with two or more dwelling units may qualify.

**Incentive levels**

**Table 6:** The MFEER offers incentives in the following forms:

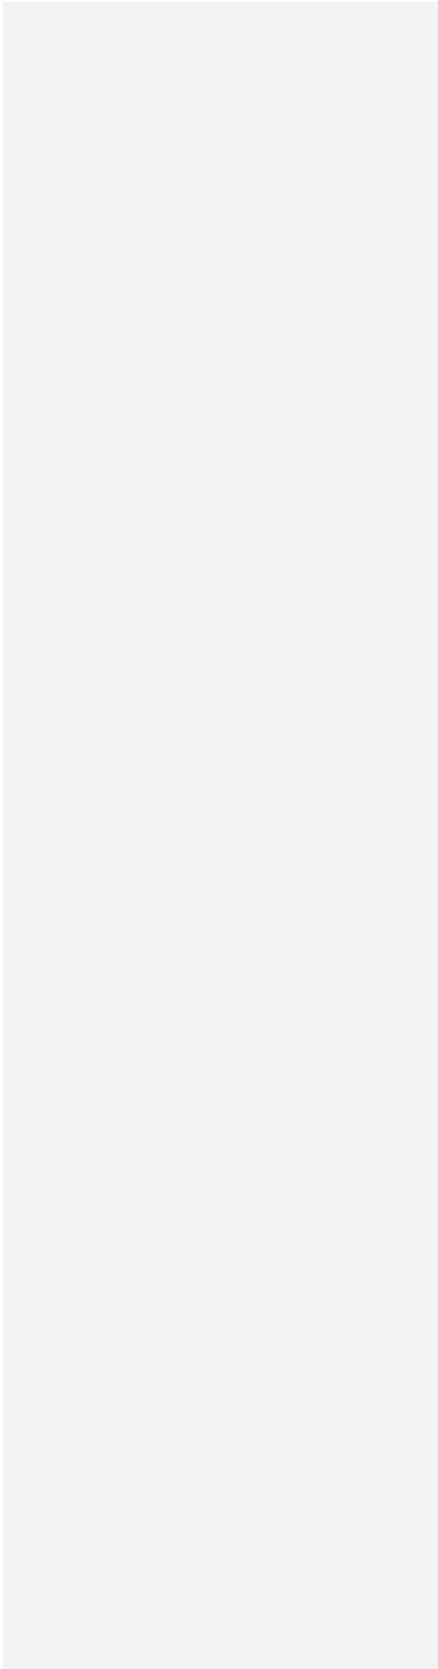

<p>• M E A S U R E</p>	<p>• P G &amp; E</p>	<p>• S € E</p>	<p>• S € G</p>	<p>• S D G &amp; E</p>

- [Prescribed rebates;](#)
- [Mid-stream incentives through retailers, distributors, and/or contractors; and](#)
- [Direct Installation of energy efficiency products](#)

**i. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

The MFEER statewide marketing plans include print collateral material, direct mail campaigns, print media advertisements, trade show exhibitions and presentations [to related target market organizations](#), and leveraging with other IOU energy efficiency efforts and programs where feasible (see targets above, Table 5). [The utilities may use a range of tactics such as; e-mails, flyers, on-Line marketing, direct mail, bill messaging, social media, local events, ethnic media, and other channels that suit the target audience, the message, and the resources. MFEER will also coordinate outreach activity with the ESA program, WHUP, PLA, and HVAC programs to maximize customer engagement and opportunities.](#)

**ii. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

The MFEER program will coordinate with CEC, ARB, AQMD, and other local agencies and municipalities to implement environmental programs in support of California’s long term Strategic Plan and CPUC initiatives.

**iii. Similar IOU and POU programs**

The MFEER is a statewide program. Programs outside of California are implementing similar program designs (e.g., Austin Energy).

**b) Program delivery and coordination**

To motivate multifamily property owners/managers to install energy-efficient products in the common areas and dwelling units of multifamily complexes and common areas of mobile home parks and condominiums, the MFEER Program offers prescribed

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

rebates for energy efficient products. An additional objective is to increase the energy efficiency awareness and knowledge of property owners/managers and tenants.

The program leverages an extensive network of contractors to reach property owners and property managers. In addition to these contractors, the program also makes direct outreach to ~~mega-larger~~ property ~~management~~ companies ~~such as the Irvine Company~~. This network of contractors helps identify prospective properties and contact people. The contractors also help property managers develop lists of improvements that are eligible for utility incentives. When ready, the contractors install the measures then often will assist the property owners/managers complete the incentive application paperwork.

For marketing and outreach activities, the MFEER not only reaches out to the end users, but will also make special outreach and training sessions available to the ~~MFEER affiliated~~ specific trade contractors ~~on a regular basis~~.

### **i. Emerging Technologies (ET) Program**

The program collaborates with the Emerging Technologies Program in assessing energy efficiency technologies that are new and/or underutilized in the residential/multifamily market.

### **ii. Codes & Standards Program**

The MFEER works with the codes and standards group to ensure that all the measures offered by the program are updated timely.

### **iii. WE&T efforts**

The implementation of various training and coverage may differ for each IOU. For SCE, the energy centers traditionally did not offer classes specifically designed for the MFEER contractors and property owners. The MFEER will work with the energy centers to develop new and modify existing education and training classes for contractors and property owners, to assist in advancing the objectives of the Strategic Plan.

### **iv. Program-specific marketing and outreach efforts**

The MFEER marketing plans consist of print collateral material, direct mail campaigns, print advertisement, trade show exhibitions and presentations, ~~statewide advertising to related target market organizations~~, and leveraging other IOU energy efficiency efforts and programs where feasible. Additionally, program-specific marketing and outreach activities are necessary to drive participation and attain program goals.

~~i.~~

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

v. **Non-energy activities of program**

Training of contractors and outreach to [mega-large](#) property owners are part of the program's non-energy activities.

vi. **Non-IOU programs**

The program allows cross promotion of other applicable programs, such as those of water agencies that offer rebates for clothes washers and dishwashers. Program staff will work with other utilities and groups, as appropriate, to increase program participation and savings levels.

vii. **CEC work on [PIEREPIC](#)**

The MFEER will work with the residential program team to track the latest developments from CEC and [PIEREPIC](#).

viii. **CEC work on C&S**

MFEER is very sensitive to the codes and standards that the IOUs and CEC are working on. The program will monitor these activities and incorporate any standards ratcheting as appropriate.

ix. **Non-utility market initiatives**

Along with the HEER program, MFEER supports all ENERGY STAR<sup>®</sup> activities. In addition, MFEER also participates in activities with the local and national housing authorities.

c) **Best Practices**

Given the difficulty of reaching potential customers, the MFEER is designed to leverage the knowledge and contacts of its network of contractors. Given the limited marketing budget, this targeted outreach method has yielded fruitful results for the program. It also consistently helped the program in overcoming the split-incentive barrier within this segment.

This program also drives permanent change in California and achieves market transformation through the installation of ENERGY STAR<sup>®</sup> [interior and exterior hardwired fixtures](#)[qualified products](#), thereby reducing tenants' energy usage in apartments and also reducing property owners' energy usage in common areas.

d) **Innovation**

A key program innovation is the customer referral process, which was developed to assist property owners who own apartment buildings served by different IOUs. In this process, a property owner who is working with an IOU and owns properties served by other IOUs is automatically referred to the appropriate program managers at those IOUs. Confusion

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

and barriers that can result when working with multiple entities is reduced since the IOUs operate identical rebate programs and use similar rebate applications.

As one of the few programs in the nation that specifically address this hard-to-serve market segment, this unique and innovative program has developed a model approach for other utilities to emulate. In addition, the program represents an innovative partnership among California utilities, demonstrating the great potential of a statewide energy efficiency program and creating processes, upon which other partnerships can build.

This program is especially innovative since multifamily property owners/managers and tenants have traditionally been unable to receive energy efficiency rebates. Some tenants qualified for the low-income programs, and before 2002, under the RCP program, a few multifamily properties received installation of CFLs, water heater controllers, and duct test and sealing. The development and implementation of the statewide MFEER has increased the participation of not only property owners/managers (for the common area energy efficient measures), but also of tenants who use approximately 80% of the energy in multifamily buildings. Traditionally, this has been an untapped market. Each year that rebate funding has been available, energy savings have increased exponentially.

e) **Integrated/coordinated Demand Side Management (ISDM)**

To identify successful integration approaches and offerings, potential pilot programs and metrics, the IOUs will coordinate program efforts with the local utility integration teams and the Statewide Integration Task Force.

The MFEER [program](#) will work with ISDM initiatives to identify the best possible collaboration. The potential offer could include smart metering, load management and other services, as appropriate. The details of this collaboration will be better defined in the ~~2010-2012~~[2013-2014](#) program cycle.

f) **Integration Across Resource Types (energy, water, air quality, etc)**

The program allows for cross-promotion of other available programs, such as water companies that offer rebates for clothes washers and dishwashers. SCE agrees to investigate and implement a similar market program to make multiple resource offerings in MFEER consistent statewide.

~~SCE and SoCalGas will [identify areas of opportunity to](#) collaborate to create a pilot program specifically for the [Multifamily-multifamily](#) market segment. [The pilot will be created by adding a multifamily component to the current \(joint\) HEES Program. The audits will address water, gas, and electric savings for multifamily buildings. SCE and SCG will share the results of the multifamily HEES pilot. If successful, the MFEER will adopt this implementation as part of the statewide initiative.](#)~~

g) **Pilots**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

~~A multifamily component will be added to the HEES program. SCE and SCG will create a pilot program that emulates the current energy audit program for single family residents. In order to accomplish this, SCE and SCG will work with a third party to create the multifamily audit tool. IOUS plan to offer the pilot program at various venues such as the Apartment Owners Association meetings, tradeshow, and seminars. This approach should be met favorably as owners typically want to save as much money as possible. By using the audit to perform a comprehensive energy analysis, the MFEER core measures will be recommended when appropriate. We will incorporate recommendations for water savings and refer customers to their local water districts when appropriate.~~

MF Audit Tool - Pilot to target other mixed use property types such as: SF HOA common areas, Senior Living facilities and SROs (i.e. dorms), would like to consider including common areas of HOA for single-family home communities, and Single-room occupancy (SRO) facilities, such as dormitories and assisted living facilities; these are not segments currently targeted by other efforts.

SoCalGas– MF Audit Tool: SoCalGas will offer in coordination with the Energy Advisor Program a multi-family survey as a pilot program in 2012. This involves surveys targeted at the facility owners of apartment buildings that will focus closely and specifically on overall property efficiency. SCG will expand the survey in 2013-2014 to mixed use property types such as SF HOA common areas of condominiums and motor home parks in order to assist those hard-to-reach segments in reaching greater energy savings potential.

**h) EM&V**

The utilities plan to work with each other and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the PIPs.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided below:

- Work with Energy Division to resolve market baseline and transformation issues;
- Update and repeat CLASS and RASS/RMST Appliance Tracking & Saturation studies, as appropriate;
- Conduct statewide process evaluation to assess the following:
  - i. Track the all proposed key metrics;
  - Conduct SCE specific process evaluation to improve program design, implementation and market effectiveness; and

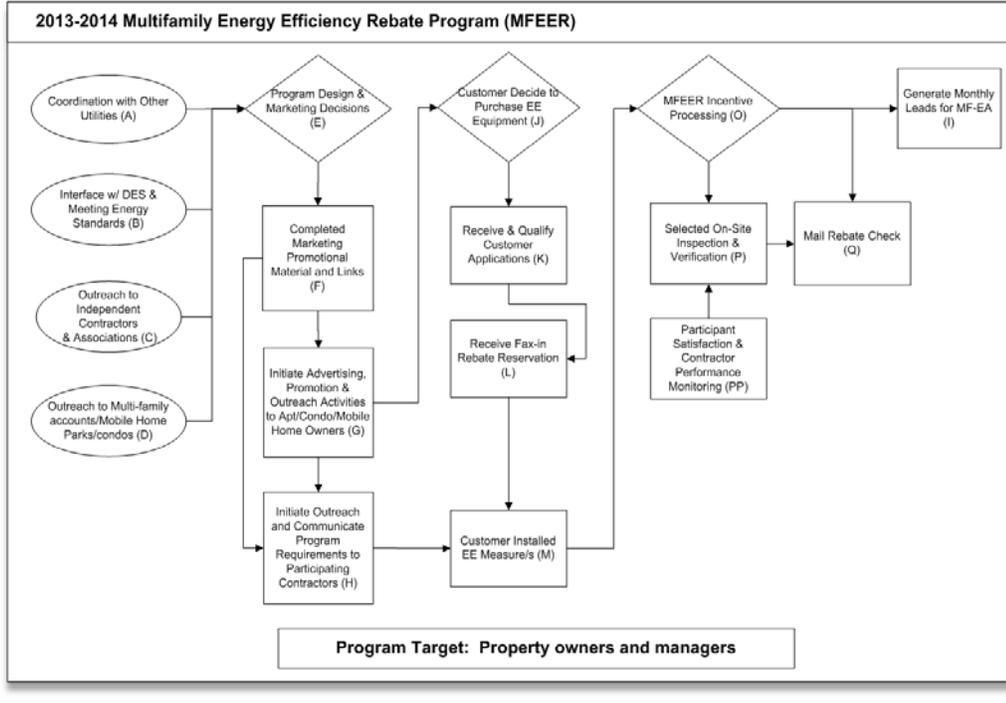

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Design an M&E study to monitor the pilot program mentioned above, especially to examine the conversion rate from multifamily [HEESEA](#) to MFEER program participation and assess the level of participation relative to the scope of [HEESEA](#) recommendations.

As indicated by the Itron Final Report: Scenario Analysis to Support Updates to the CPUC Savings Goals, 3/2007, the residential sector (single family and multifamily) will be expected to deliver a significant portion of California's energy savings in nearly all scenarios. The statewide MFEER program delivers a portion of the required savings and is part of the total energy efficiency strategy.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**8) Sub-Program Description, Objectives and Theory**

**a) Sub-Program Description and Theory:**

According to a report released by the Office of the Vice President, “homes in the United States generate more than 20 percent of our nation’s carbon dioxide emissions, making them a significant contributor to global climate change.”<sup>33</sup> The challenge of addressing residential emissions has been a significant topic for California stakeholders and was addressed when D.09-09-047 acknowledged, “Improving the energy efficiency of all households is necessary to achieve the target outcome for the 2020 existing residential *Strategic Plan* goals.”<sup>34</sup>

The Office of the Vice President report also identifies three market barriers to comprehensive residential retrofits:

- 1) Lack of customer and contractor awareness and access to information;
- 2) Lack of access to financing; and
- 3) Lack of access to skilled workers.

A shift in market perception, both for contractors and customers, towards a whole house approach must take place to drive customer action. WHUP is designed to offer a one-stop approach to whole-house energy efficient improvements that recognize the need for customers to participate over varied timelines. To assist in the effort to overcome these problems and market barriers, WHUP for single family residences will:

- 1) Offer a statewide entry level pre-set measures based approach (*Basic Path*) and a comprehensive and flexible performance based approach (*Advanced Path*) whole house incentives to help build the home performance contracting industry and offer customers and building owners and managers an easy entry point on the path to home performance (barrier 1);
- 2) Educate customers on the house-as-a-system concept and to encourage behavior changes that increase residential energy efficiency (barrier 1);
- 3) Educate contractors on the benefits of learning how to properly sell and install whole house measures as part of coordinated WE&T efforts (barrier 1 & 3);
- 4) Offer incentives that influence customers to undertake comprehensive residential retrofits (barrier 1); and
- 5) Coordinate with relevant utility financing programs and external funding and financing mechanisms at the county, state and federal levels (barrier 2).

In addition, energy efficiency efforts for the multifamily (MF) segment must overcome a number of barriers, primarily:

- 1) Lack of knowledge regarding energy efficiency, as well as the comprehensive energy efficiency EE programs offered by IOUs;

<sup>33</sup> Middle Class Task Force. Council on Environmental Quality. “*Recovery Through Retrofit*.” October, 2009. Page 1.

<sup>34</sup> D. 09-09-047. Page 110.

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

- 2) The economics of “split-incentives” where the building owner invests capital but the savings primarily benefit the tenants;
- 3) Access to investment capital and insufficient return on investment (ROI). Up-front out-of-pocket costs and extended payback periods required pose a significant participation barrier for property owners and managers;
- 4) Hassle of dealing with multiple contractors and visits required;
- 5) Time burden for tenants and owners;
- 6) Impact on rental income; and
- 7) Business policy/ profit incentive from replacing equipment on burn-out and unwillingness to negate remaining life in building components requiring capital outlay.

The *Multifamily Path* is envisioned to include a number of tactics to overcome these barriers, primarily:

- 1) To improve a property owner or manager’s energy efficiency knowledge, the *Multifamily Path* would seek to leverage comprehensive investment grade building assessments to identify potential energy efficiency opportunities. (barrier 1).
- 2) To address split incentives and cost of upgrades, the *Multifamily Path* would integrate with the existing Energy Savings Assistance Program (“ESAP”) and the Multifamily Energy Efficiency Rebate (“MFEER”) Program. This would provide comprehensive services to the building, including “low cost” or “no cost” tenant measures in conjunction with the WHUP *Multifamily Path* whole building incentives in order to maximize energy savings for the up-front investment. (barrier 2).
- 3) Incentives would assist property owners or managers with overcoming a wide array of market and financial barriers which may otherwise prevent energy efficiency upgrades (barrier 1 and 5).
- 4) Create a single point of contact that would assist the property owner or manager navigate through the incentive and retrofitting process. This approach would provide support in understanding the various program rules and assistance in determining eligibility. The property owner or manager would be guided through an easy and streamlined preliminary assessment to establish feasibility and estimate project cost for the *Multifamily Path*, with an eye toward leveraging all eligible programs. (barrier 4).
- 5) Target buildings planning on or undergoing renovation projects to limit customer time burden and lost rental income. (barrier 4 and 5).
- 6) Multifamily sector is comprised of a wide diversity of properties which can be segmented by: 1.) rental rate (low – medium – or high; and/or 2.) size of the building and also size of the company that owns or manages the building. Defining the unique concerns and needs of building owners and managers by these variables of tenant socio-economic status and ownership/management

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

structure will allow much more effective messaging and marketing communications. (barrier 1, 2, 3, 4, 7)

- 7) Statewide EE energy efficiency financing (SW Fin) which could be focused on the tenant or the common property energy agendas. This program will provide access to capital to fund investments in energy efficiency upgrades for buildings at an attractive interest rate. (barrier 2, 3, 7).

Other considerations to meet all income strata and address split incentives for property owners and tenants may include a direct install strategy, as well as prescriptive rebates through the existing MFEER Program. While programs will be coordinated and integrated, their respective policies, and procedures will be followed in the delivery of services. Efforts at operational efficiencies would be made to streamline eligibility, income verification, and installation of measures.

Despite the noted barriers, the multifamily sector presents a significant opportunity for whole building energy efficiency programs with a deep energy reduction approach. A whole building offering has the potential to achieve deep energy savings because:

- 1) Building owners can leverage incentives to address common areas and systems as well as individual unit upgrades to make more cost effective improvements.
- 2) Major rehabilitation projects are common in the multifamily sector. It is theoretically more cost effective to include energy efficiency upgrades at the time of these renovation projects. These projects typically have well-financed construction budgets and broad scopes that could include energy efficiency measures.
- 3) Multifamily properties tend to be operated and maintained by professional building staff. Providing resources to building staff would theoretically increase the odds that the building will be operated efficiently after energy upgrades are installed, perpetuating savings benefits.
- 4) Within the tenant units, the energy efficiency upgrades will often be duplicated – allowing for efficiency in bulk purchases of supplies and equipment, as well as hiring of specialized workers with less non-productive set-up/break-down and travel time.

The WHUP is a Market Transformation orientated program and is a continuing program which began in the 2010-2012 residential energy efficiency portfolio of the four California Investor Owned Utilities (IOUs) – Pacific Gas & Electric Company (PG&E), Southern California Edison (SCE), San Diego Gas & Electric Company (SDG&E) and Southern California Gas Company (SoCalGas).

As a recognized market transformation program only halfway through its second full year of statewide rollout, the WHUP is expected to be a major contributor to achieving the goals of the California Long Term Energy Efficiency Strategic Plan (*Strategic Plan*) as it relates to existing residential homes, and it faces significant

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

hurdles in customer and contractor awareness, industry and workforce development, and traditional cost effective metrics towards measuring effectiveness and success.

This Program Implementation Plan (PIP) is for the statewide WHUP that will be offered consistently across the IOU service territories. The PIP is intended to align with the goals established in the *Strategic Plan* and is a culmination of ongoing statewide efforts to design WHUP.

WHUP is designed to build customer and contractor<sup>35</sup> awareness of the house-as-a-system approach to residential retrofits and the many corresponding benefits of improving the energy savings potential and comfort of their dwelling. It promotes the idea that energy efficiency measures are most effective when taking into account interactive effects of measures.

The WHUP moves customers from a prescriptive, widget or single-measure based approach to energy efficiency to one of deeper, comprehensive energy retrofits that respect the energy efficiency loading order<sup>36</sup>, and which takes the approach that a house is a series of interdependent systems that must be considered holistically. In addition, this approach optimizes building shell (thermal boundary) provides increased comfort and indoor air quality while enabling smaller and more affordable space conditioning equipment and reduced energy use associated with space heating and cooling. The thermal boundary consists of two layers or components – air barrier and insulation – which should both be continuous as well as contiguous (in contact with each other) for optimum performance. Because of the interaction between the thermal boundary and space conditioning loads, heating or cooling system upgrades are ideally not to be performed until the building shell is optimized. Building shell and duct air sealing will be addressed in conjunction with combustion appliance safety and indoor air quality tests. Base load reduction measures involving major electrical appliances, lighting, plug loads, and demand response can be performed at any time without compromising the loading order.

Customer outreach and education efforts for the WHUP will be coordinated with other IOU Demand Side Management (DSM) program offerings (e.g. Energy Advisor, Plug Load and Appliance (PLA), Comprehensive HVAC, SmartAC and other Residential Demand Response programs, Energy Savings Assistance [program](#), California Solar Initiative (CSI)) to leverage multiple customer touch points.

---

<sup>35</sup> A successful program recognizes the need to develop the pool of qualified home retrofit contractors (with the help of third party implementers) to engage in – and have the opportunity to profit from – performing quality work. Through comprehensive training curricula (currently available in the marketplace) broken into the key elements of a home: Building Envelope and Lighting, and Heating, Cooling and Hot Water delivery (major systems); skilled tradespersons will have the opportunity to enter the home retrofit market and grow their businesses.

<sup>36</sup> The loading order specifies improvements in the following sequence: (1) air sealing to obtain a tight building envelope; (2) insulation to complete the thermal boundary; (3) proper sizing, design, installation and commissioning of space heating and cooling systems; (4) proper sizing, design, installation, commissioning and insulation of the hot water system, including distribution; (5) efficient lighting and appliances, and demand response measures; and (6) renewables.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

For single family residences, the whole house approach of WHUP promotes two paths, a prescriptive based *Basic Path* and a comprehensive, measured *Advanced Path*. These complimentary paths will be presented to customers<sup>37</sup> as one comprehensive offering.

For multifamily buildings, building owners and managers will be able to participate in the WHUP *Multifamily Path*. WHUP will offer a consistent program model that can be contractor or rater driven and/or adopted by local governments for roll-out in their communities.

In sum, these paths will provide an ideal platform to utilize the concept of continuous energy improvement for residential customers; tracking and encouraging a logical sequence of energy improvements made by customers over time, creating an ongoing, actionable dialogue with each customer regarding their energy use.

### **WHUP *Advanced Path***

WHUP *Advanced Path* offers customers a customized path to comprehensive whole house energy efficiency that drives the customer to deep retrofits. *Advanced Path* solutions will require Participating Contractors to obtain higher levels of expertise than those who perform the *Basic Path* installations. Customers can also participate in *Advanced Path* by using a Participating Rater. The *Advanced Path* requires diagnostic “test-in” and “test-out” whole house assessments. The “test-in” assessments will generate a comprehensive work scope and the “test-out” assessments will be used to document that specified improvements have been properly sized and installed. The *Advanced Path* will build off of the pre-set measures of the *Basic Path* and:

The *Advanced Path* delivers comprehensive energy efficiency improvement packages tailored for both the home resale and home remodeling markets. The *Advanced Path* solicits, screens, and trains qualified residential repair and renovation contractors and HERS II Raters, to assemble capable contracting teams and perform whole-house diagnostics, propose a comprehensive energy efficiency improvement package, and install the improvements. The program also includes marketing activities to help educate customers on program services, and in some cases may provide additional customer leads to trained and experienced contractors. Incentives and resources for available financing options will be provided to help offset the initial homeowners cost for the energy efficiency improvements.

### **WHUP *Basic Path***

During the 2013-2014 transition cycle, the IOUs will convene interested stakeholders at the state and/or regional level to propose one or more statewide and/or regional pilot programs to explore potential changes to the *Basic Path* in order to make it more appealing to customers, particularly moderate income households.

---

<sup>37</sup> Residential customers including homeowners, renters, and multifamily properties when these services are available to them.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

WHUP *Basic Path* will offer customers and contractors an easy entry point on the path to home performance with a defined package of measures. Incentives will be available for customers to offset a portion of the cost of specific comprehensive retrofits. The *Basic Path* will allow customers to reduce their energy usage while increasing the energy performance of their existing homes and minimizing lost opportunities for future comprehensive retrofit options.

The *Basic Path* will also educate contractors and customers on the benefits of implementing comprehensive whole house retrofits on existing buildings that will provide systematic reductions in energy use. The *Basic Path* will help to:

- Utilize no-cost (to customer) surveys (Energy Advisor) as an entry point to identify opportunities for efficiency improvements<sup>38</sup>;
- Offer targeted marketing campaigns to engage participants that receive stand-alone EE rebates for completing qualified home improvement measures;
- Promote completion of retrofits based on preferred building science loading order;
- Offer incentives to encourage progression along a preferred approach towards comprehensive retrofits;
- Continuously engage customers over time as they progress toward a home performance approach;
- Leverage available opportunities to move customers to the *Advanced Path* by informing them about available local or third-party financing options and other complementary revitalization efforts that may be available within a particular jurisdiction;
- Offer a holistic path towards home performance by aggregating key elements of a dwelling into its core elements: building envelope and fixed lighting; heating, cooling and hot water, and appliances;
- Coordinate with communities, local governments, workforce education & training, industry organizations and allied third-parties for outreach on local retrofit and contractor training opportunities available.

---

<sup>38</sup> The Energy Advisor provides residential customers with entry-level energy surveys online, over the phone, or by mail. The surveys are not intended to serve as an audit but are meant to provide consistent messaging and an easy on-ramp to WHUP. The Energy Advisor surveys are also an ideal link between the California Solar Initiative (CSI) and EUC WHRP. This synergy will be discussed later in the document.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

The WHUP *Basic Path* offers a comprehensive approach to delivering prescriptive pre-set retrofit solutions to Californians by recognizing the essential interplay and relationships between groups necessary in the delivery of a successful program.

### **SoCalGas Gas Only Whole House Retrofit Program 2013-2014**

SoCalGas will continue implementing a “gas only” Whole House Retrofit program that will service those customers that are in a municipal electric service provider territory. This enables SoCalGas to reach out to approximately 1.7 million customers who are not eligible for the joint SCE/SoCalGas Energy Upgrade California Whole House program. Due to our single fuel utility effort, we can only substantiate the therm savings for our program hence the difference in the incentive amounts from the other IOU incentives. SoCalGas will look for additional partnership opportunities with municipalities’ EE programs to maximum savings to shared customers.

SoCalGas will also continue its efforts to implement a joint program with SDG&E that would result in a shared application and single streamlined process for our contractors and the customers. Additionally, besides QA/QC shared costs, SoCalGas will look for other synergies between our programs in our joint PG&E/SoCalGas service territories (i.e.: one shared application, processing).

### ***WHUP Multifamily Path***

The vision of a WHUP *Multifamily Path* is to deliver comprehensive energy efficiency upgrades tailored to the needs of existing multifamily dwellings and their owners, tenants and management companies

The *Multifamily Path* will is envisioned to specifically target the multifamily housing (MF) retrofit market and would promote long-term energy benefits through comprehensive whole building energy efficiency retrofit measures—including building shell upgrades, high-efficiency HVAC units, central heating and cooling systems, central domestic hot water heating and other deep energy reduction opportunities. These energy efficiency measures would be identified through an investment grade assessment.

This performance-based approach would assist property owners and managers with making informed decisions, identify measures for energy savings, and to maximize energy reductions for each property owner, manager, and tenant, as applicable. The *Multifamily Path* is envisioned as a logical next step to the prescriptive based MFEER and would be coordinated with the ESA Program and MFEER to present a singular and streamlined approach for multifamily tenants, property owners and property managers, in accordance with the Strategic Plan. A key feature of the *Multifamily Path* would be a single point of contact to assist multifamily raters and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

customers and to streamline their experience. The single point of contact will recruit and assist multifamily owners and property managers to evaluate specific property and advise the program that best suits the needs of particular buildings.

This integrated approach combines market-rate and income-qualified energy efficiency measures and educates building owners on the benefits of energy efficiency and conservation efforts spanning the range of needs for the multifamily market. The *Multifamily Path* will leverage and integrate the MFEER resource components and ESA program offerings in a singular customer facing program that presents a simplified view from the customer perspective.

The *Multifamily Path* would guide ~~MF~~-multifamily customers towards deeper, comprehensive energy efficiency measures, including: whole house solutions, plug load efficiency, visual monitoring and displays, performance standards, local government opportunities, and IDSM integration. The *Multifamily Path* will support the strategies, where possible, in the Low Income Proposed Decision.

**b) Sub-Program Energy and Demand Objectives-**

**Table 6.** Projected Sub-Program Net Energy and Demand Impacts, by Calendar Year

*[Table-6 to be provided as an Excel Attachment to this PIP]*

**c) Program Non-Energy Objectives:**

**Table-16:** Non-Energy Objective

*[Table-16 to be provided as an Excel Attachment to this PIP]*

**d) Cost Effectiveness/Market Need:**

The California IOUs look forward to continue playing a leading role, in collaboration with local governments, in moving the existing residential homes market towards larger reductions in energy usage and towards the *Strategic Plan* goal of achieving 40% purchased energy reductions in all existing homes by 2020.

At this time, current market conditions and barriers are:

1. Relatively high cost of home assessments.
2. Relatively high gross costs of comprehensive energy upgrades.
3. Market unawareness of non-economic value to comprehensive energy upgrades.
4. Fledgling contracting and supporting industry for existing home energy upgrades.
5. Low consumer awareness of incentive programs and the concepts of comprehensive home energy assessments and upgrades.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Lack of common home rating protocols and common vernacular for the market to assign value to homes which undergo comprehensive energy upgrades.

**The WHUP seeks to address these barriers through:**

- Continued marketing of Energy Upgrade California and whole house concepts. (barrier 3, 5).
- Continued contractor recruitment (at a pace aligned with demand), training and mentoring. (barrier 4, 5).
- Continued customer uptake through WHUP incentives. (barrier 1, 2, 5).
- Continued stakeholder outreach to address barriers. (barrier 1, 3, 4, 5,6).
- Continued partnerships with local and state government to address barriers. (barrier 1, 2, 3, 4, 5, 6).

It will be critical to establish market transformation (MT) metrics and milestones that are in alignment with cost effective metrics that can more accurately assign cost effectiveness of resources expended towards MT goals. As the Value Proposition figure below represents, there currently is significant non-economic value being assigned by the marketplace towards whole house projects but which are not accounted for in cost effectiveness metrics currently used.

*Non-economic value can be assigned as:*

**Gross Cost – (annual savings x EUL) – (assigned increased market value of home)**

By this definition, and information regarding gross costs and savings to date, it would appear that the market currently is assigning significant non-economic value to WHUP projects. However, current cost effective metrics assign all value towards economic value related to energy savings only. Failure to align MT goals and cost effective metrics will result in inaccurate measurement of resource impacts on MT goals.

The IOUs during the 2013-2014 cycle recommend the Commission remove the WHUP from the EE portfolio cost effective analysis and to work with commission staff and relevant stakeholders to develop meaningful cost effective metrics during the 2013-2014 cycle that aligns MT goals of WHUP towards the *Strategic Plan*.

**VALUE PROPOSITION**

(Greater the Value Proposition = Faster Market Transformation and Consumer Uptake)

	Consumer Value	Consumer Costs
<b>Economic Value</b>	<ul style="list-style-type: none"> <li>Monthly utility bill savings (kWh, kW, therm)</li> <li>Recognized Market Value of EE home</li> </ul>	<ul style="list-style-type: none"> <li>Gross Project Costs</li> </ul>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Non-Economic Value</b>	<ul style="list-style-type: none"> <li>• Health &amp; Comfort</li> <li>• Altruistic               <ul style="list-style-type: none"> <li>• Environment</li> <li>• National Security</li> <li>• Being part of Green Movement</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• <i>Offsets:</i> <ul style="list-style-type: none"> <li>IOU Incentives</li> <li>Financing</li> </ul> </li> </ul>
	<b>Driving Up Value</b>	<b>Driving Down Costs</b>
	<ul style="list-style-type: none"> <li>• Standard Ratings where the Market can assign value</li> <li>• Higher monthly utility bills</li> </ul>	<ul style="list-style-type: none"> <li>• More Qualified Providers</li> <li>• Higher Demand</li> <li>• Streamlined Processes</li> <li>• Innovative Marketplace</li> </ul>

e) **Measure Savings/ Work Papers:**

- a. WHUP *Basic Path* utilizes deemed savings values by climate zone for building vintages pre-1979 and by climate zone post- 1979

WHUP *Advanced Path* utilizes CEC approved software (i.e. Energy Pro Res Module at the time of this PIP) for calculated project savings.

WHUP *Multifamily Path* envisions measured savings for all low-rise multi-family buildings utilizing the Energy Pro, Residential Performance Module (for Site savings calculations). For all high-rise buildings, would utilize the Non Res Module.

- b. Indicate work paper status for program measures:

**Table 4 – Work paper Status**

*[Table 4 Work paper Status to be provided as an Excel Attachment to this PIP]*

**9) Program Implementation Details**

In addition to traditional marketing efforts, the IOUs will work through service providers and vendors to engage qualified tradespersons in the crafts that they have chosen and will continue to invite input from stakeholders to further develop additional ways to meet program objectives.

One of the avenues that the IOUs plan to pursue to advance the program’s efforts to achieve deeper energy savings retrofits in homes is to build closer partnerships with

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

California's real estate industry, including via such activities such as voluntary training and outreach partnerships. Based on input already gathered from relevant stakeholder groups, experts, and Commission Staff, the IOUs plan to implement the following main areas of activities for this initiative to leverage partnerships with the real estate industry:

- 1) Training for all relevant aspects of the real estate industry and point of sale chain (real estate agents, lenders, inspectors, green/efficiency specialists, appraisers, rater's public agencies and contractors). An emphasis will be placed on training the cross-functional teams that already work together in the market, since all pieces of the process needs to be covered to be effective, especially on the financing side. The use of successful case studies will also be explored.
- 2) Driving customer demand for energy efficient homes via collaborative consumer education and outreach, using easy to understand messaging and including efforts such as the promotion of home energy improvements and "green" labeling around the time of purchase and sale of a home. This is a critical timing in the market that can be leveraged. The Joint Center for Housing Studies estimates that home buyers spend more than \$6,000 per year on home improvements in the first two years after buying homes. In subsequent years, the annual average outlay drops to \$2,500.<sup>39</sup>

A key to success for this initiative is properly aligning design with the personal and business interests of the stakeholders involved particularly the Realtors, home buyers, and sellers. While promotion of energy efficiency and green building practices is the paramount objective, the initiative would remain consistent with stakeholders' interests. By remaining stakeholder focused, the initiative aligns short-term private interests with long-term public interests.

Further details and continuous improvement of this plan will be developed by inviting additional input from an ongoing set of stakeholder collaboration discussions. Identification of appropriate regional differences and their implications to implementation will be incorporated into the plan. And short- and long-term success criteria and a periodic assessment timeline for evaluation of this initiative will be developed.

Also, during the transition cycle the IOUs will explore potential of offering pilot tests of expanding building science certifications and home evaluation and performance improvement processes beyond BPI to potentially include equivalent certifications, and home evaluation and performance improvement processes such as those through ACCA. To increase the number of qualified participating contractors and contribute to the creation of a sustainable workforce, third party program implementers will solicit and

---

<sup>39</sup> Joint Center for Housing Studies of Harvard University (2011), *The State of the Nation's Housing: 2011*, [http://www.jchs.harvard.edu/research/state\\_nations\\_housing](http://www.jchs.harvard.edu/research/state_nations_housing)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

screen qualified contractors. The program will also include marketing activities to help educate customers on program services and other activities to provide additional customer leads to trained contractors.

The program will employ a number of integrated delivery strategies:

- 1) Educate contractors and residential customers on the concept of home performance;
- 2) Coordinate with existing residential program offerings (e.g. ESA, HVAC, HEER, Energy Advisor and MFEER) within the utility portfolios;
- 3) Provide robust quality assurance and quality control protocols that encourage quality installation and drive contractors to obtain additional training and qualifications;
- 4) Provide robust EM&V feedback loops to inform program enhancements;
- 5) Integrate with marketing efforts of the broadened statewide “Energy Upgrade California” brand, when launched, and deliver complementary marketing messaging to drive customer demand and contractor participation;
- 6) Coordinate contractor training, marketing and outreach efforts with local governments, as appropriate; and
- 7) Develop an incentive structure that drives customers to undertake comprehensive residential retrofits.

**Statewide Steering Committee**

Given the ambitious market transformation goals of WHUP, it’s relatively new entrance into the IOU EE portfolio, and its challenges during the first two years of rollout, the IOUs during the 2013-2014 transition cycle are committed to providing the leadership and working with CPUC, CEC, local government staff, as well as relevant stakeholders to convene a statewide WHUP steering committee to address relevant and significant issues for adoption in the 2015 IOU program cycle.

Where feasible, necessary and relevant, the IOUs will retain the services of qualified consultants or other entities with experience in the whole house retrofit industry to assist in these efforts in the areas of research, facilitation, or other assistance as may be required. IOUs will also engage utilities, non-profits and other stakeholders who may have experience in other parts of the country in deploying whole house programs. The steering committee will as necessary to focus on the following issues on a statewide level for consideration in the 2015 program cycle:

1. Role of local governments
2. Software standards
3. Data collection standards
4. Home Assessment standards
5. Home Assessment reporting standards
6. HERS II Ratings and alignment with WHUP EE Programs

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

7. Contractor certification standards
8. QA/QC standards
9. Streamlined project reporting and programmatic best practices
10. Integration of HVAC programs
11. Engagement of California Real Estate Market
12. Future of Basic Path
13. Identification of Market Transformation Milestones and Metrics
14. Cost effectiveness metrics aligned with Market Transformation goals.
15. Long term incentive structure

a) **Timelines:**

**Table 5:** Sub-Program Milestones

*[Table 5 to be provided as an Excel Attachment to this PIP]*

b) **Geographic Scope:**

**Table 6:** Geographic Regions Where the Program Will Operate

*[Table 6 Geographic Regions to be provided as an Excel Attachment to this PIP]*

c) **Program Administration**

**Table 7:** Program Administration of Program Components

*[Table 7 to be provided as an Excel Attachment to this PIP]*

d) **Program Eligibility Requirements:**

**i. Customers:**

Single family or multi-family building customers with an active IOU account OR owners or property management firms who own or operate single family or multifamily buildings that are served by an active IOU account, may participate in WHUP provided they utilize a Participating Contractor or a Participating Rater per program guidelines.

Participating Contractors or Participating Raters shall be the single point of contact for customers and are responsible for submission of all program requirements. Participating Contractors and Participating Raters will install or ensure installation of all measures in accordance with IOU QA/QC and Measures Installation Standards guidelines in accordance with applicable contractor/ rater participation agreements.

**Table 8:** Customer Eligibility Requirements (Joint Utility Table)

*[Table 8 to be provided as an Excel Attachment to this PIP]*

**ii. Contractors/Participants:**

**Participating Contractor Requirements for Basic Path and Advanced Path**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Participating WHUP Contractors must be certified and licensed according to all applicable federal, state and local laws. Participating Contractors shall meet, and provide sufficient evidence and supporting documentation for the following minimum requirements:

1. Contractor State Licensing Board (CSLB) license in the appropriate specialty;
2. Bonding and in good standing.
3. Insurance to IOU minimum insurance standard;
4. Execution of a contractor participation agreement;
5. Completion of all utility training course requirements, including Participation Workshop and a 3-Day Basic and/or Energy Upgrade Training, Workshop, if not BPI-certified Basic or Advanced Training, as appropriate;
6. BPI-certified Building Analyst (BA) to complete Combustion Safety and Carbon Monoxide Protection and all other minimum Health and Safety Requirements specified in the BPI Technical Standards for Building Analyst Professional;
7. Ensure HVAC permits will be pulled on all work that is appropriate per local jurisdiction requirements;
8. Participating Contractors who participate in *Advanced Path* projects, must employ at least one staff person who holds an active BPI Building Analyst certification. BPI accreditation is strongly encouraged and may be required of all participating contractors at some point during the program cycle;
9. Additional IOU requirements, as appropriate.

**Participating Rater Requirements for All WHPR Paths**

Participating Energy Upgrade Raters must meet all requirements as a Participating Contractor and must be both HERS II certified and hold an active BPI Building Analyst certification or BPI MF Building Analyst certification as may be applicable. WHUP *Basic Path* and *Advanced Path* projects submitted by a Participating Rater must utilize a WHUP Participating Contractor for installation of the measures specified by the Participating Rater.

**Table 9:** Contractor/Participant Eligibility Requirements (Joint Utility Table)  
*[Table 9 to be provided as an Excel Attachment to this PIP]*

**e) Program Partners:**

**a. Manufacturer/Retailer/Distributor partners:**

**Table 10:** Manufacturer/Retailer/Distributor Partners  
*[Table 10 to be provided as an Excel Attachment to this PIP]*

**b. Other key program partners:**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Table 15:** Energy Division, California Energy Commission, local governments, BPI and other standards bodies, as well as other partners  
[Table 15 to be provided as an Excel Attachment to this PIP]

f) **Measures and incentive levels:**

**Advanced Path Incentives**

Incentives for the *Advanced Path* will be paid based upon modeled site savings energy utilizing any CEC approved simulation modeling software approved by IOUs. Incentives for *Advanced Path* are designed to encourage customers to reach for deep energy savings. *Advanced Path* incentives are for both gas and electric measures provided by the customers' participating utility program.<sup>40</sup> Currently, Energy Pro simulation modeling software is the only approved software for use with WHUP. During the 2013-2014 transition cycle, the IOUs will work collaboratively with the CEC and other stakeholders to identify potential approaches to adequately broaden the allowable software under the WHUP while containing costs required for needed Commission Staff reviews.

Savings/ Participation Level: % Reduction	Incentive Amount
<i>Basic Package: 10%</i>	<i>\$1,000</i>
<b>10%</b>	<b>\$1,000</b>
<b>15%</b>	<b>\$1,500</b>
<b>20%</b>	<b>\$2,000</b>
<b>25%</b>	<b>\$2,500</b>
<b>30%</b>	<b>\$3,000</b>
<b>35%</b>	<b>\$3,500</b>
<b>40%</b>	<b>\$4,000</b>
<b>45%+</b>	<b>\$4,500</b>

<sup>40</sup> In various service territory where one of the customer's utility service provider (municipality), is not a program participant adjustments may be necessary to the incentive.

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

### ***Basic Path Incentives***

The *Basic Path* customer incentive is up to \$1,000. The customer will receive the entire rebate amount as a direct result of participating in *Basic Path*. Additionally, *Basic Path* incentives will be:

- Consistent statewide;
- Lower than the *Advanced Path* incentives;
- Compatible with municipal financing options; and
- Implemented so as to leverage external funding where appropriate.

### ***Multifamily Path Incentives***

Incentives for *Multifamily Path* will be paid based upon modeled site savings energy utilizing any CEC approved simulation software approved by IOUs. Incentives will be offered on a tiered structure, paid per building on a “per dwelling unit” basis according to the total building energy savings percentage. The tiered approach will reward participants for realizing deeper savings. While a “per unit” approach enables participants to experience economies of scale with larger multifamily buildings.

### **Ten Year Stepwise Incentive Structure**

During the 2013-2014 transition period the IOUs will meet not fewer than two times with statewide stakeholders to develop a 10 year stepwise incentive structure which will be triggered at defined market transformation milestones. It is anticipated that the plan will include a defined timeline, for incentive update decisions and that incentive level changes will be updated at defined market trigger metrics associated with the number of participating homes towards the *Strategic Plan* goals. As the number of participants increases over time, incentive levels will be lowered accordingly to reset the incentive amounts.

The IOUs will invite statewide stakeholder inputs to lock in these targets prior to the start of 2015, using every 20,000 homes/dwelling units treated and decreasing incentive levels in \$250 increments as a starting point for discussion. Once the statewide target is confirmed, the IOUs will notify contractors when the program has reached 75%, 90% and 95% of the goal so contractors can plan accordingly.

**Table 11:** Summary Table of Measures, Incentive Levels and Verification Rates  
*[Table 11 to be provided as an Excel Attachment to this PIP]*

### **Permitting Requirements**

No incentives for equipment requiring a building permit shall be provided any contractor or customer without that contractor or customer certifying that s/he has complied with all permit requirements and utilized a licensed contractor.

### **Qualified Measures**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

During the transition cycle, the IOUs will work to better leverage WHUP to achieve greater energy savings from plug loads, appliances and swimming pools through:

1. Greater cross marketing of HEER and WHUP customers.
2. Work with EnergySoft to find solutions to pool pump modeling.
3. Incorporate lighting and appliance options as a more predominate feature in standard assessment reports to customers.

**Required *Basic Path* Measures Installed Per Measures Installation Standards:**

- Whole House Air Sealing
- Attic Insulation
- Duct Test and Seal
- Domestic Hot Water Pipe Insulation
- Thermostatic Shut-Off Valve
- Low-Flow Shower Head

***Advanced Path* Measures Installed Per Measures Installation Standards:**

- Attic Insulation
- Cool Roof Installation (CRRC-certified)
- Cooling System Upgrade
- Domestic Hot Water Heater Upgrade (non-solar)
- Domestic Hot Water Pipe Insulation
- Duct Insulation
- Duct Test and Seal
- Exterior Lighting Upgrade – Permanently Installed High-Efficacy
- Floor Insulation
- Heating System Upgrade
- Interior Lighting Upgrade – Permanently Installed High-Efficacy
- Low-Flow Shower Head
- Radiant Barrier Installation
- Thermostatic Shut-Off Valve
- Wall Insulation
- Whole House Fan Installation
- Whole House Air Sealing
- Window Upgrade
- Other Measures as may be modeled and allowed by IOUs per regional market needs

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Ineligible Measures**

- Screw-In Lighting Fixtures and Lamps
- Solar Domestic Hot Water Heater System
- Distributed Generation Systems - Solar PV, Fuel Cell, Wind, etc.
- Pool Pump Upgrade
- Clothes Washer Upgrade
- Clothes Dryer Upgrade
- Dishwasher Upgrade

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Multifamily Building Eligible Measures**

- Attic insulation upgrade
- Wall Insulation upgrade
- Floor insulation upgrade
- Window replacements – 2008 T-24 standard or better
- Cool roof – CRRC rated product
- Radiant barrier
- Window shading – permanent, non-retractable
- Duct Sealing - with HERS test
- A/C equipment replacement – Must meet current T-20 standard
- Furnace replacement – Must meet current T-20 standard
- Premium efficiency motors (ECM included)
- VFD controls for CHW, HW, CW pumps
- VFD controls for cooling tower fans
- Pipe insulation – From ½ inch to 1-inch, or none to 1-inch
- Controls optimization (OA reset, zone reset)
- Boiler or DHW replacement – Must meet current T-20 standard
- Insulate hot water piping – From ½-inch to 1-inch, or none to 1-inch
- DHW tank insulation
- Add VFD to circulation pump
- Update central DHW pump to demand control – From no control to demand control
- Common area lighting fixtures – high efficacy hardwired fixtures
- Dwelling unit lighting fixtures – high efficacy hardwired fixtures
- Lighting controls – Occupancy sensor, photo sensor, or dimmer switch
- Outdoor lighting retrofits – high efficacy hardwired fixtures
- ENERGY STAR Refrigerator
- ENERGY STAR Dishwasher (if a dishwasher is installed in pre-retrofit condition)

**g) Additional Services:**

**Table 12:** Additional Service

*[Table 12 to be provided as an Excel Attachment to this PIP]*

**h) Sub-Program Specific Marketing and Outreach:**

IOUs will conduct integrated as well as program-specific marketing and outreach which will be coordinated with the statewide marketing and outreach program. The utilities may use a range of tactics such as; e-mails, flyers, on-Line marketing, direct mail, bill messaging, social media, local events, ethnic media, and other channels that suit the target audience, the message, and the resources.

**Marketing, Education and Outreach plans**

**1) Objectives**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Generate greater awareness, understanding and for the whole house system concept;
- Drive response amongst qualified customers to seek out whole house projects; and
- Build demand in the marketplace for home retrofit services.

**2) Target Audiences**

WHUP marketing and outreach aims to include all stakeholders in the retrofit process, throughout the life of the program. This will help to ensure that all audiences receive consistent information and will enable a more informed dialogue about program specifics, in an effort to continuously engage stakeholders in the energy efficiency retrofit process. The initial target group is comprised of the following audiences listed below. Based on the results of the statewide market survey research.

Target Group:

- Single family residential customers in proposed targeted segments
- Multifamily residential customers
- Residential customers with a history of prior EE engagement including, but not limited to: rebates, online tool enrollment and energy audits
- Local governments, community-based organizations and other stakeholders (i.e. the realtor community)
- Efforts may target select public events and work with local earned media to publicize the program's benefits.

**3) Keys to Success**

Execution of a successful campaign that introduces customers and contractors to the benefits of comprehensive home energy efficiency retrofits will largely be dependent on funding available to support outreach to all audiences. With that in mind, following is the proposed approach and specific tactical recommendations that the IOUs aim to pursue, funding permitting:

- Continue to utilize a statewide brand and message; and a creative envelope for WHUP marketing efforts to avoid market confusion;
- Co-brand where feasible;
- Coordinate with local governments;
- Engage contractors, stakeholders and local governments in generating customer demand; and
- Provide collateral pieces to participating contractors to assist in lead generation and education;
- Employ expanded community based marketing approach; and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Use a variety of innovative marketing strategies such as time of sale assessment vouchers.

i) **Sub-Program Specific Training:**

Specific workforce development efforts supporting WHUP include the following:

- CEC/EDD: California Clean Energy Workforce Training Program Community college programs;
- Third party programs; and
- IOU training offerings (IOU trainings will serve as backup if required. IOU courses do not duplicate modules available in the marketplace but will serve backup role in the event that a market need is identified and best served by the IOU Energy Training Centers).

WHUP will be coordinated with the statewide IOU WE&T program, local government residential retrofit and contractor training programs that are tied directly to workforce education and training efforts on a state and federal level. In addition, IOU WE&T programs will continue to offer both building-block house as a system courses that educate students on the concepts that form the foundation of home retrofit programs when a needs assessment determines that these areas require attention. Those concepts include:

- Advanced house-as-a-system concepts and issues;
- Combustion and other safety training updates;
- Green building techniques applicable to the program;
- Blower Door Based Air Sealing;
- Codes and standards (Title-24) implications;
- Advanced lighting, HVAC technologies and problem solving; and
- Business training (including the enhancement of sales, marketing, training, and accounting skills).

Contractor training requirements will be based WHUP requirements and will provide contractors necessary training without sacrificing any considerations for applicable safety requirements.

Contractor recruitment efforts will be conducted primarily by third party program implementers – a model that has proven successful in statewide IOU HVAC programs in the 2010-12 program cycle. Program implementers will continue to primarily recruit contractors through:

- The network of contractors already participating in IOU HVAC, insulation and weatherization programs;
- Direct outreach through trade groups with locally active memberships;

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Workforce development departments (to target unemployed general contractors)

Program implementers will verify and enroll Participating Contractors and Raters and provide required program participation related training. Once enrolled, the Participating Contractor and Rater lists will be posted in a centralized location for customers to view. IOUs will direct customers to appropriate websites for lists of eligible Participating Contractors and Raters.

Upon completion of 2012 Energy Upgrade California process evaluations, the IOUs will convene a workshop to review workforce training needs.

j) **Sub-Program Software and/or Additional Tools:**

- a. List all eligible software or similar tools required for sub-program participation.

- Energy Pro energy simulation modeling software

- b. Indicate if pre and/or post implementation audits will be required for the sub-program.

Pre-implementation audit required  Yes \_\_\_ No

Post-implementation audit required  Yes \_\_\_ No

- c. As applicable, indicate levels at which such audits shall be rebated or funded, and to whom such rebates/funding will be provided (i.e. to customer or contractor).

**Table 13:** Post-implementation Audits

*[Table 13 Program to be provided as an Excel Attachment to this PIP]*

k) **Sub-Program Quality Assurance Provisions:**

Payment of customer incentives will be tied to the contractor's delivery of full job required program documentation. Program implementers will randomly select a minimum of 5 percent of each participating contractor's reported retrofits for onsite job verification and review 100 percent of the job data inputs from contractors. Verifications will include homeowner interviews, intensive visual checklist inspections, and selective retesting of key items. A subset of these energy savings estimates may later be validated against the first year's after-retrofit utility bills plus climate data and homeowner interviews as needed to identify changes in other factors affecting energy use. IOUs will collaborate to develop QA/QC plans and documents that reflect statewide uniformity to the greatest extent possible. QA/ QC documents and standards will be updated regularly with contractor input and will include:

1. QA/QC Process and Protocols

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

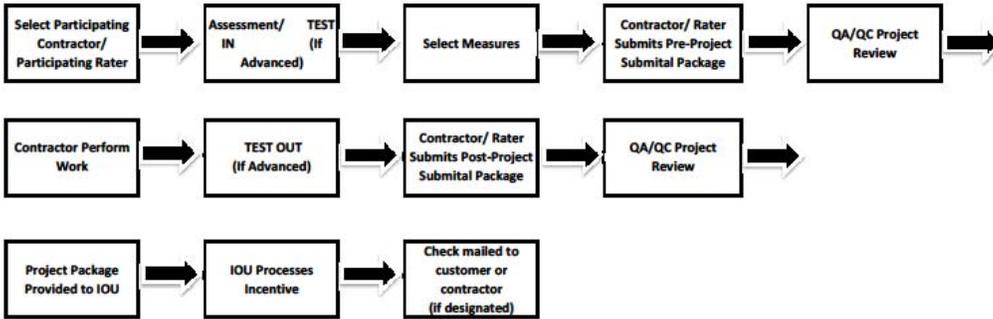

2. Minimum installation standards for all allowable measures
3. Emergency and Fast Track equipment replacement protocols.
  - a. Exhibit A attached includes existing and continuing IOU Emergency and Fast Track protocols.
4. Permitting requirements
  - a. WHUP shall support Heating Ventilation and Air Conditioning permit acquisition as a matter of course.
  - b. WHUP jobs involving HVAC replacement must include submittal of the HVAC permit number and a contractor certification that appropriate permits have been obtained, for inclusion in program records.

**Table 14:** Quality Assurance Provisions  
*[Table 14 to be provided as an Excel Attachment to this PIP]*

| **Sub-program Process Flow Chart:**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Whole Home Upgrade Program Process Flow**

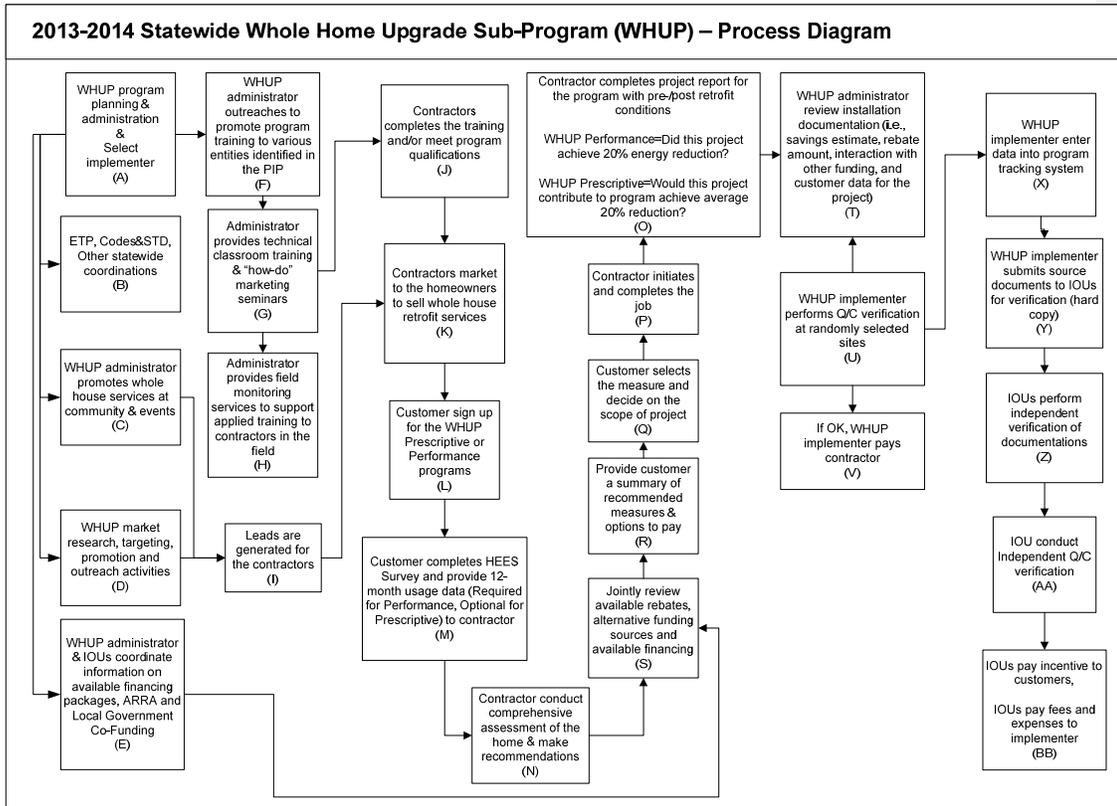

l) **Cross-cutting Sub-program and Non-IOU Partner Coordination:**

**Table 15:** Cross-cutting Sub-program and Non-IOU Partner Coordination  
*[Table 15 to be provided as an Excel Attachment to this PIP]*

m) **Logic Model:**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**10) Additional Sub-Program Information**

a) **Advancing Strategic Plan Goals and Objectives:**

The WHUP is consistent with the requirements of the *Strategic Plan*. The program addresses the Whole-House Strategy of the *Strategic Plan* by influencing contractors and customers to implement comprehensive home retrofit energy efficiency measures through either the *Basic Path* on-ramp, *Advanced Path* or *Multifamily Path*.

WHUP responds to the need for much larger energy savings in existing homes and multifamily buildings than is possible with conventional checklist audits or single measure improvement (prescriptive) programs. WHUP addresses the key “whole house” strategy of the *Strategic Plan* by influencing “decision triggers” to improving energy efficiency and understand advantages to expand participation to reach savings goals. This program is also a vehicle to increase penetration of shell upgrades and cost effective, high efficiency appliances, water heaters and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

HVAC upgrades. The *Strategic Plan* further states that a similar approach must be developed for multifamily housing. The program will help to achieve the following goals identified in Section 2 of the *Strategic Plan*:

<b>Table 6. Whole House Alignment with California Long Term Energy Efficiency Strategic Plan</b>			
<b>Residential and Low Income Goal 2: Existing Homes</b>			
<b>Goal Number</b>	<b>Strategy</b>	<b>WHUP Strategy</b>	<b>Integrated Programs &amp; Activities</b>
2-1	Deploy full-scale Whole-House programs.	Monitor performance of selected lower energy homes. Design implement, monitor and continuously improve full-scale programs for whole-house energy efficiency and renewable energy retrofits.	Programs: WHUP, Solar, Demand Response, MFEER, Plug Loads, ESAP  Marketing: Customer segmentation and local coordination  EM&V: Studies to provide early feedback and establish baselines
2-2	Promote effective decision-making to create widespread demand for energy efficiency measures.	Continue to offer Energy Advisor programs online, by mail, and over-the-phone to provide customers with information to promote effective decision-making, in combination with other segment specific marketing outreach and educational activities.	Programs: Energy Advisor WHUP, MFEER  Marketing: Customer and contractor education to promote building efficiency and appropriate EE behaviors in a segmented manner
2-3	Manage research into new/advanced cost-effective innovations to reduce energy use in existing homes.	Coordinate with Emerging Technologies and other programs to integrate market-ready technologies into the Whole House offering when appropriate. Promote commercialization of home energy management tools including AMI-based monitoring and display tools	Programs: Emerging Technologies, Demand Response, Solar, and others
2-4	Develop financial products and programs such as on-bill financing to encourage demand for energy efficiency building products, home	Ensure that customers are aware of the most effective and attractive financing packages that are available to them.	Programs: WHUP  Coordination: Local government partnerships and other state/federal financing entities

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

	systems, and appliances.		
2-5	Increase Title 24 compliance through specific measures leading to aggressive statewide enforcement.	Partner with local governments to expedite the permitting process to decrease the barriers to entry in the home performance industry.	Coordination: Local government partnerships

**b) Integration**

- i. **Integrated/coordinated Demand Side Management:** As applicable, describe how sub-program will promote customer education and sub-program participation across all DSM options. Provide budget information of non-EE sub-programs where applicable.

The IOUs have identified IDSM as an important priority. The IOUs plan to monitor the progress of other IDSM efforts and to work closely to identify comprehensive integration approaches that feed into the overall statewide strategy and to implement best practices as rapidly as practical.

The statewide WHUP is a platform for integration of solutions to the residential customer and is intended to provide an easy entry point for customers and contractors that ultimately integrate other programs for whole house and customer solutions. As awareness of the cost-effective opportunities in whole house retrofits grows through training and education efforts, customers will be presented with the ability to integrate Demand Response and properly-sized onsite generation.

With the inherent synergy that exists between the energy efficiency awareness efforts of CSI and the Whole House programs, WHUP information will be made available to IOU teams in call-centers with the intent of providing a WHUP introduction to customers or contractors interested in CSI.

Coordination with stakeholders who maintain approved solar contractor lists may also provide an opportunity to deliver the whole house message to parties interested in installing solar systems.

The statewide Energy Advisor program will also provide a unique nexus between CSI and WHUP. CSI customers are required to conduct an energy efficiency survey prior to installing solar, which presents a unique opportunity to educate customers on the benefits of improving the efficiency of their home

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

prior to purchasing solar equipment. These efforts are expected to include, but will not be limited to:

- WHUP links and information on IOU CSI sites;
- Links to WHUP landing pages from Energy Advisor;
- Targeted messaging during and after each survey;
- Information about WHUP incentives; and
- Educational information that encourages customers to “reduce then produce.”

In addition, any contractors who work onsite with customers can provide delivery channels for DR programs information or installation of DR technology.

WHUP will also serve as a platform to integrate technology advancements in DR and Advanced Metering. IDSM efforts will be part of an ongoing conversation with customers to enhance program offerings and increase their participation in DSM efforts over time.

**Table 16:** Non-EE Sub-Program Information  
*[Table 16 to be provided as an Excel Attachment to this PIP]*

- ii. **Integration across resource types** (energy, water, air quality, etc): If sub-program aims to integrate across resources types, please provide rationale and general approach.

WHUP is designed to deliver comprehensive solutions to customers while integrating across resource types to maximize customer benefits not only in terms of energy savings, but through improvements to occupant health, safety and comfort. Primarily, there are opportunities for water efficiency and indoor air quality improvements.

One of the major benefits of comprehensive home retrofits is improved indoor air quality. Residents will notice more consistent temperatures throughout their home and in many cases, improved indoor air quality.

The embodied energy in water distribution will become an increasingly important part of utility programs. The consumer education process in the house-as-a-system approach will provide an opportunity for local governments to present customers with information on non-energy savings inherent in comprehensive retrofits.

*[This information can be found in Table 16 Non-EE Sub-Program Information to be provided as an Excel Attachment to this PIP]*

- c) **Leveraging of Resources:**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Local Governments

**i. SDG&E**

Local Governments play a unique and important role in the promotion and advancement of Energy Upgrade California. Beginning in 2009, when the American Recovery and Reinvestment Act was passed and programs like the State Energy Program and the Energy Efficiency & Conservation Block Grant program, jurisdictions across the state were given the unique opportunity to make significant investments on energy programs. Because of the unique and collaborative relationship that exists among the local jurisdictions and SDG&E, and the existence of a non-resource local government partnership program, the San Diego region saw the development of a number of community focused residential retrofit programs including innovative marketing pilots, specialized workforce education & training programs, and a variety of rebate and loan programs that sought to incentivize residents to perform energy upgrades in their homes.

Over the course of the last few years, SDG&E has worked closely with each local government to ensure local programs are closely coordinated and achieve the highest level of collaboration and consistency across the region. Building off the lessons learned over the course of the last few years as well as the unique authorities afforded local governments, SDG&E and the local government program advisory group has developed the following list of key roles that local governments will play to advance Energy Upgrade California during the transition cycle.

1. Incorporate building retrofits & building occupant health and safety issues into Climate Action Plans, General Plans, and other relevant planning and long term strategy documents;
2. Leverage community relationships and resources to market Energy Upgrade California including targeted outreach and education to the community;
3. Provide targeted education on EUC and its benefits to key community stakeholders, business sectors and elected officials
4. Coordinate workforce education and training program activities;
5. Leverage building permit interactions to encourage WHUP enrollment and work to develop streamlined permitting process as it relates to WHUP;

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

6. Leverage unique authority to encourage/require building rating/audits to drive customers to EUC;
7. Pilot unique incentive programs such as point of sale audits, to encourage participation in Energy Upgrade California;
8. Work with the financing community to deploy innovative products and services to further enable residential and commercial energy upgrades throughout their jurisdictions.
9. Pilot incentives for Whole Home Energy Rating System II assessment as part of the WHUP.

Please refer to the Local Government Partnership Program PIP for budget details associated with these activities.

WHUP will coordinate IOU incentives and marketing outreach with local government efforts in neighborhood outreach and contractor recruitment. This effort allows for multiple levels of engagement that, through coordination with local entities, will reach to a neighborhood level that will drive awareness and market adoption.

**ii. PG&E**

During the development and implementation of the 2010-2012 Whole House Program PG&E partnered and coordinated closely with recipients of American Recovery Reinvestment Act (ARRA), State Energy Program (SEP), and Energy Efficiency & Conservation Block Grant (EECBG) statewide and within the PG&E service territory. In the 2013-2014 Transition Period, PG&E plans to continue to work with and leverage these partners as described in further detail in the Local Government PIP.

**iii. SoCalGas**

SoCalGas has worked closely with local governments who received American Recovery Reinvestment Act (ARRA), State Energy Program (SEP), and Energy Efficiency & Conservation Block Grant (EECBG) in the last couple of years. This has allowed SoCalGas and local governments to achieve a high level of collaboration and consistency across the service territory. In conjunction with SCE, SoCalGas is in discussion with local governments who are interested in continuing collaboration post ARRA, SEP, and EECBG era. These discussions will determine key roles for local governments, based on lessons learned and their successful offerings from ARRA, SEP, and EECBG grants. Such activities may include:

1. Expanding existing outreach programs to the Real Estate Community
2. Leveraging existing low-interest financing

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- [3. Drawing upon LA County's experience with FlexPath for modifications to meet the CPUC's goal for a more appealing approach.](#)
- [4. Marketing and Workforce Development support for contractors](#)

**iv. SCE**

SCE has worked closely with local governments who received American Recovery Reinvestment Act (ARRA), State Energy Program (SEP), and Energy Efficiency & Conservation Block Grant (EECBG) in the last couple of years. This has allowed SCE and local governments to achieve a high level of collaboration and consistency across the service territory. SCE is in discussion with local governments who are interested in continuing collaboration post ARRA, SEP, and EECBG era. These discussions will determine key roles for local governments, based on lessons learned and their successful offerings from ARRA, SEP, and EECBG grants. Such activities may include:

1. Expanding existing outreach programs to the Real Estate Community
2. Leveraging existing low-interest financing
3. Drawing upon LA County's experience with FlexPath for modifications to meet the CPUC's goal for a more appealing approach.
4. Marketing and Workforce Development support for contractors

**d) Trials/ Pilots:**

**1) SCE/ SoCalGas Moderate Income Direct Install-MIDI**

The Local MIDI Program will be offered by SCE and SoCalGas to eligible customers residing in single family and multifamily properties (multifamily common areas excluded) served by SCE and SoCalGas. The MIDI Program will coordinate with SCE and SoCalGas' Energy Savings Assistance program (ESAP) to deliver MIDI measures through select ESAP Contractors. ESA Program infrastructure will be used to administer the MIDI Program. When working in joint SCE/SoCalGas territory, shared contractors will offer both IOU's Program measures. The MIDI Program will encourage residential owners/property managers of single family and multifamily properties to install comprehensive energy efficiency improvements.

The EUC Program traditionally requires significant financial contributions by customers who wish to participate. The MIDI Program closes the financial gap by installing no-cost measures thereby reducing the total amount of money a customer would need to invest in their property in order to participate in the SF or MF EUC Program.

SCE and SoCalGas propose:

- To implement a MIDI trial with a set goal of 1,000 units served
- Develop a scalable program design for larger rollout in future cycles.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Evaluate delivery of MIDI Program utilizing existing ESA program infrastructure.

**a) Customer/Living Unit Eligibility**

To participate, the following guidelines must be met:

- i. participants must be income eligible (between 201% and 250% of FPG)
- ii. living unit must not have received ESAP services after January 1<sup>st</sup>, 2002
- iii. living unit must meet the current ESAP/MIDI minimum measure requirements

**b) Measures**

ESA program approved measures excluding appliances

**c) Contractors**

SCE and SoCalGas will coordinate with select experienced joint ESAP contractors to perform an assessment of the living unit, complete customer enrollment, and install measures as applicable in the MIDI Program trial.

**2) SDG&E Trial Incentives**

SDG&E may explore additional incentive trial offerings for customers who perform an HVAC QI installation as part of a scope of work. Additional trial integration offerings may include offering IHDs, PCTs, or other enabling technologies for advance path customers who achieve certain saving levels.

**11) Market Transformation Information:**

**1) Summary of the market transformation objectives of the program.**

The WHUP program is designed to fulfill the goals of the *Strategic Plan* by guiding and incenting home and building buyers, owners and renovators to implement a whole house approach in energy consumption undertaken in their purchase and use of existing and new homes and buildings, home and building equipment (e.g. HVAC systems), household appliances, lighting and “plug load” amenities. The target is all existing homes in an effort to realize the maximum energy efficiency potential via the delivery of a comprehensive package of cost-effective whole-house and whole-building energy efficiency retrofit measures. These programs will include building shell upgrades, high-efficiency HVAC systems – appropriately sized for the building structure, and emerging deep energy reductions in the lighting, appliance, plug-load and other residential oriented sectors. This initiative will be structured around a comprehensive audit, installation of the variety of retrofits required across the

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

entire building structure, and access to attractive financing programs. The WHUP effort will be achieved via the parallel and coordinated efforts of the utility programs, partners and other private market actors, and the State and local government policies and programs made available. As IOUs implement a system of automatic meters and wide-area network to enable data transport, the IOUs and customers will have the opportunity to integrate additional home automatic systems and integrated energy management features into the home (i.e., interim Intelligent Home Network, comprehensive Home Automatic Network and etc.) to support IDSM integration and deployment. The Plug Load and Appliance Program will have the potential to offer not only hardware based energy savings, but also comprehensive behavior savings opportunities.

**2) Identification of the relevant market actors and the relationships among them.**

The Whole Home Upgrade program is designed to serve residential homeowners, moderate income households and property owners and managers. For the 2013-2014, the program consists of the following paths:

- *Basic Path,*
- *Advanced Path*
- *Multifamily Path*

The Whole Home Upgrade Program is a contractor lead program in that it is the local contractor who interfaces with the customer, markets and sells the concept of Whole House Retrofits, and completes the actual work. The Statewide Process Evaluation (5/1/12) revealed that 32% of participants first heard about the EUC program from a contractor. A number of Local Governments, most initially supported by CEC/ARRA funding during the 2010-12 time frame, also support the program via local marketing and incentive offerings. Coordinated on a Statewide basis – the IOUs offer consistency in program scope (to the degree possible) and a consistent marketing message.

**3) A market characterization and identification of key barriers and opportunities to advance demand-side management technologies and strategies**

**Market Characterization**

The IOUs statewide Whole House Program has initially focused on training a pool of qualified contractors available to perform these comprehensive retrofits. The number of individuals with active BPI certifications grew dramatically between January 1, 2010 and November 1, 2011. Total active certified individuals grew from 65 to 1,596. The number of certifications (individuals may have more than one type of BPI certification) grew from 88 to 2,349. The 2010-2012 PG&E and SCE Whole-House process evaluation study by SBW/ODC/ASW, produced a number of findings, including:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Overarching program participant profile**

- The program participation is primary through the *Advanced Path* and there is little engagement in the *Basic Path* service.
- *Advanced Path* jobs report energy savings of 30% average in this first program phase.
- The average cost per job ranges from \$13,000 to \$16,000
- The utility incentives covered typically 23% to 27% of the project costs.
- Despite the large supply of program contractors, only a limited pool of larger contractors complete the majority of the projects
- Many – 44% of participants – used financing to pay for their projects.

**Contractor recruiting/training/mentoring—from SCE’s in-depth assessment**

- There are widespread contractor performance gaps despite a certification requirement (i.e., BPI).
- The current contractors’ participation training does not adequately prepare them for job processing expectations and the rigor of the QA/QC process,
- BPI certification does not guarantee a standardized job performance level
- Since the requirements for certification often vary (i.e., (1) on-line training versus in-person classes, (2) different region may place different emphasis, i.e., Vermont may focus more on heating, while California may focus more on HVAC).

**For the targeted population—from PG&E’s in-depth market effectiveness assessment**

- 29% of the targeted population are aware of Energy Upgrade California (EUC),
- 13% of the targeted population reported seeing logo displayed,
- 3% of the targeted population have visited the website,
- 43% of the targeted population has been exposed to at least one marketing treatment from EUC.
- Among those “aware” in the targeted population, 27% first heard of the program from radio, (PG&E did not do radio ads but the local governments did), 18% from direct mail, 11% Newspaper, and 10% each for Word-of-Mouth, Internet and Television.
- Among workshop participants, word-of-mouth and events are the most effective communication channels.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Program homeowner participants ranked “comfort”, “reduced energy bill”, “benefits of the incentive” and “home energy assessments” as important reasons for why they participated.
- Contractors report the most effective messaging in their opinion are the messages of: Comfort, Incentives, Lowering energy bills

**Market Actors:**

- Homeowners/renters & property owners/managers
- Contractors
- Realtors
- Financial Institutions
- Property Appraisers
- Local governments

**Relationship Among the Market Actors:**

The contractor community is the key actor with the WHUP. They are the program actor who outreaches personally to the owner of the building and home and communicates the concepts of approaching a building on an entire whole basis. And it is the contractor who proposes the appropriate work and completes the retrofit. The contractor provides the linkage between the WHUP and the customer who receives the rebate.

Working together, the realtor, appraisal and financial communities are market actors that can help push energy efficiency in the home resale market. Realtors can be educated to differentiate the advantages of purchasing energy efficient existing residential structures to prospective home buyers. Working with the appraisal community to perceive installed energy efficient measure in a home as monetary assets to a structure thus increasing the property’s value can be a significant push to the acceptance and importance of energy efficiency and financial institutions recognizing this effort to provide exceptional financing opportunities to prospective home buyers for their investment in an energy efficient home.

Many local governments were very active in the EUC sector in the prior 2010-12 cycle as supported by ARRA funding. Some of those local government programs will be continuing on into the 2013-14 program cycle. The IOUs will continue to provide WHUP as a foundation offering to our customers, and local governments can continue to build upon these (with additional rebates) or support these with customized marketing programs. The IOUs will coordinate and partner with local governments in an effort to achieve the synergy possible between these aligned efforts.

**Opportunities to advance demand side management technologies and strategies:**

Building owners who have committed to a WHUP retrofit solution will have taken the ultimate step in applying energy efficiency technology to minimize their energy usage. They have evidenced their willingness to pursue minimizing energy usage, and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

are therefore self-identified as highly likely to embrace the next step(s) of demand side technologies and strategies to further minimize energy usage. So the next phase of energy reduction for the EUC retrofit customers will be the variety of demand side reduction programs that the IOUs can make available.

**Key Barriers & Opportunity for Intervention:**

The barriers for this program for the homeowner sector are the:

- (1) Relatively high cost of home assessments,
- (2) Relatively high gross costs of comprehensive energy upgrades,
- (3) Market not aware of additional non-economic values resulting from comprehensive energy upgrades,
- (4) Fledgling contracting and supporting industry for existing home energy upgrades,
- (5) Low consumer awareness of incentive subprograms and the concepts of comprehensive home energy assessments and upgrades,
- (6) Lack of common home rating protocols and common vernacular for the market to assign value to homes which undergo comprehensive energy upgrades,
- (7) The economic downturn and its impact on the residential housing sector.
- (8) Contractor awareness and access to information,
- (9) Access to financing,
- (10) Lack of access to skilled labor.

Note: Potential participants who have attended a workshop (PG&E) also explain their lack of participation in that they haven't been able to contact/find a contractor yet.

For the owners and/or managers of multifamily buildings, there are another set of barriers, closely aligned to those for private single-family homes, but different in some very important dimensions:

- (1) Lack of knowledge regarding energy efficiency as well as the comprehensive programs that are offered by the IOUs,
- (2) Challenge of the "split incentive" where it is the building owner/manager who must pay for all building improvements, including those inside of the individual rental units. But it is the tenants of the unit that pay the energy bills and therefore receive the immediate benefits of the energy efficient investment (by the landlord),
- (3) Multifamily buildings are managed as businesses, where capital for major improvements must be borrowed. But the extended ROI for most energy efficiency projects is longer than the few years that most business allow for recouping their investments,
- (4) To implement a "whole building" retrofit, the apartment owner/manager must typically bring in several specialty contractors for multiple visits, which in tenant occupied units is a very challenging task,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- (5) Tenants having to out of the rental units during retrofit work, as well as the management time required on behalf of the building owner/manager – is a costly investment of resources,
- (6) Major retrofit often can only happen when the rental unit(s) is unoccupied – which is a significant loss of income for the owner/manager,
- (7) Managed as a business – multifamily building owners/managers are not inclined to replace any major building component or energy system prior to its actual wear-out/break-down. Building retrofits usually take place toward the “end-of-life” of key components (HVAC – for example) – but not when they break-down. Building owners/managers cannot afford the impact on tenants of having key systems not functioning for any length of time.

**4) A description of proposed intervention(s) and its/their intended results**

The WHUP seeks to address these barriers for private single-family homes through:

- ~~1)~~—Continued marketing of Energy Upgrade California and whole house concepts. (Barrier 3, 5, 8)  
▪ *Intended Results:* Increase awareness
- ~~2)~~—Continued contractor recruitment, training and mentoring. (Barrier 4, 5, 8, 10)  
▪ *Intended Results:* Continue to maintain and improve the supply and quality of the contractors serving the program
- ~~3)~~—Expanded customer uptake through WHUP incentives. (Barrier 1, 2, 5)  
▪ *Intended Results:* Use incentives to reduce the barrier of entry into the comprehensive retrofit projects
- ~~4)~~—Offering of Financing programs (by IOUs and/or other entities) (Barrier 1,2, 9)  
▪ *Intended Results:* Provide building owners the upfront cash they need to borrow  
▪ ———to invest in a retrofit project, and amenable loan terms by which to repay that loan (note: this program component will be particularly important in the multifamily sector).
- ~~5)~~—Continued stakeholder outreach to address barriers. (Barrier 1, 3, 4, 5, 6, 8, 10)  
▪ *Intended Results:* Leverage resources outside the IOUs to address market needs
- ~~6)~~—Continued partnerships with local and state government to address barriers. (Barrier 1, 2, 3, 4, 5, 6, 8, 9, 10)  
▪ *Intended Results:* Leverage local government resources to engage communities and targeted population to participate in the program

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

*The IOU's considered the following when determining the Program's low, medium and high scenarios for program year 2013-2014:*

<u>SoCalGas</u>					
<u>Scenarios</u>	<u>2013</u>		<u>2014</u>		<u>Assumptions</u>
	<u>SF Homes</u>	<u>Budget</u>	<u>SF Homes</u>	<u>Budget</u>	
<u>Low</u>	<u>508</u>	-	<u>508</u>	-	<ul style="list-style-type: none"> <li>· <u>ARRA sunset more challenging than expected</u></li> <li>· <u>Competition from Local Government programs</u></li> <li>· <u>Further challenges with the economy</u></li> </ul>
<u>Medium</u>	<u>725</u>	-	<u>725</u>	-	<ul style="list-style-type: none"> <li>· <u>Expected program performance</u></li> </ul>
<u>High</u>	<u>870</u>	-	<u>870</u>	-	<ul style="list-style-type: none"> <li>· <u>Efficiencies and improvement in program model</u></li> <li>· <u>New financial options coming online</u></li> <li>· <u>Increase local government involvement &amp; support</u></li> </ul>

*Note: These scenarios include SoCalGas only and shared IOU territories.*

And for WHUP *Multifamily* the barriers will be addressed by these actions:

- 1) To improve a property owner or manager's energy efficiency knowledge, the *Multifamily Path* would seek to leverage comprehensive investment grade building assessments to identify potential energy efficiency opportunities. (Barrier 1)
  
- 2) To address split incentives and cost of upgrades, the *Multifamily Path* would integrate with the existing Energy Savings Assistance Program

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

(“ESAP”) and the Multifamily Energy Efficiency Rebate (“MFEER”) Program. This would provide comprehensive services to the building, including “low cost” or “no cost” tenant measures in conjunction with the WHUP *Multifamily Path* whole building incentives in order to maximize energy savings for the up-front investment. (Barrier 2)

3) Incentives would assist property owners or managers with overcoming a wide array of market and financial barriers which may otherwise prevent energy efficiency upgrades (Barrier 1, 5)

4) Create a single point of contact that would assist the property owner or manager navigate through the incentive and retrofitting process. This approach would provide support in understanding the various program rules and assistance in determining eligibility. The property owner or manager would be guided through an easy and streamlined preliminary assessment to establish feasibility and estimate project cost for the *Multifamily Path*, with an eye toward leveraging all eligible programs. (Barrier 4)

5) Target buildings planning on or undergoing renovation projects to limit customer time burden and lost rental income. (Barrier 4, 5)

6) Multifamily sector is comprised of a wide diversity of properties which can be segmented by: 1.) rental rate (low – medium – or high; and/or 2.) size of the building and also size of the company that owns or manages the building. Defining the unique concerns and needs of building owners and managers by these variables of tenant socio-economic status and ownership/management structure will allow much more effective messaging and marketing communications. (Barrier 1, 2, 3, 4, 7)

7) On Bill Financing or Repayment program which could be focused on the tenant or the common property energy agendas. This program will provide access to capital to fund investments in energy efficiency upgrades for buildings at an attractive interest rate. (Barrier 2, 3, 7)

**5) A coherent program or “market” logic model**

The WHUP is designed to use a market transformation framework to pull in new measures and push out the mature measures. The diagram below describes this iterative process.

The Whole House Program will be serving both homeowners and property owners/managers, with the intent to coordinate its program activities with the low-income program to meet special needs. Like the other market transformation programs, the Whole House program, will work with Emerging Technology (I), Plug

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Load & Appliance, Residential HVAC Programs and other residential programs to leverage new and innovative technologies and applications, while pruning more mature technologies and applications from program offerings. These program interactions are described in the Whole House Program Key Support Activity Process Diagram below. These interaction and coordination decisions will be facilitated by IOUs' Decision Panel (A) as indicated in the logic model.

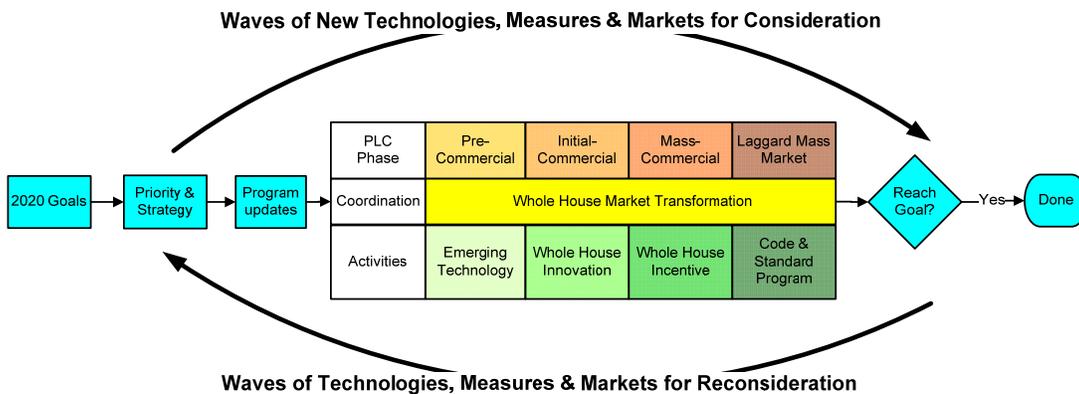

To reduce market barriers, the program's activities are designed to "get the word" out about the benefits of comprehensive retrofits through both mass marketing (D) as well as ground-up individual outreach for neighborhoods and communities (C), by working with local governments and entities. To help property owners understand their energy consumption profile (E), the participants will be encouraged to use a Energy Advisor survey (E) to gauge the overall consumption profile prior to making retrofit decisions, thus respecting the load order of implementation cost effectiveness, and to engage and motivate additional behavior-oriented energy efficiency and conservation actions. To ease the financial burden of the project cost and investment, the program will make financing packages and information available to prospective participants (G).

The program recognizes the importance of having a pool of qualified and competent contractors available to meet the market needs (J & O). The program offers BPI certification training as well as participating contractor ongoing training and mentoring to meet the needs of the workforce and program quality control requirements. This increase in the quality and the quantity of the labor pool, will contribute to contractors' performing projects, outside of the program, to meet deep energy retrofit needs, leading to non-participant spillover effects (R, S & V).

The expected outcome of this program includes increased and improved awareness, knowledge and attitude (AKA) of homeowners and apartment owners towards understanding the benefits of deep energy retrofits (P). After realizing these benefits from program participation, the participant further enjoys other non-energy benefits such as improved comfort of the house and increased value of their properties. The increased value in the property will become more pronounced as the state finalizes its home rating system, so the home purchasers will be aware of the inherent value of properties complete with deep energy reduction retrofits (U). All of these benefits will help the program participants to continue property improvements outside of the program and outside of the program offerings, leading to spillover effects (T). These participant and non-participant spillover effects will eventually change the overall composition of the housing stock at the market level, making housing and building code ratcheting possible for society (X & Y). These codes and standards changes will lead to further reduction of energy consumption at the market level leading to fulfilling the objectives of the California Long-Term energy and environmental policies (AA).

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

For the benefit of readers, the associated Program Performance Metrics (PPMs) and appropriate Market Transformation Indicators (MTIs) are identified in this logic model. Additional key program support activities are diagrammed as a process diagram for further illustration. The Whole House program will have the option to conduct additional pilots/trials to test technologies, applications or other programmatic design and marketing possibilities. The learning from those activities is expected to contribute to the program innovation and further learning.

Within this context, a decision making body, the IOUs Decision Panel, is formed to manage and guide this process. (Please refer to logic model & activities below)

**6) Appropriate evaluation plans, corresponding Market Transformation Indicators and Program Performance Metrics based on the program logic model**

Due to the need to comply with the Decision’s timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

**Summative evaluation:** Market Effects. The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program “spillover” and market effects: spillover is energy savings not

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

**Program Performance Metrics:**

*This information can be found in Table 3 PPM Information to be provided as an Excel Attachment to this PIP*

**Market Transformation Indicators:**

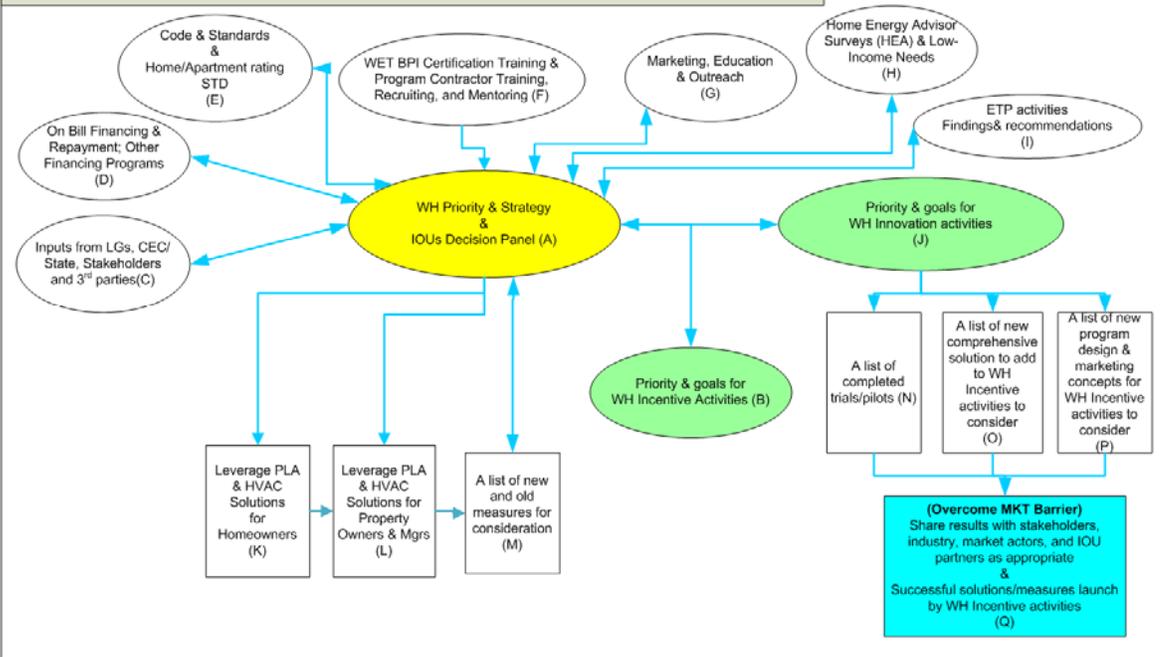

DeepRetrofit-2 The number of households that elect to perform comprehensive energy upgrades.

Market transformation indicator results shall be reported, as available, by Energy Division or the IOUs, depending upon who conducts the necessary market studies. (Res. 4385, 12/2/10)

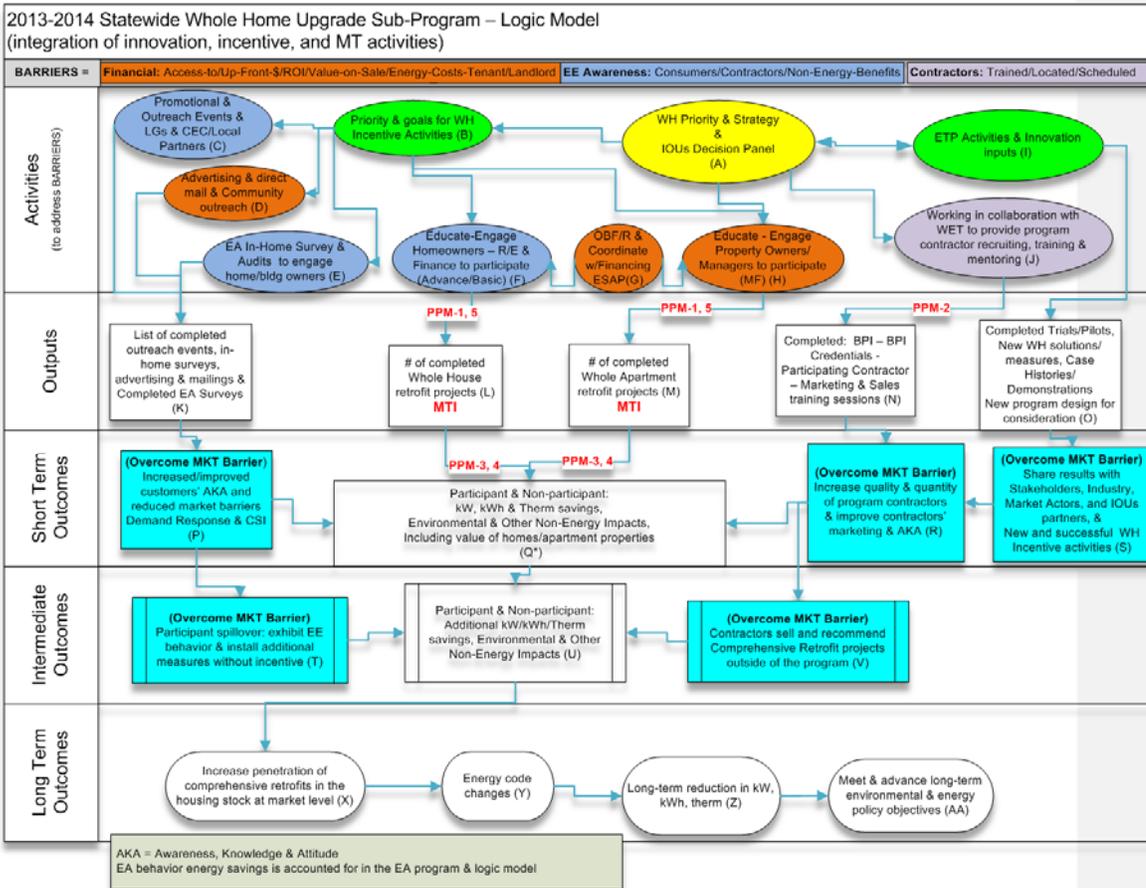

**Attribution.** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Prahl (MT Workshop, Nov 2011) suggest that declaring the program’s strategic intent through the market transformation initiative’s theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

**2013-2014 Whole Home Upgrade Sub-Program Key Support Activities  
– Process Diagram**

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

### 12) Additional information as required by Commission decision or ruling or as needed:

Include here additional information as required by Commission decision or ruling (As applicable. Indicate decision or ruling and page numbers):

### IOU Streamlined Emergency Replacement Protocol and Streamlined High Performing Contractor Protocol

#### 1. SDG&E

##### a. Streamlined Emergency Replacement Protocol

Per section 7 of SDG&E's QA/QC Quality Assurance and Quality Control Plan:

7.0 Emergency Replacement of Major Systems

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- 7.1 *It is recognized that there may be instances whereas immediate replacement of major systems is required due to health, safety and quality of life circumstances. In the event the customer has immediate need for equipment replacement, the QA/QC process will not interfere with a customer's ability to participate in the WHUP.*
- 7.1.1 Major systems that qualify under this provision are identified as:
- a. HVAC Systems or components
  - b. Hot water heater replacements
- 7.1.2 In the event that a contractor wishes to install a major system identified herein under the provisions of an emergency replacement, the contractor shall contact and notify the QA/QC vendor immediately of the customer's emergency situation and to request accommodation under this provision. The QA/QC provider will determine if the circumstances warrant this provision.
- a. The contractor will provide the QA/QC the customer contact information, make/model/serial numbers of existing equipment and date the replacement will be installed.
  - b. The QA/QC vendor may field-verify the equipment to be replaced.
  - c. The contractor can proceed with emergency work.
  - d. To include the emergency work as part of any WHUP project scope, contractors must follow all other procedures for participation in the WHUP program.
  - e. Any and all changes to the home prior to submitting a Pre-Retrofit Project Submittal Package shall be only for the immediate emergency need pre-approved by the QA/QC vendor and must be documented in the Pre-Retrofit Project Submittal Package.
  - f. All other project scope work outside of the approved emergency work must go through the standard QA/QC process as defined in this plan.

**b. Streamlined High Performing Contractor Protocol**

Per SDG&E's Quality Assurance and Quality Control Plan, SDG&E QA Review turnaround times are guaranteed to be 3 working days or less for both pre and post QA Review (desktop). This time period is consistent with state contracting laws concerning consumer's 72 hr. right to rescind.

Tier 3 contractors, meaning those contractors who have successfully completed a minimum of 30 projects are eligible for random QC Inspection sampling rate of 10% pre and 5% of post project submittals.

In essence this means that high performing contractors with at least 30 projects will have 90% of their pre project submittals and 95% of post project submittals reviewed within 3 working days.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**2. PG&E**

**a. Streamlined Emergency Replacement Protocol**

The following process that is already in place in 2012 serves the purpose of both an emergency replacement protocol, as well as a Fast Track process for all participating contractors in good standing.

The general policy for all equipment replacements performed within the PG&E program is that participating contractors and their subcontractors should wait for a Notice to Proceed to be issued before commencing work on a job for the program. However, in order to proceed with emergency replacements or expedited upgrades due to customer specific needs, contractors may proceed within the guidelines of this Fast Track Process. In order to be eligible for this Process, participating contractors must be active and in good standing under the PG&E program.

Upgrades may be started before the Notice to Proceed is issued if the participating contractor is confident that the job qualifies for the Program. Prior to adjusting or installing measures, the contractor must perform a comprehensive test-in, including combustion safety testing, to document the pre-existing conditions. The contractors should take pictures to document uncommon or unique situations.

Participating contractors that choose to perform work without the Notice to Proceed accept full liability that the rebate funds have not been reserved and that their customers may not be eligible.

In order to make the Fast Track Process work for participating contractors and their customers, the PG&E program recommends that the contractors do the following:

- Ask for a copy of recent PG&E bill to validate that the customer has an active account and have a clear understand the Program eligibility requirements.
- Make sure to understand how to use and model homes in EnergyPro proficiently to reduce the chance of error in rebate calculation or delayed application processing.
- If providing a rebate estimate, make it clear in the proposal that it is based on the un-validated energy model savings and may change after the quality control review process.
- Participate in the Process after completing at least 10 upgrades without desktop or field QA issues.
- Submit the application as soon as possible to ensure timely payment to the customer.

**3. SCE**

**a. Streamlined Emergency Replacement Protocol**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Southern California Edison & Southern California Gas Emergency Equipment Replacement Policy for HVAC/DHW System**

Due to the climate of Southern California, during the first few months of summer and winter there is a rise in the volume of HVAC emergency replacements driven by homeowners re-engaging their HVAC systems after periods of non-use. Participating Contractors will be involved in these replacements and they have the opportunity to inform homeowners of the additional benefits of the Program. The Emergency Equipment Replacement Policy for HVAC/DHW Systems allows homeowners to take credit for energy savings from emergency equipment replacement provided **all of the following conditions are met.**

**Eligibility**

1. The homeowner meets all mandatory *Advanced Path* program requirements as described in the Advanced Package Minimum Specifications and this Emergency Equipment Replacement Policy for HVAC/DHW Systems.
2. The space heating and/or domestic hot water system must have been 'red tagged' or deemed unsafe by the utility, service technician or building inspector; or the system has failed, cannot be repaired and must be replaced.
3. The contractor submits the completed Record of Emergency Equipment Replacement Form within the timelines indicated in the Notification/Authorization Requirements section.

**Note:** In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

**Notification/Authorization Requirements**

To submit notification and receive authorization to proceed for an eligible emergency equipment replacement, the following steps must be followed:

**Step 1: Submit for Pre-Replacement Approval**

1. The contractor is required to submit a Record of Emergency Equipment Replacement Form.
2. The contractor is required to complete Sections 1 – 4 of the Record of Emergency Equipment Replacement Form, sign and date the customer/contractor signature section, provide detailed photographic evidence of the existing equipment installed in the residence (clearly showing the area around the existing unit) to include nameplate information (make, model, serial number, etc) and then provide a scanned copy in .PDF format to [EUCA\\_Processing@icfi.com](mailto:EUCA_Processing@icfi.com).
3. Upon receipt of the completed form, ICF will provide written notification of Authorization to proceed via e-mail to the contractor within one business day (8-10 business hours).

**Step 2: Receive Authorization to Proceed**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Upon Authorization to proceed the contractor may commence installation of the new HVAC and/or DHW equipment.

**Step 3: Complete Emergency Replacement and Submit Final Paperwork**

1. Upon completion of the installation of the new equipment the contractor shall complete Section 5 of the Record of Emergency Equipment Replacement Form, sign and date the customer/contractor signature section, detailed installation invoice, and then provide a scanned copy in .PDF format to ICF ([EUCA\\_Processing@icfi.com](mailto:EUCA_Processing@icfi.com)) within five (5) business days of the new equipment installation. If measures installed exceed the scope of written authorization given, credit will not be given for those additional measures. If the paperwork is not received within those 5 business days, the final decision to allow the credit for the installed equipment will be at the sole discretion of Program Management and will not be able to be appealed.
2. The Incentive Reservation Form must be turned into the Program within 30 calendar days of Emergency Equipment Replacement Approval. Failure to do so will result in not receiving credit for installed equipment.

While age, size and efficiency of the existing system are a factor, it shall not be the sole determining factor for selection of equipment replacement. Best practices dictate that any replacement of central heating or cooling systems require submittal of a Manual J load calculation and must take into account all existing and/or proposed energy efficiency measures that will significantly impact load and allow for correct equipment sizing.

If HVAC re-ducting is required in this emergency, the pre-retrofit building simulation model will automatically use the default vintage default tables for total duct leakage. This percentage is not able to be contested, should an appeal situation arise.

**Mandatory Documentation for Emergency Space Heating Equipment Replacement**

The contractor shall provide information about the existing equipment being removed utilizing the Record of Emergency Equipment Replacement Form. At a minimum, the information collected regarding the existing space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of removal
- Reason for replacement (operational failure; health and safety)
- Manufacturer's name and model number of space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Type of venting (e.g. chimney, side vent, barometric damper)

The existing space heating equipment must be replaced with equipment meeting the Advanced Package Minimum Specifications. New gas-fired furnaces must have an Annual Fuel Utilization Efficiency (AFUE) of 92% or greater to qualify under the Emergency Replacement Policy for HVAC Equipment.

The contractor shall provide a copy of the invoice for the new space heating equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed with the new equipment installation. At a minimum, the invoice for the new space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of installation
- Manufacturer's name, model and serial number of new space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)
- Type of venting (e.g. chimney, side vent, barometric damper)

While replacing the space heating equipment, this may be an opportunity to also replace the central air conditioner with a higher efficiency model. The existing equipment must be replaced with equipment meeting the requirements listed in the Advanced Package Minimum Specifications. Contractor will need to supply the following information about both the new and existing air conditioning unit:

- Contractor's business name, address and phone number
- Date of installation
- Reason for replacement (operational failure; health and safety; Other, please explain)
- Manufacturer's name and model number of cooling equipment
- Type of system (central air, heat pump )
- Rated efficiency (SEER, HSPF), unit size, and cooling output from the nameplate

**Mandatory Documentation for Domestic Hot Water Equipment Replacement**

The existing domestic hot water system must be replaced with equipment meeting Advanced Package Minimum Specifications. In addition, new domestic hot water heaters must have an Energy Factor (EF) of 0.62 or greater, and new domestic tankless hot water heaters must have an Energy Factor (EF) of 0.82 or greater to qualify under the Emergency Equipment Replacement Policy.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The contractor shall provide a copy of the invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed with the new equipment installation. At a minimum, the invoice for the new domestic hot water equipment shall include the following:

- Manufacturer's name and model number of domestic hot water equipment
- Type of system (gas, electric )
- Rated efficiency (energy factor)
- Unit size (gallons)
- Input from the nameplate (Btu's)

**Mandatory Requirements for Emergency Equipment Replacement Approval**

Once administrative approval and written authorization to proceed is granted, the contractor may immediately install the individual measures if the following conditions are met:

1. Provide photographic evidence of the existing system installed in the residence clearly showing the area around the existing unit and detailed pictures of the existing equipment to include nameplate information (make, model, serial number, etc.).
2. The contractor shall provide a copy of the Invoice for the new space heating and/or cooling equipment and the completed Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).
3. The contractor shall provide a copy of the Invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).

In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

**b. Streamlined High Performing Contractor Protocol**

Contractors who have completed 10 Basic or 10 Advanced projects and have completed all of their field mentoring and online learning center modules with a passing score can be eligible for their projects to be sampled instead of being selected for 100% pre and post on-site inspection.

**4. SoCalGas**

**a. Streamlined Emergency Replacement Protocol**

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Southern California Gas Emergency Equipment Replacement Policy for HVAC/DHW System**

Due to the climate of Southern California, during the first few months of summer and winter there is a rise in the volume of HVAC emergency replacements driven by homeowners re-engaging their HVAC systems after periods of non-use. Participating Contractors will be involved in these replacements and they have the opportunity to inform homeowners of the additional benefits of the Program. The Emergency Equipment Replacement Policy for HVAC/DHW Systems allows homeowners to take credit for energy savings from emergency equipment replacement provided **all of the following conditions are met.**

**Eligibility**

1. The homeowner meets all mandatory *Advanced Path* program requirements as described in the Advanced Package Minimum Specifications and this Emergency Equipment Replacement Policy for HVAC/DHW Systems.
2. The space heating and/or domestic hot water system must have been 'red tagged' or deemed unsafe by the utility, service technician or building inspector; or the system has failed, cannot be repaired and must be replaced.
3. The contractor submits the completed Record of Emergency Equipment Replacement Form within the timelines indicated in the Notification/Authorization Requirements section.

**Note:** In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

**Notification/Authorization Requirements**

To submit notification and receive authorization to proceed for an eligible emergency equipment replacement, the following steps must be followed:

**Step 1: Submit for Pre-Replacement Approval**

1. The contractor is required to submit a Record of Emergency Equipment Replacement Form.
2. The contractor is required to complete Sections 1 – 4 of the Record of Emergency Equipment Replacement Form, sign and date the customer/contractor signature section, provide detailed photographic evidence of the existing equipment installed in the residence (clearly showing the area around the existing unit) to include nameplate information (make, model, serial number, etc) and then provide a scanned copy in .PDF format to [EUCA\\_Processing@icfi.com](mailto:EUCA_Processing@icfi.com).
3. Upon receipt of the completed form, ICF will provide written notification of Authorization to proceed via e-mail to the contractor within one business day (8-10 business hours).

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Step 2: Receive Authorization to Proceed**

Upon Authorization to proceed the contractor may commence installation of the new HVAC and/or DHW equipment.

**Step 3: Complete Emergency Replacement and Submit Final Paperwork**

1. Upon completion of the installation of the new equipment the contractor shall complete Section 5 of the Record of Emergency Equipment Replacement Form, sign and date the customer/contractor signature section, detailed installation invoice, and then provide a scanned copy in .PDF format to ICF ([EUCA\\_Processing@icfi.com](mailto:EUCA_Processing@icfi.com)) within five (5) business days of the new equipment installation. If measures installed exceed the scope of written authorization given, credit will not be given for those additional measures. If the paperwork is not received within those 5 business days, the final decision to allow the credit for the installed equipment will be at the sole discretion of Program Management and will not be able to be appealed.
2. The Incentive Reservation Form must be turned into the Program within 30 calendar days of Emergency Equipment Replacement Approval. Failure to do so will result in not receiving credit for installed equipment.

While age, size and efficiency of the existing system are a factor, it shall not be the sole determining factor for selection of equipment replacement. Best practices dictate that any replacement of central heating or cooling systems require submittal of a Manual J load calculation and must take into account all existing and/or proposed energy efficiency measures that will significantly impact load and allow for correct equipment sizing.

If HVAC re-ducting is required in this emergency, the pre-retrofit building simulation model will automatically use the default vintage default tables for total duct leakage. This percentage is not able to be contested, should an appeal situation arise.

**Mandatory Documentation for Emergency Space Heating Equipment Replacement**

The contractor shall provide information about the existing equipment being removed utilizing the Record of Emergency Equipment Replacement Form. At a minimum, the information collected regarding the existing space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of removal
- Reason for replacement (operational failure; health and safety)
- Manufacturer's name and model number of space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)
- Type of venting (e.g. chimney, side vent, barometric damper)

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

The existing space heating equipment must be replaced with equipment meeting the Advanced Package Minimum Specifications. New gas-fired furnaces must have an Annual Fuel Utilization Efficiency (AFUE) of 92% or greater to qualify under the Emergency Replacement Policy for HVAC Equipment.

The contractor shall provide a copy of the invoice for the new space heating equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed with the new equipment installation. At a minimum, the invoice for the new space heating equipment shall include the following:

- Contractor's business name, address and phone number
- Date of installation
- Manufacturer's name, model and serial number of new space heating equipment
- Rated efficiency, output, input from the nameplate
- Fuel type (natural gas, electric)
- Type of system (forced air, hydronic/radiant or combo)
- Type of venting (e.g. chimney, side vent, barometric damper)

While replacing the space heating equipment, this may be an opportunity to also replace the central air conditioner with a higher efficiency model. The existing equipment must be replaced with equipment meeting the requirements listed in the Advanced Package Minimum Specifications. Contractor will need to supply the following information about both the new and existing air conditioning unit:

- Contractor's business name, address and phone number
- Date of installation
- Reason for replacement (operational failure; health and safety; Other, please explain)
- Manufacturer's name and model number of cooling equipment
- Type of system (central air, heat pump )
- Rated efficiency (SEER, HSPF), unit size, and cooling output from the nameplate

**Mandatory Documentation for Domestic Hot Water Equipment Replacement**

The existing domestic hot water system must be replaced with equipment meeting Advanced Package Minimum Specifications. In addition, new domestic hot water heaters must have an Energy Factor (EF) of 0.62 or greater, and new domestic tankless hot water heaters must have an Energy Factor (EF) of 0.82 or greater to qualify under the Emergency Equipment Replacement Policy.

The contractor shall provide a copy of the invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of written authorization to proceed

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

with the new equipment installation. At a minimum, the invoice for the new domestic hot water equipment shall include the following:

- Manufacturer's name and model number of domestic hot water equipment
- Type of system (gas, electric )
- Rated efficiency (energy factor)
- Unit size (gallons)
- Input from the nameplate (Btu's)

**Mandatory Requirements for Emergency Equipment Replacement Approval**

Once administrative approval and written authorization to proceed is granted, the contractor may immediately install the individual measures if the following conditions are met:

1. Provide photographic evidence of the existing system installed in the residence clearly showing the area around the existing unit and detailed pictures of the existing equipment to include nameplate information (make, model, serial number, etc.).
2. The contractor shall provide a copy of the Invoice for the new space heating and/or cooling equipment and the completed Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).
3. The contractor shall provide a copy of the Invoice for the new domestic hot water equipment and the Record of Emergency Equipment Replacement Form to their dedicated account manager within 5 business days of the installation of the new equipment (if applicable).

In the event the customer/contractor fail to meet the timelines indicated the project runs the risk of not being able to include the energy savings from the installation of the new equipment in the energy simulation (Energy Pro) model.

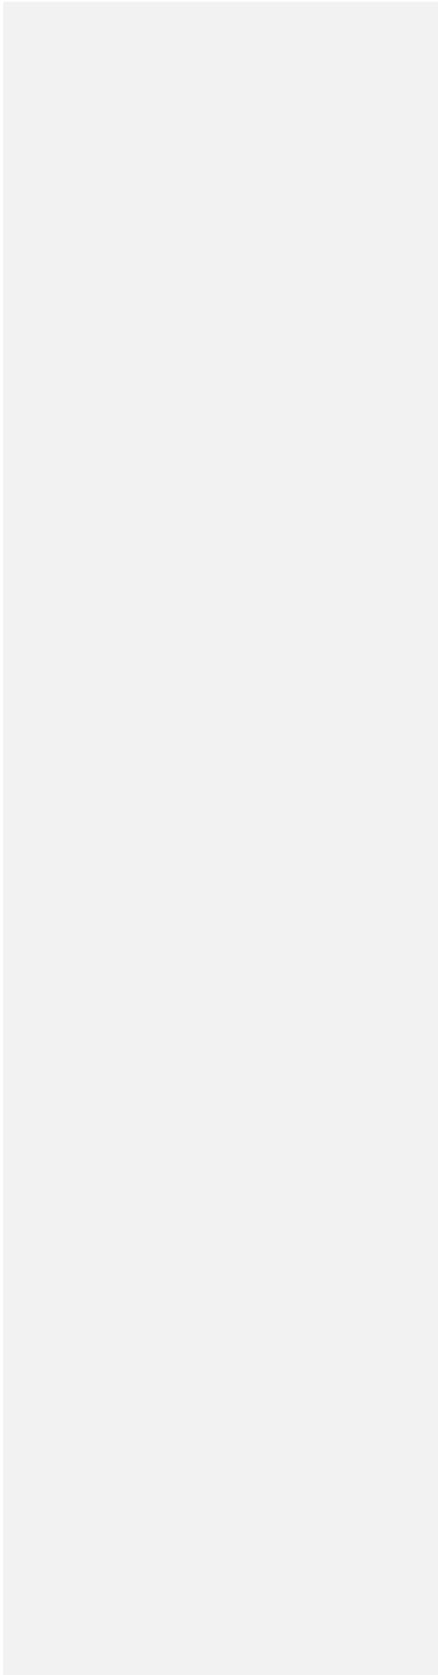

**b. Streamlined High Performing Contractor Protocol**

SoCalGas follows the Home Performance with ENERGY STAR® guidelines for QA/QC protocols. Since the implementation of the SoCalGas EUC Program, SoCalGas has established an adjustable onsite inspection rate for contractors based on job experience and performance.

SoCalGas conducts onsite inspections, at set inspection rates, of the work of all participating contractors. This inspection rate is reduced as the contractor gains experience in the program and as onsite inspections show the contractor is performing at a satisfactory level per program requirements. See chart below

- a. Tier 1 Contractor- 60% onsite inspection of first five project
- b. Tier 2 Contractor- 27% onsite inspection of next 15 projects
- c. Tier 3 Contractor- 5% onsite inspection after 20th project

**4. Program Description**

~~a) Program name~~

~~Residential HVAC Subprogram~~

~~Residential Quality Maintenance and Residential Quality Installation will be a program promoted externally to customers and contractors as the AC Quality Care Program. The HVAC Industry Task Force is named the Western HVAC Performance Alliance.~~

~~b) Describe Program~~

~~The Residential HVAC Program is a Statewide program that will continue the transformation process of California's HVAC market to ensure that:~~

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- The above changes lead to sustained profitability for HVAC trade allies as the business model for installing and maintaining heating and cooling systems changes from a commodity-based to a value-added service business.

The IOUs propose building towards this vision for HVAC by implementing a comprehensive set of downstream and midstream strategies that builds on existing program, education, and marketing efforts and leverages relationships within the HVAC industry to transform the market towards a sustainable, quality driven market. Through this Statewide HVAC Program and a Statewide HVAC Industry Leadership Task Force (Western HVAC Performance Alliance), we will gain a better understanding of the market response to our programs, as well as the behavioral implications of the various market participants, and then actively revise/update strategies and programs accordingly, as guided by the California Long-term Energy Efficiency Strategic Plan (Strategic Plan).

The IOUs cross-sector collaborative activities and information-sharing tools that have been developed through the 2010-2012 Statewide HVAC programs will be discontinued.

Formatted: Indent: Left: 0.5"

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

These programs were distributed in the Residential, Commercial, WE&T and Emerging Technologies Statewide programs. The Quality Maintenance, Quality Installation Development, and HVAC Core (Western HVAC Performance Alliance) programs will be implemented under this Residential HVAC Subprogram.

Market transformation and direct energy savings and demand reductions will be achieved through a series of sub-programs that are described in detail and summarized below:

**Residential HVAC Quality Maintenance**

Residential HVAC Quality Maintenance program represents one of the more creative aspects of the HVAC “Big Bold Energy Efficiency Strategy.” It is based on the assumption that there are energy and demand savings achievable through the regular application of quality maintenance (QM) procedures applied to existing residential HVAC equipment. This program intends to (1) quantify those potential savings and (2) develop and implement a residential maintenance program. This program will be focused on comprehensive, continuously improving O&M activities that capture energy savings and provide a high value to the end-user thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan.

**Residential HVAC Quality Installation Development**

Residential Quality Installation Development is applicable to quality installation (QI) of split or packaged HVAC systems, with a rated capacity up to 65,000 BTU/H. This Residential sub-program element is based on the assumption that energy and demand savings are achievable through the application of QI in accordance with appropriate industry standards (e.g., ACCA, SMACNA and ASHRAE) applied to new HVAC equipment.

This sub-program intends to:

- Collaborate with EM&V efforts to quantify those potential savings;
- Develop and implement a sub-program focused on comprehensive, continuously improving installation activities that capture those savings and provide a high return on investment to the end-user, thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan;
- IOU’s will continue to development in 2013. The sub-program will be developed in collaboration through stakeholder input from the HVAC industry.

For SDG&E the Quality Maintenance and Quality Installation program may be implemented by a third party through a competitive bid process for the purpose of soliciting innovative ideas and proposals for improved portfolio performance.

e)b)            List of Measures

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

To achieve the market transformation desired by the Strategic Plan, a variety of appropriate financial and non-financial incentives is required to influence specific market actions. Incentives will be targeted to services including Quality Maintenance and Quality Installation Development.

**Residential HVAC Quality Maintenance**

In support of both the market transformation and the energy resource savings goals of the program, rebates are available for specific measures. The intention of these rebates is to help offset the extra cost of providing a higher quality comprehensive service performed in accordance with the ACCA 4 industry standard for Quality Maintenance. Additionally, in coordination with the Emerging Technologies Program, the Residential HVAC QM program will continue to consider higher initial incentives for any HVAC emerging technologies that may be newly introduced to the market place via this program. Once the new products have taken hold in the market place, such incentives would be adjusted to reflect market conditions. The current set of measures is as follows:

**Table A – List of Residential Quality Maintenance Measures**

<b>Measure</b>	<b>Prerequisite</b>	<b>Measure Requirements</b>	<b>Range</b>
<b>QM-Standard Basic Assessment</b>	No prerequisite measures.	Must cover all the steps included in the Assessment Process, including a conversation with customer about their goals and concerns.	<b>\$ 50.00</b>
	All measures must be performed by a participating contractor's qualified technician.	Must include a report with a written estimate for work required to meet standard.	
<b>Advanced Air Flow Correction</b>	Completion of the Assessment	Must address any deficiencies in air flow per the standards identified in the Assessment process.	<b>\$ 250.00</b>
<b>Blower Motor Retrofit</b>	Completion of the Assessment	The installed motor model must be a direct drive, permanent magnet, and constant speed motor.	<b>\$ 150.00</b>
<b>Refrigerant System Service</b>	Completion of the Assessment and Air Flow Correction	Work must meet the protocols covered in training and is expected to be incorporated into a software tool.	<b>\$50 to \$100</b>
		Must be done when weather conditions will support accurate results.	
		Must be done within eight months of completion of Air Flow Correction work (the delay is allow time for proper weather conditions to resume).	

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>QM-Standard Preventive Maintenance Agreement</b>	Completion of the Assessment • Completion of either Air Flow Correction or Blower Motor Retrofit	The optional standard service agreement must include the provided Service Agreement QM Addendum. • The optional agreement must cover at least one year of service with two seasonal visits.	<b>\$ 50.00</b>
---	---	--	---------------------

**Residential HVAC Quality Installation Development**

At this point, providing a list of measures and incentive levels is premature, as a valid quality installation based sub-program must be well planned and vetted through the Western HVAC Performance Alliance (WHPA). This sub-program will be designed during 2012 and 2013 for the 2013-2014 program cycle and therefore will not be providing incentives, at least not initially.

c) List Non-incentive Customer Services

**Residential HVAC Quality Maintenance**

- Education of the market on the value of selecting high-efficiency systems.
- Reports for customers of estimated energy savings, cost savings and carbon reductions for their HVAC systems treated under the program.
- Training for contractors on HVAC industry standards, sales and marketing of the value of those standards, and their implementation in the field.
- Education for customers on how HVAC industry standards can help them compare bids of contractor services and select those with high-road skills.
- Customer education about the benefits of establishing a long-term trust relationship with a qualified contractor, which can lead to future energy and cost savings, such as from better planning for future HVAC system replacements and the quality installation of those systems when replaced.
- Improved comfort and indoor air quality for customers.

**Residential HVAC Quality Installation Development**

This sub-program development process will be performed with HVAC industry involvement to ensure that:

- The measures eventually included in the program can be reasonably assured to save energy and lower peak demand;
- A clear value proposition can be demonstrated so that contractors will see the path for a profitable business opportunity based on QI and customers will understand the benefits of equipment maintained at a higher level of quality;
- An effective training program will be put in place to ensure that technicians can properly implement QI services;
- The processes employed will document that work performed in the field meets minimum program quality control standards and can be validated.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- The initial QI efforts will focus on uncovering the root causes, rectifying design and implementation shortcomings, determine realistic energy savings estimates, and then launch program incentives.

The following non-incentive services will be offered through this sub-program:

- Active enrollment and promotion of qualified contractors
- IOU promotion of QI through the Whole-Home Upgrade subprogram and other customer marketing.
- Contractor training on quality installation practices, selling and marketing QI, service management of QI, etc.
- If incentives are offered for energy savings and the measures are cost effective, the program will comply with Senate Bill 454 on HVAC permit acquisitions with the work completed by a licensed contractor.
- The program will retain appropriate combustion safety testing and other procedures to ensure customer safety.

**Western HVAC Performance Alliance Activities**

The program will be active in a number of additional non-resource activities. These activities are required to ensure that the HVAC industry is fully involved in the development and implementation of the many tactics required to address the short and long-term goals of the Strategic Plan. One such non-resource activity is an Western HVAC Performance Alliance that will be initially chartered and funded by the IOUs. The Western HVAC Performance Alliance is necessary to keep the industry engaged in the Strategic Plan process and to provide guidance and support for the implementation of the various tactics required to transform the industry. Mindful that HVAC industry organizations are not traditionally structured or staffed, and have not traditionally allocated enough resources to achieve the level of involvement envisioned by the Strategic Plan, the HVAC Convener's Report concluded that: *"The agencies and utilities should work together to ensure the working group is adequately funded to meet its responsibilities."*<sup>41</sup>

It is envisioned that this Western HVAC Performance Alliance will involve high-level HVAC industry stakeholders, such as manufacturers, distributors, contractors, associations, organized labor and influential end-user customers—to coordinate industry sponsorship of and participation in HVAC strategies. Membership should also include other key players, including the CPUC, the California Energy Commission (CEC), utilities, building owners/managers, university researchers, consumers, and the Federal Government. The Western HVAC Performance Alliance will be charged with establishing and prioritizing a substantial IOU-funded response (recognizing the roles of other appropriate organizations including CEC, the publicly-owned utilities, and local governments) to the activities described in the suite of IOU-proposed HVAC Programs — both utility administered programs and third-party administered programs which focus

---

<sup>41</sup> HVAC Convener's Report, Appendix B.5, Pg 10.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

on HVAC efficiency — resulting in a structured roadmap with specific actions, schedules, and the technical and financial resources identified to initiate near-term, mid-term and long-term issue resolution.

The Western HVAC Performance Alliance will provide the necessary guidance to both California and the western U.S. so that the many issues required to transform the industry can be prioritized and facilitated by the IOUs and the WCEC (as described in the HVAC Technologies and System Diagnostics Advocacy sub-program).

Some of the actions of the Western HVAC Performance Alliance may include:

- Recommending guidelines that would make it possible for IOUs to directly contract with existing HVAC industry institutions (e.g., associations, societies, conference hosts, and the trade press) through a rigorous Request For Quotation (RFQ) or similar processes to implement specific aspects of IOU-administered energy efficiency programs.
- Making recommendations for standards and qualification guidelines for trainers and educators who receive funding from the IOUs.
- Update the “HVAC Action Plan” that prioritizes specific actions required to address the Strategic Plan.
- Formally reaching out to utilities in neighboring states, including Arizona, Colorado, Nevada, New Mexico, and Utah, and energy organizations in the Pacific Northwest, to involve them in the overall planning and implementation processes.
- Identifying for inclusion in the HVAC Action Plan other HVAC technical work underway through the existing IOU programs, CEC/EPIC-BERG, LBNL, HVAC industry vendors, and others inside and outside California. Much of this work is continuing in a fragmented way. A cohesive planned and prioritized framework and action is needed.
- Channeling appropriate HVAC work through the existing IOU program framework, on a fully-planned basis, not on an *ad hoc* basis.
- Integrating all efforts as appropriate with the current and out year work plans of the WCEC.
- Integrating the suite of demand response/demand side management (DR/DSM) options that are already considered in utility DR/DSM programs as well as additional solutions that are emerging for residential and small commercial markets.
- Create a sustainable governance of the Western HVAC Performance Alliance to assist in meeting the deliverables of the CLTEESP and HVAC Action Plan.

**5) Program Rationale and Expected Outcome**

a) ~~a)~~ **Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Quality Maintenance Program (Resolution E-4385, Appendix A, pp 35-36):

**Table 3 – Residential HVAC Quality Maintenance**

<b>Program</b>	<b>Metric</b>	<b>Metric Type</b>
<i>Residential Quality Maintenance</i>	1. Measured progress towards specific milestones provided in the project GANTT chart indicating the development/finalization of this IOU program based on Quality Maintenance standards.	2a

**Residential HVAC Quality Installation Development**

<b>Program</b>	<b>Metric</b>	<b>Metric Type</b>
<i>Residential Quality Installation Development</i>	1. Percentage of HVAC contracting companies that are participating in statewide residential QI program as a share of the targeted market*  * "Target market" defined as C20 licensed HVAC contracting companies in CA.	2a

**b) Market Transformation Information**

MTI Language – Based on the email received from Carmen Best on 6/19, we have updated the language for all PIPs with MTIs as follows:

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

Market Transformation metrics should neither be used for short-term analyses nor for specific program analyses; rather, should focus on broad market segments. Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>42</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>43</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>44</sup>. Markets are social institutions<sup>45</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>46</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>47</sup>. According to York<sup>48</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are 3 ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate - particularly

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>49</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>50</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>51</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>52</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)"<sup>53</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>54</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>55</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look forward to working with the CPUC and all stakeholders to help

---

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>56</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Historically, the nonresidential retrofit programs have had very low uptake rates on high-efficiency HVAC systems. Consequently, a first step towards market transformation is to do what it takes to achieve a high level of program participation, thereby increasing market share of high-efficiency equipment sales and quality installations. An initial increase in market share allows for increased levels of customer, installer, and distributor/manufacturer knowledge and interest in these systems, which should make further increases easier. In addition, tracking the ratio of certified HVAC technicians in the field, over time, can provide a gauge of the likelihood for quality installations and maintenance.

c) **Program Design to Overcome Barriers**

**Residential HVAC Quality Maintenance and Residential HVAC Quality Installation Development**

The program addresses the following barriers:

Recent data available from AHRI indicates that as a result of the 2006 increase in federal residential equipment efficiency standards, which increased equipment costs significantly, unitary equipment sales have dropped while repairs to existing systems (low efficiency compressor replacement) have increased nationwide by more than 25 percent and window unit sales have increased by a similar amount. A similar trend occurred in 2002 when ENERGY STAR® increased its qualifying efficiency level to Seasonal Energy Efficiency Rating (SEER) 13. Prior to the change, ENERGY STAR® Central Air Conditioner (CAC) sales had an average market share of 33 percent<sup>57</sup>. After the change, the average market share of ENERGY STAR® units fell to 7 percent. Additionally, recent studies indicate that 30 to 50 percent of existing systems have not been installed properly. Further, Title 24 compliance rates for

<sup>56</sup> Pelozo & York, (1999).

<sup>57</sup> Itron, "California Residential Efficiency Market Share Tracking," 2006, pp.3-6.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

replacement systems are approximately 10 percent<sup>58</sup>. The net effect of this market failure is a 20 to 30 percent increase in space energy use<sup>59</sup>.

- **Lack of awareness:** By demonstrating the energy efficiency benefits of QI/QM, the benefits of QI/QM will be better understood by program participants. It is our goal to discover the evidence, and expected return on investment, that customers will require to authorize payment for these measures (and those premium measures that prove to outperform the QI/QM ANSI standards) when subsidies are removed.
- **Performance uncertainties:** Much research has been conducted on the energy savings achievable through HVAC system maintenance measures such as RCA and Duct Sealing, but despite all this research many performance uncertainties still exist. The implementation of this program with an increasing set of customers and the corresponding EM&V efforts shall be coordinated through the HVAC EM&V Project Coordination Group (PCG).
- **Asymmetric Information:** Delivering QI/QM training opportunities through existing industry channels (e.g., distributors, trade associations) will provide a higher level of credibility for QI/QM training rather than offering exclusively through IOUs.
- **Bounded rationality:** It is logical to assume that the HVAC industry would want to deliver quality service; however, market dynamics have not supported such logic as the industry has largely become commoditized and low price/low quality typically wins out. The program supports HVAC contractors that perform quality work. This helps to build momentum towards market transformation.
- **Hidden costs:** By promoting the concepts and value of quality maintenance at the time of system installation, the customer is assured that the energy efficiency performance benefits of their new system will continue throughout the life of their system.
- **Organizational customs:** The HVAC industry has largely become commoditized into an industry driven by low costs and quality, where quality is assumed but not understood or valued by the customer. This is a result, in part, by contractors having minimal success in communicating the value of QI/QM to consumers and consumers not understanding the linkages between comfort and energy use. The HVAC QI/QM Program demonstrates the value proposition of a high quality contracting business and educating consumers on the energy benefits of QI/QM.

---

<sup>58</sup> Quantec LLC, "Statewide Codes and Standards Market Adoption and Noncompliance Rates," pp. 4

<sup>59</sup> Strategic Plan, Appendix A, HVAC Convener Report, pp. 38-39

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- **Product cost:** Substantial incentives for equipment and QI will offset a substantial percentage of product costs. Customers will be encouraged to participate in the program and use one of the qualified program contractors to install their new HVAC system.
- **Lack of awareness:** Focused marketing and training on QI and code compliance for consumers, contractors, and building inspectors<sup>60</sup> will ensure that the importance of complying with Title 24 will be better understood by program participants. Additionally, requiring demonstrated code compliance (e.g., CF-6R) in order to qualify for program rebates will further reinforce the importance of permitted installations.
- **Information or search costs:** Active support of qualified program contractors and listing them on IOU websites will increase consumer confidence in having a reliable source of quality contractors. Moreover, satisfied customers will recommend these contractors to friends and neighbors and thus create additional momentum for using contractors with a reputation for high-quality work.
- **Transaction costs:** Potential for streamlined incentive application processes that require the same information required for Title 24 compliance (e.g., CF-6R) will reduce the difficulty of participating in the program and complying with permit requirements. Furthermore, the high incentive levels offered by the program will reduce the likelihood that customers will choose not to participate in the QI activity.
- **Hidden costs:** Promoting the concepts of QI at the time of system installation will increase the likelihood that customers will understand the energy efficiency performance benefits resulting from maintenance, and will continue such periodic maintenance over the life of their system.

Additionally, several other issues could potentially influence sub-program design, including:

- Other organizations have established processes and procedures for QI. These processes should be evaluated to determine how well they perform in comparison to minimum QI standards.
- Lack of industry consensus on QI standards and technical protocols
- Overcoming market barriers to exceeding Title 24 Standards
- Cost-effective constraints arising from limited savings for QI measures exceeding Title 24.
- Forging sustainable HVAC industry and market actor support.

---

<sup>60</sup> See the HVAC WE&T Sub-program PIP, below, for more information.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Addressing challenges in standard applicability across a range of commercial building types and HVAC systems.
- True energy savings measurement procedures.

**d) Quantitative Program Targets**

The program will achieve the following program targets:  
**See Table 5 above.**

**e) Advancing Strategic Plan goals and objectives**

The Residential HVAC Quality Maintenance and Residential HVAC Quality Installation Development program helps to achieve the following near-term strategic goals as identified in Chapter 6 of the Strategic Plan:

- 2-1: Create a Statewide QI/QM Brand – In addition to promoting the industry standards for QI and QM, leveraging the program statewide Energy Upgrade California (EUC) brand for all IDSM efforts is a cost effective approach to branding QI/QM. In order to help residential consumers more clearly recognize contractors and technicians who can truly deliver QI/QM, the program also aggressively helps the HVAC industry to more firmly establish the higher value/consumer benefit of its own industry standards and credentials. This program is based on and promotes the use of ACCA Standard 4 for Quality Maintenance and examples of consensus HVAC credentials are the Industry Competency Exam (ICE), technician certification by North American Technician Excellence (NATE), a variety of union “Journeyman” designations, TABB, NEBB, AABC, NBC and STAR® certifications.
- 2-2: Launch Statewide Brand – The Energy Upgrade California IDSM umbrella brand will be expanded via the statewide ME&O program efforts and the Residential HVAC QM program will make corresponding adjustments accordingly to leverage that brand within a reasonable time during 2013-14. This branding activity will help participating contractors to promote the QI/QM effort. The program will continue to communicate information about the QI/QM branding effort to contractors, technicians and other HVAC industry stakeholders via such means as inserts in trade journals such as Indoor Comfort News, The ACHR News, and Contracting Business.
- 2-3: Provide expanded QI/QM training – The program continues to ensure that HVAC service technicians of participating contractors are fully trained on the delivery of the measures promoted by the Program. Furthermore, feedback mechanisms will be utilized to continually evaluate technician performance to ensure that they are applying the information they are being taught in the QI/QM training. As part of the program’s market transformation

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

efforts and to ensure quality services are provided to customers, the program will continue to work with the HVAC industry to reduce (and wherever possible eliminate) the direct costs of this transformative training to technicians and contractors willing and able to apply their skills and new tools to delivering industry standard and energy saving Quality Maintenance services.

- 2-4: Implement contractor accreditation program – Additional consideration will be made for program efforts to promote NATE and any other certifications that the consensus of the HVAC industry determines to be appropriate.
- 3-3: Accelerate whole-building educational opportunities - Create pathways for HVAC contractors to evolve into whole building contractors by partnering with private and public community colleges and/or universities to develop the appropriate curriculum on whole building design practices.
- 4-1: Pursue regional climate-optimized equipment standards - IOU staff, in close consultation with WCEC/CEC and other appropriate parties, will continue to stay attentive to and engaged in the federal proceeding as it continues into 2011
- 4-3: Accelerate market penetration of advanced technologies - Partnering with manufacturers through activities such as the WCEC's Western Cooling Challenge will increase their dedication to developing climate-appropriate equipment that delivers energy savings and peak load reduction.
- 4-4: Adopt a progressive set of building codes that support peak-efficient equipment - Through the efforts proposed by the Statewide Codes and Standards Program, the IOUs will continue to work with the CEC to advance current building codes.
- 4-5: Develop standards for on-board diagnostic functionality – In coordination with HVAC efforts within the Emerging Technologies program, the program leverages the use of hand held and other types of systems in the field to assist in determining viable protocols for residential applications.
- 4-6: Prioritize in-field diagnostic approaches – Through coordination with the Emerging Technologies program, the program leverages the use of hand held and other types of systems in the field to assist in determining viable protocols for residential applications and contributes information to the HVAC industry that is expected to be helpful in targeting future efforts based on quantifiable energy efficiency benefits.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**6) Program Implementation**

**a) Statewide IOU Coordination**

The IOUs will jointly participate in California's residential HVAC efforts to achieve real-market transformation. In order to accomplish this task, the IOUs will use the principles of adaptive management and follow a structured process to continuously update and enhance the program throughout the 2013-2014 Transition Period. The process will continue as follows:

**IOU Program Lead** – The process for adaptive management will begin with each IOU designating an HVAC Program Lead. The lead will be the conduit through which information between IOUs will flow and will investigate new innovations, special accomplishments and challenges faced by sub-program managers and the managers of cross-cutting Statewide programs within their own IOU. Where such innovations or challenges intersect HVAC and show potential for improving the HVAC program, the Program Lead will present such information to a quarterly HVAC Program Management Team meeting.

**Hold Quarterly HVAC Program Management Team Meetings** – At this quarterly meeting, individual innovations and accomplishments experienced in one IOU will be transmitted to all IOUs. The HVAC Program Management Team will evaluate the innovations and accomplishments of the individual IOUs, hear ideas for course corrections and overcoming challenges, measure the HVAC program's progress against Statewide metrics and goals, and prepare summations for presentation to the Western HVAC Performance Alliance at its semi-annual meeting.

**Adopt Program Enhancements** – Once the HVAC Program Management Team agrees that a particular idea or innovation has merit on a Statewide-level, each IOU Program Lead will distribute the information to their sub-program managers for adoption and integration as appropriate. In some cases, it may be necessary to invite the sub-program managers to the HVAC Program Management Team to get their feedback and ensure they receive the same message.

**Evaluate Program Enhancements Against Statewide Targets** – To complete the adaptive management loop, the HVAC Program Management Team will track the program's accomplishment of Statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The HVAC Program Management Team will determine whether future course corrections are needed, and if so, will activate a fresh start of the adaptive management cycle to generate the improvements necessary to stay on track.

All California IOUs continue to work together and jointly with the HVAC industry to lead efforts to implement and explore design enhancements for a viable residential HVAC program. Specific areas of coordination include:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- **Program delivery mechanisms  
Residential Quality Maintenance**

-The program is delivered to customers via qualified participating contractors. Training of participating contractors and management of the program includes a combination of third-party implementers and internal administrative staff. This follows the adaptive management process. The program is targeted to consumers and contractors to create a push/pull dynamic that influences the achievement over time of sustained market transformation.

**Residential Quality Installation Development**

The IOUs will jointly coordinate and work with industry groups to prepare a design for a statewide-consistent program design that is cost effective and meets California's market transformation objectives.

After the new program design is launched, the IOUs will manage the program through a combination of third-party programs and internal administrative staff, and will follow the adaptive management process. The program will be targeted to consumers and contractors to create a push/pull dynamic that influences sustained market changes.

**Western HVAC Performance Alliance**

The IOUs will deliver the program through a combination of third-party vendors and internal administrative staff. The program will be delivered in collaboration with existing industry infrastructures in order to increase its overall effectiveness. Program guidance will be provided to the CPUC/IOUs through the Western HVAC Performance Alliance as described above.

- **Incentive levels**  
See Section 4.b above.

- **Marketing and outreach plans  
Residential Quality Maintenance**

Program marketing includes common outreach materials shall be developed by the IOU's in partnership with HVAC industry, including feedback from HVAC contractors. This QI/QM branding shall be under the statewide Energy Upgrade California brand efforts after the expansion of that brand. The program will continue to work with industry and participating contractors for additional methods to promote the program and the value of QI. If warranted by such feedback, the program may explore providing additional point-of-purchase information on QI that would be made available for equipment dealer locations and building departments (where residential customers may be receptive to "neutral" public service messages).

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Residential Quality Installation Development**

Common outreach materials will only be available to participating contractors. Additional point-of-sale information on QI will be made available for equipment dealer locations and building departments.

**Western HVAC Performance Alliance**

Specific outreach efforts are currently being facilitated to the industry to keep it engaged in the Strategic Plan process (both updates to and implementation of). On a macro level, this outreach is occurring through the Western HVAC Performance Alliance and any subcommittees established by this group. On a micro level, each sub-program has specific tactics in place to engage the industry in its own particular demand reduction, energy savings and market transformation objectives.

Utilities will conduct integrated as well as program-specific marketing and outreach which will be coordinated with the statewide marketing and outreach program. The utilities may use a range of tactics such as; e-mails, flyers, on-Line marketing, direct mail, bill messaging, social media, local events, ethnic media, and other channels that suit the target audience, the message, and the resources.

- **IOU program interactions**

**Residential Quality Maintenance**

One of the strategies outlined in the Strategic Plan HVAC chapter is to create a better linkage between the CEC's Title 24 compliance efforts with the IOUs energy efficiency programs. Previous efforts have been managed with different yet consistent purposes. The IOU's will continue the market transformation goals of the Strategic Plan; the IOUs will support CEC and CPUC efforts to develop one common effort.

**Residential Quality Installation Development**

In order to support the need for increased code compliance, the program will cooperate with CEC training and enforcement activities targeted at local building departments. Such activities will also be used to promote the economic and performance benefits of QI/QM. The program will also coordinate its activities with IOU local government partnerships and third-party programs, to ensure that code compliance could become integrated into these programs.

**Western HVAC Performance Alliance**

One of the strategies outlined in the Strategic Plan HVAC chapter is to create a better linkage between the CEC's Title 24 compliance efforts with the IOU energy efficiency programs. Previous efforts have been managed with different, yet consistent purposes. In order to achieve the market transformation goals of the Strategic Plan, the IOUs will support CEC and

## **2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan**

CPUC attempts to develop one common effort. Interaction with other IOU programs will be coordinated through the adaptive management process described above. Within this process, a Joint HVAC/Emerging Technologies/Codes and Standards Program Management Team (“Joint Program Management Team”) will be established to ensure that the individual program efforts are aligned and progressing towards the same near and long-term goals.

- **Similar IOU and POU programs  
Residential Quality Maintenance**

As a result of increased federal equipment efficiency standards, many utilities across the country have begun to offer service-based programs that independently offer measures such as RCA and Duct Sealing. It is expected that the HVAC QM Program could stimulate a paradigm shift through its delivery of a comprehensive suite of maintenance services that comply with or exceed ACCA industry standards (premium maintenance) designed to address the full range of efficiency measures available for residential HVAC systems.

- **Residential Quality Installation Development**

The ENERGY STAR® Residential QI program was introduced in early 2008. Several utilities, including Oncor, National Grid, Nstar, and Puget Sound Energy, are either offering or planning to offer this program. Both PG&E and SCE piloted the program in 2006 and 2007 respectively, and the program continued in SCE’s territory from 2009 to 2012. SDG&E launched the program in 2010. Such program design, however, was found to be non cost ineffective, prompting a need to arrive at a new program design that can be cost effective and meet market transformation objectives at the same time. In order to promote the holistic approach proposed herein, the California IOUs propose to initiate a Statewide IOU/POU coordinating group — perhaps under the auspices of CEE or some other umbrella organization — to discuss and implement HVAC program best practices that advance the goals of the Strategic Plan throughout California.

- **Western HVAC Performance Alliance**

POUs manage many different types of HVAC programs. However, none of them seeks to accomplish the aggressive market transformation goals being proposed by the IOUs. During the 2010-2012 program cycle, the IOUs will seek to increase their interactions with the POUs to better align IOU and POU HVAC programs. This involved the creation of periodic Western HVAC Performance Alliance activities with POUs to increase awareness of the Strategic Plan and how programs could and should be designed to help meet its aggressive targets.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**b) Program delivery and coordination**

The program will be coordinated with the following activities:

- **Emerging Technologies program**

- **Residential Quality Maintenance**

- The Residential HVAC QM Program is expected to interact with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment. Coordination activities will be realized through the Program ongoing statewide coordination among programs and across IOUs.

- **Residential Quality Installation Development**

- N/A (this program does not seek to influence emerging technologies).

- **Western HVAC Performance Alliance**

- The program is expected to interact with the Emerging Technologies Program to ensure the proper focus on remote and on-board diagnostic equipment. Coordination of HVAC, Codes and Standards and Emerging Technologies activities will be realized through an inter-utility program management team (consisting of the appropriate program managers from the four IOUs) that meets on a quarterly basis to discuss program integration and implementation issues.

- **Codes and Standards program**

- **Residential Quality Maintenance**

- This service-based program is not much affected or regulated by building codes, except in the possible case of a participating contractor installs 40 or more feet of new ducting as part of the Advanced Air Flow Correction measure. Program to help support proper permit compliance, the program requires the reporting of any applicable permit number in such cases or any other case that may require a permit as a result of work performed through the program. Additionally, to further support proper compliance with all permitting and licensing requirements, the program requires that both the customer and the contractor certify that all permitting and licensing requirements were followed before any program incentives would be paid.

- **Residential Quality Installation Development**

- Efforts will be coordinated to ensure that a consistent message is delivered regarding code compliance and QI. Codes and Standards will take the lead on compliance items, while the Residential Quality Installation Development will take the lead on QI efforts but will leverage similar delivery channels to increase effectiveness. Additionally, coordination

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

activities will be realized through the Joint IOU Program Management Team.

**Western HVAC Performance Alliance**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This will ensure that the code-based solutions are consistent with that program's other activities. Section 6 of the Codes and Standards PIP describes the specific actions that the program will employ to address HVAC. HVAC, Codes and Standards, and Emerging Technologies activities will be coordinated through the Joint Program Management Team.

- **WE&T efforts**

**Residential Quality Maintenance**

Participating contractors are required to attend program-specific QM training in order to participate in the program.

**Residential Quality Installation Development**

Participating contractors are required to attend program-specific QI training in order to participate in the program.

**Western HVAC Performance Alliance**

WE&T needs for the HVAC industry are unique to the industry. Therefore, the IOUs have decided to place the responsibility of managing the effort under the Statewide IOU WE&T Program umbrella. However, the HVAC WE&T activity is coordinated with the Statewide activity to ensure that the individual efforts are complementary (e.g., HVAC training information is integrated in the WE&T web portal).

- **Program-specific marketing and outreach efforts**

**Residential Quality Maintenance and Residential Quality Installation Development**

Utility-branded marketing support for participating contractors is provided to advance statewide QM efforts. Such support may include exclusive promotion on IOU websites, brochures and other leave-behind materials that contractors can use to promote QM and their involvement with the program. As mentioned above, the program will continue to work with industry and participating contractors for additional methods to promote the program and the value of QM, and if warranted by such feedback, the program may explore providing additional general promotional materials such as point-of-purchase displays for equipment dealers. Additional supporting outreach will include QM and QI content on IOU websites and the statewide ME&O program, which will build general awareness and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

educate customers about energy management and provide a touch point for local marketing efforts related to QM and QI. (Specific IOU budget information for program-specific marketing activity is provided in Table 1).

Targeted campaigns use segmentation analyses, self-selection activities, and event-based knowledge of customer actions to provide residential customers and small businesses with integrated and program-specific solutions that are relevant to their needs. Additionally, program-specific marketing and outreach activities are necessary to drive participation and attain program goals.

**Western HVAC Performance Alliance**

Such support may include exclusive promotion on IOU websites, brochures, and other leave-behind materials that contractors can use to promote QI/QM and their involvement with the program. Additional general promotional materials such as point-of-sale displays for equipment dealers will also be developed. (Specific IOU budget information for this marketing activity is provided in Table 1, above.)

- **Non-energy activities of program**

**Residential Quality Maintenance**

The direct energy benefits of the program result from the quality maintenance of HVAC systems. Other activities will be required to support these energy savings goals, as well as the program's market transformation goals. These activities include significant efforts in program design, systems development, contractor training and consumer marketing. Additionally, some incentive measures within the program, such as the QM-standard Basic Assessment and QM-standard optional Preventive Maintenance Service Agreement, have been specifically designed to support market transformation. Finally, by implementing combustion appliance safety evaluation and testing, the program improves customer health and safety.

**Residential Quality Installation Development**

The direct energy benefits of the program result from the quality installation of central air conditioning systems. Other activities will be required to support these energy savings goals. These activities include significant efforts in contractor training and consumer marketing.

**Western HVAC Performance Alliance**

The direct energy benefits of the program result from the quality installation and maintenance of HVAC systems. Other activities will be required to support these energy savings goals. These activities include

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

significant efforts in program design and coordination, technology evaluation and integration, contractor training and consumer marketing.

- **Non-IOU Programs**

- **Residential Quality Maintenance**

- The program interacts with the HVAC industry to continue to develop and introduce increasingly stronger QM standards that ensure systems are operating in their most efficient state.

- **Residential Quality Installation Development**

- Collaboration with local programs will synergize the program delivery.

- **Western HVAC Performance Alliance**

- The program will remain engaged with CEC, the California Air Resources Board (CARB), DOE, and other government agencies responsible for regulating various aspects of HVAC equipment, HVAC industry-driven initiatives such as NATE and the HVACR & Plumbing Instructors Workshop, and private/public partnerships such as Skills U.S.A.

- **CEC work on EPIC**

- **Residential Quality Maintenance**

- The program continues to coordinate with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment program

- **Residential Quality Installation Development**

- N/A (this program does not seek to influence emerging technologies.)

- **Western HVAC Performance Alliance**

- The program will interact with the Emerging Technologies Program to ensure the proper focus on remote and on-board diagnostic equipment. Such efforts are already underway with the EPIC Program. This activity will primarily be managed under the Technology and System Diagnostics Advocacy Program (see the sub-program PIP for more details).

- **CEC work on codes and standards**

- **Residential Quality Maintenance**

- The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This will ensure that the code-based solutions are consistent with that program's other activities.

**2013-2014 Energy Efficiency Programs**  
**California Statewide Program for Residential Energy Efficiency**  
**Program Implementation Plan**

Section 6 of the Codes and Standards PIP describes the specific actions that the program will employ to address HVAC. HVAC, Codes and Standards, and Emerging Technologies activities will be coordinated through the Joint Program Management Team.

**Residential Quality Installation Development**

In a similar manner as with the Codes and Standards Program, the Residential QI Program will work in cooperation with CEC training and compliance efforts targeted at local building departments. The Codes and Standards Program will take the lead on this effort.<sup>61</sup>

**Western HVAC Performance Alliance**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This will ensure that the code-based solutions are consistent with that program's other activities. Section 6 of the Codes and Standards PIP describes the specific actions that the program will employ to address HVAC. HVAC, Codes and Standards, and Emerging Technologies activities will be coordinated through the Joint Program Management Team.

- **Non-utility market initiatives**

**Residential Quality Maintenance**

The tenets of QM are being actively pursued by the HVAC industry itself. ACCA has taken the lead in this national effort by developing various ANSI recognized QM standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR, Utilities). Other organizations have also developed processes designed to improve the operating efficiency of HVAC systems (e.g., NCI). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**Residential Quality Installation Development**

The tenets of QI are being actively pursued through the HVAC industry. The Air Conditioning Contractors of America (ACCA) has taken the lead in this national effort by developing various ANSI recognized QI standards. These standards have been widely adopted throughout the

---

<sup>61</sup> For additional information about Codes and Standards HVAC activities, see Section 6 of the Codes and Standards PIP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR®®, utilities, etc.) The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**Western HVAC Performance Alliance**

The tenets of QI/QM are being actively pursued by leaders in the HVAC industry itself. ACCA has taken the lead in this national effort by developing various ANSI-recognized QI/QM standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR®®, Utilities, etc.) Other organizations have also developed processes designed to improve the operating efficiency of HVAC systems (e.g., SMACNA, NCI). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**a) Best Practices**

As described in Section 5.a, the IOUs had been managing RCA and Duct Sealing programs for several years and have seen that the results they delivered were uncertain. This Program has created a new standard for HVAC service-based programs through offering a more comprehensive approach that delivers reliable energy savings. This program was developed with full industry involvement to ensure that it (1) is accepted by the industry, to ensure it meets its market transformation objectives program; (2) effectively trains service technicians to provide QM services; (3) provides the necessary quality control processes to ensure that the appropriate service measures are performed; (4) delivers reliable energy savings; and (5) demonstrates a clear value proposition for contractors and customers.

**b) Innovation**

The innovation of this program exists through the adoption of a comprehensive maintenance approach based on industry-accepted standards. Traditional utility programs have delivered individual service measures such as RCA and Duct Sealing. The delivery of these measures has generated questions about their energy savings. A more comprehensive maintenance effort through this Residential HVAC QM program delivers well-documented energy savings and sets the standard for HVAC efficiency programs. Furthermore, delivering this program through active partnership with the industry increases the likelihood of its success. Finally, innovation results through a continuous improvement process to evaluate the viability of offering additional incentives for services and other offerings that exceed established program standards (e.g., TABB, NEBB, and NCI).

**c) Integrated/coordinated Demand Side Management**

As with most HVAC oriented programs, the primary source of integration exists between energy efficiency and demand response activities. At a minimum, all marketing materials developed to support QM will cross promote DR to educate customers on the availability of IOU DR Programs. The required contractor training will be designed to include a

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

discussion on DR programs and participating contractors will be required to deliver DR information as part of their customer sales efforts. The program will continue to explore closer linkages between EE and DR.

**d) Integration across resource types**

The program may support CARB's efforts to regulate GHGs by providing consumer information on the phase-out of existing refrigerants and the move to zero-ODP refrigerants with the customer's maintenance invoice. Such information would seek to influence the customer's adoption of newer equipment by explaining the likelihood of increased maintenance costs as existing refrigerants become less available.

**e) Pilots**

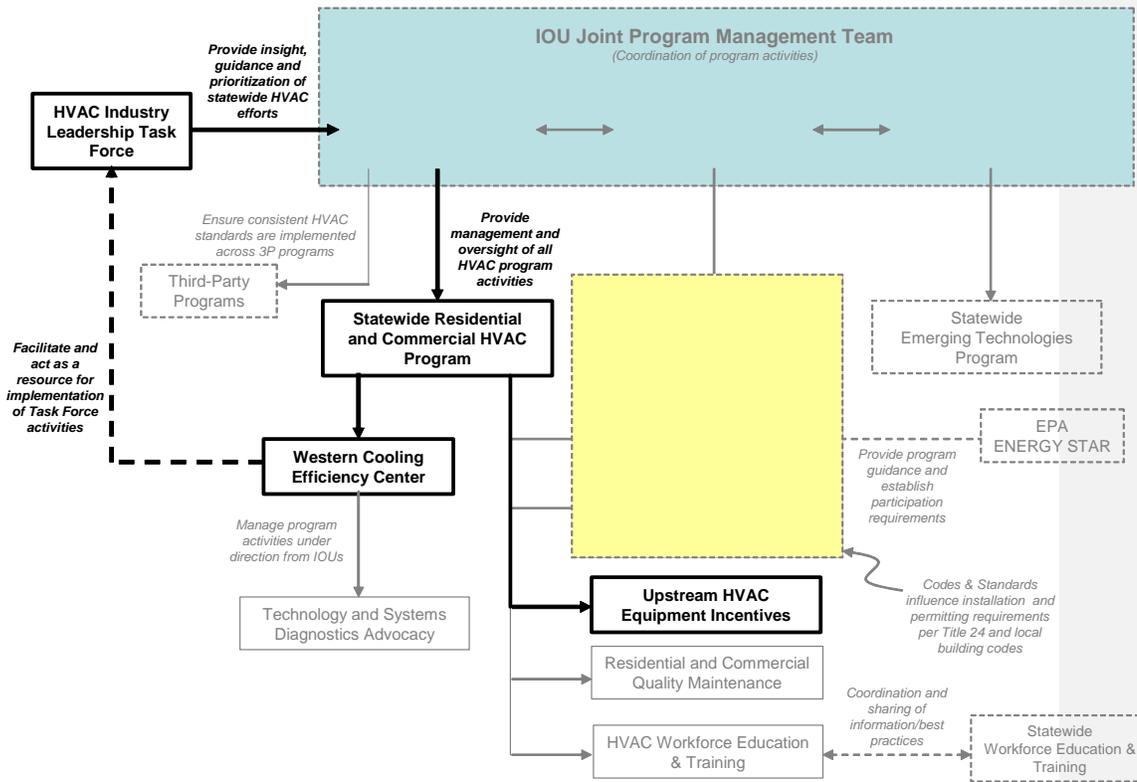

As with any good product/program design, pilots may be needed to test program enhancement concepts prior to full-scale launch of any enhancement. The HVAC QM Program may utilize pilots to test the implementation of program concepts, processes and the integration of ever increasing QM standards.

**f) EM&V**

EM&V for the Residential HVAC program will be managed via the EM&V program. Appropriate EM&V activities and detailed plans will be conducted as coordinated by the HVAC EM&V Project Coordination Group (PCG) and overseen by the CPUC.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

### 7) Diagram of Program

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**8) Program Logic Model**

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs.

**Market Transformation Information**

**a. Summary of the market transformation objectives of the program:**

The Residential HVAC Program is a Statewide program that will continue the transformation process of California's HVAC market to ensure that:

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- The above changes lead to sustained profitability for HVAC trade allies as the business model for installing and maintaining heating and cooling systems changes from a commodity-based to a value-added service business.

Description of the market, including identification of the relevant market actors and the relationships among them:

The Residential HVAC market for maintenance and installation is largely a market designed to offer these services at the lowest price to meet acute needs, rather than one with product differentiation by quality that is designed to meet the long-term needs of customers in terms of thermal comfort, indoor air quality, and thermal comfort.

The primary market actors are contractors, technicians, and property owners/managers. Contractors manage the firms that provide installation and maintenance. They set the direction for their firms in terms of what services to provide, how to provide them, and how to price them. Technicians actually provide those services. Thus the successful provision of the services depends on the technicians' skill levels as well as how they respond to the constraints imposed on them by contractors. Property owners and managers constitute the demand side of the market. They request and pay for the services provided by the contractors' firms. Renters do not tend to participate in this market.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**b. Market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies:**

Property owners and managers often lack important information about the cost and value implications of their HVAC decisions, as well about the quality of the work that contractors' firms can perform. That is, there are not clear indicators of quality by which consumers can judge providers, and consumers do not have a well-defined set of goals by which to evaluate the quality of work after the fact. This facilitates a commoditization of HVAC services whereby firms compete based on price and not on quality, which can lead to a "race to the bottom" mentality in certain segments of the market. This lack of information is exacerbated by the highly technical nature of HVAC maintenance and installation that can confound the efforts of contractors and technicians who are attempting to do high quality work, leading to sub-optimal HVAC system performance in terms of thermal comfort, indoor air quality, and energy efficiency.

These barriers provide an important opportunity for energy efficiency programs to intervene in the market in a number of ways to facilitate high-quality work. The first is providing a definition of quality through the promotion of standards for installation and maintenance. Second is facilitating a business relationship between contractors and customers to promote high quality, and not just low price. Third, the program can build the skills of technicians who perform maintenance and installation so they are able to implement those services at a high level of quality.

**c. Description of the proposed intervention(s) and its/their intended results, including which barriers the intervention is intended to address:**

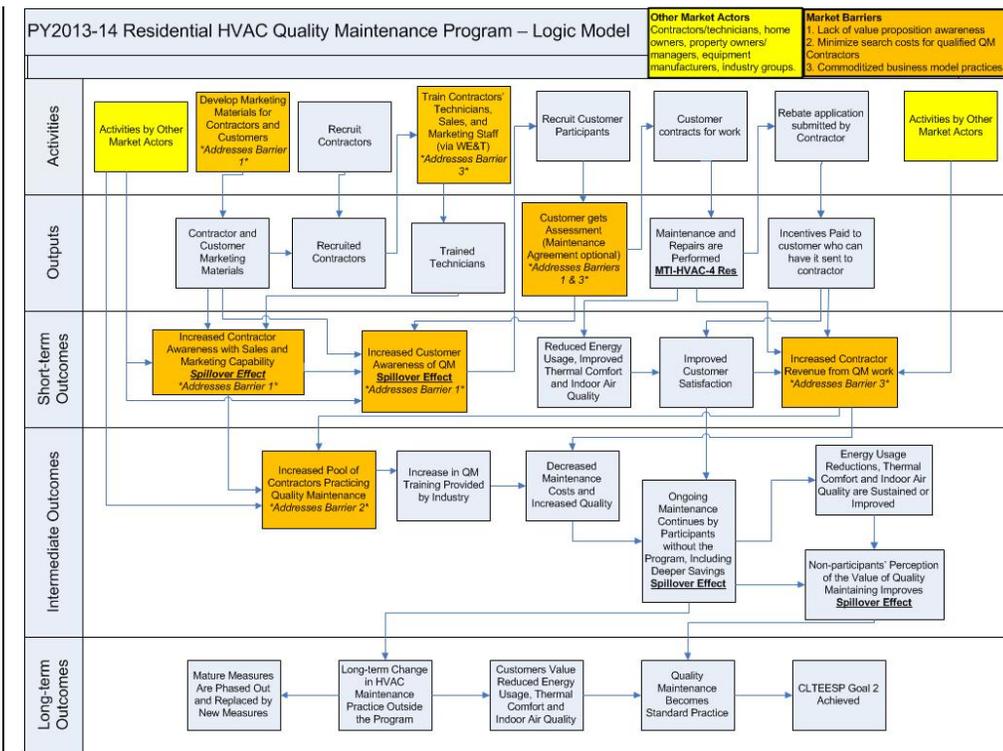

By promoting industry standards for maintenance and installation, the program helps consumers know what the characteristics of a good contractor are. For maintenance, part of this standard is leads the customer and the contractor to define performance guidelines for thermal comfort, indoor air quality, and energy efficiency, helping make clear what the level of quality of work was after the fact. For installation, the standards provide clear performance characteristics through such elements as load calculations.

The programs facilitate the creation of an ongoing business relationship between the contractor and the customer. This provides an inducement to the contractors' firms to provide a high-quality service that will bring long-term value to the customer, and thus long-term value to the contractor, rather than rely on winning bids with a lowest price under the assumption that there would be no more business dealings with a customer and so high quality would bring a low return.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

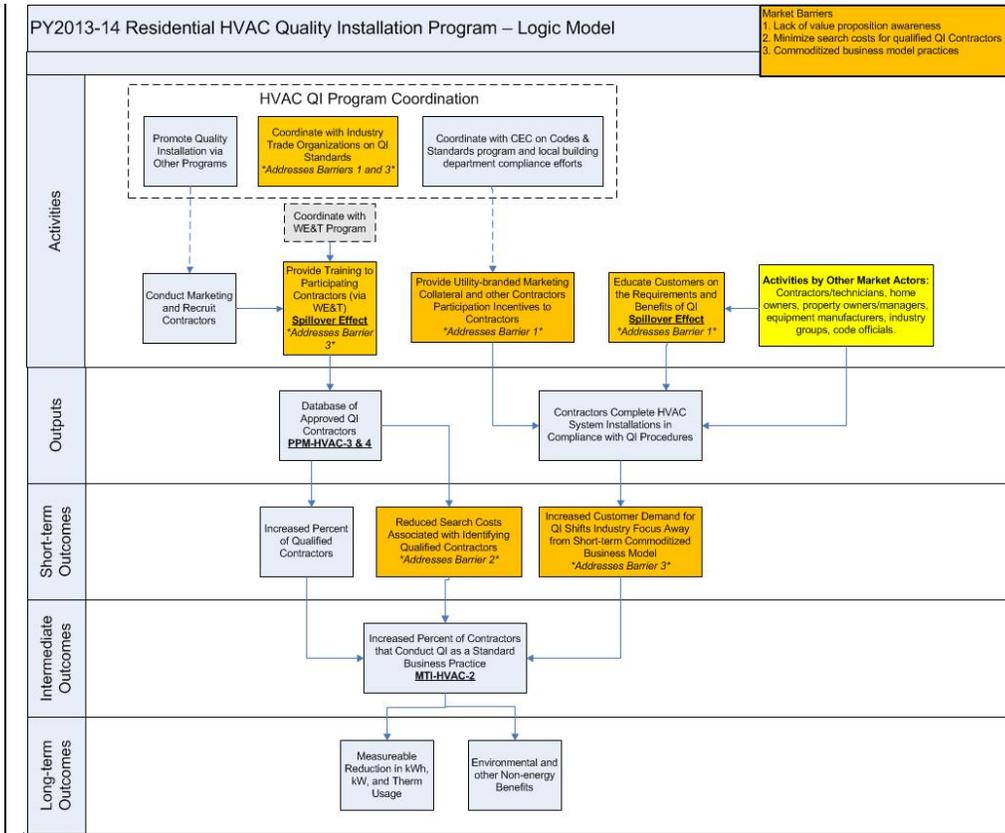

Finally, the programs build the skills of technicians. This enables continuing improvement in the quality of work over time. It also provides for spillover as those contractors and technicians can provide higher quality service to their customers even outside the program to reduce energy usage.

**d. Program or market logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results:**

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

Formatted: Font: (Default) Arial, 10 pt

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

1. **Program Name:** Statewide Residential New Construction (RNC)  
**Program ID:** SCG 3707  
**Program Type:** Statewide Core Program

2. **Projected Program Budget Table**

**Table 1** – Reference CalSPREE program for budget details.

3. **Projected Program Gross Impacts Table – by calendar year**

**Table 2** - Reference core program for projected savings detail.

4. **Program Description**

**a. Describe program**

CAHP is part of the statewide Residential New Construction (RNC) sub-program offering. The RNC sub-program represents one-sixth of the CalSPREE core offering. CAHP encourages single and multi-family builders of all production volumes to construct homes that exceed California’s Title 24 energy efficiency standards by a minimum of 15 percent. Through this plan, multi-family and single-family projects are approached identically for program purposes except where explicitly noted. The ENERGY STAR Manufactured Homes program, offered by Sempra and Southern California Edison, addresses new factory-built housing. The structure of the relevant Residential New Construction program elements is as follows:

CalSPREE Program (Core)

1. RNC Sub-Program

2.1 Single-family/Multi-family Sub-Program (CAHP)

2.1.1 ZNE Homes Sub-Program

2.2 Manufactured Homes Sub-Program for SDG&E, SoCalGas and Southern California Edison

For the convenience of the reader, two other programs related to New Construction are also called out:

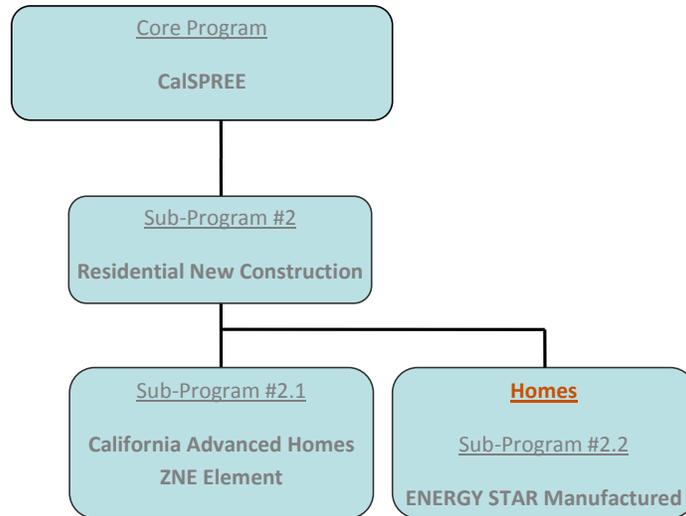

1. Sustainable Communities Program (Name/location differs by IOU) (Third party)  
Covering Master-planned communities, mixed-use projects, campuses, and commercial projects pursuing advanced energy efficiency and green targets.

2. Partnership Programs (Core)

a. Strategic Planning Sub-Program (Energy Leader Partnership Strategic Support)  
Trains cities and counties to procure city projects to meet energy efficiency

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

standards, to identify funding sources, to share best practices, and recognize them for their achievements.

The goal of energy-efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan), and works in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the New Solar Homes Partnership (NSHP).

As explored in greater detail below, CAHP will incorporate a ZNE sub-element to adopt the following strategies toward achieving the Strategic Plan goals. As program technologies and approaches are developed and demonstrated in ZNE, they will be incorporated into the CAHP.

- Raise plug load efficiency (ZNE)
- Promote Whole House solutions, with a particular focus on zero peak homes as an interim step toward zero net homes (CAHP)
- Encourage In-home Monitoring and visual display tools (ZNE)
- Encourage incorporation of Green Building Standards (ZNE)
- Coordinate CAHP with demand response programs (CAHP) specific strategies for achieving net zero homes will be reviewed in more detail below. Moreover, as

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

outlined above, where strategies enter the market more rapidly than anticipated, they will be rolled into the core CAHP.

To further help make ZNE a reality in the residential sector, utilities will:

1. Integrate successful ZNE strategies and activities proven through program and/or pilot projects during the 2013-2014 Transition Period. The residential new construction program will absorb and enhance existing residential programmatic elements aimed at delivering ZNE best practices to the marketplace, potentially including but not limited to:
2. Project consultations that pair projects with experts capable of driving unique designs to ZNE;
3. Provide education opportunities to key architectural, engineering, and other design professionals (see WE&T plans); and
4. Explore cost effective ZNE solutions that consider the intersection of building and community energy use

**b. List measures**

CAHP Program measures, known savings. All IOUs<sup>62</sup>.

- Marketing assistance as feasible and appropriate for builders who achieve ENERGY STAR certification.
- Calculated incentives.

**c. List non-incentive customer services**

- Technical support to Energy Analysts and Design Teams<sup>63</sup>
- Economic modeling/measure selection support to builder/construction managers
- Marketing support to builders (sales agent training, marketing materials)
- DSM coordination (PV, DR, AMI, ET) for builders

The program will coordinate with the statewide Codes & Standards team to ensure that the impacts of any code changes are incorporated into program design and implementation and will also tie into the Strategic Plan Codes and Standards strategy and support the ZNE goals.

Coordination activities include:

- Builders often set-aside a certain number of units for various income classifications to meet low and moderate income housing goals. Builders must

<sup>62</sup> Savings per appliance will be consistent across all IOUs.

<sup>63</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes/workshops for design teams.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

meet state-mandated housing goals in the housing elements of local city and county strategic plans.<sup>64</sup>

- CAHP would treat market-rate units using the standard calculated approach and claim all energy savings.

**Zero Net Energy (ZNE)**

The ZNE program element recognizes that critical to achieving zero net new construction is the integration of DSM approaches and truly integrated design. This can only be done when the entire suite of DSM offerings is at the table (electric transportation, demand response, energy efficiency, smart meters, and distributed generation). These will be maximally effective when they are part of a truly integrated design. To that end, ZNE will help educate the industry on how to achieve energy-efficient, green homes.

The ZNE program element will consist of projects that have used advanced modeling techniques to project total kBtu usage and demonstrates a plan to offset said usage with onsite generation over the course of 12 months. This portion of the program will provide customized financial incentives that intend to cover a portion of the verified incremental cost for a portion of the homes, at levels that may vary. This incentive will only apply to the energy efficiency measures of the home and will explicitly exclude the cost of renewable energy generation. The Emerging Technology program may also fund the purchase, installation, and monitoring of candidate technologies. The ZNE program element will also provide support in the form of soft-cost design support to help design teams meet their energy and environmental objectives. This portion of the program works closely with home builders seeking assistance in the development of sustainable design and construction, green building practices and emerging technologies.

The ZNE program element, in conjunction with WE&T programs, offers educational opportunities to builders, architects and other Residential construction stakeholders. The program encourages single and multifamily architects and builders to design and construct dwelling units that exceed California's Title 24 standards, reduce greenhouse gas emissions, and provide a healthier and less resource-intensive environment. Such non-standard design elements may include optimization for solar orientation, design for comfort without traditional HVAC, or non-vapor compression cooling systems. It also is a priority goal of this element of the program to execute candidate technologies and integrated approaches to realize zero-peak homes, even if zero-net homes (site Btu's for both therms and kWhs) prove too costly.

**Design Assistance Options:**

- General Team Education: Give presentations, review rating system options, determine big picture green building goals.
- Energy Efficiency/Green Building Recommendations: Project specific recommendations report highlighting ways to incorporate energy efficiency,

<sup>64</sup> See, <http://www.hcd.ca.gov/hpd/hrc/plan/he/>, accessed 25 Apr 08.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

healthy materials, and other green building features into the unique parameters of the project. Specific product recommendations will not be provided.

- Energy Modeling Support: Provide support and recommendations for Title 24 energy performance modeling to estimate actual building usage and give the project credit for energy efficiency measures that are difficult or uncommon to model.
- Plan and Specification Review: Provide comments on the construction documents at various stages to give feedback on clarity of green building specifications.
- Green Feature Cost Assessment: Provide cost-benefit analyses or value engineering assistance to evaluate specific green building features under consideration for inclusion in the project.

**Rating System Documentation Support:** Assess and identify project credit/certification goals, identify and assign rating system tasks to members of the design team, guide the team in system process and timing, assist team in understanding and/or documenting credit achievement. This aid will enhance - but not supplant - participants' efforts to pursue project specifications, designs, calculations, modeling and other necessary services.

The minimum threshold for acceptance in the ZNE program element will be a whole building performance with advanced modeling showing the total kBtu usage of the home as well as the method of generating the offsetting kBtu's.

**CAHP Incentive Rationale**

The program's most ambitious goal for the 2013-2014 Transition Period is to promote the early adoption of reach as well as future code elements into the builders standard practices.

Getting the market to adopt these levels of efficiency will not be easy. The IOUs expect significant pushback from the building industry due to rising costs. This argument will become even more significant in 2014 when the 2013 Title 24 energy codes take effect. The projected increase in cost to comply with these new codes may be between \$3,000 and \$5,000. The program is considering the following changes to the current incentive structure:

- In 2013 the sliding scale will stay as it is currently. The IOUs plan to eliminate the kickers from the program to help streamline and lower administration costs. After providing the kickers for the past 3 years it is the program's determination the kickers are not influencing the decisions of the builders and as such have proved not to be essential incentives.

Once the 2013 Energy code becomes effective the program will adjust the incentives in a

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

way that will still cover a portion of the verified incremental cost for homes achieving high levels of efficiency above and beyond those required by code.

The program believes ENERGY STAR is an important and highly recognizable brand for energy efficiency. Focus group studies have shown that while the brand is known to be good the typical buyer does not understand the whole house can achieve the label as it is typically only associated with appliances. The program will therefore explore a marketing incentive for all homes that achieve the ENERGY STAR for Homes label.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Lighting Market Transformation Statewide Program (Resolution E-4385, Appendix. A).

<u>SW PROGRAM / Sub-Program</u>	<u>PROGRAM PERFORMANCE METRIC (PPM)</u>	<u>Metric Type</u>
<b><u>NEW CONSTRUCTION</u></b>		
<b><u>California Advanced Homes Program (CAHP)</u></b>	<u>1. Number and percentage of committed CAHP participant homes (applied and accepted) with modeled, ex-ante savings exceeding 2008 T24 units (Single family (SF) and multifamily (MF)) by 15%-19%, by 20%-29%, 30%-39%, and 40+%.</u>	<u>2a</u>
	<u>2a. Percentage of (current year SF CAHP program paid units)/ (SF building permits within service territories from the previous year)</u>	<u>2a</u>
	<u>2b. Percentage of (current year MF CAHP program paid units)/ (MF building permits within service territories from the previous year)</u>	
	<u>3. Number and percentage of CAHP participant new homes verified* by IOUs' HERS which exceed Title 24 (T24) building standards (SF and MF) by 15%-19%, 20%-29%, 30%-39%, 40%+.</u>	<u>2b</u>
<u>* The IOUs use the existing HERS Rater infrastructure to verify HERS measures and other building characteristics as required by CA Title 24</u>		

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
	<p><u>and the CEC. The IOUs do not perform the verification inspections and do not certify HERS raters. Note: HERS inspection protocol for production builders does not require inspection of 100% of homes; there is a sampling protocol. For more information on HERS inspection please see <a href="http://www.energy.ca.gov/HERS/index.html">http://www.energy.ca.gov/HERS/index.html</a></u></p>	

**b) Market Transformation Information**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in Attachment “H” are approved for this sub-program as applicable.

**Bullet 1) A description of the market, including identification of the relevant market actors and the relationships among them;**

The MT elements described here follow guidelines and terminology explained in Rosenberg & Hoefgen’s (2009) *Market Effects and Market Transformation: Their Role in Energy Efficiency Program Design and Evaluation*.

<<paper is available here [http://uc-ciee.org/downloads/mrkt\\_effts\\_wp.pdf](http://uc-ciee.org/downloads/mrkt_effts_wp.pdf) >>

Ideally, information about a market would come from a variety of sources, including existing studies and newly-commissioned studies. Rosenberg & Hoefgen (2009) recommend that California should “Commission initial market characterization research for those products and services for which the structure of the market and the motivations of the market actors are not well understood or documented, at least in terms of their response to the product in question.” Due to a lack of time, the following market information draws heavily upon qualitative analyses made by the program managers based upon information they have obtained through experience in implementing the program. We look forward to an opportunity to develop a better understanding of these markets through future commissioned studies, in conjunction with ED and other market transformation stakeholders.

The RNC market consists of several key players including builders, designers, sub-contractors, HERS raters, local cities, manufacturers, real estate agents, financing agencies, and home buyers. The RNC sub-program is located upstream, targeting builders and subcontractors early in the design stage of the production process. Upstream of the IOU’s RNC influence are local cities’ permitting rules and associated costs. Downstream of the RNC sub-program are real estate agents, financing agencies, and home buyers. The RNC sub-program works directly with builders, designers, subcontractors, HERS raters,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

builder sales staffs, and manufacturers via equipment recommendations at the design stage.

**Bullet 2) Identification of the key barriers and opportunities to advancing demand-side management technologies and strategies:**

The key barriers and opportunities to be addressed through a market transformation initiative would ideally draw upon a market characterization study. Due to lack of planning time, the following market barriers and opportunities are drawn from qualitative analyses made by the program managers.

Key RNC market barriers include A) entrenched builder and subcontractor habits, B) a lack of buyer knowledge, interest, and demand, and C) an ensuing disconnect between the price buyers are willing to pay and the related increased builder costs of incorporating DSM technologies, energy efficient equipment, and advanced building practices. Opportunities to address these barriers include education and outreach to builders, subcontractors, and buyers to increase demand and alter builder habits; design assistance to improve builder knowledge and maximally cost-effective strategies; and incentives to bridge the gap of builder costs and buyer demand.

**Bullet 3) A description of the proposed intervention(s) and its/their intended results, and specify which barriers each intervention is intended to address:**

To address Barrier A, the following intervention is proposed:

Builders and sub-contractors will be offered training and design assistance to facilitate the acceptance and incorporation of new technologies and building practices including DSM.

To address Barrier B, the following intervention is proposed:

Builder sales staffs will be provided training and marketing support on the advantages of EE homes that incorporate DSM technologies. Financing mechanisms will be explored to reduce buyer costs and increase demand.

To address Barrier C, the following intervention is proposed:

Incentives will target a reduction in the cost to builders of incorporating EE measures and DSM technologies.

Market transformation interventions can be expected to take 2, 5 or even 10 yrs before effects can be quantified. We propose the following that these would be the results that can be seen in the market at various time intervals:

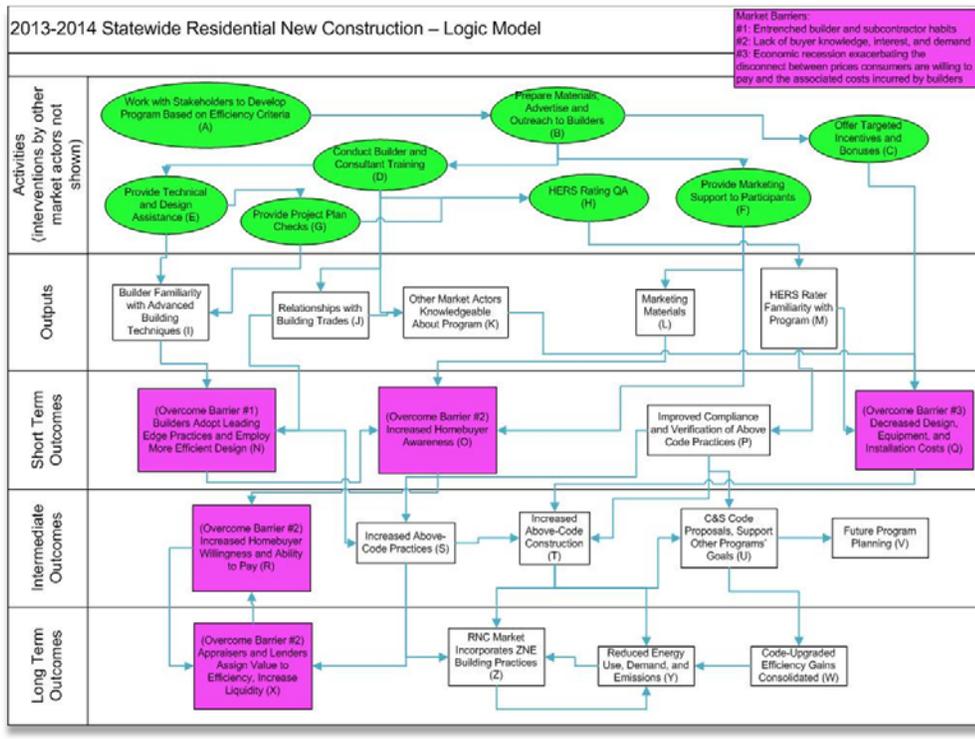

After 2 years of implementation builders and subcontractors should feel significantly more confident in accepting new technologies and advanced building practices. By this time they should be familiar with IOU design assistance procedures and how to maximize the incentives and minimize the increased costs. Sales staffs should be well-versed in the advantages of participant homes.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

After 5 years, builders and subcontractors should be very confident in advanced EE technologies, building practices, and DSM. At this time the market should be nearing ZNE building practices. Financing mechanisms should be in place to improve buyer demand.

After 10 years, the RNC market should be exclusively building ZNE developments. At this point the program focus will be devoted to education and outreach, helping the industry competes with the less efficient existing market. Financing mechanisms will continue to play a role.

**Bullet 4) A coherent program, or “market,” logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results; and**  
In this example below, “Portfolio Program Elements” are the market transformation interventions that are specifically directed to the market barriers. “Outcomes” are the outputs of the MT interventions, which are the market effects and reductions in market barriers than can be seen in the short-, mid-, and long-term. Please note that the long term outcomes are “sustainable,” which is what the market should look like after the market intervention has ended.

Formatted: Font: Times New Roman, 12 pt

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Bullet 5) Appropriate evaluation plans and corresponding Market Transformation Indicators and PPMs based on the program logic model. (The IOUs should be prepared to start tracking proposed Market Transformation Indicators immediately in order to establish a baseline, and in cases where the logic model calls for metrics to be differentiated in terms of the sequence and timeframe in which they are expected to be relevant – i.e., leading vs. intermediate vs. lagging indicators of change – each metric should be identified as such).**

Due to the need to comply with the Decision’s timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

**Summative evaluation - Market Effects**

The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program “spillover” and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

**Program Performance Metrics:** Please see Section 5, Table 3, above.

**Market Transformation Indicators:** Market transformation indicator results shall be reported, as available, by Energy Division or the IOUs, depending upon who conducts the necessary market studies. (Res. 4385, 12/2/10)

**Attribution:** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasizes that attribution of market effects to programs bears further research. Others (R&H, 2009; Keating & Prahl (MT Workshop)

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

suggest that declaring the program's strategic intent through the market transformation initiative's theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a "preponderance of evidence" approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a "Shared Mission" of meeting the CPUC's very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

In lieu of the above results and recommendations, the RNC sub-program will carry forward the PPMs and MTIs that were in place during the 2010-2012 cycle.

**c) Program Design to Overcome Barriers**

**Priority Barrier: Building Industry**

Effective January 1, 2014, California's Title 24 standards will be revised and updated. Overall, Residential baseline energy performance requirements for heating, cooling, and hot water will be increased by approximately 25 to 30 percent, which implies marked increase in production costs for builders at a time when the industry and the economy at large are experiencing significant challenges.

**Priority Barrier: Homebuyers**

The energy used in the average home produces roughly twice the greenhouse gas emissions as the average automobile. In fact, 16% of U.S. greenhouse gas emissions result from the generation of energy used in houses nationwide (U.S. EPA). However, there is little consumer awareness of the impact that homes have on the environment. CAHP is working with IOU marketing efforts, statewide partners, ENERGY STAR campaigns, and builders' own messaging to increase consumer awareness of this idea. Moreover, there is scant evidence that energy efficiency drives decision-making among homebuyers whose access to capital is more difficult in a constrained capital market.

**Overcoming Market Failure: CAHP**

In a buyer's market, builders are looking to differentiate themselves from competition. This presents an opportunity for CAHP to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to meet the state's and IOUs' goals for the reduction of greenhouse gas emissions and utility source demand.

The RNC market without IOU intervention is a lost opportunity for long-term energy savings. However, with IOU intervention in the form of incentives and design support,

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

the new construction market is well placed to demonstrate innovative approaches and cost-effective energy savings technologies.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

<b>California Advanced Homes</b>	<b>Program Target 2013</b>	<b>Program Target 2014</b>	<b>Total</b>
Single Family Units Paid	TBD	TBD	TBD
Multi-family Units Paid	TBD	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

Since its inception in 2002, CAHP has had a substantial impact on the homebuilding market. There is a significant opportunity to continue to influence builders, architects and other players in the RNC industry.

The RNC program is designed to enable the achievement of several goals and strategies identified in the Strategic Plan. The Strategic Plan envisions a transformation of the core Residential sector to ultra-high levels of energy efficiency, resulting in ZNE new construction standards by 2020. It spells out several goals and strategies to address energy reduction in RNC.

**Goal #1:** RNC will deliver ZNE performance for all new single and multi family homes by 2020. By 2011, 50% of New Homes will exceed 2005 Title 24 energy efficiency standards by 35%; 10% will surpass 2005 Title 24 standards by 55% (Strategy 1-1)

**Goal #2:** Home buyers, owners and renovators will implement a whole house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment household appliances, and plug load amenities

**Goal #3:** Plug load will grow at a slower rate and then decline through technological innovation spurred by market transformation and customer demand for energy-efficient products.

The goal of energy-efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan, and works in close coordination with the ZNE sub-element. Together these programs seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The ZNE program element is designed primarily with the focus of accelerating the achievement of the ZNE goals envisioned by the Strategic Plan. The purpose of the ZNE element is to examine a wide array of energy saving technologies, accelerate the market acceptance of new and emerging technologies, explore new solutions, and encourage distinctive approaches in demonstration projects. Each being distinctive, the case studies will be positioned to highlight the underutilized potential of sustainability in RNC, in a range of market segments and climate zones. The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other agencies to further assist the projects in advancing sustainability and achieving very high levels of energy efficiency.

Financial incentives and marketing support offered for the ZNE projects will be higher than those offered under the standard CAHP model. By providing strong encouragement for builders to move up on the energy efficiency scale with financial and non-financial incentives, the ZNE program element is uniquely positioned to support the Strategic Plan goal of ZNE by 2020.

CAHP will work closely with builders who seek assistance in the development of sustainable design and construction, green building practices and emerging technologies through the ZNE program element. ZNE is the place to demonstrate innovative technologies and to help drive the market for energy efficiency through the adoption and marketing of green standards. IOUs have already initiated preliminary research on policies and programs supporting residential ZNE programs in other states for potential new and innovative program design approaches to increase homeowner demand and marketplace change, consulting with relevant experts in this area. This research reveals a lack of other utility programs serving this market. Rather, ZNE currently exists in a piecemeal fashion throughout the country without a consolidated approach. IOUs will continue research in this area and report more complete findings by April 1, 2013.

## **6. Program Implementation**

### **a. Statewide IOU coordination**

Given the success of the collaborative process that led to the production of this PIP, the statewide RNC team plans to continue meeting on at least a quarterly basis going forward, in order to review progress toward the goals and make corrections needed to help achieve them.

#### **i. Program Name**

RNC falling under Title 24 is covered by the California Advanced Homes Program. Factory-built housing will be covered by the ENERGY STAR Manufactured Homes Program, where offered.

#### **ii. Program delivery mechanisms**

CAHP and ESMH are delivered via online program materials and dedicated account executives, supported by a dedicated team of program management staff.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**Differences in Program Implementation**

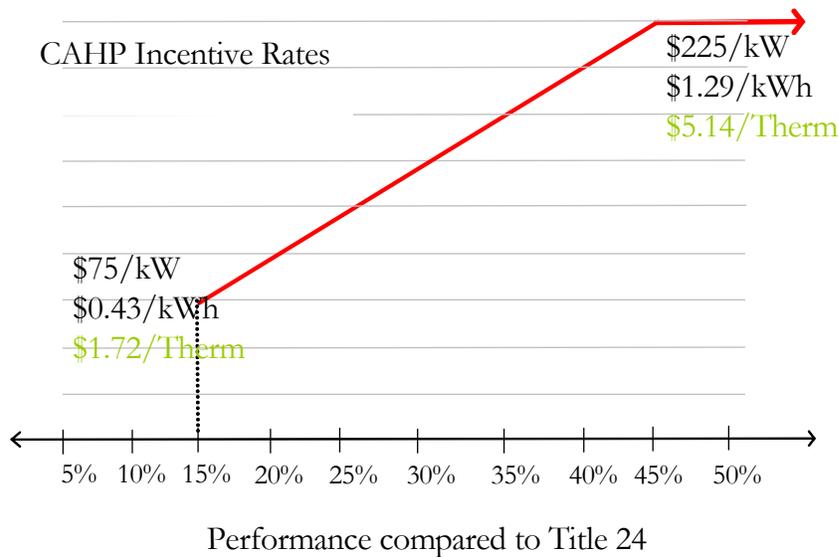

This section highlights the major areas where individual IOUs implementation of the program will differ from that of the others. While the incentive structure and other elements of the program will remain synchronized with the statewide nature of the program, each IOUs will leverage its unique strengths and structural differences to enhance the effectiveness of execution. This section highlights some of those differences.

**iii. Incentive levels**

**Incentive Structure**

The pay-for-performance incentive structure for the 2013 - 2014 CAHP will continue to be refined as the state approached implementation of the 2013 Title 24 code changes (see CAHP Incentive Rationale section above for additional detail).

The 2013-2014 calculated approach will be similar to the method used from 2010-2012:

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

This approach rewards builders for achieving higher levels of energy efficiency and avoids the “clustering” problem in tiered programs. A tiered approach discourages builders from achieving incremental performance if they are unable to reach the next higher tier. In line with the elements of the strategic plan, the approach rewards builders for undertaking whole house solutions where the entire structure can be considered as an integrated system.

Moreover, executing a net zero home remains a financial and technical challenge, the program will have customized incentives for homes that achieve ZNE.

**Confidence that incentives will move the market**

The statewide team has a high degree of confidence that the revised program design is sufficient to realize substantial market movement. As discussed above, incentives alone are not enough to move the market. While more dollars are always preferred by any target industry, it has been the experience of the Southern California utilities that while incentives get one to the table with decision makers, it is the design, technical, and marketing support that makes the sale.

It is the belief of the IOUs that the proposed combination of performance-based incentives, increased incentives for targeted ZNE, marketing support, sales agent training, technical support, coordinated delivery through trade allies and ongoing cultivation of builder relationships provide an integrated solution to the priority market barriers builders face in delivering more efficient homes.

The IOUs support adjusting program incentive levels in conjunction with the more stringent Title 24 code taking effect in 2014. More efficient incentives will be critical in helping builders defray additional compliance costs associated with the stronger code. However, the IOUs believe there is a need to explore the deadline for incentive adjustments. A date after March 2013 may be appropriate for a number of reasons, including:

- Changing incentive levels before the new code takes effect may provide an added incentive for builders to rush to beat the code. Ideally, the incentive adjustments would be timed to coincide with the implementation of the new code so as to incentivize building under a more stringent Title 24. A fast turnaround would prevent the IOUs from determining the ideal incentive structure. Given uncertainty about the market’s response to the unprecedented updates to Title 24, extra care should be taken in calibrating incentive levels to their optimal value.

The IOUs will comply with the March 1, 2013 deadline for adjusting incentive levels, but propose January 1, 2014 as a preferred date.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**How CAHP supports CEC's NSHP, Tier II**

CAHP supports the revised NSHP Tier II (30% < T24 2008) and the goals of the CEC.

1. The IOUs are committed to partnering with the NSHP to streamline the solar application process and to make referrals between NSHP and CAHP. Indeed, the goals of ZNE appear impossible without the significant presence of solar.
2. The IOUs will leverage CEC NSHP material, marketing, and event support for opening events for those projects that commit to the platinum level: 100% penetration at the Tier II EE performance (30%).
3. The design of the graduated, performance-based incentive will tend to drive projects to the higher end of the performance curve, consistent with CEC goals.
4. The threshold efficiency (15%) is consistent with the Tier I minimum, and the top end (45%) was selected to support the CEC's desire to project out three code-cycles (Tier III) into the future.

The IOUs support the goals of the NSHP and the marketing synergies of PV and EE remain one of our best strategies for moving the market. Nevertheless, the IOUs position is that if 30% < T24 is very good, 31% is better, and 32% more so.

**iv. Marketing and outreach plans**

CAHP offers financial incentives, training opportunities, technical support, and marketing resources to single-family and multi-family Residential builders who construct homes that exceed California's energy efficiency standards for new construction. All types of Residential builders are welcome to participate.<sup>65</sup> For the multi-family segment of the program, qualifying homes include condominiums, townhomes, apartment buildings, and mixed-use projects.

There will be closer coordination of marketing efforts to synergize wherever possible. While each utility would like to leverage on their strengths and existing relationships within their service territories, certain marketing elements can be launched on a common localized platform. The common website will be maintained to provide builder information that will be commonly disseminated.

To reduce costs and increase participation, the IOUs plan to be actively engaged in the development and implementation of joint marketing, education and training efforts as described in detail in the common section of this PIP.

In 2013-2014, the program will expand its builder/contractor education and training certification courses to increase overall awareness and understanding of the CAHP and service offerings. The IOUs will continue to strengthen delivery channels of

---

<sup>65</sup> As discussed above, manufactured housing is not subject to Title 24 and uses the national HUD baseline.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

information by providing relevant information and support materials, reaching target audiences in key decision-making phases. The IOUs' innovative communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the Internet.

Additionally, CAHP will leverage its stellar relationships in partnering with trade organizations and other groups actively promoting the benefits of green, sustainable building practices. Such organizations include:

- California Energy Commission (CEC)
- National Association of Home Builders (NAHB)
- California Building Industry Association (CBIA)
- Green Building Consultants (that is, Build it Green, California Green Builder, Global Green)
- United States Green Building Council (USGBC)
- ULI
- LABC
- California Manufactured Housing Institute
- IES
- AEE
- IHACHI
- PHCC, and
- Others

Through an innovative, coordinated approach, we will maximize outreach opportunities that keep energy efficiency and CAHP's program benefits top-of-mind and maximize program participation.

Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

CAHP marketing efforts will be enhanced by leveraging IOU market studies and builder focus groups identifying consumers' decision triggers and the effect of GHG labeling on purchase decisions. The IOUs will pursue additional sources of research to determine the most cost-effective ways builders can meet program requirements; the results will be incorporated into marketing materials and/or communicated to builders as part of the design assistance recommendations.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Given consumers' interest in going green and the market's deficiency in driving energy efficiency sales, marketing the green features (one of which is EE) is the best way to increase consumer demand for more efficient homes. To that end, CAHP will help educate the industry on how to achieve energy-efficient, green homes. To increase participation in programs and the general understanding of sustainability, greater emphasis will be placed on education and outreach.

The precipitous decline in the building industry offers a great opportunity to improve education and training. Through their Education & Training programs offered at SoCalGas' Energy Resource Center, SDG&E's Energy Innovation Center, SCE's Energy Education Center, and PG&E's Pacific Energy Center, the statewide new construction team will work to expand course offerings, web cast seminars, and cost-benefit effectiveness training classes, thermal by-pass checklists compliance training, cost comparison of alternative measures, etc. In order to meet or exceed increased energy savings goals in an extremely difficult Residential construction market, the IOUs will utilize a broad range of marketing tactics and communications tools working in concert to expand program awareness and participation.

The IOUs will diligently explore other means of encouraging builder participation in the CAHP program:

- Developing a list of resources and contractors that could be used by builders
- Providing information on comparative costs and energy savings of alternative measures
- Exploring financing arrangements (green mortgages, energy-efficient mortgages, etc.), in consultation with the other IOUs and financial institutions
- Expedited permitting for high efficiency buildings
- Working with Municipalities to develop educational channels for codes and standards.

**v. IOU program interactions**

The plan addresses above, in the CAHP Incentive Rationale section, the ways CAHP is responding to current code changes and how it anticipates a leading role in code modifications requiring demand performance, in-home displays, on-site generation, square footage reductions, and green elements.

CAHP is particularly interested in promoting integrated thermal hot water system designs to displace therm demand with on-site renewable sources. In addition to cold water savings from embedded energy and the energy to heat water, longer term there may be GHG reductions that accrue either to the builder, the homeowner, or the utility associated with each demand side reduction as a result of AB 32 and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

pending national CO<sub>2</sub> legislation. SoCalGas works closely with builders to appropriately evaluate their options.

CAHP prides itself on its established close relationships and memberships with other groups involved with the building industry. These relationships make it possible to provide comprehensive services to our customers. CAHP will continue to seek out and coordinate synergies with, but not limited to, the following groups:

- California Energy Commission (CEC)
- Flex Your Power (FYP)
- National Association of Home Builders (NAHB)
- California Building Industry Association (CBIA)
- Green Building Consultants (e.g., Build it Green, California Green Builder, Global Green)
- National Association of Homebuilders (BIASC)
- United States Green Building Council (USGBC)
- Urban Land Institute (ULI)
- Los Angeles Business Council (LABC)
- California Manufactured Housing Institute
- Illuminating Engineering Society (IES)
- Association of Energy Engineers (AEE)
- Institute of Heating and Air Conditioning Industries (IHACHI)
- Plumbing-Heating-Cooling Contractors Association (PHCC)

The California Building Industry Association and the CEC continue to seek out partnerships and opportunities with the utilities to help educate builders and other industry participants in order to promote energy efficiency in new construction.

CAHP will continue its commitment to the EPA's ENERGY STAR program and will strive to support, partner and contribute to the success of the ENERGY STAR Homes label and branding. Numerous surveys and studies continue to show the ENERGY STAR label represents greater value to consumers and the environmental stewardship it represents.

Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR New Homes and has won ENERGY STAR Achievement awards for the last five consecutive years. In 2011 SCG was rewarded for "Sustained Excellence in Energy Efficiency Program Delivery."

The program will continue to offer comprehensive training courses and educational seminars relevant to building energy efficiency and green measures into new construction projects including Title 24 code training and ENERGY STAR requirements.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

In response to builder requests, CAHP will offer a new training workshop for 2013 - 2014 designed for builders' sales agents. Sales agents have direct contact with the homebuyer and have the greatest impact on selling homes. In order to help promote ENERGY STAR developments, CAHP will teach sales agents about energy efficiency. Topics will include what qualifies as an ENERGY STAR home and what is 'green'.

Other CAHP activities will include attendance at building industry trade conferences, outreach events and any necessary contractor/builder field visits. The target audience consists of builders, developers, energy consultants, architects, and other industry professionals.

Each IOU may pursue partnership efforts with local government entities to display leadership in the carbon arena by expediting plan check, waiving permit fees, or allowing builders to pay impact fees on the back end (instead of up-front) in exchange for higher levels of home performance documented by our CAHP program.

**Similar IOU and POU programs**

The statewide CAHP team will reach out to leading POU programs, such as those at SMUD to learn from their experience how best to deliver energy-efficient homes. In addition, the IOUs will work closely with the existing home remodeling programs (Home Performance with ENERGY STAR and the Comprehensive Mobile Home Program) to maintain a two-way communication of best practices and lessons learned between the new and existing sectors.

**b. Program delivery and coordination**

**i. Emerging Technologies (ET) program**

Coordination with Emerging Technologies will chiefly be handled within the ZNE sub-element of CAHP. The IOUs are looking to partner with our ET and EPIC-funded Testing Facilities to pilot zero-net energy approaches. The proposed incentive approach allows the IOUs the flexibility to include both deemed and calculated energy savings from new technologies as they become market ready.

The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

**ii. Codes and Standards program**

Codes and Standards is looking to draft pre-approved "drop-in" legislation that can be used by local municipalities looking to create reach codes. Such activities would all be eligible for utility incentives since IOUs are playing

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

such a critical role in drafting the language. See Codes and Standards PIP for more information.

**iii. WE&T efforts**

The RNC team is seeking ongoing support from the three energy and training centers for classes relevant to the building industry and training the next generation of trade allies, builders, contractors, and the like.

Specific workforce development efforts supporting RNC include training on topics including, but not limited to the following:

- Energy Pro
- Title-24
- Micropas

SoCalGas will explore voluntary incentive-based approaches to encourage contractors and other industry professionals to complete the full bundle of RNC workforce development training. For professionals who complete the pre-requisite courses and pass a high-road skill standards test, such approaches may include (as applicable):

- Allowing marketing or advertising differentiation;
- An incentive bonus; and/or
- Providing preference to these professionals during bid evaluation process.

RNC workforce development training will be coordinated with the statewide IOU WE&T program. In addition to the trainings described above, SW IOU WE&T programs will continue to offer building-block courses that educate professionals on the concepts that form the foundation of Residential New Construction programs. Those concepts include:

- Green building techniques;
- Codes and standards;
- Lighting and HVAC technologies;
- Energy cost management; and
- Food service equipment.

Contractor recruitment efforts will be conducted primarily by SW WE&T program implementers through:

- The network of contractors already participating in Residential EE programs;

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- -Direct outreach through industry organizations with locally active memberships (e.g. IHACI, USGBC, IFMA, AIA, BOMA, etc.);
- Workforce development departments (to target unemployed general contractors); and
- Community Based Organizations with a proven track-record of effective outreach to the hard-to-reach workforce.

**iv. Program-specific marketing and outreach efforts**

In 2013-2014, the program will expand its builder/contractor education and training materials to increase awareness of the CAHP and better communicate the advantages of participation. The IOUs will continue to strengthen delivery channels through improved information and support materials. The IOUs' communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the internet.

**v. Non-energy activities of program**

SoCalGas will continue to develop collaborative working relationships with the LADWP and other municipal utilities to offer comprehensive incentive packages to participating builders in territories served by SoCalGas and the municipalities. Where applicable, the ZNE program element will seek to identify new types of water savings technologies opportunities.

**vi. Non-IOU programs**

There may also be opportunities to partner with local AQMDs and County Integrated Waste Management Boards to encourage material recycling in ZNE and green programs.

**vii. CEC work on codes and standards**

The IOUs will continue to support code development work with the CEC and to test candidate technologies in the new construction programs.

**viii. Non-utility market initiatives**

The homebuilding industry is facing some of the worst times in its history<sup>66</sup>. In fact, new Residential single-family housing permits declined by 37.1% relative from 2006 and multi-family permits have declined by 21.2 percent<sup>67</sup>. As a result, builders are building fewer homes and releasing them more slowly to the market. The significant costs associated with carrying inventory coupled with declining prices of houses has created additional resistance in a building industry already

<sup>66</sup> Alan N. Nevin, CBIA Chief Economist and Principal, Market Pointe Realty Advisors, California Builder Magazine, January/February 2008

<sup>67</sup> California Industry Research Board (CIRB) Report, January 24, 2008

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

averse to additional construction costs. In addition, the industry is consolidating operations and eliminating staff to reduce overhead costs and avoid bankruptcy. Homebuilding in California may be just beginning to show signs of revival, although growth in activity is likely to remain considerably slow.

The industry faces the burden of stringent California Title 24 building code standards. Each code is approximately 15% more stringent than the last, increasing costs and requiring additional efforts on the part of the builder. In California, homes built to current Title 24 standards are 35% more energy-efficient<sup>68</sup> than homes built to the federal government's standards. In addition, reducing greenhouse gas emissions will become mandatory, due to the adoption of AB 32 (Global Warming Solutions Act). Builders confirm that growing consumer awareness of "green" concerns will lead to greater demand for these advanced homes and builders will adapt to meet these demands at the least possible cost.

As alluded to above, buyers are increasingly asking for green and energy efficiency and may pay more (up to \$11,000) for such features.<sup>69</sup> For the first time, a majority of respondents in the National Association of Home Builders' survey are asking for efficiency first, likely in response to rising energy prices economy-wide. A majority of the same respondents also requested higher ceilings, more square footage, and were willing to trade a larger home for a longer commute, reflecting a "soft" commitment to green.

**Energy Savings Assistance (ESA) Program**

CAHP is working with the ESA program to coordinate energy efficient new construction with low income housing development.

- For housing units designated by builders for low-income occupants, SoCalGas' ESA program will pay the full incremental cost of installing energy-efficient equipment, such as high SEER (Seasonal Energy Efficiency Rating) AC systems, and refrigerators. ESA will claim the savings from the measures funded by that program.
- CAHP will pay the standard calculated incentives for all other measures in low-income units (e.g. improved duct work and windows). CAHP will claim the energy savings resulting from EE measures other than high SEER A/C and refrigerators.
- CAHP would treat market-rate units using the standard calculated approach and claim all energy savings.

This collaboration will:

<sup>68</sup> Ray Becker, Chairman, CBIA, Southern California Builder Magazine Vol. 25. CAHP's internal research has shown typical 2005 T24 performance is 20% above IECC 2006

<sup>69</sup> Jan Dimeo, Builder. <http://www.builderonline.com/business/surveys-reveal-home-buyer-wishes-for-energy-efficiency-and-beyond.aspx>. Accessed 14 Mar 08

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- Encourage the development of more below market rate low income units by developers,
- Increase participate in the RNC sub-program based on the combined higher incentives, and
- Benefit low income occupants over the life of the installed equipment.

The partnerships program will assist in gathering information to ensure that the units actually are occupied by low income qualified customers. Local governments typically track this information in order to show compliance with state mandates.

CAHP will be implemented by direct contact with the market actors: builders, architects, civil and mechanical engineers, energy analysts, HERS providers, HERS raters and other participants. Through design assistance and coordination with the builders and their consultants and contractors, projects will be evaluated for optimal approaches to increase energy savings and demonstrate green building concepts.

The program will target the Residential design and construction teams, architects, energy analysts, HERS raters, trade contractors, and builders. The target segment is low-rise and high-rise RNC with participation being open to all RNC including custom homes, single-family production housing, condominiums, town homes and rental apartments.

Builders may qualify to participate under one of the two sub-program categories: CAHP or ZNE. Through financial incentives, design assistance, education and training, the IOUs will aggressively support high performance single family and multifamily building designs that exceed Title 24 standards in an overall performance design of 15% or greater. Energy savings and incentives will be based upon a sliding scale from 15% to 45% reduction in energy usage from Title 24 budget. Program focus will be on increasing the participation to a 30% threshold.

**c. Best Practices**

The RNC team has gathered information and gained experience in successful low energy and ZNE projects to evaluate best practices. Thus far the research shows that while ZNE practices exist in piecemeal fashion throughout the state and nation, there are no other utility incentive programs specifically targeting ZNE. RNC will continue to conduct further research and will disseminate its finding by April of 2013 in accordance with the program guidance. This information will be used to develop pilot projects that will demonstrate low energy homes and include home performance monitoring.

**Processes**

- Improve marketing materials and improve participant recognition: Marketing materials and other collaterals will continue to be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- RNC has undertaken substantial marketing material revisions in the 2010-12 cycle, and will continue to improve the materials to enhance customer communication.

**Program Services: Training**

- Taking advantage of the slowdown in the industry, the utilities intend to ramp up the training for builders and other industry participants. Training is an area where significant synergies can be extracted and the IOUs will participate in developing and implementing common training modules and web based training tools. Training will focus particularly on cost / benefit evaluation of energy efficiency improvements and thermal bypass checklist compliance.

**Program Services: Information, Communication and resources**

- A web-based incentive calculation tool will be evaluated by the IOUs. This tool is intended to assist builders in comparing costs and energy savings of alternative measures and arriving at the most optimal approach for the builder.
- Currently, the technical staff provides preliminary evaluation, engineering review and recommendations for builders to move up on the efficiency scale. It is expected that builders will utilize the services of qualified Energy Analysts and designers in arriving at the final set of measures that should be included. The program will continue to work closely with these companies to promote continued improvement and a commitment to integrated design.
- The IOUs will explore the implementation of an enhanced set of communication tools that will serve to educate builders and enhance participation. As explained earlier, our communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns; all materials and communications will be made available in electronic file formats.

**d. Innovation**

SoCalGas' RNC program has gone through significant evolution over the years, constantly adopting innovative approaches and eliminating non-working elements. The current incentive design is based on a whole building performance. It appropriately rewards higher levels of building performance and is likely to motivate home builders to move towards higher efficiency buildings. This approach offers the builder adequate flexibility to choose the optimal combination of design features. It also enables the utilities to work together and support new construction projects with fuel neutrality.

By focusing on efficiencies beyond 35% better than Title 24, and encouraging ZNE projects, the IOUs hope to generate sufficient enthusiasm in the market place for very high efficiency homes. Wherever possible, the California utilities will continue to extract

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

synergies in marketing and program design by developing a truly statewide program with common features and coordinated efforts.

As a gas-only utility, SoCalGas has been consistently seeking innovative approaches in program implementation to enhance the cost effectiveness of CAHP. During the 2010-12 cycle, SoCalGas executed energy sharing agreements with SCE and PG&E to effectively address the program needs of builders in joint service territories. These agreements have enabled the utilities to offer the program benefits with a single point of contact for the builder, while reimbursing each other (incentives offered on the type of energy not provided by that utility) after completion of the projects.

**e. Integrated / coordinated Demand Side Management**

The ZNE element offers a great opportunity for savvy builders to demonstrate their commitment towards a truly integrated approach to DSM options. With design assistance, custom home builders are uniquely positioned to leverage the various tools available at their disposal. The program management teams will educate and strongly advocate these builders to serve as model designers and be recognized and rewarded in the builder community. ZNE homes offer an excellent opportunity for builders to install not just energy saving measures, but also renewable energy, in-home display, solar roofs, innovative water saving technologies and other state-of-the art appliances to demonstrate how sustainable design can be achieved.

**f. Integration across resource types**

As discussed above, the program is looking to partner with relevant stakeholders to identify water, air quality, and waste-diversion opportunities.

**g. Pilots**

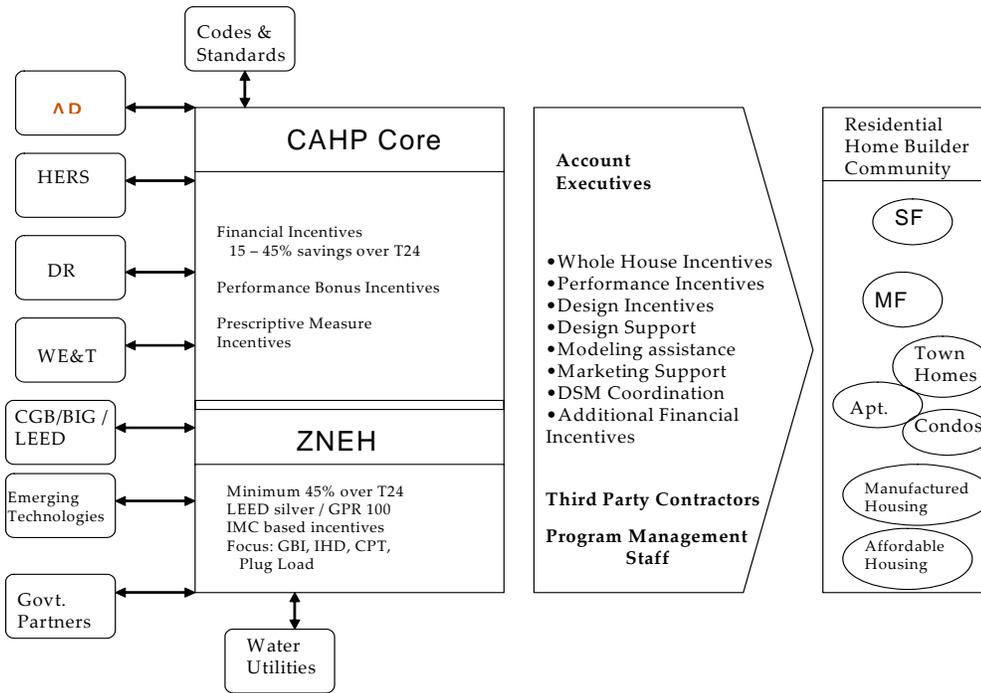

During the course of the program cycle the IOUs may encounter the need to run pilot programs before an idea is introduced to the core program offerings. At that time the utility will submit the plans for such pilots.

**h. EM&V**

The utilities are proposing to develop and submit a comprehensive EM&V plan for 2013-2014 after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader utility studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

3. Projected Program Cross Impacts Table  
Table 2— See core program for projected gross impacts detail.

### 4. Program Description

#### Describe program

#### ENERGY STAR® Manufactured Homes Program (ESMH)

Formatted: Indent: Left: 0", Hanging: 0.25", No bullets or numbering, Tab stops: 0.25", Left

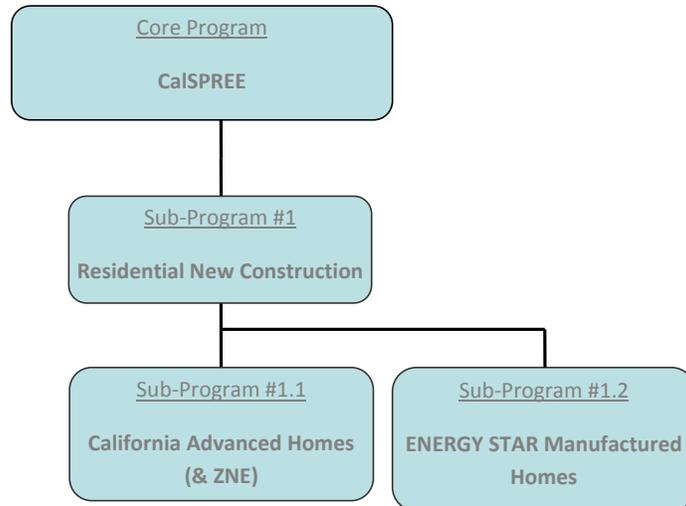

The ENERGY STAR® Manufactured Homes Program is part of the statewide RNC program offering. The RNC program is itself one sixth of the CalSPREE core offering. ESMH addresses new factory-built housing, offered by SDG&E, SoCalGas and SCE. The structure of the relevant New Construction program elements is as follows:

#### CalSPREE Program (Core)

1. Residential New Construction Sub-Program
  - 2.3 Single family/Multifamily Sub-Program (CAHP)
    - 2.3.1 ZNE Sub-Program
  - 2.4 Manufactured Homes Sub-Program for SoCalGas, SDG&E and SCE

For the convenience of the reader, two other programs relevant to New Construction are also called out:

1. Sustainable Communities Program (Name / location differs by IOU)  
Covering Master-planned communities, mixed-use projects, campuses, and commercial projects pursuing advanced energy efficiency and green targets.
2. Partnership Programs (Core)  
Strategic Planning Sub-Program (Energy Leader Partnership Strategic Support) - Trains cities and counties to procure city projects to meet energy efficiency standards, to identify funding sources, to share best practices, and recognizes them for their achievements.

The goal of energy-efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP and ESMH support the ambitious goals of the Strategic Plan, and work in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP.

As explored in greater detail below, CAHP and ESMH will work closely together with the ZNE sub-element to adopt the following strategies toward achieving the Strategic Plan goals. As program technologies and approaches are developed and demonstrated in ZNE, they will be incorporated into the CAHP. The lead program is listed in parentheses after each strategy.

- Raise plug load efficiency (ZNE)
- Promote whole house solutions, with a particular focus on zero peak homes as an interim step toward zero net homes (CAHP / ESMH)
- Encourage in-home monitoring and visual display tools (ZNE)
- Encourage incorporation of Green Building Standards (ZNE)
- Coordinate CAHP with demand response programs (CAHP)

Specific strategies for achieving net zero homes will be reviewed in more detail below. Moreover, as outlined above, where strategies enter the market more rapidly than anticipated, they will be rolled into the core CAHP.

#### a) List measures

- \$500 per gas heated home
- \$500 per electric heated home

**b) List non-incentive customer services**

- Technical support to Energy Analysts and Design Teams<sup>70</sup>
- Economic modeling/measure selection support to builder/construction managers
- Marketing support to builders (sales agent training, marketing materials)
- DSM coordination (PV, DR, AMI, ET) for builders to maximize demand-side reductions.

**ENERGY STAR® Manufactured Homes**

In addition to the performance approach cited above, RNC will retain a deemed prescriptive approach for the manufactured home market segment. Homes will have the flexibility to include the entire ENERGY STAR® package for manufactured housing or to incorporate elements within those standards, such as improved windows.

The ENERGY STAR® Manufactured Homes sub-program is designed to promote the construction of new manufactured homes in SoCalGas' service territory that comply with ENERGY STAR® energy efficiency standards. The program targets manufacturers, retailers, and homebuyers of new manufactured homes. The current baseline for manufactured homes is the HUD standard specification. The program encourages manufacturers to install "right-size" HVAC, install high-efficiency HVAC equipment, and evaluate homes on a whole-building basis covering windows, insulation levels, and quality installation inspections. The program works in coordination with the ZNE program element.

The program is a logical fit in the RNC portfolio of programs and will serve another market segment within CAHP, alongside single family and multi-family dwellings. Likewise, the ZNE element will also look to leverage consumer interest in green building in promoting zero peak homes and market transformation.

The objectives of the program are:

- To capture cost effective energy savings and demand reduction opportunities
- To move the industry toward coordinated demand side management (c-DSM), including self-generation and SCE's AMI (SmartConnect™)
- To move the industry toward zero-net energy as identified in the BBEES and advanced in the Strategic Plan
- To move the market segment from HUD compliant to ENERGY STAR® and provide savings for customers purchasing energy-efficient, manufactured homes

The program encourages manufacturers to:

<sup>70</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes for design teams.

- Install “right-size” HVAC equipment
- Install high-efficiency HVAC equipment
- Evaluate homes on a whole-building basis covering windows, insulation levels, and quality installation inspections

The program will also include an education and outreach component as a means to promote awareness of energy-efficient practices in the construction of ENERGY STAR<sup>®</sup> manufactured homes. All segments related to the sale and construction of a manufactured home, including retailers, customers and manufacturers will be engaged. The marketing plan will also target new retailers to inform them of the program benefits and encourage their participation in the program.

Market-actors include manufacturers, retailers and homebuyers. As the primary focus is on retailers, the program is considered a midstream program. Incentives are offered to help induce retailers to promote ENERGY STAR<sup>®</sup> qualified manufactured homes.

<b><u>Program Criterion</u></b>	<b><u>Incentive</u></b>
<u>Prescriptive elements, e.g. windows, add'l insulation</u>	<u>TBD, deemed rather than calculated per CZ</u>
<u>ENERGY STAR<sup>®</sup> Manufactured Home – Gas Heat</u>	<u>\$500/Home (total of prescriptive elements)</u>
<u>ENERGY STAR<sup>®</sup> Manufactured Home – Electric Heat</u>	<u>\$500/Home (total of prescriptive elements)</u>
<u>Zero-peak Home</u>	<u>\$75 for each peak kW reduction due to on-site photovoltaic system</u>

Financial incentives will take the form of fixed rebates (deemed) or may be calculated on a project by project basis.

RNC will pursue zero-peak homes as a reasonable milestone on the way to achieving the Strategic Plan’s ZNE homes. The potential addition of a zero- peak photovoltaic kicker is part of the effort toward achieving zero-peak homes.

As part of the effort to address plug loads, ESMH is exploring such technologies as master plug shut-off switches (smart outlets that shut off when they detect only parasitic loads). Additionally, and as part of the integrated demand side management (DSM) approach recommended by the Strategic Plan, ESMH will reward builders for installing demand response offerings such as PCTs and A/C Cycling controllers. ESMH will deliver demand response measures paid for by the demand response programs, to reward builders for these items based on a deemed amount rather than a performance-based incentive. CAHP will work with their AMI metering infrastructure teams to test and develop in-home displays to both drive plug load usage down and give customers both financial and social reasons to conserve energy<sup>71</sup>. In addition to financial savings, the rationale is that customers

<sup>71</sup> To the extent possible, CAHP intends to leverage AMI funding to incent IHDs in new construction projects. However, AMI has its own schedule and its own priorities for research projects. If DR/AMI is not ready for AMI-integrated IHDs, the ZNE program through its demonstration projects, working in concert with ET, seeks to demonstrate simpler IHD technologies perhaps

will gain social status and personal satisfaction by being the most conserving, much as Prius current owners compete to outperform each other and the EPA's expected miles per gallon.

Marketing efforts will target manufactured home retailers as well as customers.

Desired program outcomes are:

- To achieve short and long term energy savings and demand reduction in the most cost effective manner possible.
- To increase the penetration of ENERGY STAR® manufactured homes within California, and to make ENERGY STAR® the customer's preferred choice.
- To transform the marketplace by promoting ENERGY STAR® qualified manufactured homes the new standard choice instead of homes that merely meet the existing HUD standards.
- To establish a strong working relationship with manufactured home retailers.

A finished project is defined as the completion and assembly of a manufactured home. The process of purchasing and installing an ENERGY STAR® qualified home can be lengthy, so projects need to be monitored closely throughout the program cycle.

The program will include a quality assurance plan with a field inspection component to verify that the manufactured home(s) meets ENERGY STAR® and program's requirements. The program will also have a mechanism to verify that the assembly of the home is in accordance with these standards. This will include ducting work and installation of end-use equipment (for example, HVAC). Many ENERGY STAR® components are assembled on-site and the compliance must be verified once assembled.

Customer information will be captured once a project is complete to allow the utility to integrate delivery of other program offerings to these customers as well as tracking any possible double-dipping. Information on parties receiving incentives will be tracked and reported.

---

without the full capabilities of an AMI-integrated device. As these technologies mature into the marketplace, the statewide IOUs will consider adopt them as additional measures into the core CAHP.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Lighting Market Transformation Statewide Program (Resolution E-4385, Appendix A):

<u>SW PROGRAM / Sub-Program</u>	<u>PROGRAM PERFORMANCE METRIC (PPM)</u>	<u>Metric Type</u>
<u>Residential ENERGY STAR<sup>®</sup> Manufactured Housing</u>	<u>1. Number of manufactured housing units sold in IOU service territories (via retailers and/or manufacturers) participating in program</u>	<u>2a</u>
	<u>2. Number and percentage of participating projects utilizing: (a) whole house incentive for gas heat; (b) whole house incentive for electric heat</u>	<u>2a</u>

**b) Market Transformation Information**

Resolution E-4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

**c) Program Design to Overcome Barriers (Priority Barrier: Homebuyers)**

The energy used in the average home produces roughly twice the greenhouse gas emissions as the average automobile. In fact, 16% of U.S. greenhouse gas emissions result from the generation of energy used in houses nationwide (U.S. EPA). However, there is little consumer awareness of the impact their homes have on the environment. CAHP is working with IOU marketing efforts, statewide partners (e.g. Flex Your Power), ENERGY STAR<sup>®</sup> campaigns, and builder’s own messaging to increase consumer awareness of this idea. Moreover, there is scant evidence that energy efficiency drives

decision- making among homebuyers, whose access to capital is more difficult in a constrained capital market.

#### **Manufactured Housing: a potential opportunity**

The current decline in the housing industry, the high cost of Residential housing, and increasing customer awareness of energy efficiency all make this a good time to address this underserved market segment. The manufactured housing industry is somewhat counter-cyclical to the site-built home market. As buyers are priced out of site-built homes, manufactured housing has become an affordable alternative.

Historically, manufactured housing has been considered a lost opportunity. Manufacturers recognize that ENERGY STAR® manufactured homes address both the high cost of purchasing a traditional new home and the high cost of energy bills. However, without IOU intervention in the market, retailers are not pushing ENERGY STAR® homes and there is not enough demand for manufacturers to justify building them.

#### **Overcoming Market Failure: CAHP**

In a buyer's market, builders are looking to differentiate themselves from competition. This presents a opportunity for ESMH to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to help meet the state's and IOUs' goals for the reduction of greenhouse gas emissions and utility source demand.

The RNC market without IOU intervention is a lost opportunity for long-term energy savings. However, with IOU intervention in the form of incentives and design support, the new construction market is well placed to demonstrate innovative approaches and cost-effective energy savings technologies.

#### **Overcoming Market Failure: Manufactured Housing**

The program provides an incentive to manufactured home retailers when they sell a manufactured home that meets or exceeds the current ENERGY STAR® standards. These standards extend to the ducting and installation guidelines for heating/cooling equipment, be tracked and reported.

ENERGY STAR® qualified manufactured homes will generate energy savings and demand reduction. In addition to leveraging retailers of manufactured homes, the program will leverage the Partnerships Program to reach out to local governments where the homes will be built.

Manufactured homes have a higher potential for market transformation than the site-built industry due to factory standardization, and the fact that recent research indicates that eight manufacturers control approximately 98%<sup>72</sup> of the manufactured housing market.

#### **Current Program Baseline: Manufactured Housing:**

Prior to IOUs' intervention in the market, there was no ENERGY STAR® qualified manufactured homes sold in our service territory. The construction of manufactured homes

<sup>72</sup> "Synopsis of manufacturer market share and status," Manufactured Research Association, communication, October 2007.

that meet ENERGY STAR® program standards, as opposed to the less stringent HUD standards, will result in demand reduction, energy savings, and the reduction of greenhouse gas emissions.

The energy savings will result from a combination of improved envelope efficiency (thermal and air tightness), use of high efficiency equipment, and the proper sizing (downsizing) of the cooling equipment. This program is statewide among the IOUs, to provide continuity and better service to the builder at reduced costs.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

<b><u>ENERGY STAR® Manufactured Homes</u></b>	<b><u>Program Target 2013</u></b>	<b><u>Program Target 2014</u></b>
<u>Units Paid</u>	<u>TBD</u>	<u>TBD</u>

**e) Advancing Strategic Plan goals and objectives**

Since its inception in 2002, CAHP has had a substantial impact on the homebuilding market. There is a significant opportunity to continue to influence builders, architects and other players in the Residential New Construction industry.

The RNC sub-program is designed to enable the achievement of several goals and strategies identified in the Strategic Plan. The Strategic Plan envisions a transformation of the core Residential sector to ultra-high levels of energy efficiency, resulting in ZNE new construction standards by 2020. It spells out several goals and strategies to address energy reduction in Residential New Construction.

**Goal #1:** New Construction will deliver “ZNE” performance for all new single and multi family homes by 2020.

- By 2012, 50% of New Homes will exceed 2008 Title 24 energy efficiency standards by 20%; 10% will surpass 2008 Title 24 standards by 40% (Strategy 1-1)<sup>73</sup>

**Goal #2:** Home buyers, owners and renovators will implement a whole house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment household appliances, and plug load amenities

**Goal #3:** Plug load will grow at a slower rate and then decline through technological innovation spurred by market transformation and customer demand for energy-efficient products.

The goal of energy-efficient Residential New Construction will be achieved through a combination of incentives, technical education, design assistance, and verification.

<sup>73</sup> As modified in D.09-09-047

CAHP supports the ambitious goals of the Strategic Plan, and works in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole-house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP. In fully aligning itself with the Strategic Plan, the CAHP targets an interim goal of 50% of RNC to Tier II (2005) by 2011, 10 per cent of RNC to 55% by 2011, and a final goal of 100% of Residential New Construction to be net zero by 2020. In fully aligning itself with the Strategic Plan, as modified by Decision 09-09-047, the CAHP targets an interim goal of 50 percent of RNC to be 20% better than the 2008 Title 24 Standards by 2012, and 10% of RNC to be 40% better than the 2008 Title 24 Standards by 2012, and a final goal of 100 percent of residential new construction to be net zero by 2020.

## **6) Program Implementation IOU-specific elements**

### **a) Statewide IOU coordination**

Given the success of the collaborative process that led to the production of this PIP, the statewide RNC team plans to meet on at least a quarterly basis going forward in order to review progress toward the goals and make corrections need to achieve them.

#### **i. Program name**

The single-family and multi-family programs will be implemented under the common name of CAHP. The zero peak pilots will be referred to as ZNE Homes, although the details differ somewhat by utility. Factory-built housing will be referred to as ENERGY STAR Manufactured Homes.

#### **ii. Program delivery mechanisms**

SoCalGas delivers the program primarily through in-house account executives with some outside technical support for specific analyses. SCE leverages third-party implementers and in-house account executives. For the 2013-2014 program period, SoCalGas and SCE will continue implementation of ESMH, as their service territories overlap significantly. This will ensure cost effective implementation as well as a consistent program delivery to the applicable customer base.

#### **iii. Incentive levels**

The IOUs have agreed upon a common incentive methodology that will be implemented throughout the service territories. The incentive levels are as indicated earlier.

#### **iv. Marketing and outreach plans**

ESMH will ensure closer coordination of marketing efforts to synergize wherever possible. While each utility would like to leverage on their strengths and existing relationships within their service territories, certain marketing elements can be launched on a common platform. A common website will be created to provide builder information that will be commonly disseminated. Training and education is an area where pooling of resources is possible to reduce cost and increase participation.

The participating IOUs plan to be actively engaged in the development and implementation of joint marketing, education and training efforts as described in detail in the common section of this PIP.

In 2013-2014, the program will expand its builder/contractor education and training certification courses to increase overall awareness and understanding of CAHP and service offerings. We will continue to strengthen our delivery channels of information by providing relevant information and support materials, reaching target audiences in key decision-making phases. The IOUs' innovative communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, e-mail blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the Internet. Additionally, CAHP will leverage its excellent relationships in partnering with trade organizations and other groups actively promoting the benefits of green, sustainable building practices. Such organizations include: CEC, FYP, AIA, USGBC, ULI, California Manufactured Housing Institute, Build It Green, IES, AEE, IHACHI, PHCC and others. Through an innovative, coordinated approach, we will maximize outreach opportunities that keep energy efficiency and program benefits top-of-mind and maximize program participation.

Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

**v. IOU program interactions**

The plan addresses above, in the Incentive Rationale section, the ways CAHP is encouraging demand performance, in-home displays, on-site generation, square footage reductions and green elements.

CAHP is particularly interested in promoting integrated thermal hot water system designs to displace therm demand with on-site renewable sources. In addition to cold water savings from embedded energy and the energy to heat water, longer term there may be GHG reductions that accrue either to the builder, the homeowner, or the utility associated with each demand side reduction as a result of AB 32 and pending national CO<sub>2</sub> legislation.

CAHP prides itself on its established close relationships and memberships with other groups involved with the building industry. These relationships make it possible to provide comprehensive services to our customers. Thus, CAHP will continue to seek out and coordinate synergies with, but not limited to, the following groups:

- NSHP

- EPA
- California IOUs
- Green Building Consultants (i.e. Build it Green, California Green Builder, Global Green)
- Rater Organizations (e.g. ResNet, CalCerts, CHEERS)

CAHP will continue its commitment to the EPA’s ENERGY STAR program and will strive to support, partner and contribute to the success of the ENERGY STAR homes label and branding. Numerous surveys and studies continue to show the ENERGY STAR label represents greater value to consumers and the environmental stewardship it represents.

Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR New Homes and has won ENERGY STAR achievement awards for the last seven consecutive years. In 2011 SCE was rewarded for “Sustained Excellence in Energy Efficiency Program Delivery”.

The program will continue to offer comprehensive training courses and educational seminars relevant to building energy efficiency and green measures into new construction projects including Title 24 code training and ENERGY STAR requirements. In response to builder requests, CAHP will offer a new training workshop during 2013 - 2014 designed for builders’ sales agents. Sales agents have direct contact with the homebuyer and have the greatest impact on selling homes. In order to help promote ENERGY STAR developments, CAHP will teach sales agents about energy efficiency. Topics will include what qualifies as an ENERGY STAR home and what is 'green'. Other activities will include attendance at building industry trade conferences/ outreach events and any necessary contractor/builder field visits. The target audience consists of builders, developers, energy consultants, architects, and other industry professionals. IOUs may pursue partnership efforts with local government entities who are looking to display leadership in the carbon arena by expediting plan check, waiving permit fees, or allowing builders to pay impact fees on the back end (instead of up-front) in exchange for higher levels of home performance documented by our program.

**vi. Similar IOU and POU programs**

The statewide team will reach out to leading POU programs, such as those at SMUD to learn from their experience how best to deliver energy-efficient homes.

In addition, the IOUs will work closely with the existing home remodeling programs (Home Performance with ENERGY STAR and the Comprehensive Mobile Home Program) to maintain a two-way communication of best practices and lessons learned between the new and existing sectors.

**b) Program delivery and coordination**

**i. Emerging Technologies (ET) program**

Emerging technologies will chiefly be handled within the ZNE program. The IOUs are looking to partner with our ET and EPIC-funded Testing Facilities to pilot zero-

net energy approaches, particularly in the manufactured home/prefabricated segment. However, the proposed incentive approach allows the IOUs the flexibility to include both deemed and calculated energy savings from new technologies as they become market ready.

The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

**ii. Codes and Standards program**

As mentioned above, manufactured housing is not subject to Title 24, although there are national efforts to improve the HUD code.

**iii. WE&T efforts**

The RNC team is seeking ongoing support from the three energy and training centers for classes relevant to the building industry and training the next generation of trade allies, builders, contractors, and the like.

**iv. Program-specific marketing and outreach efforts**

In 2013-2014, the program will expand its manufacturer and retailer outreach to increase overall awareness and understanding of ESMH. We will continue to strengthen our information and support materials, focusing on the value to the retailer of making the sale to the homebuyer. The IOUs' communication tools will include: account representative meetings/presentations, targeted customer mailings, trade organization affiliations, and builder award recognition. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the internet.

**v. Non-IOU Programs**

There may also be opportunities to partner with local AQMDs and County Integrated Waste Management Boards to encourage material recycling in ZNE and green programs.

**vi. CEC work on C&S**

The IOUs will continue to support Codes and Standards development work with the CEC and to test candidate technologies in the new construction programs.

**c) Best Practices**

The Residential New Construction team will gather information and past experience in successful low energy and ZNE existing projects to evaluate best practices. This information will be used to develop pilot projects that will demonstrate low energy homes and include home performance monitoring.

**d) -Integrated/coordinated Demand Side Management**

The statewide RNC team is committed to a full integration of all resource types. A first step has been taken by way of a recent joint agreement between SoCalGas and SCE,

which allows the two utilities to buy back therms and kWh. Water saving technologies and CO<sub>2</sub> reduction are strongly emphasized and tracked in ZNE projects. As these technologies get accepted and recognized, they will become integrated into the base CAHP projects.

**e) Integration across resource types (energy, water, air quality, etc)**

As discussed above, RNC is looking to partner with relevant stakeholders to identify water, air quality, and waste-diversion opportunities.

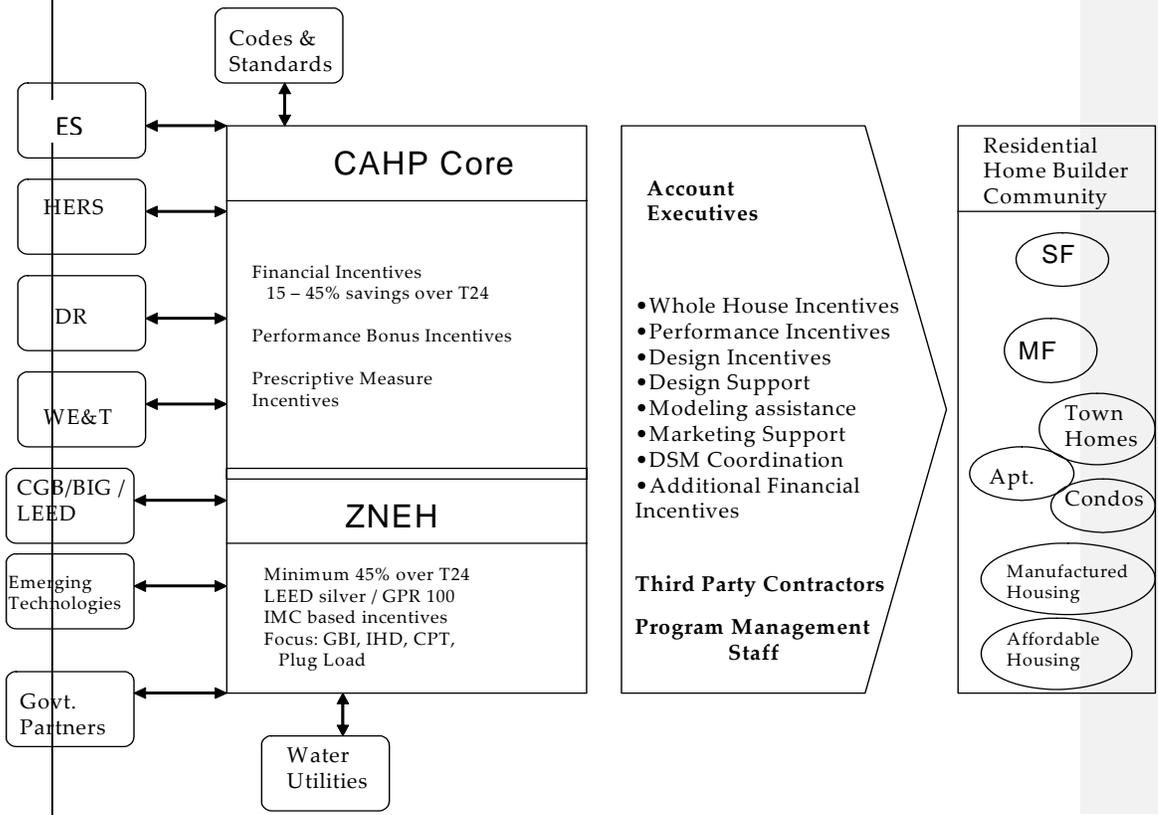

**f) Pilots**

As discussed above, The IOUs may in the future need to create a pilot program to test the viability of an offering.

**g) EM&V**

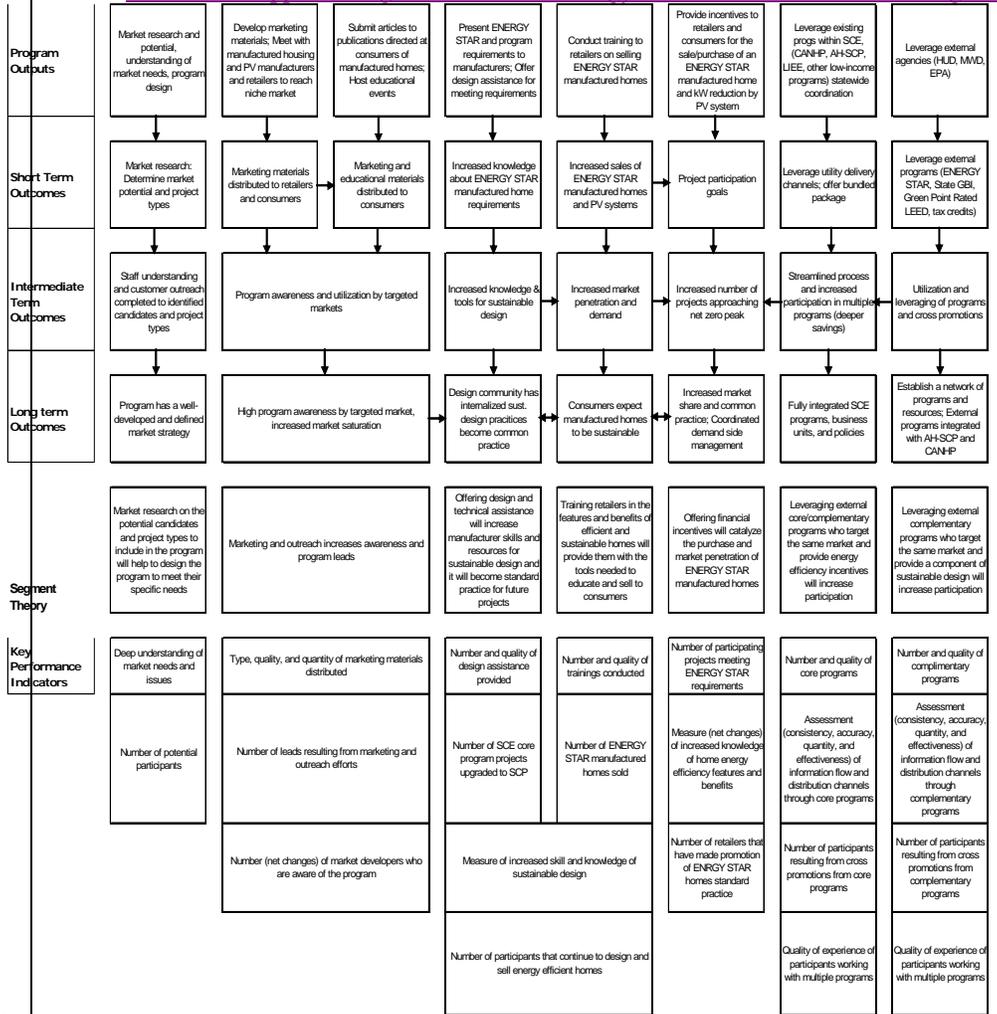

The utilities are proposing to develop and submit a comprehensive EM&V plan for 2013-2014 after the program implementation plans are filed. This will include process evaluations and other program-specific studies within the context of broader utility studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

**7. -Diagram of Program**

## 8. Program Logic Model

Note: On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas & Electric Company, Southern California Edison Company, Southern California Gas Company, and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Energy Star Manufactured Homes Program.

Formatted: Font: Times New Roman, 12 pt

**4. Table 2 – Reference core program for projected gross impacts detail.**

**4. Program Description**

a. Describe program

The California Advanced Homes Program (CAHP) is part of the statewide Residential New Construction (RNC) sub-program offering. The RNC sub-program is itself represents one-half sixth of the New Construction CalSPREE core offering. CAHP encourages single and multi-family builders of all production volumes to construct homes that exceed California’s Title 24 energy efficiency standards by a minimum of 15

<sup>75</sup> For all electric IOUs, the therm column should include interactive effects.

percent. Through this plan, multi-family and single-family projects are approached identically for program purposes except where explicitly noted. The ENERGY STAR® Manufactured Homes program, offered by Sempra and Southern California Edison, addresses new factory-built housing. The structure of the relevant Residential New Construction program elements is as follows:

New Construction CalSPREE Program (Core)

— Non-residential New Construction Sub-Program (Savings by Design)

1. Residential New Construction Sub-Program

2.1 Single-family/Multi-family Sub-Program (California Advanced Homes CAHP)

a. — Zero Net Energy ZNE Homes Sub-Program

2.2 Manufactured Homes Sub-Program for Sempra and Southern California Edison

Formatted: Space After: 0 pt, Line spacing: single

Formatted: Space After: 0 pt, Line spacing: single, Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 2.25" + Tab after: 2.75" + Indent at: 2.75"

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single

For the convenience of the reader, two other programs relevant related to New Construction are also called out:

— Sustainable Communities Program (Name / Location differs by IOU) (Third-party)

- — Covering Master-planned communities, mixed-use projects, campuses, and commercial projects pursuing advanced energy efficiency and green targets.

• Strategic Planning Sub-Program (Energy Leader Partnership Strategic Support)

Trains cities and counties to procure city projects to meet energy efficiency standards, to identify funding sources, to share best practices, and recognize them for their achievements.

The goal of energy-efficient Residential New Construction (RNC) will be achieved through a combination of incentives, technical education, design assistance, and

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single

verification. CAHP supports the ambitious goals of the California Long Term Energy Efficiency Strategic Plan (CLTEESP), and works in close coordination with the Zero Net Energy Homes ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the New Solar Homes Partnership. In fully aligning itself with the CEESP, as modified by Decision 09-09-047, the CAHP targets an interim goal of 50 percent of RNC to be 20% better than the 2008 Title 24 Standards by 2011, and 10% of RNC to be 40% better than the 2008 Title 24 Standards by 2011, and a final goal of 100 percent of residential new construction to be net zero by 2020. (NSHP).

As explored in greater detail below, CAHP will work closely together with the Zero Net Energy Homes (ZNEH) incorporate a ZNE sub-element to adopt the following strategies toward achieving CLTEESP the Strategic Plan goals. As program technologies and approaches are developed and demonstrated in ZNEHZNE, they will be incorporated into the California Advanced Homes Program. The lead program is listed in parentheses after each strategy CAHP.

7. Raise plug load efficiency. (ZNEH (ZNE))
8. Promote Whole House solutions, with a particular focus on zero peak homes as an interim step toward zero net homes. (CAHP)
9. Encourage In-home Monitoring and visual display tools. (ZNEH (ZNE))
10. Encourage incorporation of Green Building Standards (ZNEHZNE)  
—Coordinate CAHP with demand response programs. (CAHP)

-specific

11. Specific strategies for achieving net zero homes will be reviewed in more detail below. Moreover, as outlined above, where strategies enter the market more rapidly than anticipated, they will be rolled into the core CAHP.

- a) To further help make ZNE a reality in the residential sector, utilities will:
- b) \_\_\_\_\_
- e) Integrate successful ZNE strategies and activities proven through program and/or pilot projects during the 2013-2014 Transition Period. The residential new construction program will absorb and enhance existing residential programmatic elements aimed at delivering ZNE best practices to the marketplace, potentially including but not limited to:
  - d) Project consultations that pair projects with experts capable of driving unique designs to ZNE;
  - e) Provide education opportunities to key architectural, engineering, and other design professionals (see WE&T plans); and

i. List measures

CAHP Program measures, known savings. All IOUs.<sup>76,77</sup>

- Whole House Incentive
- Dishwashers
- Aerators/Showerheads
- Clothes washers (Water agency Partnership)<sup>78</sup>
- Dryers
- Interior Lighting
- Refrigerators

Pending Program Measures, savings/incentive TBD. IOU dependent<sup>79</sup>

- Programmable Communicating Thermostat (deemed, delivers DR measure)
- Refrigerant Charge Adjustment (deemed, delivers Comp HVAC measure)<sup>80</sup>
- In-Home Display (deemed, delivers AMI measure)
  - Specifications, incentive levels, TBD
- Whole House Fan (savings TBD)
- Demand Re-circulation DHW systems (savings TBD)
  - Increase in electric pumping, decrease in heating therms, water usage
- IOU team will evaluate future emerging technologies for inclusion
- Marketing assistance as they become market ready.

Incentive Structure

<sup>76</sup> Savings per appliance will be consistent across all IOUs.

<sup>77</sup> Savings per appliance will be consistent across all IOUs.

<sup>78</sup> Program intent (with regulatory approval) is to maintain IOU funding for appliances regardless of water agency contribution. Since incentive dollars are coming from different sources, there is no double dipping. However, customer's cost will decrease in IMC calculation. Nevertheless, even in worst case if IMC goes negative, which seems unlikely, clothes washers are small budget and savings measure relative to total RNC program and will have minimal impact on TRC. Future water energy pilot results may also provide additional cold water savings to augment therm savings.

<sup>79</sup> Since funding is coming from other sources (AMI, Comp HVAC, DR), incentives in this group will be deemed rather than calculated. The intent however, is to maintain consistency in deemed amount across IOUs. Other measures, such as whole house fans and demand recirculation systems need additional research to determine savings.

<sup>80</sup> T24 requires CIL or RCA in prescriptive path. If used for compliance, measure ineligible

Formatted: Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 1" + Indent at: 1"

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single

i. ~~The pay for performance incentive structure for the 2010–12 CAHP will change from the current deemed structure of three tiers (15 percent, 20 percent, and 35 percent). Under the current deemed program, feasible and appropriate for builders receive the same incentive regardless of how much energy the project saves. By definition, a deemed incentive rewards the same, so overcompensates those who save the least, and under rewards those who save the most. Since the deemed amount is an average across a wide variety of climate zones, those in the mildest zones are paid more per kWh than those in hotter areas. This effectively shortchanges those whose homes have the highest performance. It also tends to discourage participation in hotter areas (for example, climate zone 15, Palm Springs) where costs are in fact higher for achieving the same level of energy performance to achieve ENERGY STAR® certification.~~

h) ~~Calculated incentives:~~

i)

ii. ~~List non-incentive customer services~~

• ~~Technical support to Energy Analysts and Design Teams<sup>84</sup>~~

• ~~Economic modeling/measure selection support to builder/construction managers~~

• ~~Marketing support to builders (sales agent training, marketing materials)~~

• ~~DSM coordination (PV, DR, AMI, ET) for builders~~

~~The proposed approach is closely modeled on the calculated whole building approach used by the Savings By Design program. In this approach, the incentive rate per unit of energy (\$/kW, \$/kWh or \$/Therm) is a function of the percentage by which the project exceeds code.~~

~~Therefore, a kWh at 15% better than code is worth only \$0.43, but a kWh at 35% better than code is worth \$1.00 to the builder. Multiply this increase in rate by the absolute increase in units of energy saved as performance margins increase, and the result is an arithmetic progression.~~

Formatted: Space After: 0 pt, Line spacing: single, No bullets or numbering, Tab stops: 1.5", List tab

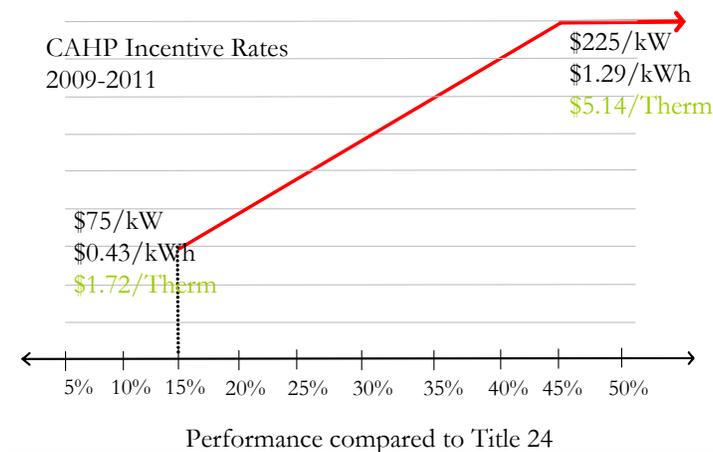

Formatted: Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 1" + Indent at: 1"

Formatted: Indent: Left: 1", Hanging: 0.5", Space After: 0 pt, Line spacing: single, Numbered + Level: 2 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Tab after: 1.25" + Indent at: 1.25", Tab stops: 1.5", List tab + Not at 1.25"

Formatted: Space After: 0 pt, Line spacing: single, No bullets or numbering

<sup>84</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes/workshops for design teams.

The 2010–2012 calculated approach will be as follows:

Formatted: Font: Times New Roman, 12 pt

The peak demand incentive rate is also variable, rising from \$75/kW at 15% to \$225/kW at 45%.

Moreover, because of the challenges faced by builders in adopting the new energy code requirements, the statewide IOU team has adopted the 10% rate to ease the transition to the new code for builders and to compensate for the abandonment of stand-alone prescriptive measures, discussed in more detail below. The IOUs assert that the special rate shall only be offered for a limited time, the five months from August 1, 2009 until December 31, 2010 for those projects subject to the 2008 Title 24 code. It will not be available after January 1, 2010.<sup>82</sup>

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

This approach rewards builders for achieving higher levels of energy efficiency and avoids the “clustering” problem in tiered programs. A tiered approach discourages builders from achieving incremental performance if they are unable to reach the next higher tier. In line with the elements of the strategic plan, the new approach rewards builders for undertaking whole house solutions where the entire structure can be considered as an integrated system.

<sup>82</sup> Because of the anticipated delay of the launch of the full 2010–2012 CAHP until 1 Jan 2010, an accommodation for projects reaching 10% < 2008 T24 will be made within the existing 2006–2008 deemed approach. The amount for this and the timing is TBD by the statewide team.

Moreover, while executing a net zero home remains a financial and technical challenge, a zero peak home is well within the reach of existing technologies and is particularly appealing to a utility with summer capacity issues. To that end, CAHP has elected to focus on zero peak homes as a bridging strategy to net zero homes, which is another reason to include in its calculated approach a substantial incentive for peak kW reduction.

#### Analysis leading to calculated approach

While the need to move to a calculated approach was clear, setting the rates requires additional analysis. Efforts are currently under way to make appropriate software modifications to support incentive calculations over the range of efficiency improvements and climate zones. The goal of the incentives is to cover approximately 50% or more of project IMC at 20% better than 2008 Title 24, although it is difficult to set one set of rates that works perfectly for all climate zones and building designs, which will be aligned with the IOUs' overall push to drive projects to higher levels of code performance.

#### Confidence that incentives will move the market

The statewide team has a high degree of confidence that the revised program design is sufficient to realize substantial market movement toward the 50% penetration goal. As discussed above, incentives alone are not enough to move the market. While more dollars are always preferred by any target industry, it has been the experience of the Southern California utilities that while incentives get one to the table with decision makers, it is the design, technical, and marketing support that makes the sale.

It is the belief of the IOUs that the proposed combination of performance based incentives, marketing kickers for targeted zero net energy, renewable, and marketing elements, sales agent training, technical support, coordinated delivery through trade allies and ongoing cultivation of builder relationships provide an integrated solution to the priority market barriers (discussed below) builders face in delivering more efficient homes.

Regarding the goal to achieve 50% penetration in the entire California market to '35% below 2005 T24' by 2011, the IOUs make the following assumptions:

- 2008 code is 15% more stringent than 2005 code
- 2011 code will be implemented in 2011.
- 2011 code will be 15% more stringent than 2008 code.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

The goal of 50% of market to 35% < T24 is essentially an area function where A (area)= penetration (50% of market) x performance (35% < T24). That is, getting 25% of the market to 70% <T24 represents an equivalent amount of savings.

Code compliance is at 70%.

IOUs will claim the full 30% delta between standard practice and code, in addition to the traditional above code performance achieved by participating builders.

IOUs use 70% compliance in 2005 as benchmark against which to demonstrate results.

In the following analysis, the 70% compliance rate is unimproved over time [c], and similarly, IOU participant penetration holds steady at 10% [g]. Both are likely to increase as a result of planned activities in CAHP or in codes and standards; in fact statewide penetration rates for CAHP are closer to 12% and are increasing. Similarly, project marginal performance [h] remains at 15%, although the entire incentive design is intended to increase marginal performance.

Code	Rate > 2005 [b]	Compliance [c]	BMrk Performance [b*c=d]	Non-Participant Penetration [e]	NP Performance [d*e=f]	Participant Penetration [g]	Participant %<T24 [h]	Partic. Performance [(h+b-c)*g+d*g=i]	Total [i+f]
Title 24 2005	100%	70%	70.0%	90%	63.0%	10%	15%	11.5%	74.5%
Title 24 2008	115%	70%	80.5%	90%	72.5%	10%	15%	14.1%	86.5%
Title 24 2011	130%	70%	91.0%	90%	81.9%	10%	15%	16.6%	98.5%
CLTEESP 50%	135%	70%	92.8%						
CLTEESP 100%	135%	70%	94.5%						

Formatted: Font: Times New Roman, 12 pt

In this simplified analysis, it is assumed that non-participants are building only code minimum homes. At 70% compliance, the CLTEESP target at 35% better than 2005 code has a benchmark performance target [d] of 92.8% of minimal T24 2005 compliance. Put another way, with 70% compliance as the baseline, improving compliance to 7.2% worse than 2005 code is equivalent to getting half the homes to 35% better than 2005 code. Getting 100% of new construction to 35% better is equivalent to performance of 94.5% of 2005 code, or 5.5% worse than a 2005 minimum.

When the 2011 code goes into effect, the IOUs will exceed the equivalent industry wide performance of 100% of homes to 35% better than 2005 code benchmark [d] of 94.5% with a

total industry wide [i+f] performance (participant and non-participant) of 98.5% compliance with 2005 code.

Without the 2011 code change occurring in 2011, a market penetration rate of 21% is required to achieve the target industry wide performance of 94.5% of 2005 code.

If 2011 code does not go into effect in 2011, and the utilities are not allowed to claim for purposes of reaching the 50% target using the compliance rate (whatever it may be), the goal of 50% of homes to 35% < T24 2005 would require a penetration rate of 50% to a performance level of 20% better than 2008 code, which is outside the experience and reasonable expectation of the statewide IOUs.

How program supports CEC's New Solar Homes Partnership, Tier II

CAHP supports the revised NSHP Tier II (30% < T24 2008) and the goals of the CEC in six ways:

The IOUs are committed to partnering with the NSHP to streamline the solar application process and to make referrals between NSHP and CAHP. Indeed, the goals of zero peak and ZENH appear impossible without the significant presence of solar.

The IOUs will leverage CEC NSHP material, marketing, and event support for opening events for those projects that commit to the platinum level: 100% penetration at the Tier II EE performance (30%).

The design of the graduated, performance based incentive will tend to drive projects to the higher end of the performance curve, consistent with CEC goals.

The kicker for peak kW reduction by solar equipment, will also reward projects that pursue efficiency before adding solar, and rather than a pass fail approach, provide the greatest reward to those who achieve the highest efficiency.

The threshold efficiency (15%) is consistent with the Tier I minimum, and the top end (45%) was selected to support the CEC's desire to project out three code cycles (Tier III) into the future.

The IOUs will provide a \$1,000 per single family unit and \$200 per multi family unit for projects that meet the NSHP Tier II requirement AND participate in the NSHP to entice builders to reach for Tier II.

However, the fact remains that the program design does not provide anything "special" for projects that get to 30%. This is consistent with the CEC's incentive design, which provides no more PV incentive for a home that gets to 30% < T24 than to 15%. The IOUs support the goals of the NSHP and the marketing synergies of PV and EE remain one of our best strategies for moving the market. Nevertheless, the IOUs position is that if 30% < T24 is very good, 31% is better, and 32% more so.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Prescriptive Measures

For those prescriptive measures that the current performance software cannot model (e.g. appliances, lighting, etc.), the builder will be paid at the same rate as the overall home achieves on the incentive scale. As an example, a typical qualifying refrigerator saves 58 kWh, and 0.0099 kW. If the home reached performance of 35 percent, that refrigerator is worth \$59.73. However, should the home only achieve the 10 percent performance level, that dishwasher is worth only \$17.32.

**Incentive per refrigerator**

<u>% &lt; T24</u>	<u>kWh</u>	<u>\$/kWh</u>	<u>kW</u>	<u>\$/kW</u>	<u>Total</u>
<u>35%</u>	<u>58</u>	<u>\$1.00</u>	<u>0.0099</u>	<u>\$ 175</u>	<u>\$ 59.73</u>
<u>10%</u>	<u>58</u>	<u>\$0.29</u>	<u>0.0099</u>	<u>\$ 50</u>	<u>\$ 17.32</u>

Formatted: Font: Times New Roman, 12 pt

See complete list under 4 Program Description, b) List measures, above.

N.B. prescriptive measures may not be used to improve the marginal performance of the home as a whole.

The statewide team has elected to eliminate prescriptive incentives (lighting, appliances) as stand alone measures separate from overall building performance. This is to encourage more builders to adopt a whole building approach, and to provide the right price signals to builders to encourage higher levels of performance. However, prescriptive measures such as refrigerant charge and airflow (RCA) and programmable communicating thermostats (PCTs), and In Home Displays (IHDs) will continue to be paid at the deemed rates of their originating program, in large part because the funding for these items is coming from another program's budget.

As part of the effort to address plug loads, ZNEH is exploring such technologies as master plug shut off switches (smart outlets that shut off when they detect only parasitic loads). Additionally, and as part of the coordinated demand side management (DSM) approach recommended by the CLTEESP, CAHP will reward builders for installing demand response offerings such as PCTs and A/C Cycling controllers. CAHP will deliver demand response

~~measures paid for by the demand response programs. CAHP intends to reward builders for these items based on a deemed amount rather than a performance based incentive.~~

~~CAHP will work with their AMI metering infrastructure teams to test and develop in-home displays to both drive plug load usage down and give customers both financial and social reasons to conserve energy.<sup>83</sup> In addition to financial savings, the rationale is that customers will gain social status and personal satisfaction by being the most conserving, much as Prius current owners compete to outperform each other and the EPA's expected miles per gallon.~~

~~Energy savings will be modeled based on the entire package of optimized energy efficiency solutions and will influence the project at the design stage when changes to specifications are most cost effective.~~

~~In addition to the direct energy savings incentives, builders will be eligible for Performance Bonus Incentives when they use any of the program elements listed in the following table. Each Performance Bonus is discrete and independent of the other program elements.~~

<del>Program Criterion</del>	<del>Percentage Added to Overall Incentive</del>
<del>— ENERGY STAR® Home</del>	<del>10 percent (fixed)</del>
<del>— Green Home</del>	<del>Independent, third party, transparent verification provider will be retained to verify green building elements have been installed (similar to HERS registry function). The IOUs will establish a</del>

<sup>83</sup> ~~To the extent possible, CAHP intends to leverage AMI funding to incent IHDs in new construction projects. However, AMI has its own schedule and its own priorities for research projects. If DR/AMI is not ready for AMI integrated IHDs, the ZNEH program through its demonstration projects, working in concert with ET, seeks to demonstrate simpler IHD technologies perhaps without the full capabilities of an AMI integrated device. As these technologies mature into the marketplace, the statewide IOUs will consider adopt them as additional measures into the core CAHP.~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

<u>Program Criterion</u>	<u>Percentage Added to Overall Incentive</u>
	<u>minimum threshold for participation and set an incentive equal to 5% of the total, rising proportionally for higher levels of green performance.</u>
<u>— Compact Home</u>	<u>Percentage by which home &lt; Climate Zone Sq Ft Average for new construction, by building type. Minimum threshold of 10% &lt; CZ average, updated annually. There will be separate baselines for SF and MF homes.</u>
<u>— kW Reduction (Zero Peak Home)</u>	<u>The same \$/kW rate for each peak kW reduction due to on-site photovoltaic system</u>

~~The program will coordinate with the statewide Codes & Standards team to ensure that the impacts of any code changes are incorporated into program design and implementation and will also tie into the CLTEESP Strategic Plan Codes and Standards Strategy strategy and support the zero net energy ZNE goals.~~

~~The California IOUs are working with the local water districts on water energy pilots promoting water conservation in joint territory with water agencies. If the pilot is able to demonstrate meaningful embodied energy savings from water efficiency, CAHP will consider providing additional incentives for water efficiency. These incentives and our coordinated efforts with the water agencies reflect our commitment to an integrated approach both within and between different utilities.~~

~~IOUs are working with their Low Income Energy Efficiency (LIEE) programs to coordinate energy efficient new construction with low income housing development. Coordination activities include: (review with LIEE staff)~~

~~• Builders often set aside a certain number of units for various income classifications to meet low and moderate income housing goals. Builders often set aside a certain number of units for various income classifications to meet low and moderate income housing goals. Builders must meet state mandated housing goals in the housing elements of local city and county strategic plans.<sup>84</sup>~~

~~— CAHP would treat market rate units using the standard calculated approach and claim all energy savings. For those units designated by the builder for low income occupants,~~

<sup>84</sup> See <http://www.hcd.ca.gov/hpd/hrc/plan/ho/>, accessed 25 Apr 08.

SDG&E's LIEE program will pay the full incremental cost of installing higher efficiency equipment (high Seasonal Energy Efficiency Rating (SEER) A/C systems and refrigerators). LIEE will claim the energy savings from measures they funded.

CAHP will pay the standard calculated incentives for all other measures in low income units (e.g. improved duct work and windows). CAHP will claim the energy savings resulting from EE measures other than high SEER A/C and refrigerators.

CAHP would treat market rate units using the standard calculated approach and claim all energy savings.

This collaboration will encourage the development of more below market rate low income units by developers, will increase participate in the New Construction program based on the combined higher incentives, and will benefit low income occupants over the life of the installed equipment.

Formatted: Space After: 0 pt, Line spacing: At least 12 pt, Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25"

The partnerships program will assist in gathering information to ensure that the units actually are occupied by low income qualified customers. Local governments typically track this information in order to show compliance with state mandates.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

#### Zero Net Energy Homes (ZNEH(ZNE)

The ZNEH sub ZNE program element recognizes that critical to achieving zero net new construction is the integration of DSM approaches and truly integrated design. This can only be done when the entire suite of DSM offerings is at the table (electric transportation, demand response, energy efficiency, smart meters, and distributed generation). These will be maximally effective when they are part of a truly integrated design.

To that end, ZNEHZNE will help educate the industry on how to achieve energy efficient, green homes. To avoid inter program competition, ZNEH will claim no energy savings of its own but will add value to the builder and the homebuyer. Pending future measurement and evaluation efforts to disaggregate its effects, all ZNEH projects will be routed through CAHP for incentives and energy and demand savings claims. More about the incentives for green elements is below. efficient, green homes.

Formatted: Font: (Default) Times New Roman, 12 pt, Not Superscript/ Subscript

Formatted: Normal, Indent: Left: 0"

Formatted: Font: Times New Roman

The ZNEH sub ZNE program element will consist of a series of pilot projects, typically custom homes with motivated owners willing to pick up a substantial projects that have used advanced modeling techniques to project total kBtu usage and demonstrates a plan to offset said usage with onsite generation over the course of 12 months. This portion of the program will provide customized financial incentives that intend to cover a portion of the verified incremental cost for a portion of the homes, at levels that may vary. This incentive will only apply to the energy efficiency measures of the home and will explicitly exclude the cost of renewable energy generation. The Emerging Technology program may also fund the purchase, installation, and monitoring of candidate technologies. additional features. The sub program may, at its discretion, provide direct financial incentives over and above the standard CAHP offer, but only on a case by case basis. The Emerging Technology program may also fund the purchase, installation, and monitoring of candidate technologies. The ZNEH sub ZNE program element

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

will also provide its support in the form of soft-cost design support to help design teams meet their energy and environmental objectives. The sub This portion of the program works closely with home builders seeking assistance in the development of sustainable design and construction, green building practices and emerging technologies.

The ZNEH sub ZNE program element, in conjunction with WE&T programs, offers educational opportunities to builders, architects and other residential Residential construction stakeholders seeking knowledge about emerging technologies and new home design. The program encourages single and multi-family architects and builders to design and construct dwelling units that exceed California's Title 24 standards, reduce greenhouse gas emissions, and provide a healthier and less resource-intensive environment. Such non-standard design elements may include optimization for solar orientation, design for comfort without traditional HVAC, or non-vapor-compression cooling systems. It also is a priority goal of this element of the sub program to execute candidate technologies and integrated approaches to realize zero-peak homes, even if zero-net homes (site BTUs for both therms and kWhs) prove too costly.

• Design Assistance Options:

- i. General Team Education: Give presentations, review rating system options, determine big-picture green building goals.
- ii. Energy Efficiency/Green Building Recommendations: Project-specific recommendations report highlighting ways to incorporate energy efficiency, healthy materials, and other green building features into the unique parameters of the project. Specific product recommendations will not be provided.
- iii. Energy Modeling Support: Provide support and recommendations for Title 24 energy performance modeling to estimate actual building usage and give the project credit for energy efficiency measures that are difficult or uncommon to model.
- iv. Plan and Specification Review: Provide comments on the construction documents at various stages to give feedback on clarity of green building specifications.
- v. Green Feature Cost Assessment: Provide cost-benefit analyses or value engineering assistance to evaluate specific green building features under consideration for inclusion in the project.

• Rating System Documentation Support: Assess and identify project credit/certification goals, identify and assign rating system tasks to members of the design team, guide the team in system process and timing, assist team in understanding and/or documenting credit achievement. This aid will enhance—but not supplant—participants' efforts to pursue project specifications, designs, calculations, modeling and other necessary services.

The minimum threshold for acceptance in the ZNEH sub ZNE program element will be a whole building performance of at least 45% over Title 24 standards. Projects must meet LEED for Homes (Silver) equivalent and/or qualify for a minimum of 100 points from Build It Green's

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: At least 14.5 pt, Bulleted + Level: 1 + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tab stops: 0.25", List tab + Not at 0.5" + 0.95"

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: At least 14.5 pt, Bulleted + Level: 1 + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75", Tab stops: 0.25", List tab + Not at 0.5" + 0.75"

Green Point Rated system. Energy savings will be evaluated based on with advanced modeling showing the diversity total kBTU usage of measures and the overall energy performance. The life cycle CO2 reductions and water savings will also be tracked.

#### ENERGY STAR Manufactured Homes

In addition to the performance approach cited above, CAHP will retain a deemed prescriptive approach for the manufactured home market segment. Homes will have the flexibility to include the entire ENERGY STAR package for manufactured housing or to incorporate elements within those standards, such home as improved windows.

The ENERGY STAR Manufactured Homes Sub-program is designed to promote the construction of new manufactured homes in SDG&E's service territory that comply with ENERGY STAR® energy efficiency standards. The program targets manufacturers, retailers, and homebuyers of new manufactured homes. The current baseline for manufactured homes is the Housing and Urban Development (HUD) standard specification. The program encourages manufacturers to install "right size" heating, cooling, and ventilation equipment (HVAC), install high efficiency HVAC equipment, and evaluate homes on a whole building basis covering windows, insulation levels, and quality installation inspections. The program works in coordination with the ZNEH sub-program.

The program is a logical fit in SDG&E's Residential New Construction portfolio of programs and will be another market segment within the California New Homes Program (CAHP), alongside single family and multi family dwellings. Likewise, the ZNEH element will also look to leverage consumer interest in green building in promoting zero peak homes and market transformation.

#### The objectives of the program are:

- To capture cost effective energy savings and demand reduction opportunities
- To move the industry toward coordinated demand side management (e DSM), including self-generation
- To move the industry toward zero net energy well as identified in the BBEES and advanced in method of generating the CLTEESP
- To move the market segment from HUD compliant to ENERGY STAR and provide savings for customers purchasing energy efficient, manufactured homes

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

The program encourages manufacturers to:

- Install “right size” heating, cooling, and ventilation equipment (HVAC)
- Install high efficiency HVAC equipment
- Evaluate homes on a whole building basis covering windows, insulation levels, and quality installation inspections

The program will also include an education and outreach component as a means to promote awareness of energy efficient practices in the construction of ENERGY STAR manufactured homes. All segments related to the sale and construction of a manufactured home, including retailers, customers, and manufacturers will be engaged. The marketing plan will also target new retailers to inform them of the program benefits and encourage their participation in the program.

Market actors include manufacturers, retailers and homebuyers. As the primary focus is on retailers, the program is considered a midstream program. Incentives will influence retailers and customers to promote ENERGY STAR qualified manufactured homes.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

<u>Program Criterion</u>	<u>Incentive</u>
<u>— Prescriptive elements, e.g. windows, additional insulation</u>	<u>TBD, deemed rather than calculated per CZ</u>
<u>— ENERGY STAR Manufactured Home — Gas Heat</u>	<u>\$300/Home (total of prescriptive elements)</u>
<u>— ENERGY STAR Manufactured Home — Electric Heat</u>	<u>\$600/Home (total of prescriptive elements)</u>
<u>— Zero peak Home</u>	<u>\$75 for each peak kW reduction due to on-site photovoltaic system</u>

Financial incentives will take the form of fixed rebates (deemed) or may be calculated on a project by project basis.

As in CAHP, SDG&E will pursue zero peak homes as a reasonable milestone on the way to achieving the CLTEESP’s zero net energy homes. The addition of a zero peak photovoltaic kicker is part of the effort toward achieving zero peak homes.

Marketing efforts will target manufactured home retailers as well as customers.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Desired program outcomes are:

- To achieve short and long term energy savings and demand reduction in the most cost effective manner possible.
- To increase the penetration of ENERGY STAR manufactured homes within California, and to make ENERGY STAR the customer's preferred choice.
- To transform the marketplace by promoting ENERGY STAR qualified manufactured homes the new standard choice instead of homes that meet the existing HUD standards.
- To establish a strong working relationship with manufactured home retailers.

Formatted: Space After: 0 pt, Line spacing: At least 12 pt, Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tab stops: Not at 0.5"

Formatted: Space After: 0 pt, Line spacing: At least 12 pt, Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tab stops: Not at 0.5"

A finished project is defined as the completion and assembly of a manufactured home. The process of purchasing and installing an ENERGY STAR qualified home can be lengthy, so projects need to be monitored closely throughout the program cycle.

The program will include a quality assurance plan with a field inspection component to verify that the manufactured home(s) meets ENERGY STAR and program's requirements. The program will also have a mechanism to verify that the assembly of the home is in accordance with these standards. This will include ducting work and installation of end use equipment (e.g., HVAC). Many ENERGY STAR components are assembled on-site and the compliance must be verified once assembled.

Customer information will be captured once a project is complete to allow SDG&E to integrate delivery of other program offerings to these customers as well as tracking any possible double-dipping. Information on parties receiving incentives will be tracked and reported offsetting kBTUs.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

#### CAHP Incentive Rationale

The program's most ambitious goal for the 2010-12 program cycle 2013-2014 Transition Period is to have 50 percent promote the early adoption of the residential new construction market to 20% better than the 2008 Title 24 Standards by 2011 (interim goal).

Getting half of the market to 20 percent better than code exceeds the IOUs historical expectations for RNC. There are five new program incentive elements to move the industry toward this important goal. The new elements are as follows:

— The first program element is to lower the program’s incentive cost per home in order to bring the program’s cost effectiveness into closer alignment with the portfolio at large, to budget for incentives necessary to reach 50 percent of the market, and to do so in ways that do not threaten the overall portfolio’s total resource cost. The available project funding has increased, but additional performance is required to earn it. By paying for performance, the program rewards higher performing projects, pushing more savings among participants. By combining technical expertise with marketing support, successful participants will outsell non participants, driving deeper market penetration as well as non participants get on board.

— The second program element is to identify interim features of zero net energy homes. To that end, utilities will pursue zero peak homes as a reasonable milestone on the way to net zero homes. The addition of a peak kW incentive and a zero peak photovoltaic kicker are both efforts toward zero peak.

- The third program element is the recognition that the typical homebuyer is more interested in green features than energy efficiency per se. By tying energy efficiency specifically to green measures, the IOUs will effect deeper penetration into the market. Similarly, to the extent that CAHP can influence future code elements into the builders to design smaller homes, there are energy savings from reduced cooling volume, reduced lighting and likely, reduced plug load standard practices.

— The fourth program element is to encourage, wherever possible, the implementation of in-home displays or other devices that give homeowners the information and price signals they need to modify their behavior consistent with the needs of the utility and the state.

Finally, times are particularly difficult in the building industry and expedited action is expected from the building community and other partners. Our intention in offering a short term reduction in entry performance from 15 percent to 10 percent above code compliance is to allow first time participants to test the waters at reduced risk.

**Formatted:** Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tab stops: Not at 0.75"

**13) — List non incentive customer services**

- Technical support to Energy Analysts and Design Teams<sup>85</sup>
- Economic modeling/measure selection support to builder/construction managers
- Marketing support to builders (sales agent training, marketing materials)
- DSM coordination (PV, DR, AMI, ET) for builders to maximize demand side reductions.

**Formatted:** Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 1" + Indent at: 1"

**Formatted:** Indent: Left: 1", Hanging: 0.5", Space After: 0 pt, Line spacing: single, Numbered + Level: 2 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Tab after: 1.25" + Indent at: 1.25", Tab stops: 1.5", List tab + Not at 0.75" + 1.25"

**5:**

Getting the market to adopt these levels of efficiency will not be easy. The IOUs expect significant pushback from the building industry due to rising costs. This argument will

<sup>85</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes/workshops for design teams.

become even more significant in 2014 when the 2013 Title 24 energy codes take effect. The projected increase in cost to comply with these new codes may be between \$3,000 and \$5,000. The program is considering the following changes to the current incentive structure:

- In 2013 the sliding scale will stay as it is currently. The IOUs plan to eliminate the kickers from the program to help streamline and lower administration costs. After providing the kickers for the past 3 years it is the program's determination the kickers are not influencing the decisions of the builders and as such have proved not to be essential incentives. Once the 2013 Energy code becomes effective the program will adjust the incentives in a way that will still cover a portion of the verified incremental cost for homes achieving high levels of efficiency above and beyond those required by code. The program believes ENERGY STAR® is an important and highly recognizable brand for energy efficiency. Focus group studies have shown that while the brand is known to be good the typical buyer does not understand the whole house can achieve the label as it is typically only associated with appliances. The program will therefore explore a marketing incentive for all homes that achieve the ENERGY STAR® for Homes label.

## 5. Program Rationale and Expected Outcome<sup>86</sup>

a)

### 10. a) Quantitative Baseline and Market Transformation Information:

Refer to the overarching PIP section

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The

<sup>86</sup> To be provided for each program and sub-program in PIP.

Formatted: Space After: 0 pt, Line spacing: single

Formatted: Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75"

Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Lighting Market Transformation Statewide Program (Resolution E 4385, Appendix A):

**Table 3**

SW PROGRAM/ Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
<b>NEW CONSTRUCTION</b>		
<b>California Advanced Homes Program (CAHP)</b>	1. Number and percentage of committed CAHP participant homes (applied and accepted) with modeled, ex ante savings exceeding 2008 T24 units (Single family (SF) and multi family (MF)) by 15%–19%, by 20%–29%, 30%–39%, and 40+%.	2a
	2a. Percentage of (current year SF CAHP program paid units)/(SF building permits within service territories from the previous year)	2a
	2b. Percentage of (current year MF CAHP program paid units)/(MF building permits within service territories from the previous year)	
	3. Number and percentage of CAHP participant new homes verified* by IOUs' HERS which exceed Title 24 (T24) building standards (SF and MF) by 15%–19%, 20%–29%, 30%–39%, 40%+.	2b
* The IOUs use the existing HERS Rater infrastructure to verify HERS measures and other building characteristics as required by CA Title 24 and the CEC. The IOUs do not perform the verification inspections and do not certify HERS raters. Note: HERS inspection protocol for production builders does not require inspection of 100% of homes; there		

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
	is a sampling protocol. For more information on HERS inspection please see <a href="http://www.energy.ca.gov/HERS/index.html">http://www.energy.ca.gov/HERS/index.html</a>	

**2. Market Transformation Information**

Refer to the overarching PIP section

Resolution E 4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

**Bullet 1) A description of the market, including identification of the relevant market actors and the relationships among them;**

The MT elements described here follow guidelines and terminology explained in Rosenberg & Hoefgen's (2009) *Market Effects and Market Transformation: Their Role in Energy Efficiency Program Design and Evaluation*.

<<paper is available here [http://uc-ciee.org/downloads/mrkt\\_effts\\_wp.pdf](http://uc-ciee.org/downloads/mrkt_effts_wp.pdf)>>

Ideally, information about a market would come from a variety of sources, including existing studies and newly commissioned studies. Rosenberg & Hoefgen (2009) recommend that California should "Commission initial market characterization research for those products and services for which the structure of the market and the motivations of the market actors are not well understood or documented, at least in terms of their response to the product in question." Due to a lack of time, the following market information draws heavily upon qualitative analyses made by the program managers based upon information they have

Formatted: Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75"

obtained through experience in implementing the program. We look forward to an opportunity to develop a better understanding of these markets through future commissioned studies, in conjunction with ED and other market transformation stakeholders.

The Residential New Construction market consists of several key players including builders, designers, subcontractors, HERS raters, local cities, manufacturers, real estate agents, financing agencies, and home buyers. The RNC sub program is located upstream, targeting builders and subcontractors early in the design stage of the production process. Upstream of the IOU's RNC influence are local cities' permitting rules and associated costs. Downstream of the RNC sub program are real estate agents, financing agencies, and home buyers. The RNC sub program works directly with builders, designers, subcontractors, HERS raters, builder sales staffs, and manufacturers via equipment recommendations at the design stage.

**Bullet 2) Identification of the key barriers and opportunities to advancing demand-side management technologies and strategies;**

The key barriers and opportunities to be addressed through a market transformation initiative would ideally draw upon a market characterization study. Due to lack of planning time, the following market barriers and opportunities are drawn from qualitative analyses made by the program managers:

Key RNC market barriers include A) entrenched builder and subcontractor habits, B) a lack of buyer knowledge, interest, and demand, and C) an ensuing disconnect between the price buyers are willing to pay and the related increased builder costs of incorporating DSM technologies, energy efficient equipment, and advanced building practices. Opportunities to address these barriers include education and outreach to builders, subcontractors, and buyers to increase demand and alter builder habits; design assistance to improve builder knowledge and maximally cost effective strategies; and incentives to bridge the gap of builder costs and buyer demand.

**Bullet 3) A description of the proposed intervention(s) and its/their intended results, and specify which barriers each intervention is intended to address;**

To address Barrier A, the following intervention is proposed:

Builders and subcontractors will be offered training and design assistance to facilitate the acceptance and incorporation of new technologies and building practices including DSM.

To address Barrier B, the following intervention is proposed:

Builder sales staffs will be provided training and marketing support on the advantages of EE homes that incorporate DSM technologies. Financing mechanisms will be explored to reduce buyer costs and increase demand.

To address Barrier C, the following intervention is proposed:

Incentives will target a reduction in the cost to builders of incorporating EE measures and DSM technologies.

Market transformation interventions can be expected to take 2, 5 or even 10 yrs before effects can be quantified. We propose the following that these would be the results that can be seen in the market at various time intervals:

After 2 years of implementation builders and subcontractors should feel significantly more confident in accepting new technologies and advanced building practices. By this time they should be familiar with IOU design assistance procedures and how to maximize the incentives and minimize the increased costs. Sales staffs should be well versed in the advantages of participant homes.

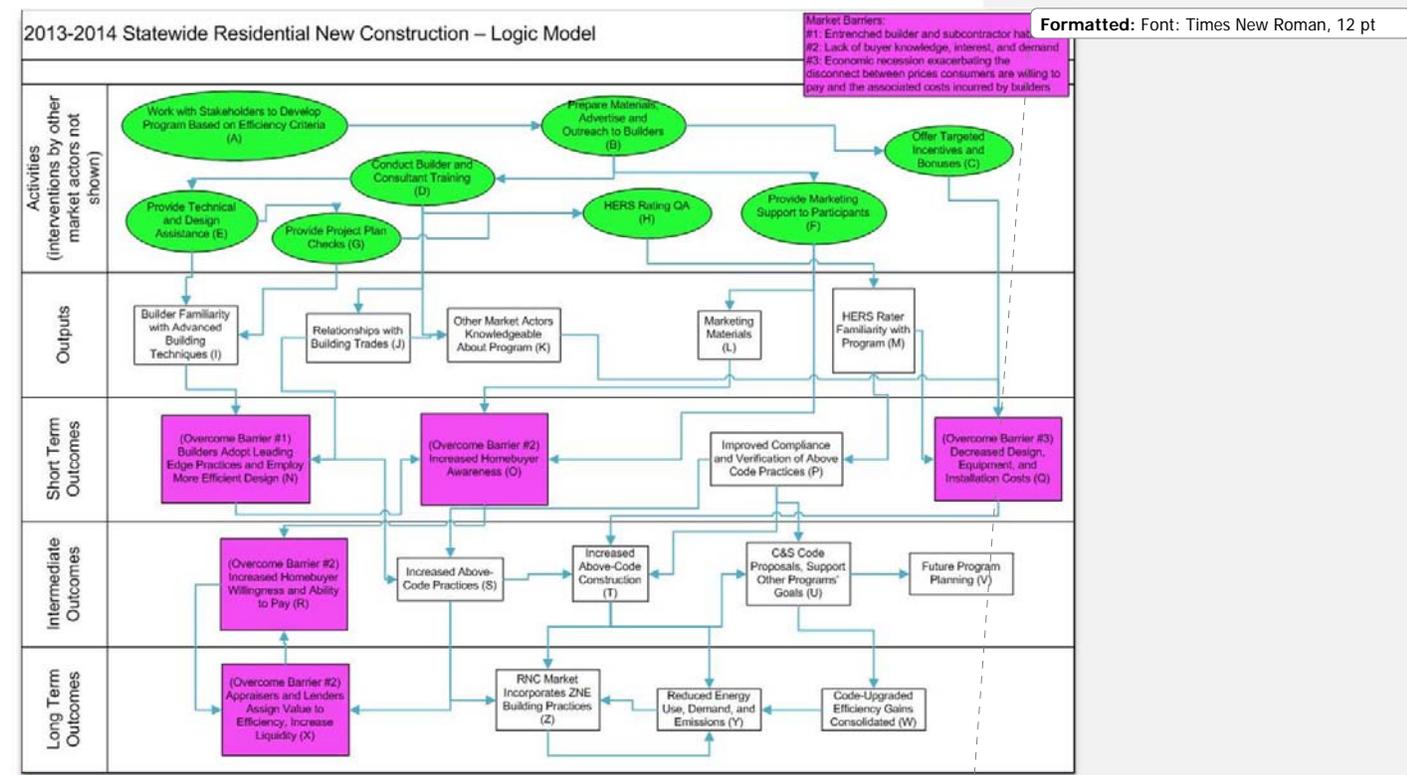

After 5 years, builders and subcontractors should be very confident in advanced EE technologies, building practices, and DSM. At this time the market should be nearing ZNE building practices. Financing mechanisms should be in place to improve buyer demand.

After 10 years, the RNC market should be exclusively building ZNE developments. At this point the program focus will be devoted to education and outreach, helping the industry competes with the less efficient existing market. Financing mechanisms will continue to play a role.

**Bullet 4) A coherent program, or “market,” logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results; and**

In this example below, “Portfolio Program Elements” are the market transformation

interventions that are specifically directed to the market barriers. “Outcomes” are the outputs of the MT interventions, which are the market effects and reductions in market barriers than can be seen in the short-, mid-, and long-term. Please note that the long-term outcomes are “sustainable,” which is what the market should look like after the market intervention has ended.

**Bullet 5) Appropriate evaluation plans and corresponding Market Transformation Indicators and PPMs based on the program logic model. (The IOUs should be prepared to start tracking proposed Market Transformation Indicators immediately in order to establish a baseline, and in cases where the logic model calls for metrics to be differentiated in terms of the sequence and timeframe in which they are expected to be relevant—i.e., leading vs. intermediate vs. lagging indicators of change—each metric should be identified as such).**

Due to the need to comply with the Decision's timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section "18.1. Evaluation Budget" in Decision R.09-11-014. Until then, we suggest the following approach:

### **Summative evaluation – Market Effects**

The market transformation program's theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program's scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program "spillover" and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

**Formative evaluation:** The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program's direct outputs.

**Program Performance Metrics:** Please see Section 5, Table 3, above.

**Market Transformation Indicators:** Market transformation indicator results shall be reported, as available, by Energy Division or the IOUs, depending upon who conducts the necessary market studies. (Res. 4385, 12/2/10)

**Attribution:** Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold

et al., 2001) emphasizes that attribution of market effects to programs bears further research. Others (R&H, 2009; Keating & Pahl (MT Workshop) suggest that declaring the program's strategic intent through the market transformation initiative's theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a "preponderance of evidence" approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a "Shared Mission" of meeting the CPUC's very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

In lieu of the above results and recommendations, the RNC sub program will carry forward the PPMs and MTIs that were in place during the 2010-2012 cycle.

### 3. Program Design to Overcome Barriers:

#### Priority Barrier: Building Industry

Effective ~~July~~ January 1, 2009/2014, California's Title 24 standards will be revised and updated. Overall, residential Residential baseline energy performance requirements for heating, cooling, and hot water will be increased by approximately ~~15~~ 25 to 30 percent, which implies marked increase in production costs for builders at a time when the industry and the economy at large are experiencing significant challenges.

#### Priority Barrier: Homebuyers

The energy used in the average home produces roughly twice the greenhouse gas emissions as the average automobile. In fact, 16 percent% of U.S. greenhouse gas emissions result from the generation of energy used in houses nationwide (U.S. EPA). However, there is little consumer awareness of the impact ~~their~~ that homes have on the environment. CAHP is working with IOU marketing efforts, statewide partners (e.g. Flex Your Power), ENERGY STAR® campaigns, and builder'builders' own messaging to increase consumer awareness of this idea. Moreover, there is scant evidence that energy efficiency drives decision-making among homebuyers, whose access to capital is more difficult in a constrained capital market.

#### Manufactured Housing: Overcoming Market Failure: CAHP

Formatted: Indent: Left: 0"

Formatted: Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75"

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

In a potential buyer's market, builders are looking to differentiate themselves from competition. This presents an opportunity

The current decline for CAHP to assist builders in the housing industry, the high overcoming cost of residential housing barriers, minimizing lost opportunities, and increasing customer awareness of energy efficiency all make this a good time to address this underserved market segment. The manufactured housing industry is somewhat counter cyclical to the site built home market. As buyers are priced out of site built homes, manufactured housing has become an affordable alternative.

Historically, manufactured housing has been considered a lost opportunity. However, as SCE found in the 2006-08 IDEEA program, there is significant interest among manufacturers in promoting the ENERGY STAR brand. Manufacturers recognize that ENERGY STAR manufactured homes address both the high cost of purchasing a traditional new home and the high cost of energy bills. However, without IOU intervention in the market, retailers are not pushing ENERGY STAR homes and there is not enough demand for manufacturers working collaboratively to justify building them.

#### Overcoming Market Failure: CAHP

In a buyer's market, builders are looking to differentiate themselves from competition. This presents a opportunity for CAHP to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to meet the state's and Investor-owned Utilities' IOUs' goals for the reduction of green house greenhouse gas emissions and utility source demand.

The residential new construction Residential New Construction market without IOU intervention is a lost opportunity for long term energy savings. However, with IOU intervention in the form of incentives and design support, the new construction market is well placed to demonstrate innovative approaches and cost effective energy savings technologies.

#### Overcoming Market Failure: Manufactured Housing

The program provides an incentive to manufactured home retailers when they sell a manufactured home that meets or exceeds the current ENERGY STAR standards. These standards extend to the ducting and installation guidelines for heating/cooling equipment, water heating technologies, water saving devices, and home appliances. Customers may also receive incentives for purchasing an ENERGY STAR manufactured home. The incentives may be paid directly to the customer after successful construction, assembly, and inspection of the home site.

Formatted: Font: Times New Roman, Underline

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Manufactured homes have a higher potential for market transformation than the site-built industry, due to factory standardization, and the fact that eight manufacturers control 98%<sup>87</sup> of the manufactured housing market

Current Program Baseline: Manufactured Housing:

The construction of manufactured homes that meet ENERGY STAR program standards, as opposed to the less stringent HUD standards, will result in demand reduction, energy savings, and the reduction of greenhouse gas emissions.

The energy savings will result from a combination of improved envelope efficiency (thermal and air tightness), use of high efficiency equipment, and the proper sizing (downsizing) of the cooling equipment. Production of every ENERGY STAR manufactured home built in each IOU territory will be tracked and reported.

Participating ENERGY STAR qualified manufactured homes will generate energy savings and demand reduction. In addition to leveraging retailers of manufactured homes, the program will leverage the partnership program to reach out to local governments where the homes will be built.

This program is a statewide program among all the IOUs. In doing so, the joint program has the potential to provide better service to the builder at reduced cost.

4. Quantitative Program Targets:

The targets provided herein are best estimates, but nonetheless are forecasts.

Table 5 (Goals and # of Homes are specific to each IOU)

5. Advancing Strategic Plan goals and objectives:

Since its inception in 2002, CAHP has had a substantial impact on the homebuilding market. There is a significant opportunity to continue to influence builders, architects and other players in the residential new construction Residential New Construction industry.

The New Construction Program is designed to enable the achievement of several goals and strategies identified in the CEESP Strategic Plan. The Strategic Plan envisions a transformation of the core residential Residential sector to ultra-high levels of energy efficiency, resulting in Zero Net Energy (ZNE) new construction standards by 2020. It spells out several goals and strategies to address energy reduction in residential new construction Residential New Construction.

Goal #1: New Construction will deliver "zero net energy" (ZNE) performance for all new single and multi family homes by 2020.

2. By 2011, 50% of New Homes will exceed 2008/2005 Title 24 energy efficiency standards by 2035%; 10% will surpass 2008/2005 Title 24 standards by 40/55% (Strategy 1.1, as modified by Decision 09-09-047)

Formatted: Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75"

Formatted: Indent: Left: 1.25", Space After: 0 pt, Line spacing: single

~~3.Goal #2: Home buyers, owners and renovators will implement a whole house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment household appliances, and plug load amenities~~

Formatted: Indent: Left: 0.5", Hanging: 0.13", Space After: 0 pt, Line spacing: single, Bulleted + Level: 2 + Aligned at: 1" + Tab after: 1.25" + Indent at: 1.25", Tab stops: 0.63", List tab + Not at 1.25"

~~4.Goal #3: Plug load will grow at a slower rate and then decline through technological innovation spurred by market transformation and customer demand for energy-efficient products.~~

Formatted: Indent: Left: 0.75", Space After: 0 pt, Line spacing: single

~~The goal of energy-efficient Residential New Construction will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of CEESPthe Strategic Plan, and works in close coordination with the Zero Net Energy HomesZNE sub-element. Together these elementsprograms seek to raise plug load efficiency, focus on whole house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the New Solar Homes Partnership. In fully aligning itself with the CEESP, as modified by Decision 09-09-047, the CAHP targets an interim goal of 50 percent of RNC to be 20% better than the 2008 Title 24 Standards by 2011, and 10% of RNC to be 40% better than the 2008 Title 24 Standards by 2011, and a final goal of 100 percent of residential new construction to be net zero by 2020.NSHP.~~

Formatted: Indent: Left: 0.75", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

~~The ZNEH Sub ProgramZNE program element is designed primarily with the focus of accelerating the achievement of the ZNE goals envisioned by the Strategic Plan. The purpose of ZNEH Case Studiesthe ZNE element is to examine a wide array of energy saving technologies, accelerate the market acceptance of new and emerging technologies, explore new solutions, and encourage distinctive approaches in demonstration projects. Each being distinctive, the case studies will be positioned to highlight the underutilized potential of sustainability in residential new constructionResidential New Construction, in a range of market segments and climate zones. The utilities will seek to integrate R&D ideas from Emerging Technologies, PIEREPIC, LBNL and other agencies to further assist the projects in advancing sustainability and achieving very high levels of energy efficiency.~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

~~The minimum threshold for acceptance in the ZNEH Case Study program will be a whole building performance of at least 45% over Title 24 standards. Projects must meet LEED for Homes (Silver) equivalent and/or qualify for a minimum of 100 points from Build It Green's Green Point Rated system.~~

~~Financial incentives and marketing support offered for the case studyZNE projects will be significantly higher than those offered under the standard CAHP model. By providing strong encouragement for builders to move up on the energy efficiency scale with financial and non-financial incentives, the ZNEH Sub ProgramZNE program element is uniquely positioned to support the CEESPStrategic Plan goal of Zero Net EnergyZNE by 2020.~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

CAHP will work closely with builders who seek assistance in the development of sustainable design and construction, green building practices and emerging technologies through the Zero Net Energy Homes Program (ZNEH). The ZNEH Program ZNE program element. ZNE is the place to demonstrate innovative technologies and to help drive the market for energy efficiency through the adoption and marketing of green standards. Given consumer's interest in green, and the market's failure to drive energy efficiency sales, marketing the green features (one of which is EE) is the best way to increase consumer demand for more efficient homes. Moreover, the 15% threshold for participation aligns well with existing green building certification programs such as ConSol's California Green Builder and Build it Green's GreenPont Rated Programs IOUs have already initiated preliminary research on policies and programs supporting residential ZNE programs in other states for potential new and innovative program design approaches to increase homeowner demand and marketplace change, consulting with relevant experts in this area. This research reveals a lack of other utility programs serving this market. Rather, ZNE currently exists in a piecemeal fashion throughout the country without a consolidated approach. IOUs will continue research in this area and report more complete findings by April 1, 2013.

**Program Implementation:**

**Statewide IOU Coordination: coordination**

Given the success of the collaborative process that led to the production of this PIP, the statewide RNC team plans to meet on at least a quarterly basis going forward, in order to review progress toward the goals and make any corrections needneeded to help achieve them.

**i. Program name: The single family and multi family program will be implementedName**

**\* Residential New Construction falling under Title 24 is covered by the common name of California Advanced HomeHomes Program. The zero peak pilots will be referred to as Zero Net Energy Homes, although the details differ somewhat by utility. Factory built housing will be referred to as covered by the ENERGY STAR@ Manufactured Homes Program, where offered.**

**1. Program delivery mechanisms: Sempra and PG&E deliver the program primarily through in-house Account Executives with some outside technical support for specific analysis or niche markets (cf. PG&E, multi family). SDG&E leverages third party implementers and in-house account executives.**

CAHP and ESMH are delivered via online program materials and dedicated account executives.

**Differences in Program Implementation**

This section highlights the major areas where individual IOUs implementation of the program will differ from that of the others. While the incentive structure and other elements of the program will remain synchronized with the statewide nature of the program, each IOUs will leverage its unique strengths and structural differences to enhance the effectiveness of execution. This section highlights some of those differences.

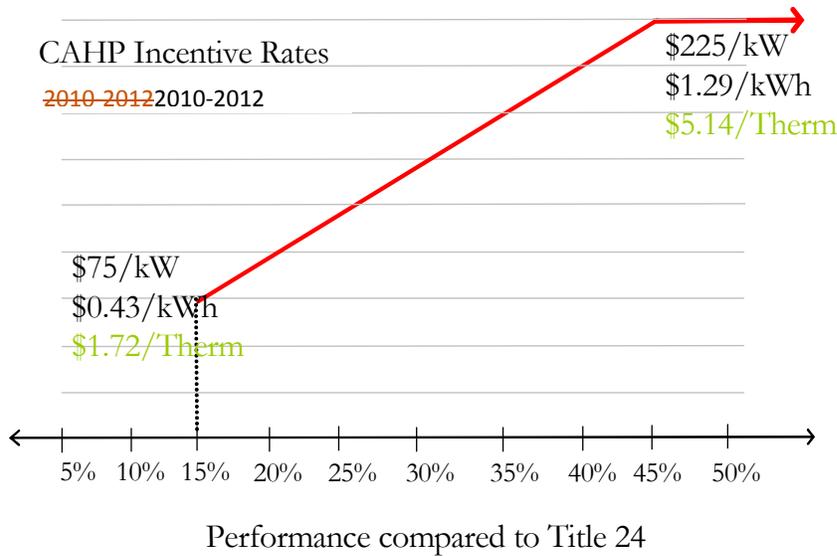

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

**2. Incentive levels**

**Incentive Structure**

The pay for performance incentive structure for the 2013–2014 CAHP will continue to be refined as the state approached implementation of the 2013 Title 24 code changes (see CAHP Incentive Rationale section above for additional detail).

The 2013–2014 calculated approach will be similar to the method used from 2010–2012:

This approach rewards builders for achieving higher levels of energy efficiency and avoids the “clustering” problem in tiered programs. A tiered approach discourages builders from achieving incremental performance if they are unable to reach the next higher tier. In line with the elements of the strategic plan, the approach rewards builders for undertaking whole house solutions where the entire structure can be considered as an integrated system.

Moreover, executing a net zero home remains a financial and technical challenge, the program will have customized incentives for homes that achieve ZNE.

#### Confidence that incentives will move the market

The statewide team has a high degree of confidence that the revised program design is sufficient to realize substantial market movement. As discussed above, incentives alone are not enough to move the market. While more dollars are always preferred by any target industry, it has been the experience of the Southern California utilities that while incentives get one to the table with decision makers, it is the design, technical, and marketing support that makes the sale.

It is the belief of the IOUs that the proposed combination of performance-based incentives, increased incentives for targeted ZNE, marketing support, sales agent training, technical support, coordinated delivery through trade allies and ongoing cultivation of builder relationships provide an integrated solution to the priority market barriers builders face in delivering more efficient homes. —

The IOUs support adjusting program incentive levels in conjunction with the more stringent Title 24 code taking effect in 2014. More efficient incentives will be critical in helping builders defray additional compliance costs associated with the stronger code. However, the IOUs believe there is a need to explore the deadline for incentive adjustments. A date after March 2013 may be appropriate for a number of reasons, including:

- Changing incentive levels *before* the new code takes effect may provide an added incentive for builders to rush to beat the code. Ideally, the incentive adjustments would be timed to coincide with the implementation of the new code so as to incentivize building under a more stringent Title 24. A fast turnaround would prevent the IOUs from determining the ideal incentive structure. Given uncertainty about the market’s response to the unprecedented

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

updates to Title 24, extra care should be taken in calibrating incentive levels to their optimal value.

The IOUs will comply with the March 1, 2013 deadline for adjusting incentive levels, but propose January 1, 2014 as a preferred date.

#### **How CAHP program supports CEC's NSHP, Tier II**

CAHP supports the revised NSHP Tier II (30% < T24 2008) and the goals of the CEC.

1. The IOUs are committed to partnering with the NSHP to streamline the solar application process and to make referrals between NSHP and CAHP. Indeed, the goals of ZNE appear impossible without the significant presence of solar.
2. The IOUs will leverage CEC NSHP material, marketing, and event support for opening events for those projects that commit to the platinum level: 100% penetration at the Tier II EE performance (30%).
3. The design of the graduated, performance-based incentive will tend to drive projects to the higher end of the performance curve, consistent with CEC goals.
4. The threshold efficiency (15%) is consistent with the Tier I minimum, and the top end (45%) was selected to support the CEC's desire to project out three code cycles (Tier III) into the future.

The IOUs support the goals of the NSHP and the marketing synergies of PV and EE remain one of our best strategies for moving the market.

Incentive levels: The IOUs have agreed upon a common incentive methodology that will be implemented throughout the service territories. Nevertheless, the IOUs position is that if 30% < T24 is very good, 31% is better, and 32% more so.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

~~i. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms.~~

~~CAHP offers financial incentives, training opportunities, technical support, and marketing resources to single family and multi family residential. Residential builders who construct homes that exceed California's energy efficiency standards for new construction. All types of residential. Residential builders are welcome to participate.<sup>88</sup> For the multi family segment of the program, qualifying homes include condominiums, town homes, townhomes, apartment buildings, and mixed use projects.~~

~~There will be closer coordination of marketing efforts to synergize wherever possible.~~

~~There will be closer coordination of marketing efforts to synergize wherever possible. While each utility would like to leverage on their strengths and existing relationships within their service territories, certain marketing elements can be launched on a common platform. A common web site will be created. While each utility would like to leverage on their strengths and existing relationships within their service territories, certain marketing elements can be launched on a common localized platform. ~~Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.~~

~~CAHP marketing efforts will be enhanced by leveraging IOU market studies and builder focus groups identifying consumers' decision triggers and the effect of GHG labeling on purchase decisions. Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. CAHP marketing efforts will be enhanced by leveraging IOU market studies and builder focus groups identifying consumers' decision triggers and the effect of GHG labeling on purchase decisions. The IOUs will pursue additional sources of research to determine the most cost effective ways builders can meet program requirements; the results will be incorporated into marketing materials and/or communicated to builders as part of the design assistance recommendations. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

~~Given consumers' interest in going green and the market's deficiency in driving energy efficiency sales, marketing the green features (one of which is EE) is the best way to increase consumer demand for more efficient homes. Given consumers' interest in going green and the market's deficiency in driving energy efficiency sales, marketing the green features (one of which is EE) is the best way to increase consumer demand for more efficient homes. To that end, CAHP will help educate the industry on how to achieve energy efficient, green homes. To increase participation in programs and the general understanding of sustainability, greater emphasis will be placed on education and outreach.~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

~~The precipitous decline in the building industry offers a great opportunity to improve education and training. To increase participation in programs and the general understanding of sustainability, greater emphasis will be placed on education and outreach.~~

The precipitous decline in the building industry offers a great opportunity to improve education and training. Through their Education & Training programs offered at ERC, CTAC, and PECSCG's Energy Resource Center, SDG&E's Energy Innovation Center, SCE's Energy Education Center, and PG&E's Pacific Energy Center, the statewide new construction team will work to expand the course offerings, web cast seminars, and cost-benefit effectiveness training classes, thermal by-pass checklists compliance training, cost comparison of alternative measures, etc. In order to meet or exceed increased energy savings goals in an extremely difficult residential construction market, the IOUs will utilize a broad range of marketing tactics and communications tools working in concert to expand program awareness and participation.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

The IOUs will diligently explore other means of encouraging builder participation in the CAHP program.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single, Don't adjust space between Latin and Asian text, Don't adjust space between Asian text and numbers, Font Alignment: Baseline

- Developing a list of resources and contractors that could be used by builders
- Developing a list of resources and contractors that could be used by builders
- Information Providing information on comparative costs and energy savings of alternative measures
- Exploring financing arrangements (green mortgages, energy efficient mortgages, etc.), in consultation with the other IOUs and financial institutions
- Expedited permitting for high efficiency buildings
- Working with Municipalities to develop educational channels for codes and standards.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable

3)

The plan addresses above, in the CAHP Incentive Rationale section, the ways CAHP is responding to current code changes and how it anticipates a leading role in code toward modifications requiring demand performance, in-home displays, on-site generation, square footage reductions, and green elements.

Formatted: Indent: Left: 1.63", Space After: 0 pt, Line spacing: single, No bullets or numbering

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

CAHP is particularly interested in promoting integrated thermal hot water system designs to displace therm demand with on-site renewable sources. In addition to cold water savings from embedded energy and the energy to heat water, longer term there may be GHG reductions that accrue either to the builder, the homeowner, or the utility associated with each demand side reduction as a result of AB 32 and pending national CO<sub>2</sub> legislation.

CAHP prides itself on its established close relationships and memberships with other groups involved with the building industry. These relationships make it possible to provide comprehensive services to our customers. Thus, CAHP will continue to seek out and coordinate synergies with, but not limited to, the following groups:

- ~~a. California Energy Commission (CEC)~~
  - ~~— New Solar Homes Partnership (NSHP)~~
  - ~~— Environmental Protection Agency (EPA)~~
  - ~~— California IOUs~~
- ~~Flex Your Power (FYP)~~
  
- ~~National Association of Home Builders (NAHB)~~
  
- ~~b. California Building Industry Association (CBIA)~~

~~The California Building Industry Association (CBIA) and the California Energy Commission (CEC) continue to seek out partnerships and opportunities with the utilities to help educate builders and other industry participants in order to promote energy efficiency in new construction.~~

~~Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR New Homes and has won ENERGY STAR Achievement awards for the last five consecutive years.~~

~~CAHP will continue its commitment to the Environmental Protection Agency's (EPA) EPA's ENERGY STAR® program and will strive to support, partner and contribute to the success of the ENERGY STAR® Homes label and branding. Numerous surveys and studies continue to show the ENERGY STAR® label represents greater value to consumers and the environmental stewardship it represents.~~

~~Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR® New Homes and has won ENERGY STAR® Achievement awards for the last five consecutive years. In 2011 SCE was rewarded for "Sustained Excellence in Energy Efficiency Program Delivery."~~

~~The program will continue to offer comprehensive training courses and educational seminars relevant to building energy efficiency and green measures into new construction projects including Title 24 code training and ENERGY STAR® requirements.~~

~~In response to builder requests, CAHP will offer a new training workshop for~~

~~2010–12/2013 designed for builders' sales agents. Sales agents have direct contact with the homebuyer and have the greatest impact on selling homes. In order to help promote ENERGY STAR® developments, CAHP will teach sales agents about energy efficiency. Topics will include what qualifies as an ENERGY STAR® home and what is 'green'.~~

~~Other CAHP activities will include attendance at building industry trade conferences, outreach events and any necessary contractor/builder field visits. The target audience~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

consists of builders, developers, energy consultants, architects, and other industry professionals.

Finally, SDG&E is pursuing Each IOU may pursue partnership efforts with local government entities who are looking to display leadership in the carbon arena by expediting plan check, waiving permit fees, or allowing builders to pay impact fees on the back end (instead of up front) in exchange for higher levels of home performance documented by our CAHP program.

ii.—

1. Similar IOU and POU programs

The statewide CAHP team will reach out to leading POU programs, such as those at SMUD to learn from their experience how best to deliver energy efficient homes.

In addition, the IOUs will work closely with the existing home remodeling programs (Home Performance with Energy Star ENERGY STAR® and the Comprehensive Mobile Home Program) to maintain a two-way communication of best practices and lessons learned between the new and existing sectors.

o — b. Program delivery and coordination:

■ Emerging Technologies (ET) program

Emerging technologies will chiefly be handled within the ZNEH program ZNE sub element of CAHP. The IOUs are looking to partner with our ET and PIEREPIC funded Testing Facilities to pilot zero-net energy approaches. SCE is looking toward the construction of a demonstration home at its CTAC facility. However, the proposed incentive approach allows the IOUs the flexibility to include both deemed and calculated energy savings from new technologies as they become market ready.

The utilities will seek to integrate R&D ideas from Emerging Technologies, PIEREPIC, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

■ Codes and Standards program Codes and Standards program

- ~~Energy Pro~~

- ~~Title 24~~

- ~~Micropas~~

SDG&E will explore voluntary incentive-based approaches to encourage contractors and other industry professionals to complete the full bundle of Residential New Construction workforce development training. For professionals who complete the pre-requisite courses and pass a high road skill standards test, such approaches may include (as applicable):

1. ~~Allowing marketing or advertising differentiation;~~
2. ~~An incentive bonus; and/or~~
3. ~~Providing preference to these professionals during bid evaluation process.~~

Residential New Construction workforce development training will be coordinated with the statewide IOU WE&T program. In addition to the trainings described above, SW IOU WE&T programs will continue to offer building block courses that educate professionals

on the concepts that form the foundation of Residential New Construction programs. Those concepts include:

4. Green building techniques;
5. Codes and standards);
6. Lighting and HVAC technologies;
7. Energy cost management; and
8. Food service equipment.

Contractor recruitment efforts will be conducted primarily by SW WE&T program implementers through:

9. The network of contractors already participating in Residential EE programs;
10. Direct outreach through industry organizations with locally active memberships (e.g. IHACI, USGBC, IFMA, AIA, BOMA, etc.);
11. Workforce development departments (to target unemployed general contractors); and
12. Community Based Organizations with a proven track record of effective outreach to the hard to reach workforce.

▪ Program specific marketing and outreach efforts

TBD

i. In 2013-2014, the program will expand its builder/contractor education and training materials to increase awareness of the California Advanced Home Program and better communicate the advantages to builders of

~~The IOUs will continue to support code development work with the CEC and to test candidate technologies in the new construction programs.~~

~~▪ Non-utility market initiatives~~

~~The homebuilding industry is facing some of the worst times in its history.<sup>8990</sup> In fact, new residential Residential single family housing permits have declined by 37.1 percent% relative~~

~~from 2006 and multi-family permits have declined by 21.2 percent.<sup>9192</sup> As a result, builders are building fewer homes and releasing them more slowly to the market.~~

~~The significant costs associated with carrying inventory coupled with declining prices of houses has created additional resistance in a building industry already averse to additional construction costs. In addition, the industry is consolidating operations and eliminating staff to reduce overhead costs and avoid bankruptcy.~~

~~The industry faces the burden of stringent California Title 24 building code standards.~~

~~The CEC will institute a new code in 2009 and 2011, and on a three year schedule thereafter. Each code is approximately 15% more stringent than the last, increasing costs and requiring additional efforts on the part of the builder. In California, homes built to current Title 24 standards are 35 percent% more energy efficient<sup>93</sup> than homes built to the federal government's standards. In addition, reducing greenhouse gas emissions will become mandatory, due to the adoption of AB 32 (Global Warming Solutions Act). Builders confirm that growing consumer awareness of "green" concerns will lead to greater demand for these advanced homes and builders will~~

<sup>89</sup> Alan N. Nevin, CBIA Chief Economist and Principal, Market Pointe Realty Advisors, California Builder Magazine, January/February 2008

<sup>90</sup> Alan N. Nevin, CBIA Chief Economist and Principal, Market Pointe Realty Advisors, California Builder Magazine, January/February 2008

<sup>91</sup> California Industry Research Board (CIRB) Report, January 24, 2008

<sup>92</sup> California Industry Research Board (CIRB) Report, January 24, 2008

<sup>93</sup> Ray Becker, Chairman, CBIA, Southern California Builder Magazine, Vol. 25. CAHP's internal research has shown typical 2005 T24 performance is 20% above IECC 2006.

~~-adapt to meet these demands at the least possible cost.~~

~~Population growth drives the economy and “California’s population is expected to keep growing by 500,000 a year for the next three decades. That means California needs between 220,000 and 240,000 new homes and apartments every year to keep pace with the state’s population growth.”<sup>94</sup> The year 2007 saw only 112,000 new units permitted. The 2008 forecast is for only 87,000.~~

~~As alluded to above, buyers are increasingly asking for green and energy efficiency and would pay more (up to \$11,000) for such features.<sup>95</sup> For the first time, a majority of respondents in the National Association of Home Builders’ survey are asking for efficiency first, likely in response to rising energy prices economy wide.~~

~~Paradoxically, a A majority of the same respondents also requested higher ceilings, more square footage, and were willing to trade a larger home for a longer commute, reflecting a soft commitment to green.~~

### Transmission & Distribution

~~CAHP staff has been working with our counterparts in the Transmission & Distribution business unit that designs electrical service for new construction projects.~~

- ~~● CAHP will pay the standard calculated incentives for all other measures in low-income units (e.g. improved duct work and windows). CAHP will claim the energy savings resulting from EE measures other than high SEER A/C and refrigerators.~~
- ~~● CAHP would treat market rate units using the standard calculated approach and claim all energy savings.~~

<sup>94</sup> Wes Keusder, Former Chairman, CBIA, Southern California Builder Magazine Vol. 24

<sup>95</sup> Jan Dimeo, Builder, <http://www.builderonline.com/business/surveys/reveal-home-buyer-wishes-for-energy-efficiency-and-beyond.aspx>. Accessed 14 Mar 08

Formatted: Indent: Left: 0.25", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0.25", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

This collaboration will:

- Encourage the development of more below market rate low income units by developers;
- Increase participate in the RNC sub program based on the combined higher incentives; and
- Benefit low income occupants over the life of the installed equipment.

The partnerships program will assist in gathering information to ensure that the units actually are occupied by low income qualified customers. Differences in Program Implementation

This section highlights the major areas where individual IOUs implementation of the program will differ from that of the others. While the incentive structure and other elements of the program will remain synchronized with the statewide nature of the program, each IOUs will leverage its unique strengths and structural differences to enhance the effectiveness of execution. This section highlights some of those differences:

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

~~Local governments typically track this information in order to show compliance with state mandates.~~

The program will be implemented by direct contact with the market actors: builders, architects, civil and mechanical engineers, energy analysts, home energy rating system (HERS) providers, HERS raters and other participants. Through design assistance and coordination with the builders and their consultants and contractors, projects will be evaluated for optimal approaches to increase energy savings and demonstrate green building concepts.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

The program will target the residential Residential design and construction teams, architects, energy analysts, HERS raters, trade contractors, and builders. The target segment is low rise and high rise residential new construction Residential New Construction with participation being open to all residential new construction Residential New Construction including custom homes, single family production housing, condominiums, town homes and rental apartments.

Builders may qualify to participate under one of the two subprogram sub-program categories: California Advanced Homes Program (CAHP) or the Zero Net Energy Home (ZNEH). As explained in detail in the common section of this PIP, through ZNE. Through financial incentives, design assistance, education and training, the IOUs will aggressively support high performance single family and multifamily building designs that exceed Title 24 standards in an overall performance design of 15% or greater. Energy savings and incentives will be based upon a sliding scale from 15% to 45% reduction in energy usage from Title 24 budget. Program focus

will be on increasing the participation to a 35% threshold. The sliding scale incentive structure was discussed in detail under the common section of this PIP.30% threshold.

#### o — Best Practices

The Sempra Energy Utilities and PG&E deliver the California Advanced Home Program in their service territories through a team of experienced account executives. Project qualification will be conducted through internal project review by program management staff, or if necessary, using external consultants.

SDG&E Residential New Construction program management teams have extensive experience in designing and implementing successful offerings to the industry as demonstrated by the 2002-2005 California ENERGY STAR® New Homes programs and the 2006-2008 Advanced Home program. Recognized as an outstanding energy efficiency resource, this team has the ability to successfully work closely with other local, regional, statewide and national stakeholders to ensure the widest opportunities for potential program participants.

SDG&E will deliver the ZNEH sub program through the same account executive and program management staff as the CAHP. Through case studies and demonstration projects, the utilities will examine a wide array of energy saving technologies, accelerate the market acceptance of new and emerging technologies, explore new solutions, and encourage distinctive approaches in demonstration projects. Participating builders will be encouraged to integrate environmentalism, economics, and social equity, while integrating landscape into the built environment for human interaction. Each being distinctive, these case studies will be positioned to highlight the underutilized potential of sustainability in residential new construction. The utilities will seek to integrate R&D ideas from Emerging Technologies, PIER, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

Design assistance for interested builders will be offered through various mechanisms. Design Team Charrettes that will include the architect, energy analyst, civil and mechanical engineers, HVAC contractors and the builder will allow a review of the product and recommendations that will increase the sustainability and energy efficiency of the product. Education and training will be offered through utility training programs (offered frequently at the ERC) that have been extremely successful in the past. SDG&E also intends to offer a structured Design Team Incentive to encourage architects and design engineers to enhance building performance through innovative approaches. Details of the Design Team Incentive are currently under development, and may range from \$250 to \$2000 depending on the number of residences in a project.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single, Allow hanging punctuation, Font Alignment: Auto

In recognition of the increased societal movement towards sustainability, and in line with the other IOUs, SDG&E will offer additional financial incentives beyond direct Therm incentives to projects that achieve a green building certification, perform building commissioning during design and construction, and establish and follow a building measurement and verification plan after occupancy. The USGBC LEED program, Build It Green's GreenPoint Rated program, and California Green Builder represent just a few of the rating systems that will be considered for the incentive. Many credits are available in LEED-H for energy efficiency, especially the incorporation of renewable energy. Renewable energy is a significant component to the state's goals of achieving zero net energy in the new construction market by 2020. Building commissioning incentives ensure that the as designed building becomes the as built building.

The minimum threshold for acceptance in the ZNEH sub program will be a whole building performance of at least 45% over Title 24 standards. Projects must meet LEED for Homes (Silver) equivalent and/or qualify for a minimum of 100 points from Build It Green's Green Point Rated system. Energy savings will be evaluated based on the diversity of measures and the overall energy performance. The life cycle CO2 reductions and water savings will be tracked. A broad based support, including outside expertise, education, resources, public recognition, marketing support, design and financial assistance will be offered to qualified builders. The program will explore and encourage the incorporation of innovative measures, such as: Passive Solar, Active Solar (solar water heating), Photovoltaics, Sustainable Urbanism, Smart Growth, Innovative Environmentally Sensitive Building Design, Ecological Design, Innovative Thermal Comfort Solutions, Day Lighting, Carbon Sequestration, Water Recovery and Zero Peak Design. Financial incentives and marketing support offered for the Case Study projects will be significantly higher than those offered under CAHP. However, due to the "show case quality requirements", the number of projects enlisted for case studies is likely to be limited to no more than ten per year per utility.

In addition, the following two new construction programs will be supported through Third Party participation (see separate PIP on Third Party programs):

California Sustainability Alliance. Managed by Navigant Consulting, Inc.

Innovative cross cutting market transformation, marketing and outreach programs that targets comprehensive sustainability. The program includes energy efficiency, water efficiency, renewable energy, waste management, transportation management, smart

growth/land use best practices, and climate action delivered in a single program under the broad umbrella of sustainability. The program will seek to inform the utility as to potential opportunities for future program design that may be available.

*HERS Rater Training Advancement Program. Managed by Conservation Services Group.*

This program targets training to certified new construction Home Energy Rating System (HERS) raters and Energy Analysts to improve the consistency of ratings and expand the reach of existing programs. Program team members CalCERTS and CHEERS have direct contact with raters, allowing for reduced marketing costs and improved penetration. Conservation Services Group will utilize classroom training and an on line learning management system (LMS), which includes an assessment test and customizable learning units.

e. Best practices

The residential new construction team will gather gathered information and past experience in successful low energy and zero net energyZNE existing projects to evaluate best practices. Thus far the research shows that while ZNE practices exist in piecemeal fashion throughout the state and nation, there are no other utility incentive programs targeting ZNE. RNC will continue to conduct further research and will disseminate its finding by April of 2013 in accordance with the program guidance. This information will be used to develop pilot projects that will demonstrate low energy homes and include home performance monitoring.

Several recommendations were made in the Cadmus Report that evaluated the communication plans, program elements, and services offered by IOUs residential new construction programs. These recommendations have been carefully studied and incorporated into the CAHP program design.

Program Components:

- In~~stitute~~ more continuity in program offerings: The program name, incentive structure and several elements of execution will be developed on a statewide basis, ensuring consistency across all the utilities and continuation into the future.
- Leverage ENERGY STAR AND LEED: The CAHP incentive mechanism incorporates a Performance Bonus element for ENERGY STAR.
- SDG&E has made LEED certification as one of the requirements for participation in the ZNEH sub program.

Formatted: Space After: 0 pt, Line spacing: single

- Continue to offer prescriptive options: The CAHP incentive mechanism is based on a sliding scale; however, the Performance Bonus element emphasizes prescriptive elements that are not included in the Title 24 base.
- Enhance demonstration / case study component: The case study component is an integral and crucial element of the ZNEH sub program. The IOUs will strive to show case these homes as reaching far beyond the minimum energy efficiency requirements and serving as the “model homes of the future”.

Processes:

- i. — Improve marketing materials and improve participant recognition: As explained in the Marketing, Education and Outreach section of this PIP, marketing materials and other collaterals will continue to be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.
  - In 2008, SDG&E redesigned RNC has undergone substantial marketing collaterals to be more informative material revisions and professional in appearance.
- — Enhance AE’s role in recruiting and marketing: Working closely with the project management teams, they would enhance their role in identifying and developing the ZNEH case study homes. Joint presentations with home builders will improve builder understanding of the purpose and expectations for the case studies; continue to do so.
  - The SDG&E teams now consist of seasoned account executives and are effective.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Formatted: Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0.5" + Tab after: 1" + Indent at: 1"

Formatted: Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0.5" + Tab after: 1" + Indent at: 1"

Program Services: Incentives

- In accord with Cadmus recommendations, the CAHP incentives have been fully revamped to be more meaningful and effective for the builders as well as the utilities. Additional incentives under consideration include a Design Team Incentive, more flexible incentives for ZNEH case study projects, and other financial support enumerated earlier are all designed to enhance builder participation in the program and deliberate movement towards the upper end of the energy efficiency scale.

Program Services: Training

- — Taking advantage of the slow down slowdown in the industry, the utilities intend to ramp up the training for builders and other industry participants. Training is an area where significant synergies can be extracted and the IOUs will participate in developing and implementing common training modules and web based training tools. Training will focus particularly on cost / benefit evaluation of energy efficiency improvements and thermal bypass checklist compliance.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single

Formatted: Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0.25" + Tab after: 0.75" + Indent at: 0.75"

Program Services: Information, Communication and resources

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

▪ ~~A web-based incentive calculation tool is currently being~~ will be evaluated by the IOUs. This tool is intended to assist builders in comparing costs and energy savings of alternative measures and arriving at the most optimal approach for the builder.

Formatted: Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0.25" + Tab after: 0.75" + Indent at: 0.75"

~~A suggestion was made to create a hotline for builder questions. Since the IOUs deliver CAHP through a team of account executives/field staff who serve as the focal points of contact for the builders, the utilities do not feel it is necessary to provide hot lines for builders to reach. If this becomes a necessity, the utilities will reevaluate the need and provide communication points as appropriate.~~

▪ ~~Currently, the technical staff provides preliminary evaluation, engineering review and recommendations for builders to move up on the efficiency scale. It is expected that builders will utilize the services of qualified Energy Analysts and designers in arriving at the final set of measures that should be included. The Design Team Incentive under consideration by the utilities will enable the builders in utilizing the services of qualified engineers that will complement the engineering staff review. The program will continue to work closely with these companies to promote a continued improvement and commitment to integrated design.~~

Formatted: Space After: 0 pt, Line spacing: single, Bulleted + Level: 1 + Aligned at: 0.25" + Tab after: 0.75" + Indent at: 0.75"

▪ ~~The IOUs plan to implement~~ will explore the implementation of an enhanced set of communication tools that will serve to educate builders and enhance participation. As explained earlier, our communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, email blast, builder award recognition, customer success stories and public relations campaigns; all materials and communications will be made available in electronic file formats.

#### Innovation:

Formatted: Indent: Hanging: 1.13", Space After: 0 pt, Line spacing: single, Bulleted + Level: 3 + Aligned at: 1.38" + Tab after: 1.63" + Indent at: 1.63", Tab stops: 0.13", List tab + Not at 1.63"

~~The sliding scale incentive calculations, ZNEH Case Study projects, and the IOU joint marketing efforts represent significant departure from past practices and reflect innovative approaches to new construction energy efficiency.~~

~~The incentive design is based on a whole building performance. It appropriately rewards higher levels of building performance and is likely to motivate builders them to move towards higher efficiency buildings. This approach offers the builder adequate flexibility to choose the optimal combination of design features. It also enables the utilities to work together and support new construction projects with fuel neutrality.~~

Formatted: Indent: Left: 1", Space After: 0 pt, Line spacing: single

~~By focusing on efficiencies beyond 35% better than Title 24 + 35%, and encouraging Zero Net Energy homes for showcasing ZNE projects, the IOUs hope to generate sufficient enthusiasm in the market place for very high efficiency homes. Wherever possible, the California utilities will continue to extract~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

Formatted: Indent: Left: 1", Space After: 0 pt, Line spacing: single

synergies in marketing and program design by developing a truly statewide program with common features and coordinated efforts.

o Integrated / coordinated Demand Side Management:

The ~~ZNEH case studies offer~~ZNE element offers a great opportunity for savvy builders to demonstrate their commitment towards a truly integrated approach to DSM options. ~~With design assistance and incentives from the utility, custom home builders are uniquely positioned to leverage the various tools available at their disposal. The program management teams will educate and strongly advocate these builders to serve as model designers and be recognized and rewarded in the builder community. Case study~~ZNE homes offer an excellent opportunity for builders to install not just energy saving measures, but also renewable energy, in home display, solar roofs, innovative water saving technologies and other state of the art appliances to demonstrate how sustainable design ~~could~~can be achieved.

Formatted: Indent: Left: 0", First line: 0.5", Space After: 0 pt, Line spacing: single, Bulleted + Level: 3 + Aligned at: 1.38" + Tab after: 1.63" + Indent at: 1.63", Tab stops: 0.38", List tab + Not at 1.63"

Formatted: Indent: Left: 1", Space After: 0 pt, Line spacing: single

o Integration across resource types (energy, water, air quality, etc):

As discussed above, the program is looking to partner with relevant stakeholders to identify water, air quality, and waste diversion opportunities.

~~a. The ENERGY STAR® Manufactured Homes Program (ESMH) is part of this program the statewide Residential New Construction (RNC) program offering. The RNC program is itself one sixth of the CalSPREE core offering. ESMH addresses new factory built housing, offered by Sempra and Southern California Edison. The structure of the relevant New Construction program elements is as follows:~~

~~CalSPREE Program (Core)~~

~~Residential New Construction Sub Program~~

~~Single family/Multi-family Sub Program (CAHP)~~

**Formatted:** Space After: 0 pt, Line spacing: single, Numbered + Level: 1 + Numbering Style: a, b, c, ... + Start at: 1 + Alignment: Left + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75"

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

~~a. ZNE Sub Program~~

~~—Manufactured Homes Sub Program for Sempra and SCE~~

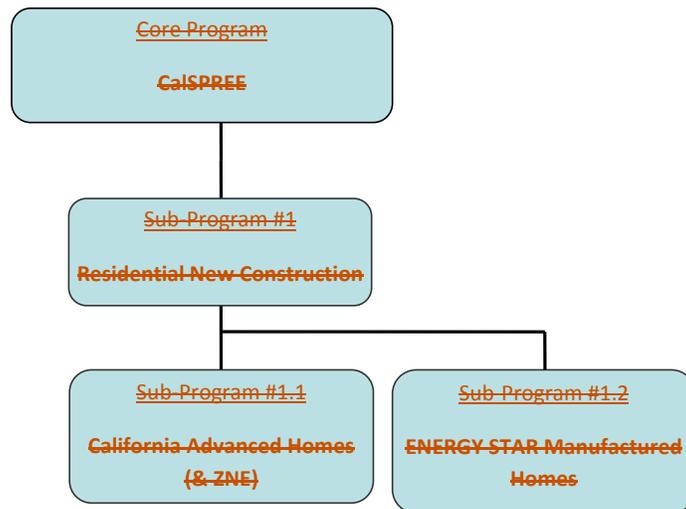

For the convenience of the reader, two other programs relevant to New Construction are also called out:

~~b) Sustainable Communities Program (Name / location differs by IOU) (Third party)~~

~~Covering Master planned communities, mixed use projects, campuses, and commercial projects pursuing advanced energy efficiency and green targets.~~

~~c) Partnership Programs (Core)~~

~~Strategic Planning Sub Program (Energy Leader Partnership Strategic Support) — Trains cities and counties to procure city projects to meet energy efficiency standards, to identify funding sources, to share best practices, and recognizes them for their achievements.~~

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

The goal of energy efficient RNC will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan, and works in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP.

As explored in greater detail below, CAHP will work closely together with the ZNE sub-element to adopt the following strategies toward achieving the Strategic Plan goals. As program technologies and approaches are developed and demonstrated in ZNE, they will be incorporated into the CAHP. The lead program is listed in parentheses after each strategy.

12. Raise plug load efficiency (ZNE)

13. Promote whole house solutions, with a particular focus on zero peak homes as an interim step toward zero net homes (CAHP)

14. Encourage in-home monitoring and visual display tools (ZNE)

15. Encourage incorporation of Green Building Standards (ZNE)

16. Coordinate CAHP with demand response programs (CAHP)

Specific strategies for achieving net zero homes will be reviewed in more detail below. Moreover, as outlined above, where strategies enter the market more rapidly than anticipated, they will be rolled into the core CAHP.

• List measures

b) \$500 per gas heated home

e) \$500 per electric heated home

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

• **List non-incentive customer services**

- ~~Technical support to Energy Analysts and Design Teams<sup>96</sup>~~
- ~~Economic modeling/measure selection support to builder/construction managers~~
- ~~Marketing support to builders (sales agent training, marketing materials)~~
- ~~DSM coordination (PV, DR, AMI, ET) for builders to maximize demand-side reductions.~~

**ENERGY STAR® Manufactured Homes**

~~In addition to the performance approach cited above, CAHP will retain a deemed prescriptive approach for the manufactured home market segment. Homes will have the flexibility to include the entire ENERGY STAR® package for manufactured housing or to incorporate elements within those standards, such as improved windows.~~

~~The ENERGY STAR® Manufactured Homes sub-program is designed to promote the construction of new manufactured homes in SCE's service territory that comply with ENERGY STAR® energy efficiency standards. The program targets manufacturers, retailers, and homebuyers of new manufactured homes. The current baseline for manufactured homes is the HUD standard specification. The program encourages manufacturers to install "right size" HVAC, install high efficiency HVAC equipment, and evaluate homes on a whole building basis covering windows, insulation levels, and quality installation inspections. The program works in coordination with the ZNE program element.~~

~~The program is a logical fit in Sempra and SCE's Residential New Construction portfolio of programs and will be another market segment within CAHP, alongside single family and multi-family dwellings. Likewise, the ZNE element will also look to leverage consumer interest in green building in promoting zero peak homes and market transformation.~~

~~The objectives of the program are:~~

---

<sup>96</sup> There is a desire by the IOUs to explore a variety of forms of design assistance, including design team incentives tied to home performance, peak kW reduction, design optimization services by implementation staff, and funded/hosted charrettes for design teams.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

- ~~To capture cost effective energy savings and demand reduction opportunities~~
- ~~To move the industry toward coordinated demand side management (c-DSM), including self-generation and SCE's AMI (SmartConnect™)~~
- ~~To move the industry toward zero net energy as identified in the BBEES and advanced in the Strategic Plan~~
- ~~To move the market segment from HUD compliant to ENERGY STAR® and provide savings for customers purchasing energy efficient, manufactured homes~~

The program encourages manufacturers to:

- ~~Install "right-size" HVAC equipment~~
- ~~Install high efficiency HVAC equipment~~
- ~~Evaluate homes on a whole building basis covering windows, insulation levels, and quality installation inspections~~

~~The program will also include an education and outreach component as a means to promote awareness of energy efficient practices in the construction of ENERGY STAR® manufactured homes. All segments related to the sale and construction of a manufactured home, including retailers, customers and manufacturers will be engaged. The marketing plan will also target new retailers to inform them of the program benefits and encourage their participation in the program.~~

~~Market actors include manufacturers, retailers and homebuyers. As the primary focus is on retailers, the program is considered a midstream program. Incentives are offered to help induce retailers to promote ENERGY STAR® qualified manufactured homes.~~

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

<b>Program Criterion</b>	<b>Incentive</b>
<del>Prescriptive elements, e.g. windows, add'l insulation</del>	<del>TBD, deemed rather than calculated per CZ</del>
<del>ENERGY STAR® Manufactured Home —Gas Heat</del>	<del>\$500/Home (total of prescriptive elements)</del>

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

<b>Program Criterion</b>	<b>Incentive</b>
ENERGY STAR® Manufactured Home —Electric Heat	\$500/Home (total of prescriptive elements)
Zero peak Home	\$75 for each peak kW reduction due to on-site photovoltaic system

Financial incentives will take the form of fixed rebates (deemed) or may be calculated on a project by project basis.

RNC will pursue zero peak homes as a reasonable milestone on the way to achieving the Strategic Plan's ZNE homes. The addition of a zero peak photovoltaic kicker is part of the effort toward achieving zero peak homes.

As part of the effort to address plug loads, ESMH is exploring such technologies as master plug shut-off switches (smart outlets that shut off when they detect only parasitic loads). Additionally, and as part of the integrated demand-side management (DSM) approach recommended by the Strategic Plan, ESMH will reward builders for installing demand response offerings such as PCTs and A/C Cycling controllers. CAHP will deliver demand response measures paid for by the demand response programs. CAHP intends to reward builders for these items based on a deemed amount rather than a performance-based incentive.

CAHP will work with their AMI metering infrastructure teams to test and develop in-home displays to both drive plug load usage down and give customers both financial and social reasons to conserve energy<sup>97</sup>. In addition to financial savings, the rationale is that customers will gain social status and personal satisfaction by being the most conserving, much as Prius current owners compete to outperform each other and the EPA's expected miles per gallon.

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

<sup>97</sup>To the extent possible, CAHP intends to leverage AMI funding to incent IHDs in new construction projects. However, AMI has its own schedule and its own priorities for research projects. If DR/AMI is not ready for AMI integrated IHDs, the ZNE program through its demonstration projects, working in concert with ET, seeks to demonstrate simpler IHD technologies perhaps without the full capabilities of an AMI integrated device. As these technologies mature into the marketplace, the statewide IOUs will consider adopt them as additional measures into the core CAHP.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Marketing efforts will target manufactured home retailers as well as customers.

• Desired program outcomes are:

•

- To achieve short and long term energy savings and demand reduction in the most cost effective manner possible.
- To increase the penetration of ENERGY STAR® manufactured homes within California, and to make ENERGY STAR® the customer's preferred choice.
- To transform the marketplace by promoting ENERGY STAR® qualified manufactured homes the new standard choice instead of homes that meet the existing HUD standards.
- To establish a strong working relationship with manufactured home retailers.

A finished project is defined as the completion and assembly of a manufactured home. The process of purchasing and installing an ENERGY STAR® qualified home can be lengthy, so projects need to be monitored closely throughout the program cycle.

The program will include a quality assurance plan with a field inspection component to verify that the manufactured home(s) meets ENERGY STAR® and program's requirements. The program will also have a mechanism to verify that the assembly of the home is in accordance with these standards. This will include ducting work and installation of end use equipment (for example, HVAC). Many ENERGY STAR® components are assembled on-site and the compliance must be verified once assembled.

Customer information will be captured once a project is complete to allow IOUs to integrate delivery of other program offerings to these customers as well as tracking any possible double dipping. Information on parties receiving incentives will be tracked and reported.

Formatted: Space After: 0 pt, Line spacing: At least 12 pt, Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tab stops: Not at 0.5"

Formatted: Space After: 0 pt, Line spacing: At least 12 pt, Bulleted + Level: 1 + Aligned at: 0" + Tab after: 0.25" + Indent at: 0.25", Tab stops: Not at 0.5"

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

On December 2, 2010, the Commission issued Resolution E 4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Lighting Market Transformation Statewide Program (Resolution E 4385, Appendix A):

**Table 3**

<b>SW PROGRAM/ Sub-Program</b>	<b>PROGRAM PERFORMANCE METRIC (PPM)</b>	<b>Metric Type</b>
<b>Residential ENERGY STAR® Manufactured Housing</b>	1. Number of manufactured housing units sold in IOU service territories (via retailers and/or manufacturers) participating in program	2a
	2. Number and percentage of participating projects utilizing: (a) whole house incentive for gas heat; (b) whole house incentive for electric heat	2a

• **Market Transformation Information**

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

Resolution E 4385 identifies a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will be presented at a public workshop to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities.

### Program Design to Overcome Barriers (Priority Barrier: Homebuyers)

The energy used in the average home produces roughly twice the greenhouse gas emissions as the average automobile. In fact, 16% of U.S. greenhouse gas emissions result from the generation of energy used in houses nationwide (U.S. EPA). However, there is little consumer awareness of the impact their homes have on the environment. CAHP is working with IOU marketing efforts, statewide partners (e.g. Flex Your Power), ENERGY STAR® campaigns, and builder's own messaging to increase consumer awareness of this idea. Moreover, there is scant evidence that energy efficiency drives decision-making among homebuyers, whose access to capital is more difficult in a constrained capital market.

### Manufactured Housing: a potential opportunity

The current decline in the housing industry, the high cost of Residential housing, and increasing customer awareness of energy efficiency all make this a good time to address this underserved market segment. The manufactured housing industry is somewhat counter-cyclical to the site-built home market. As buyers are priced out of site-built homes, manufactured housing has become an affordable alternative.

Historically, manufactured housing has been considered a lost opportunity. However, as SCE found in the 2006-2008 IDEEA program, there is significant interest among manufacturers in promoting the ENERGY STAR® brand. Manufacturers recognize that ENERGY STAR® manufactured homes address both the high cost of purchasing a traditional new home and the high cost of energy bills. However, without IOU intervention in the market, retailers are not pushing ENERGY STAR® homes and there is not enough demand for manufacturers to justify building them.

### Overcoming Market Failure: CAHP

In a buyer's market, builders are looking to differentiate themselves from competition. This presents a opportunity for CAHP to assist builders in overcoming cost barriers, minimizing

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

lost opportunities, and working collaboratively to help meet the state's and IOUs' goals for the reduction of greenhouse gas emissions and utility source demand.

The Residential New Construction market without IOU intervention is a lost opportunity for long term energy savings. However, with IOU intervention in the form of incentives and design support, the new construction market is well placed to demonstrate innovative approaches and cost effective energy savings technologies.

### Overcoming Market Failure: Manufactured Housing

The program provides an incentive to manufactured home retailers when they sell a manufactured home that meets or exceeds the current ENERGY STAR® standards. These standards extend to the ducting and installation guidelines for heating/cooling equipment, be tracked and reported.

ENERGY STAR® qualified manufactured homes will generate energy savings and demand reduction. In addition to leveraging retailers of manufactured homes, the program will leverage the Partnerships Program to reach out to local governments where the homes will be built.

Manufactured homes have a higher potential for market transformation than the site built industry due to factory standardization, and the fact that recent research indicates that eight manufacturers control approximately 98%<sup>98</sup> of the manufactured housing market.

Customers may also receive incentives for purchasing an ENERGY STAR® manufactured home. The incentives are paid directly to the customer after successful construction, assembly, and inspection of the home site.

### Current Program Baseline: Manufactured Housing:

The construction of manufactured homes that meet ENERGY STAR® program standards, as opposed to the less stringent HUD standards, will result in demand reduction, energy savings,

Formatted: Indent: Left: 0", Space After: 0 pt, Line spacing: single

<sup>98</sup> "Synopsis of manufacturer market share and status," Manufactured Research Association, communication, October 2007.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

and the reduction of greenhouse gas emissions. Prior to IOUs' intervention in the market, there was no ENERGY STAR® qualified manufactured homes sold in our service territory.

The energy savings will result from a combination of improved envelope efficiency (thermal and air tightness), use of high efficiency equipment, and the proper sizing (downsizing) of the cooling equipment. This program is statewide among all the IOUs, to provide continuity and better service to the builder at reduced costs.

● **Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

— **Table 5**

<b>ENERGY STAR® Manufactured Homes</b>	<b>Program Target 2013</b>	<b>Program Target 2014</b>
Units Paid	TBD	TBD

● **Advancing Strategic Plan goals and objectives**

Since its inception in 2002, CAHP has had a substantial impact on the homebuilding market. There is a significant opportunity to continue to influence builders, architects and other players in the Residential New Construction industry.

The RNC sub-program is designed to enable the achievement of several goals and strategies identified in the Strategic Plan. The Strategic Plan envisions a transformation of the core Residential sector to ultra-high levels of energy efficiency, resulting in ZNE new construction standards by 2020. It spells out several goals and strategies to address energy reduction in Residential New Construction:

**Goal #1:** New Construction will deliver “ZNE” performance for all new single and multi family homes by 2020.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

5. ~~By 2012, 50% of New Homes will exceed 2008 Title 24 energy efficiency standards by 20%; 10% will surpass 2008 Title 24 standards by 40% (Strategy 1-1)<sup>99</sup>~~

~~**Goal #2:** Home buyers, owners and renovators will implement a whole house approach to energy consumption that will guide their purchase and use of existing and new homes, home equipment household appliances, and plug load amenities~~

~~**Goal #3:** Plug load will grow at a slower rate and then decline through technological innovation spurred by market transformation and customer demand for energy efficient products.~~

~~The goal of energy efficient Residential New Construction will be achieved through a combination of incentives, technical education, design assistance, and verification. CAHP supports the ambitious goals of the Strategic Plan, and works in close coordination with the ZNE sub-element. Together these elements seek to raise plug load efficiency, focus on whole house solutions, drive occupant behavior through in-home monitoring and visual display tools, and leverage market demand for green building standards. CAHP is also coordinated with demand response programs, Emerging Technology, and the NSHP. In fully aligning itself with the Strategic Plan, the CAHP targets an interim goal of 50% of RNC to Tier II (2005) by 2011, 10 per cent of RNC to 55% by 2011, and a final goal of 100% of Residential New Construction to be net zero by 2020. In fully aligning itself with the Strategic Plan, as modified by Decision 09-09-047, the CAHP targets an interim goal of 50 percent of RNC to be 20% better than the 2008 Title 24 Standards by 2012, and 10% of RNC to be 40% better than the 2008 Title 24 Standards by 2012, and a final goal of 100 percent of residential new construction to be net zero by 2020.~~

~~**6. Program Implementation IOU-specific elements**~~

~~**vi. Statewide IOU coordination**~~

---

<sup>99</sup> As modified in D.09-09-047

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

Given the success of the collaborative process that led to the production of this PIP, the statewide RNC team plans to meet on at least a quarterly basis going forward in order to review progress toward the goals and make corrections need to achieve them.

**2.2.1 Program name**

The single family and multi family programs will be implemented under the common name of California Advanced Home Program. The zero peak pilots will be referred to as ZNE Homes, although the details differ somewhat by utility. Factory built housing will be referred to as ENERGY STAR® Manufactured Homes.

**2.2.2 Program delivery mechanisms**

Sempra delivers the program primarily through in house account executives with some outside technical support for specific analysis or niche. SCE leverages third party implementers and in house account executives.

**2.2.3 Incentive levels**

The IOUs have agreed upon a common incentive methodology that will be implemented throughout the service territories.

**2.2.4 Marketing and outreach plans**

CAHP offers financial incentives, training opportunities, technical support, and marketing resources to single family and multi family Residential builders who construct homes that exceed California's energy efficiency standards for new construction. All types of Residential builders are welcome to participate<sup>100</sup>.

<sup>100</sup> As discussed above, manufactured housing is not subject to Title 24 and uses the national HUD baseline.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

There will be closer coordination of marketing efforts to synergize wherever possible. While each utility would like to leverage on their strengths and existing relationships within their service territories, certain marketing elements can be launched on a common platform. A common website will be created to provide builder information that will be commonly disseminated. Training and education is an area where pooling of resources is possible to reduce cost and increase participation.

The IOUs plan to be actively engaged in the development and implementation of joint marketing, education and training efforts as described in detail in the common section of this PIP.

In 2013-2014, the program will expand its builder/contractor education and training certification courses to increase overall awareness and understanding of CAHP and service offerings. We will continue to strengthen our delivery channels of information by providing relevant information and support materials, reaching target audiences in key decision-making phases. The IOUs' innovative communication tools will include: trade advertising, account representative meetings/presentations, targeted customer mailings, shows/event sponsorships, trade organization affiliations, webcasts, e-mail blast, builder award recognition, customer success stories and public relations campaigns. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the Internet.

Additionally, CAHP will leverage its excellent relationships in partnering with trade organizations and other groups actively promoting the benefits of green, sustainable building practices. Such organizations include: CEC, FYP, AIA, USGBC, ULI, California Manufactured Housing Institute, Build It Green, IES, AEE, IHACHI, PHCC and others. Through an innovative, coordinated approach, we will maximize outreach opportunities that keep energy efficiency and CAHP's program benefits top-of-mind and maximize program participation.

Marketing materials and other collaterals will be enhanced to communicate more effectively with savvy builders. Participant recognition (plaques, feature presentations, etc.) has proven to be an effective tool in encouraging builder involvement, and will continue to remain as part of the overall marketing tools.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**2.2.5 IOU program interactions**

The plan addresses above, in the Incentive Rationale section, the ways CAHP is encouraging demand performance, in home displays, on-site generation, square footage reductions and green elements.

CAHP is particularly interested in promoting integrated thermal hot water system designs to displace therm demand with on-site renewable sources. In addition to cold water savings from embedded energy and the energy to heat water, longer term there may be GHG reductions that accrue either to the builder, the homeowner, or the utility associated with each demand side reduction as a result of AB 32 and pending national CO<sub>2</sub> legislation.

CAHP prides itself on its established close relationships and memberships with other groups involved with the building industry. These relationships make it possible to provide comprehensive services to our customers. Thus, CAHP will continue to seek out and coordinate synergies with, but not limited to, the following groups:

16. NSHP

17. EPA

18. California IOUs

19. Green Building Consultants (i.e. Build it Green, California Green Builder, Global Green)

20. Rater Organizations (e.g. ResNet, CalCerts, CHEERS)

CAHP will continue its commitment to the EPA's ENERGY STAR® program and will strive to support, partner and contribute to the success of the ENERGY STAR® homes label and branding. Numerous surveys and studies continue to show the ENERGY

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

STAR® label represents greater value to consumers and the environmental stewardship it represents.

Since 2002, CAHP has partnered with the EPA in promoting ENERGY STAR® New Homes and has won ENERGY STAR® achievement awards for the last seven consecutive years. In 2011 SCE was rewarded for “Sustained Excellence in Energy Efficiency Program Delivery”.

The program will continue to offer comprehensive training courses and educational seminars relevant to building energy efficiency and green measures into new construction projects including Title 24 code training and ENERGY STAR® requirements.

In response to builder requests, CAHP will offer a new training workshop during 2013–2014 designed for builders’ sales agents. Sales agents have direct contact with the homebuyer and have the greatest impact on selling homes. In order to help promote ENERGY STAR® developments, CAHP will teach sales agents about energy efficiency. Topics will include what qualifies as an ENERGY STAR® home and what is 'green'.

Other activities will include attendance at building industry trade conferences/ outreach events and any necessary contractor/builder field visits. The target audience consists of builders, developers, energy consultants, architects, and other industry professionals.

IOUs may pursue partnership efforts with local government entities who are looking to display leadership in the carbon arena by expediting plan check, waiving permit fees, or allowing builders to pay impact fees on the back end (instead of up front) in exchange for higher levels of home performance documented by our program.

### **2.2.6 Similar IOU and POU programs**

The statewide team will reach out to leading POU programs, such as those at SMUD to learn from their experience how best to deliver energy efficient homes.

In addition, the IOUs will work closely with the existing home remodeling programs (Home Performance with ENERGY STAR® and the Comprehensive Mobile Home Program) to maintain a two-way communication of best practices and lessons learned between the new and existing sectors.

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

**vii. Program delivery and coordination**

**a) Emerging Technologies (ET) program**

Emerging technologies will chiefly be handled within the ZNE program. The IOUs are looking to partner with our ET and EPIC funded Testing Facilities to pilot zero-net energy approaches, particularly in the manufactured home/prefabricated segment. However, the proposed incentive approach allows the IOUs the flexibility to include both deemed and calculated energy savings from new technologies as they become market ready.

The utilities will seek to integrate R&D ideas from Emerging Technologies, EPIC, LBNL and other avenues to further assist the projects to advance sustainability and achieve very high levels of energy efficiency.

**b) Codes and Standards program**

As mentioned above, manufactured housing is not subject to Title 24, although there are national efforts to improve the HUD code.

**c) WE&T efforts**

The RNC team is seeking ongoing support from the three energy and training centers for classes relevant to the building industry and training the next generation of trade allies, builders, contractors, and the like.

**d) Program specific marketing and outreach efforts**

In 2013-2014, the program will expand its manufacturer and retailer outreach to increase overall awareness and understanding of ESMH. We will continue to strengthen our information and support materials, focusing on the value to the retailer of making the sale to the homebuyer. The IOUs' communication tools will include: account representative meetings/presentations, targeted customer mailings, trade organization affiliations, and

**2013-2014 Energy Efficiency Programs  
California Statewide Program for Residential Energy Efficiency  
Program Implementation Plan**

~~builder award recognition. All materials and communications will also be made available in electronic file formats so information can be forwarded to customers immediately via the internet.~~

**~~e) Non-IOU Programs~~**

~~There may also be opportunities to partner with local AQMDs and County Integrated Waste Management Boards to encourage material recycling in ZNE and green programs.~~

**~~f) CEC work on C&S~~**

~~The IOUs will continue to support Codes and Standards development work with the CEC and to test candidate technologies in the new construction programs.~~

**~~e) Best Practices~~**

~~The Residential New Construction team will gather information and past experience in successful low energy and ZNE existing projects to evaluate best practices. This information will be used to develop pilot projects that will demonstrate low energy homes and include home performance monitoring.~~

**~~• Integrated/coordinated Demand Side Management~~**

~~The statewide RNC team is committed to a full integration of all resource types. A first step has been taken by way of a recent joint agreement between SCG and SCE, which allows the two utilities to buy back therms and kWh. Water saving technologies and CO<sup>2</sup> reduction are strongly emphasized and tracked in ZNE projects. As these technologies get accepted and recognized, they will become integrated into the base CAHP projects.~~

**~~• Integration across resource types (energy, water, air quality, etc)~~**

~~As discussed above, RNC is looking to partner with relevant stakeholders to identify water, air quality, and waste diversion opportunities.~~

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

### ● Pilots

As discussed above, The IOUs may in the ZENH sub program is future need to create a pilot program to test emerging technologies and the viability of zero peak and zero net homes under actual operating conditions an offering.

Formatted: Indent: Left: 0.5", Space After: 0 pt, Line spacing: single

### xx) EM&V:

11. The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Planplan for 2010-20122013-2014 after the program implementation plans are filed. This will include process evaluations and other program specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

## 2013-2014 Energy Efficiency Programs California Statewide Program for Residential Energy Efficiency Program Implementation Plan

Formatted: Font: Times New Roman, 12 pt

<b>Program Outputs</b>	Market research and potential, understanding of market needs, program design	Develop marketing materials; Meet with manufacturers, housing and PV manufacturers and retailers to reach niche market	Submit articles to publications; create educational courses of manufactured homes; Host educational events	Present ENERGY STAR and program requirements to manufacturers; Offer design assistance for meeting requirements	Conduct training to retailers on selling ENERGY STAR manufactured homes	Provide incentives to retailers and consumers for the sale/purchase of an ENERGY STAR manufactured home and a reduction in PV system	Leverage existing programs within SCE (ON-P, A-HSCP, UEE, other low-income programs) statewide coordination	Leverage external agencies (HUD, MWD, EPA)
<b>Short Term Outcomes</b>	Market research; Determine market potential and project types	Marketing materials distributed to retailers and consumers	Marketing and educational materials distributed to consumers	Increased knowledge about ENERGY STAR manufactured home requirements	Increased sales of ENERGY STAR manufactured homes and PV systems	Project participation goals	Leverage utility delivery channels offer bundled package	Leverage external programs (ENERGY STAR, State CEI, GreenPoint Rated, LEED tax credits)
<b>Intermediate Term Outcomes</b>	Self understanding and customer outreach completed to identify candidates and project types	Program awareness and utilization by targeted markets	Increased knowledge of tools for sustainable design	Increased market penetration and demand	Increased number of projects approaching retail zero peak	Streamlined process and increased participation in multiple programs (batter savings)	Utilization and leveraging of programs and cross promotions	
<b>Longterm Outcomes</b>	Program has a well-developed and defined market strategy	High program awareness by targeted market, increased market situation	Design community has internalized just design practices become common practice	Consumers expect manufactured homes to be sustainable	Increased market share and common practice; Coordinated demand side management	Fully integrated SCE programs, business units, and policies	Establish a network of programs and resources; External programs integrated with A-HSCP and ON-P	
<b>Segment Theory</b>	Market research on the potential candidates and project types to include in the program will help to design the program to meet their specific needs	Marketing and outreach increases awareness and program leads	Offering design and technical assistance will increase manufacturer skills and resources for sustainable design and it will become standard practice for future projects	Training states in the features and benefits of efficient and sustainable homes will provide them with the tools needed to educate and sell to consumers	Offering financial incentives will catalyze the up rise and market penetration of ENERGY STAR manufactured homes	Leveraging external core/complementary programs will target the same market and provide energy efficiency incentives will increase participation	Leveraging external complementary programs will target the same market and provide a component of sustainable design will increase participation	
<b>Key Performance Indicators</b>	Deep understanding of market needs and issues  Number of potential participants	Type, quality, and quantity of marketing materials distributed  Number of leads resulting from marketing and outreach efforts  Number (net change) of market developers who are aware of the program	Number and quality of design assistance provided  Number of SCE core program projects up to the SCP  Measured increase in skill and knowledge of sustainable design  Number of participants that continue to design and sell energy efficient homes	Number and quality of trainings conducted  Number of ENERGY STAR manufactured homes sold  Measured increase in skill and knowledge of sustainable design	Number of participating projects meeting ENERGY STAR requirements  Measure (net change) of increased knowledge of home energy efficiency features and benefits  Number of retailers that have made promotion of ENERGY STAR homes standard practice	Number and quality of core programs  Assessment (consistency, accuracy, quantity, and effectiveness) of information flow and distribution channels through core programs  Number of participants resulting from cross promotions from core programs  Quality of experienced participants working with multiple programs	Number and quality of complementary programs  Assessment (consistency, accuracy, quantity, and effectiveness) of information flow and distribution channels through complementary programs  Number of participants resulting from cross promotions from complementary programs  Quality of experienced participants working with multiple programs

**4. Program Description**

**a) Describe Program**

The Statewide Commercial Energy Efficiency Program offers California’s commercial customers a statewide-consistent suite of products and services to overcome the market barriers to optimized energy management. The program targets integrated energy management solutions, including energy efficiency, demand response (DR), and distributed generation, through strategic energy planning support; technical support services, such as facility audits, and calculation and design assistance; and financial support through rebates, incentives, and financing options.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Targeted end users include all commercial sub-segments such as distribution warehouses, office buildings, hotels, motels, restaurants, schools, trade schools, municipalities, universities, colleges, hospitals, retail facilities, entertainment centers, and smaller customers that have similar buying characteristics.

The Statewide Commercial Energy Efficiency Program includes six core statewide sub-program elements, including Commercial Energy Advisor, Commercial Calculated Incentives, Commercial Deemed Incentives, Continuous Energy Improvement, and Nonresidential HVAC. IOU offerings also include local program elements such as third party programs, and local government partnerships that have close ties to Business Improvement Districts (BIDs). Per CPUC directives, the IOUs will strengthen their relationships with local BIDs and develop opportunities for BIDs to participate in the marketing and delivery of direct install and deemed commercial incentives. In addition to the above sub-programs, the utilities will consider one or more demonstrations of a comprehensive whole building approach (WBA) to commercial building energy efficiency. This approach may make available the tools and resources necessary for customers to pursue and integrate multiple customized measures. This approach may also include deployment of energy management and information systems in demonstration projects that can be used to quantify and analyze energy savings based on various forms of measured performance data, including interval meter data. These elements are designed to not only overcome the traditional market barriers to energy efficiency, but also attain deeper energy savings, through distributed generation opportunities uniquely suited to the Commercial segment.

Description of the Commercial Energy Efficiency sub-programs:

- The Commercial Energy Advisor (CEA) brings together under one program all audit services offered to support customer education and participation in energy efficiency, and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities. These services include Benchmarking, Online Energy Audit Tool, CEI, Nonresidential Audits, Pump Efficiency Services, Retro-commissioning (RCx) and coordination with CEI as described below.
- The Commercial Calculated Incentives Program offering provides standardized incentives for customized and integrated energy efficiency/DR projects for retrofit, and RCX projects while also providing technical and design assistance. Customized calculation method that can consider system and resource interactions, it will be the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan and concurrently overcome technical and financial barriers. Calculated savings for the Savings By Design Program are achieved through the commercial new construction component.
- The Commercial Deemed Incentives Program offering provides utility representatives, equipment vendors, and customers an easy-to-use mechanism to cost-effectively subsidize and encourage adoption of mass market efficiency measures through fixed incentive amounts per unit/measure.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Continuous Energy Improvement (CEI) is a consultative service which targets long-term and strategic energy planning. CEI is designed to reintroduce the importance of energy management by transforming the market and to help reduce energy intensity through a comprehensive energy management approach. CEI will address technical and management opportunities for commercial customers while creating sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution.
- The Nonresidential HVAC Program delivers a comprehensive set of upstream strategies that are built on education, marketing efforts and leveraged relationships within the HVAC industry geared to transform the market towards a sustainable, quality driven market.
- The Direct Install rebate offering provides small business customers the opportunity to have a third-party contractor retrofit existing systems to energy efficient systems at no cost to the customer. However, PG&E and SoCalGas' Direct Install rebate offering is delivered through its Local Government Partnerships (LGP) and Third Party programs for small business.

When developing program metrics and targets for each sub-program element, each utility will consider market potential as available, past program participation rates, market progress, current economic conditions, work-paper and baseline updates, and customer mix and penetration. Statewide coordination and planning will facilitate inter-utility sharing of successes, lessons learned, and best practices in the pursuit of those targets and metrics.

Statewide coordination and planning between utility program planning staff, utility functional departments, government agencies, municipalities and other key partners and stakeholders will also be critical to the advancement of the Strategic Plan. Leveraging national and state initiatives, tools and resources to manage energy and resources – including greenhouse gasses (GHG), air quality, and water – is a critical path to optimizing the potential for California's commercial customer segments to thrive. The Statewide Commercial Energy Efficiency Program design includes the staged integration and coordination with existing non-utility programs, initiatives, and existing regulations today. This design is aimed to drive or support advancements in integrated resource planning, energy management certification, industry benchmarking, workforce education and training, and sharing of industry best practices.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

The commercial customer markets are uniquely suited to integrated energy strategies. Load management opportunities and demand response have had great success and show additional potential. Opportunities for distributed generation from biogas, biomass, solar, fuel cells, and wind will be supported through this plan in support of state renewable energy targets, state GHG reduction efforts under AB32, and support of emerging carbon markets and offset programs. Utilities are also using integrated energy strategies to test DSM as a means to address T&D constraints in local areas. Consistent with California's preferred loading order, however, the utilities will continue to aggressively market and support energy efficiency first, as California's most cost-effective energy resource, while also being mindful of the customer's ultimate interests and goals.

**b) List of Measures**

Technologies addressed through this program effort are varied, and include, but are not limited to, HVAC, refrigeration, food service equipment, and boilers

**c) List of Non-incentive Commercial Energy Advisor Services**

The Statewide Commercial Energy Efficiency Program will include a wide variety of non-incentive program services intended to support customer strategic planning, educate and train customers and the workforce about energy efficiency, and provide customized technical and project support. The service list includes:

- Commercial Energy Advisor (CEA)
  - Hands on workshops
  - Technical support assistance
  - Automated Benchmarking services
  - Nonresidential Audits
  - Pump tests and pumping systems technical support
  - Water leak detection services
  
- Continuous Energy Improvement (CEI)
  - Energy management assessments
  - Energy planning
  - Baselineing and benchmarking
  - Project implementation support
  - Customer recognition
  
- Customer Education and Training
  - DOE Basic, Intermediate, and Specialist Training – refrigeration systems, HVAC, motors, compressed air, and steam.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Other commercial process systems training
- Regulatory compliance and energy efficiency convergence, for example, NOX and boilers
- Integrated industry-focused workshops, e.g., restaurants, lodging, retail, hospitals, and commercial facilities
  
- Workforce Education and Training
  - DOE Basic, Intermediate and Specialist Training in support of ANSI Certification, per the Strategic Plan.
  - Title 24 Training,
  - Commercial refrigeration best practices (for designers), in support of the Strategic Plan focus on refrigeration
  - HVAC best practices for data centers, laboratories, and other specialized use facilities.
  - California Advanced Lighting Controls Training Program (CALCTP)
  
- New Construction – Savings By Design
  - Integrated Building Design Assistance
  - Whole Building, Individual Systems, and Simplified Approaches
  - Integrated design training for architects, engineers and owners
  - Partnerships and collaboration with industry groups like the California Council of American Institute of Architects, California Energy Commission, among others
  - Zero Net Energy Design Services, like consultation services, student design competitions, research activities, 2010-2012 pilot success adoptions
  - Energy Design Resources and Savings By Design – internet portals
  - Software tools and expertise

**Nonresidential HVAC**

- Education of the market on the value of selecting high-efficiency systems
- Reports for customers of estimated energy savings, cost savings and carbon reductions for their HVAC systems treated under the program
- Training for contractors on HVAC industry standards, sales, and marking of the value of those standard, and their implementation in the field
- Education for customers on how

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

## **5. Program Rationale and Expected Outcome**

### **a) Quantitative Baseline and Market Transformation Indicators**

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>3</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>4</sup>. Markets are social institutions<sup>5</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>7</sup>. According to York<sup>8</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are three ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the

## 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>9</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)<sup>13</sup>" The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look

## **2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan**

forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>16</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Attitudinal change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer attitudes, knowledge and awareness (AKA) of energy efficiency. In order to gauge an attitudinal based metric for this sector a battery of questions probing AKA among customers would have to be created and used to scale AKA. Examples of AKA would include knowledge of energy efficiency lighting and other specific measures. Evaluators could also draw from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale would need to be selected by the MT collaborative. The baseline response pattern to the AKA scale would need to be established early during the program cycle. Customers could be surveyed on an annual basis and changes in their AKA tracked along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed. In addition, the suggested metrics also include a behavioral metric.

In addition, behavioral change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer past behavior and intentions about energy efficiency. In order to gauge a behavioral based metric for this sector a battery of questions about energy efficient behaviors could be used to create a scale of Energy Behavior. Evaluators could also draw questions about specific behaviors from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale would need to be selected by the MT collaborative. The behaviors that could be probed include maintenance behaviors to keep EE measures operating correctly, and behaviors that maximize energy efficiency of existing equipment. Customers could be surveyed early in the program cycle and their responses on the scale could serve as the baseline for subsequent behavioral change. Customers could be probed annually and their Energy Behavior change measured along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Program Performance Metrics (PPMs)**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Commercial Energy Efficiency Program (Resolution E-4385, Appendix A, pp 32-33):

**Table 3**

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
<b>COMMERCIAL / INDUSTRIAL / AGRICULTURAL COMBINED</b> * Data to be reported in disaggregate form by SW program (commercial, industrial, and agricultural)		
	*1. Number and percent (relative to all eligible customers) of commercial, industrial and agricultural customers participating in sub-programs (NRA, Deemed, Calculated, and CEI) by NAICS code, by size (+/- 200 kW per yr or +/- 50K therms per yr), and by Hard to Reach (HTR)**  ** "HTR" is as defined in the EE Policy Manual  <b>Comment:</b> No comments	2a
<b>Continuous Energy Improvement (CEI)</b>	*1. Number and percent of commercial, industrial, and agricultural CEI participants that meet short-term (2010-2012) milestones as identified by their long term energy plans.  <b>Comment:</b> No comments	2a
	*2. Lessons learned, best practices, and plan to ramp up the CEI program are developed. (Y/N)  <b>Comment:</b> IOUs confirmed with ED that this is a 2b metric	2b
	*3. Number and percent of commercial, industrial and agricultural customers that created an energy plan via CEI will be tracked by program.  <b>Comment:</b> No comments	2a
<b>Non-Residential Audit Program (NRA)</b>	*1. Number and percent of commercial, industrial, and agricultural customers receiving non-residential audits by NAICS and SIC code.	2b

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
	<p><b>Comment:</b> No comments</p>	
	<p>*2. For commercial, industrial, and agricultural customers who received audits, the number and percent of adopted audit-recommended technologies, processes and practices, (Report disaggregated data by type of audit - Basic, Integrated, and Retro-commissioning audit).**</p> <p>**Data sources for reporting will come from (a) program tracking databases and (b) process evaluation to refine estimates.</p> <p><b>Comment:</b> No comments</p>	2b
<b>Deemed Incentives</b>	<p>*1. Number and percent of new, improved, or ETP measures** installed in the commercial, industrial and agricultural programs.</p> <p>** "ETP measure" defined as ET measures first introduced into the EE portfolio since January 1, 2006</p> <p><b>Comment:</b> No comments</p>	2a
<b>Calculated Incentives</b>	<p>*1. Number and percent of new, improved, or ETP measures installed in completed calculated projects.</p> <p><b>Comment:</b> No comments</p>	2a
	<p>*2. Number, percent, and ex-ante savings from commercial, industrial and agricultural sector of projects with ETP measures** included. (Report disaggregated savings by measure and number of installations by measure.)</p> <p>** "ETP measure" defined as ET measures first introduced into the EE portfolio since January 1, 2006</p> <p><b>Comments:</b> No comments</p>	2b

<b>COMMERCIAL</b>		
1. Number and percent of participating commercial customers receiving the "Integrated Bonus."**		2b
<p>** "Integration Bonus" is an incentive mechanism to promote greater integration of DSM resources, available to customers who (a) sign up or are already signed up for a DSM program, and (b) purchase, install, and/are eligible to receive a rebate for an energy saving device.</p>		
1. Number and percent of Direct Install participants that participate in other resource programs or OBF.		2a

Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

2. Number of and percent of participants that are hard to reach (HTR).**  ** "HTR" is as defined in the EE Policy Manual	2a
--	----

**b) Market Transformation Indicators (MTIs)**

As stated above, market transformation draws heavily upon diffusion of innovation theory, with the state of a market characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects. Therefore it is problematic, if not impractical, to offer internal annual milestones towards market transformation sectors and specific program activities.

As a consequence, it is not appropriate to offer more than broad and general projections. Any targets provided in the following table are nothing more than best guesstimates, and are subject to the effects of many factors and market forces outside the control of program implementers.

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in "Attachment H" are approved for this sub-program as applicable.

**c) Program Design to Overcome Barriers**

The 2013-2014 Statewide Commercial Energy Efficiency Program builds on past program successes and best practices to overcome both common and unique barriers to efficiency in the segment.

Among commercial customers, there are many market barriers to energy efficiency offerings:

- Commercial customers are a highly diverse and geographically disperse customer class, which requires utilities to develop a large number of differentiated incentive offerings for a variety of distribution channels.
- There is a general lack of awareness of the benefits of energy efficiency, and uncertainty and skepticism over long-term energy and cost savings.
- Energy efficiency improvements are not perceived to add value and marketability of properties.
- Efficient design alternatives can be lost in low-cost bidding scenarios.
- Small business customers are less likely to install EE technologies than larger customers due to lack of time, resources, financial sophistication and familiarity with energy efficiency, among other reasons.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Building owners, especially landlord owners<sup>17</sup>, tend to focus on minimizing capital costs associated with new construction, building renovation, tenant improvements and building retrofits.
- For multi-tenant buildings, property owners often have little incentive to pursue energy efficiency measures due to ubiquitous “triple net” leasing terms that pass through utility costs to tenants, while tenants may be deterred either by short lease terms relative to project payback or by contractual restrictions regarding leased space improvements.
- Institutional owners are often constrained by rigid boundaries separating capital development and operating budgets and are limited by lowest-bid regulations for capital projects.
- Some activities such as Healthcare and Biotech also face strong regulatory challenges with being integrated in energy efficiency offerings (for example: the Office of Statewide Health Planning and Development (OSHPD) and California Division of Occupational Safety and Health (CAL-OSHA)).
- In some activities like High-Tech and Hospitality, international competition drives short-term survival attitudes versus a long-term continuous improvement approach. In addition franchises have additional barriers to overcome such as Franchise owner approval.
- Whole system opportunities are missed by individual equipment vendors, many of which are only specific equipment types or building systems.
- Customers are often not aware of efficiency degradation or failure in building systems or equipment.
- Customers may be reluctant to invest in new energy savings technologies over concerns regarding product quality, reliability or obsolescence.
- Performance issues resulting from improper equipment installation, maintenance and poor owner/operator education create customer dissatisfaction with energy efficiency measures.

By uniquely approaching constituent vertical market sub segments, this Commercial Energy Efficiency Program will better serve commercial customers while gaining efficiency and consistency in the delivery of the programs. This targeted and focused approach will mitigate the indicated EE adoption barriers as follows:

- Program applications and processes will be simplified and made more consistent. There will be a central core incentive/rebate offering, with service-specific riders added as needed. This will enable customers to better understand the program delivery process. Program verification processes will also be made more consistent so that the customer is touched fewer times for multiple offerings.

---

<sup>17</sup> For properties where the landlord owns the equipment and the lessee pays the bills, there is currently minimal incentive for the customer or the landlord to invest in EE

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- When appropriate, IOUs will deliver information to customers in a way that bundles relevant EE, DR and other DSM programs and services. For example, the IOUs will develop print and electronic Case Studies that feature customers who have implemented integrated solutions in order to address their energy management needs. A package of program bundles will be made available so that typical offerings for a sub segment will be grouped together. This will minimize lost opportunities as a more comprehensive program and service offering will be readily available for customers.
- Marketing outreach efforts will be more focused on customer sub-segments rather than programs, which should lead to improved customer adoption for all programs. Utilities will continue to foster strategic partnerships with industry associations such as Building Owners and Managers Association (BOMA), Department of General Services (DGS), Green Building Council, Air-Conditioning, Heating, and Refrigeration Institute (AHRI), American Society of Heating, Refrigerating, and Air-conditioning Engineers (ASHRAE), Manufacturers Trade Associations, and specific sub-segment professional association as California Hospital Association (CHA), California Society for Healthcare Engineering (CSHE), International Society for Pharmaceutical Engineering (ISPE), to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users.
- Program bundling will be configured so that customers will have greater flexibility in how they enroll; however, the program bundles will be packaged so that customers will be encouraged to take a more comprehensive approach to EE.
- The utilities will consider one or more demonstrations of a comprehensive whole building approach (WBA) to commercial building energy efficiency. This approach may make available the tools and resources necessary for customer to pursue and integrate multiple customized measures. This approach may also include the deployment of energy management and information systems in demonstration projects that can be used to quantify and analyze energy savings based on various forms of performance data, including interval meter data.
- Multi-tenant buildings have a unique and significant barrier. Most typically referred to as the principal-agent or tenant-landlord split incentive, this issue is characterized by the natural separation of tenant energy efficiency savings and capital expenditures by building owners. The commercial program will incorporate market research and/or market tests to better understand potential programmatic offerings that can help reduce the barrier. Some examples of strategies that might warrant testing include combinations of education and creative tenant/landlord incentives or credits for centralized systems or building shell upgrades, incentives for sub-metering, and plug load control technologies.
- Because program offerings will be bundled, especially through the Continuous Energy Improvement Program, the program eligibility requirements will be made more consistent, leading to fewer areas where customers are not served.
- For public sector customers, existing federal and state programs and mandates will be leveraged.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Utilities will expand the Statewide EE Finance Program, which offers unique benefits to government departments by allowing them to retain rebates and cost savings from EE projects without having to upstream these financial benefits to the General Fund.
- The Statewide Finance PIP includes plans to explore and develop additional finance tools to facilitate the adoption of integrated projects.
- Coordination with other parties will be enhanced so that related programs (e.g., water conservation, reduction in greenhouse gas (GHG emissions, LEED™) are clearly and concisely communicated to customers, which should improve participation in all offerings.
- During the 2013-2014 period, as part of AB 1103 requirements, utility data to be used for benchmarking buildings will be provided by the IOUs to the EPA for facility owners' use. The existing energy benchmarking offering will give customers the information required to understand how their buildings perform and how the improvements they make can be tracked.

**d) Quantitative Program Targets**

**Table 5** - Program targets are provided at the sub-program level.

**e) Advancing Strategic Plan goals and objectives**

Many activities under the Commercial Statewide Portfolio advance the goals, strategies, and objectives of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan). Details on these actions are provided in the tables found in the Commercial sub-program descriptions. The examples below highlight some of the Portfolio strategies that align with the Strategic Plan:

- **Integration:** To encourage greater use of IDSM, IOUs will
  - Offer customers solutions that integrate site-specific and optimized packages of comprehensive energy efficiency, demand response, solar and combined heat and power and thermal storage opportunities.
  - Develop an active cooperation network among the different stakeholders, such as corporate and local managers, OSHPD, engineering firms, service companies, architects, and vendors.
  - Create customized long-term plans with large corporations connecting corporate and local levels integrating energy efficiency, DR, self-generation and renewables.
  - Implement integrated local integrated marketing campaigns that leverage multiple tactics and multiple communications to present customers with a holistic view of EE and other DSM programs and service offerings.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- **New energy efficiency delivery methods:** To take advantage of the significant opportunities offered by information, behavior-change strategies and training as delivery channels for increasing energy efficiency, utilities will:
  - Drive expanded involvement of the California Commissioning Collaborative in developing statewide measurement and verification protocols and professional training and accreditation programs for the retro-commissioning industry
  - Champion adoption of stringent codes and standards within the industry .
  - Publish baselines, best practices and calculation tools to facilitate the dissemination of information and to help customers select and evaluate energy efficient solutions.
- **Financing and Funds Leveraging:** To overcome cost barriers to energy efficiency, the IOUs will:
  - Create customer awareness and educate customers about standardized statewide EE financing and develop additional finance strategies for the commercial section.
  - Continue incentives for on-peak demand reduction related to retrofits and retro-commissioning.
  - Partner with integrators like Siemens, Trane to aggregate energy efficiency with other building improvements, such as security, safety, waste management, and IT.
  - Analyze the green vision of the corporations to align energy plans towards their objectives
- **Advanced Adoption of New Products:** IOUs will create demand for advanced, energy-saving products—such as lighting and HVAC—by expanding incentives to include both financial incentives and technical assistance while partnering closely with Emerging Technologies to bring new technologies through development to the market, and strengthening relationships with vendors.
- **Workforce Development:** To expand their role in creating and meeting the demand for a robust energy efficiency workforce, the IOUs will:
  - Support the development of new and innovative programs to influence commercial trade schools to teach about the financial incentives, tools, protocols, partnerships, expert analysis, and implementation support services that promote commercial building energy efficiency and optimum load management.
  - Engage various industry and energy-wise stakeholders to expand their current intellectual knowledge and coordinate education/training opportunities through the WE&T program, outreach through ME&O, and coordination with research and technology.
  - Expand the CALCTP initiative to create additional opportunities for lighting contractors to become certified in the proper installation of advanced lighting control systems.
- **ZNE Commercial Buildings:** To help make ZNE a reality in the commercial sector, utilities will:

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Integrate successful ZNE strategies and activities proven through program and/or pilot projects during the 2010-2012 program cycle. The commercial program, particularly Savings By Design, will absorb and enhance existing programmatic elements aimed at delivering ZNE best practices to the market place, potentially including but not limited to:
  - Project consultations that pair projects with experts capable of driving unique designs to ZNE;
  - Provide education opportunities to key architectural, engineering, and other design professionals (see WE&T plans);
  - Continue successful design competition elements aimed at ZNE design in the student and professional communities; and
  - Explore cost effective ZNE solutions that consider the intersection of building and community energy use
- Facilitate benchmarking and constant improvement by supporting the initiative recently launched by the DOE and Lawrence Berkeley Laboratory .
- Explore joining or continue a leadership position in the national Office of the Future Consortium (“Consortium”) which was established to help shape and inform the research and product development of individual component products that have the ability to communicate with each other, are interoperable, and that create a system that will meet defined performance standards for a described office space type. The recent publication of the 25% Solution is intended to identify significant reductions in energy used by lighting, plug loads and HVAC systems using a comprehensive “Systems” approach that also improves lighting quality and air conditioning/heating performance. The efforts of the Consortium will be fully integrated into the Commercial Calculated and Deemed incentive programs to create a delivery mechanism that supports the path to ZNE buildings.

**6. Program Implementation**

**a) Statewide IOU Coordination**

i. **Program name:** Statewide Commercial Energy Efficiency Program

ii. **Program Delivery Mechanisms**

The Statewide Commercial Energy Efficiency Program will coordinate on a statewide level to ensure the program is continuously updated and enhanced throughout the 2013-2014 program cycle. In addition, the six Commercial sub-programs will be coordinated on a statewide level to align by program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. (For a detailed description of each of these program aspects and how they will be coordinated statewide, please refer to the Commercial sub-program descriptions). The two

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

coordination systems (one for the broad programmatic level and one designed for the sub-program level) will interact with and support one another. The broad, high-level coordination effort will be described below, focusing on how the IOUs will work together to effect the continuous improvement of the Statewide Commercial Energy Efficiency Program.

The Statewide IOU coordinated effort for the Statewide Commercial Energy Efficiency Program will be as follows:

- Designate an IOU Program “Lead” – The coordination process will begin with each IOU designating a Statewide Commercial Energy Efficiency Program “lead.” The IOU lead will represent one Commercial sub-program, investigating new innovations, special accomplishments, and challenges experienced by sub-program managers in all IOUs. Where such innovations or challenges show potential for impacting the Statewide Commercial Energy Efficiency Program across multiple sub-programs or the statewide program as a whole, the IOU lead will present such information to a quarterly Steering Committee meeting.
- Hold Periodic Steering Committee Meetings – The Commercial Steering Committee will be comprised of all designated IOU leads (including at least one lead for each of the six sub-programs), and possibly other contributing stakeholders identified by the IOUs. At the Steering Committee meetings, individual innovations, challenges, and accomplishments experienced in one IOU or by one sub-program will be transmitted to all IOUs. The Steering Committee will evaluate these individual IOU and sub-program experiences, hear ideas for course corrections and overcoming challenges, replicate successful innovations for consistency statewide, resolve differences in implementation to stay unified, and measure the Commercial Energy Efficiency Program’s progress against statewide metrics and goals.
- Adopt Program Enhancements – Once the Steering Committee agrees that a particular implementation policy or innovation has merit on a statewide level, each IOU lead will distribute the information to their sub-program managers for adoption and integration. Therefore, the IOU lead will act as a conduit, feeding sub-program information up to the statewide Steering Committee and distributing measures for adoption back to the sub-program managers. This feedback loop will assure consistency and unity in programmatic improvements across the IOUs. In some cases, it may be necessary to invite the sub-program managers to the Steering Committee meeting to get their feedback and ensure they receive the same message.
- Evaluate Program Enhancements Against Statewide Targets – To complete the adaptive management loop, the Steering Committee will track the program’s accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The Steering Committee will determine whether further course corrections are needed, and if so, rely on the above coordination process to generate the improvements necessary to stay on track.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the two year ‘transition period’ will be assured.

**iii. Incentive Levels**

Incentives for commercial customers will be provided through both prescriptive and customized approaches. Refer to the Commercial Deemed and Calculated Incentive sub-program descriptions for information regarding specific incentive levels.

**iv. Marketing outreach plans**

Local commercial marketing strategy will focus on helping customers understand the relevance of EE programs and services and enabling customers to take actions that are appropriate to their needs -- including one-time measures such as rebates as well as deeper retrofits. This local EE marketing strategy will be coordinated through a variety of channels and tactics, with the intent of reaching customers at the right place and at the right time to drive increased participation and ongoing engagement.

The IOUs will continue to develop an in-depth segmentation of the commercial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the commercial sub-program plans. Local outreach to SMB customers will also leverage a new Statewide ME&O campaign that will focus on creating awareness and educating customers about energy management and integrated DSM.

**v. IOU program interactions with the California Energy Commission (CEC), Air Resources Board (ARB), Air Quality Management Districts, local government programs, other government programs as applicable**

The Commercial Energy Efficiency Program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with commercial customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. Refer to the Commercial sub-program descriptions for more specific information on linkages with other government programs.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**vi. Similar IOU and POU programs**

Several of the initiatives described herein (i.e., California Advanced Lighting Controls Training Program and Office of the Future Consortium) are joint efforts with the other California IOUs and POUs, as well as other domestic and international utilities. In addition to these joint efforts, local third-party programs that address niche opportunities within the commercial market segmented will be implemented in each of the IOUs service territory. These various efforts will be coordinated to ensure a consistent approach in terms of program message, delivery and measure incentives (as appropriate).

**b) Program delivery and coordination**

**i. Emerging Technologies program**

The long-term energy efficiency vision of California can only be attained through the continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the program will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. The Commercial Energy Efficiency Program is currently working to support a diverse list of emerging technologies

**ii. Codes and Standards**

The commercial offering relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As codes and standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The program coordinate with the Codes and Standards Planning & Coordination sub-program. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) made available as these technologies transition from 1) R&D to 2) Emerging technologies to 3) Incubation to 4) Mainstream.

**iii. WE&T Efforts**

WE&T efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. For the Commercial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Management Certification and the ISO 50001 Energy Management System development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings.

The education and training takes place through energy centers, technology test centers, and education and training program offerings.

**iv. Program-specific marketing and outreach efforts**

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. When appropriate, individual programs will be targeted to customers or industries based on segmentation data and strategy, however, such individual program-specific efforts will be part of a larger integrated approach to customer outreach to Commercial customers.

The integrated Statewide ME&O effort will focus on creating awareness and educating SMB customers about energy management and the local campaign will focus on the ways that customers can engage and take action to participate in EE as well as other integrated DSM offerings.

To address the diverse commercial customers segments, utilities will continue to foster strategic partnerships with trade association and industry groups to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users. Specific efforts will include:

- Attending trade association meetings and providing information in monthly newsletters.
- Close partnerships with key industry associations, and participation in their annual conferences, with an effort to develop conference speaking engagements.
- Targeted integrated education and training to specific market sectors to support peer-to-peer interactions and industry advancement.
- Ads and articles, with program information and case studies, in trade magazines.
- Online content and integration of marketing materials and campaigns with online tools such as audits and other energy demand and usage.
- Targeted customer efforts through assigned account representatives, technical solutions engineers and program engineers, third parties, and government partnerships.
- Telephone and web-based customer support and outreach.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Market sector specific collateral that drives customers to account representatives and websites for additional support.

**v. Non-energy activities of program**

Integrated Energy Audits (described in the Commercial Energy Advisor sub-program) and Continuous Energy Improvement are the primary vehicles to promote project solutions that look across the various IOU DSM program offerings, as well as complementary options available through other entities (e.g., water agencies).

**vi. Non-IOU Programs**

In addition to the interactions with local, state and national programs, there are a variety of programs that will be coordinated with and leveraged in support of the Program objectives. These include:

- Connecting customers with the CA Climate Action Registry
- AB32 support through CO2 tracking in program resources
- Regulatory program coordination, including EPA air quality standards, water quality standards, and new refrigerant regulations
- Non-utility financing resources, including from water utilities, industry and private banking, state and federal incentives, funds, grants, and loan products to support energy and other resource management objectives
- international energy management standards (see CEI section)

The Program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**1. CEC**

As of June 2012, PIER no longer exists. However, the program will interact with the Emerging Technologies Program (ETP) to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and projects in coordination with the applied research of CEC.

The program will also coordinate with the CEC on the BEARS tool development and launch.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**2. CEC work on codes and standards**

As indicated in Section 6.b.ii, planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

**3. Non-utility market initiatives**

The Commercial Energy Efficiency Program will coordinate with applicable market initiatives to leverage market momentum and areas of mutual advantage. The Program will leverage the following efforts:

- California Green Building Initiative
- LEED
- Zero-net energy
- DOE
- AB1103
- AB758

**c) Best Practices**

As described in prior sections, the Commercial Energy Efficiency Program reflects the best of each utility program's successful components of statewide Commercial Energy Efficiency Program offerings, and introduces new elements from other utilities and national efforts as well. Best practices include:

- Benchmarking as an appropriate first step for customers to assess their energy baseline.
- Development of a prioritization process, leveraging the CEI sub program, that works to identify the most significant upgrade potential based on building and ownership characteristics. This process will help guide customers to a building integrated approach leveraging all of the available utility programs for a customer segment rather than only pursuing the "low hanging fruit". The utilities will continuously educate the various delivery channels on the importance of the building integrated approach and how to increase customer participation at a whole building level.
- Technical Assistance: The IOUs recognize the need for a personalized, full service approach when providing technical assistance to customers –from audits to design and technical assistance, presentation of recommendations, resources to develop a long term plan, and the potential of project management assistance with financial incentives.
- Vendor Partnerships: This strategy will be coupled with vendor support and educational workshops and classes to provide the full breath of support customers may need to influence their decision to implement energy efficient equipment and practices.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Statewide Coordination: The IOU program representatives will meet on a quarterly basis to improve program operations by sharing successes and areas of operational concerns.
- Leveraging Local Commercial sector: Resources such as industry associations, trade associations, and facility management associations will be leveraged.

**d) Innovation**

Significant innovative aspects of the Commercial Energy Efficiency Program offering include:

**i. Integration**

- Benchmarking will provide customers with an easy and low cost way to assess and monitor their energy use.
- Integrated Energy Assessments provide targeted customers with integrated solutions in efficiency, DR, and DG, and advise customers on other sustainability practices such as water conservation opportunities, CO2 reduction potential or other programs references.
- IOUs will link customers with the California Climate Registry to support carbon foot printing of a customer's plant.

**ii. Marketing**

- The Customer segmentation work currently underway will support development of new, super targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs.
- IOUs will examine opportunities in the "MUSH" segments (municipalities, universities, colleges, schools and hospitals) for focused offerings in conjunction with all the segmentation plans being deployed.
- Closer coordination with third parties, government partnerships, core programs, and other delivery channels will optimize portfolio performance.
- Utilities will increase outreach to new trade and community-based associations, leveraging best practices identified in ACEEE study of utility Commercial Energy Efficiency Programs.
- Energy Design Resources, developed statewide by IOUs, will be expanded as a web-based hub of commercial and food processing best practice information, training, modeling and performance tracking tools.
- Expanded workforce education and training efforts with vendors, design teams, industry association members and other key market actors will help overcome many customer informational and transactional barriers
- Training will be provided on modeling and quantifying savings opportunities through tools such as eQUEST and Energy Pro.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**iii. Implementation**

- Utilities will coordinate process improvements for statewide programs to ease participation barriers.
- SMB-targeted local marketing will leverage the heightened levels of awareness and education that the IOUs expect to result from the Statewide ME&O campaign.

**iv. Deeper Energy Savings**

- Utilities will seek to deliver deeper energy savings to our customers through bundling of measures, continuous energy improvement, innovative auditing, and/or whole approaches.
- Utilities will explore other mechanisms to more highly reward comprehensive energy management retrofits, e.g. premium incentives for bundled measures coupled with an energy audit.
- Utilities will enhance current finance offerings by standardizing statewide financing and exploring innovative tools to leverage additional funding sources.
- Utilities will evaluate approaches which bundle various equipment and technologies to encourage customer adoption of long and short-term payback IDSM measures.
- Utilities will seek to motivate owners and operators of large facilities to undertake improvements through presenting compelling return on investment (ROI) or Payback based business cases to top decision-makers, while strengthening the skills and knowledge of building operators.
- Utilities are considering a number of different, innovative approaches to achieve deeper energy savings; including a whole building approach that integrates both customized retrofit and retro-commissioning in a single, performance-based program offering.

Energy performance measuring and benchmarking assistance/services to customers will enable customers to compare themselves to “best in class” peers utilizing tools such as the U.S. EPA’s ENERGY STAR Benchmarking tool.

**e) Integrated/coordinated Demand Side Management**

An integrated portfolio is cost effective, captures program delivery efficiencies, and serves the needs and wants of customers, who prefer a single, informed utility point of contact who can help inform and prioritize their energy investment decisions based on their unique needs. To that end, the statewide utilities and the Statewide Commercial Energy Efficiency Program have made tremendous progress in advancing integrated solutions:

- **Marketing:** In marketing integration, the IOUs are placing major emphasis on getting the right message to the right customer at the right time. Advanced customer segmentation is being used to develop detailed integrated marketing and outreach

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

plans which outline multiple tactics, delivery channels and key messages to target to specific customers based on their specific needs. The account representatives, who serve as the key customer point of contact, will be attending an integrated sales strategy and training program to ensure consistent delivery of portfolio offerings.

- Education and training – especially workshops organized around a customer segment – provides an ideal situation to integrate customer energy solutions. Utilities will build on past successes to provide integrated workshops to restaurants, retailers, office building facility managers, lodging, and warehouses. The workshop topics generally start with “analysis” resources and methods, and move on to “conservation”, “efficiency”, “demand response”, then “generation” topics and resources. These workshops provide opportunities for utilities to cross-sell solutions and share key information with other utility departments.
- As appropriate, Workforce Education and Training will also cover integrated energy and system solutions, which will be increasingly important as Critical Peak Pricing matures. For example, the California Advanced Lighting Controls Training Program addresses both the energy efficiency and demand response capabilities through the proper design, specification and installation of lighting system controls.
- The availability of a Continuous Energy Improvement approach, especially for the largest, most strategic customer accounts, will facilitate a thoughtful, integrated energy plan and will allow utilities to stay engaged in supporting the progress of that plan.
- Integrated Energy Audits combine funds and resources of energy efficiency and demand response programs to provide integrated recommendations to customers that emphasize energy management in proper sequence, in support of the California Loading Order: Incentives from both programs can help reduce payback cost and support advanced energy management decisions. Demand response opportunities will be targeted in the larger facilities, especially as part of monitoring-based retro-commissioning efforts where the controls to facilitate demand response efforts would be installed. Additionally, any energy efficiency audits required for participation in distributed generation programs will be expanded to include DR opportunities when appropriate.
- Emerging Technologies and CEC collaboration is expected to include initiatives and market acceleration assistance for market-ready products in the general categories of day lighting, lighting, HVAC, controls, and building envelope improvements.

**f) Integration across Resource Types**

California’s Commercial sectors face a multitude of environmental, regulatory, and financial (Landlord owned, capital outlay) challenges that impede the adoption of new energy efficiency technologies. In addition, new regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

The Commercial Energy Efficiency Program proposes to leverage these challenges to coordinate with the regulating agencies and the programs they are operating in order to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities.

Utilities will pursue opportunities to partner with water agencies to offer joint energy and water incentives in support for projects that reduce both resources, which ultimately improves payback and decrease project costs.

Where applicable, the program will integrate topics like LEED certification into targeted customer workshops, marketing and communications, building on a strong track record from the 2006-8 program cycle.

Third party programs at the utilities will further integrate resources. These third party programs will focus on specific customer segments offering a complete project package that will include integration aspects.

**g) Pilots**

During the course of the two-year cycle, initiatives may be created based on the needs of the commercial customers.

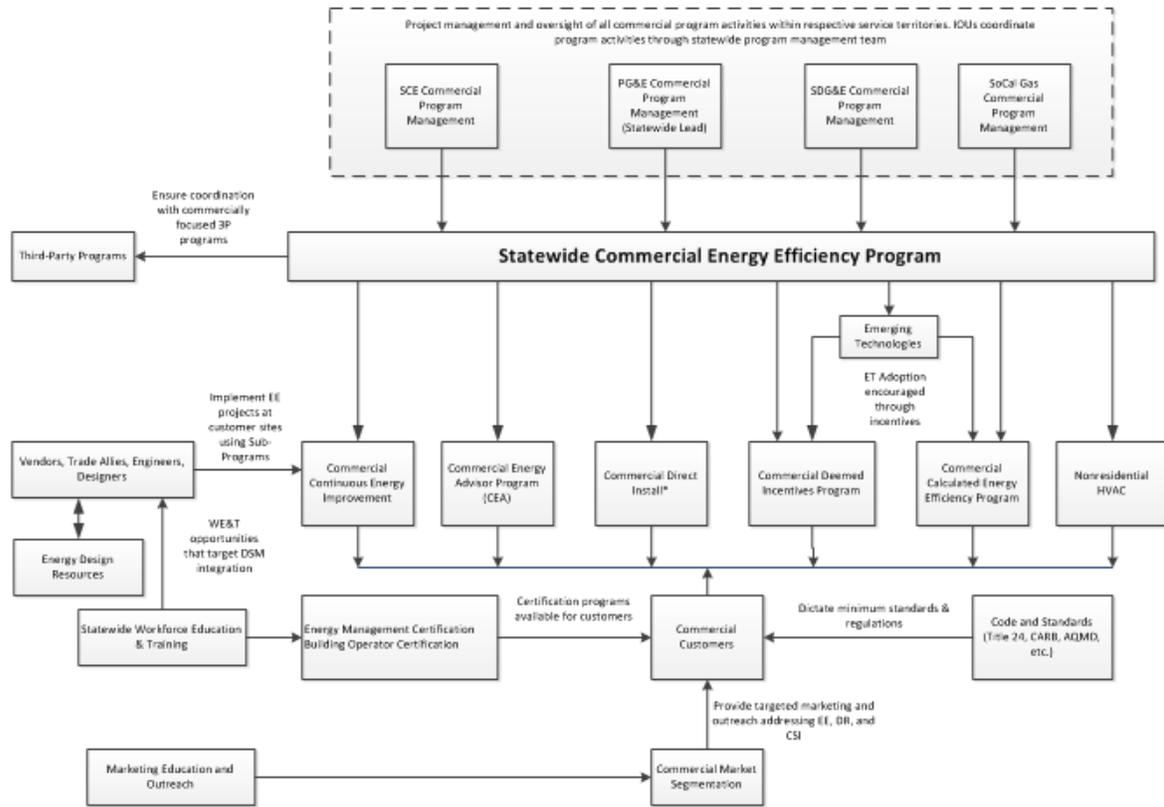

The IOU's intend on implementing methods to gather and retain more detailed performance and usage data on a pilot basis to determine more effective methods and to achieve savings. Exploring incentives for sub-metering is an option as is expanding the tool library in lieu of incentives.

**h) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues.

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 7. Diagram of Program

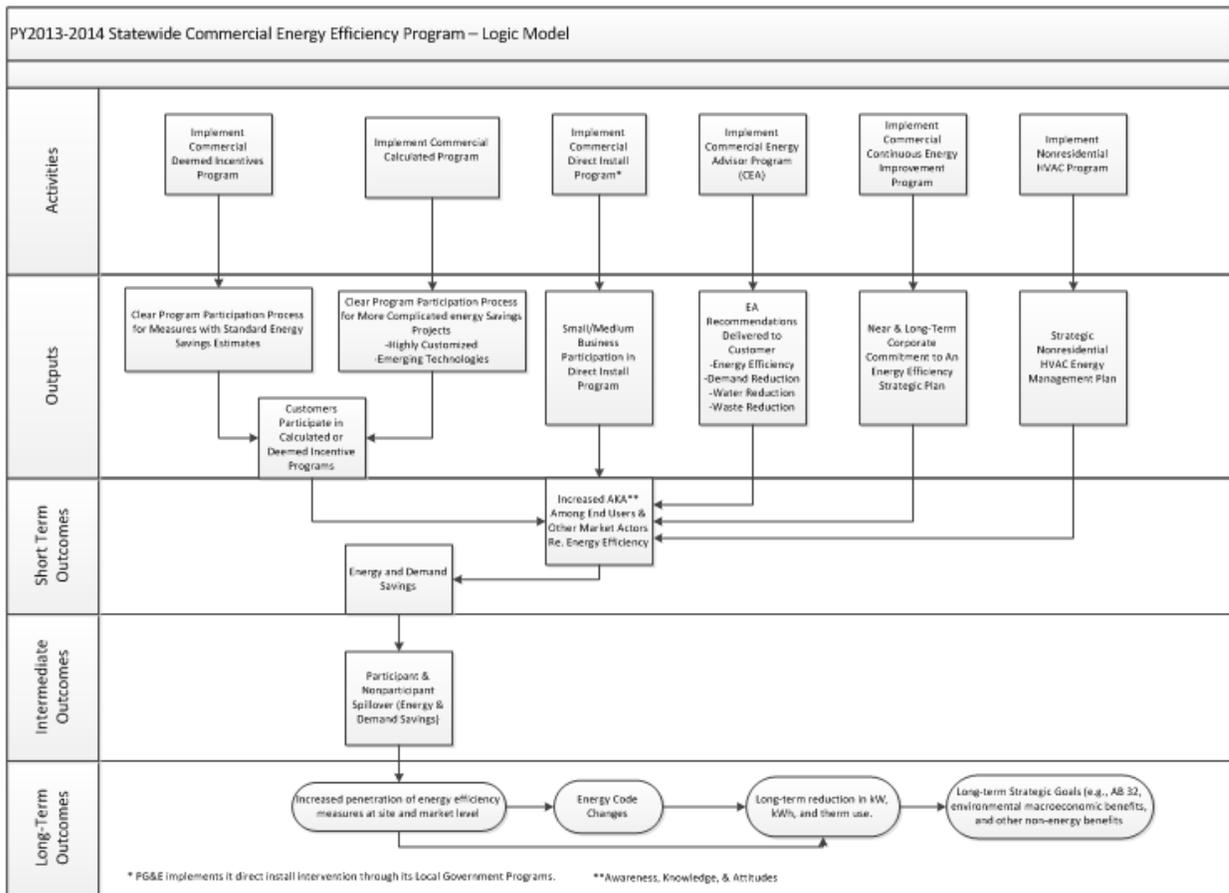

\*PG&E and SOG deliver direct install through Local Government Programs and Third-Party Programs

## 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

### 8. Program Logic Model

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Commercial Energy Efficiency Program.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

1) **Program Name:** Commercial Energy Advisor, Core Sub-program  
**Program ID:** SCG - 3708  
**Program Type:** Statewide Core Program

2) **Projected Program Budget Table**

**Table 1 – reference the overarching program for budget details**

3) **Projected Program Gross Impacts Table – by calendar year**

**Table 2 – reference the overarching program for savings details**

4) **Program Description**

a) **Describe Program**

The Statewide Investor Owned Utilities (IOUs) have created the Commercial Energy Advisor sub-program (CEA) to bring together under one program all services offered to support customer education and participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities.

CEA was created to provide a streamlined and coordinated assignment of right-sized customer solutions. The key is to start the process with an initial analysis of a customer's needs, determination from the analysis which audit will service the customer with the highest cost/benefit, identify additional program support and key indicators that will motivate the customer to implement energy saving recommendations

The utilities anticipate the restructuring of CEA will affect the way audits are provided. CEA will enhance the IOUs' ability to match customers' need(s) with the right audit service. This will result in an increased cost-effective delivery of these audit services with an increased expectation for customer adoption/installation of provided customer specific recommendations.

In its offerings, CEA will place an emphasis in deep energy saving measures and emerging technologies where appropriate. When the technologies and customer opportunities are correctly aligned, the customer will become more open to the benefits these technologies offer to their business and will therefore increase their acceptance and adoption.

Together the CEA offerings will work to support the achievement of Strategic Plan objectives across all non-residential segments.

The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

The CEA package consists of six (6) distinct offerings:

- **Benchmarking** is the first step for a customer to begin to understand the energy use of their building. Benchmarking is an initiative designed to educate and motivate customers to measure and track the energy use of their facilities, educate customers of the benefits of benchmarking their facilities and how they can track the impact of energy savings after implementing energy saving measures. To support the customer's efforts, the IOUs will offer technical support, hands-on workshops that will provide customers with information on how to benchmark, how benchmarking can be used as an energy management tool and what to do next after benchmarking.

The IOUs will develop or continue benchmarking initiatives that supports the customers' ability to comply with AB1103's benchmarking requirements (upon its implementation), utilizing ENERGY STAR Portfolio Manager and IOU supported Automated Benchmarking Services.

The IOUs will also continue to offer customers technical support ranging from email and phone hotlines, hands-on workshops and web-based benchmarking educational and instructional materials.

Support will continue to identify, evaluate and make information disposable about other benchmarking tools available.

The primary focus for benchmarking activities will continue to be centered on commercial buildings (in alignment with the target building type of AB 1103).

- **Online Energy Audit Tool (Small Business)**: The online audit tool is an enhanced, customer friendly "do-it-yourself" web-based audit tool targeting small business customers. The online audit tool offers an integrated auditing approach providing energy efficiency, demand response and self-generation recommendation and education.<sup>1</sup>

With large numbers of small business customers in each IOU's service territory, it is necessary to offer and test different cost-effective strategies that can help small business customers maximize their energy use.

The IOUs will confirm their implementation timelines and once their tool is rolled out, they will initiate a continuous improvement cycle to ensure the benefits and features of the tool are meaningful for customers use. As the timing is appropriate, the IOUs will initiate marketing campaigns to raise small business customer awareness of the tool's availability and benefits.

---

<sup>1</sup> The online energy audit tool is a continuation of the Universal Energy Audit Tool (UEAT) from the 2010-2012 program cycle and is also referred to in the Commercial Energy Efficiency Program logic diagram)

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Per the Final Transition Period Decision, IOU implementation timelines occurring beyond 2012 are listed below. Note: PG&E implemented its Residential tool, in compliance with CPUC directives, in Q1 2012.

Audit Type	Description	IOU	Small Business	Residential
Online Energy Audit Tool	The web-based energy audit tool (also known as the Progressive Energy Audit Tool) provides Small Business and Residential customers with a customized audit designed to help customers understand their business and/or home energy use. The tool provides concrete customer suggestions about ways to maximize their energy efficiency (EE), demand response (DR) and distributed-generation opportunity.	SCG	Q2 2013	Q4 2012
		SDG&E	Q2 2013	Q4 2012
		PG&E	Q4 2012	Q1 2012
		SCE	Q1 2012	Q1 2012

- Continuous Energy Improvement (CEI)** Continuous Energy Improvement (CEI) is a consultative service aimed at helping customers (utilities will target CEI services in line with market segment potential in their service territories and resource availability) engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices which address energy savings, reduction of greenhouse gas emissions and water conservation, through high-level energy commitments from executive and board-level management. CEI offers customers the pinnacle of audit offerings guiding executive management to levels of energy management self-actualization that makes energy and environmental issues a consideration in all management/business operational decisions and in long term energy planning. For additional information about CEI, please consult the CEI Program Implementation Plan.
- Non-Residential Audits (NRA)** for the Transition Period will provide Integrated Comprehensive Energy Audits (ICEA) that focus on customer energy savings, cost/benefits, and the targeted delivery of financial and technical assistance. Audit information must communicate complex information in a simple and understandable way to enable customers in identifying energy efficiency, demand response and distributed generation opportunities. Audits use “ex ante” deemed and calculated methodologies for energy savings analysis information.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

As stated above, NRA offers two (2) categories of audits – basic and integrated.

Audit Type	Description	Detail	SCG	SDG&E	PG&E	SCE
Integrated Customer Energy Audit	The ICEAT audit is a customized audit specifically designed to help customers understand and identify their facility's energy use and provide concrete suggestions to maximizing energy efficiency (EE) demand response (DR), and distributed-generation opportunity as defined by the customer's need.	Phone	YES	YES	YES	YES
		Online (Web-Based)	YES	YES	YES	YES
		Onsite	YES	YES	YES	YES

This program cycle, emphasis will be given on meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), streamlining the audit process increasing its efficiency, lessening complexity, and increasing the effectiveness of influencing customer implementation actions through actions such as integration of the demand response technical audit component directly into NRAs offerings. In addition, the IOUs will investigate ways to implement meaningful financial measurements such as return on investment (ROI) and/or simple payback metrics. The key is ensuring financial tools selected provide the customers with meaningful information by ensuring cost assumptions are appropriate to the customer. Also, NRA will assume the audit and budget responsibilities for Demand Response's technical audit services, as applicable. It is intended that these audits will be a critical component of the integrated comprehensive audit service offering.

- Pump Efficiency Services** is designed to help commercial customers make informed decisions about improving inefficient pumping systems and operations through recommendations derived from pump test audit or direct observations of processes. Pumping of water is estimated to account for more than 80% of the electric load and 73% of the natural gas requirement in California in the agricultural segment, and this load is growing as the state's water users increase their reliance on pumping water to meet their needs. Pumping is also estimated to account for 20 to 25% of energy usage within the nation.

The Pump Efficiency Services program element, implemented by a team of trained in house or third party contractors, aims to overcome key informational, technical, and financial barriers to pump optimization by offering pump tests, retrofit incentives, and targeted education, training and technical support for customers and pump companies. Each IOUs database of pump test results will be used in the near-term to target pumps in need of retrofit as a means to capture savings. However, pump performance data aggregation at the

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

statewide level will contribute to the development of metrics and targets for pump improvements, in support of a statewide pumping focus across segments, in agriculture, commercial and industrial, supporting their strategies and objectives.

The IOUs will continue to offer pump testing services at no or low cost and pumping system efficiency workshops through their energy education centers or other event opportunities.

- **Retro-commissioning:** The IOUs are planning to continue and enhance their core Retro-commissioning (RCx) programs. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments.

The RCx element is designed to optimize existing building or system performance by identifying operational deficiencies and making necessary adjustments to correct the deficiency. RCx is offered to agricultural, commercial and/or industrial customers based on the market segment potential and resources of the respective IOU. The range of projects may involve measures which reset, repair or replace existing system controls and components. Simple paybacks for these measures are usually short in duration and must meet customer expectations. Through the RCx assessment report, comprehensive projects are identified and referred to other sub-programs for completion (i.e., Commercial Calculated and Deemed Incentives). Energy savings from projects identified through RCx will be claimed in the Commercial Calculated Incentives sub-program.

Enhanced RCx program elements will explore and may include but not be limited to:

- a. Innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- b. Continuous commissioning and monitoring-based commissioning;
- c. Solutions for small and medium commercial customers;
- d. Strategies to drive savings persistence;
- e. Appropriate alignment with retrofit activities;
- f. Overall program incentives, targeting, and delivery.

The RCx program is a key offering in the Commercial Calculated sub-program and a more detailed description of the program is provided.

The CEA strategy focuses on simplifying the way audits are provided to customers. Through various assessment functions, the IOUs will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (i.e. primarily EE, DR, and SG).

It is anticipated CEA will allow the expansion of audit serves across diverse class of customers, potentially across all segments and will interconnect the customer with the wide and diverse range of programs offered. From a customer perspective, the impact on customer time and resources will be reduced, the audit analyses will include DSM, greenhouse gas

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

reduction information, provide water conservation recommendation all in a single report. The resulting report will identify comprehensive solutions that will simplify the customer decision-making process.

The primary program objectives for 2013-2014 are:

- Support the Strategic Plan by offering integrated audits across a wide selection that address the full spectrum of energy solutions, including energy efficiency, demand response, and distributed generation (California Solar Initiative and distributed generation) focusing on customer facilities as defined by each IOU's market potential and resource availability.
- Provide a focus on the "MUSH" market (municipalities, universities, colleges, schools, and hospitals) to test ideas for deeper energy savings efforts.
- The continuation of delivering high value audit reports to the customer. Audit reports will be designed in such a way that they will provide the customer with information which motivates them to implement energy efficiency, demand response and consider renewable generation options.
- Enhance efforts to identify and provide financial analyses focused on deeper energy savings and technologies. Identify ways different financial metrics, such as return on investment (ROI) and/or simple payback, can be provided where the values presented have meaning to the customer.
- The IOUs will explore and evaluate the potential of enhanced customer incentive options that are contingent on a customer's receiving an audit prior to applying to incentive programs.
- Incorporate new and/or emerging technologies appropriate for the customer's facility.
- Develop and implement enhancements to current benchmarking workshops (targeting commercial buildings) and continue providing benchmarking and AB 1103 technical support through established and new delivery channels.
- Encourage statewide consistency by offering a similar energy audits with the ultimate goal of offer customers the best energy management practices and technologies.
- Review and evaluate the CEC's Building Energy Asset Rating System tool (BEARS) once the CEC has completed developing the tool. The successful implementation of testing the new BEARS audit tool will depend on its timely release. BEARS is currently slated for completion at the end 2012. If the release of the BEARS tool is significantly delayed then the implementation of a successful pilot will also be delayed.
- Enhance the CEA ' offerings by including activities such as, but not limited to:
  1. The highlighting of emerging technologies and deep energy savings opportunities and providing education on long term energy planning/project management strategies (in coordination with the Commercial CEI program).

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

2. Will continue existing water saving services and develop Leak detection services and strategies which will offer the service to customers in all customer segments as determined by the IOUs to provide customer benefits and cost-effective to administer. The services will, be offered through the use of audit teams, in house and/or contracted, and may be required as a service in the delivery of all integrated comprehensive audits.
3. CEA will play a key role in exploring options regarding identifying deep energy savings, promotion of emerging technologies and providing the proper support to those customers who take advantage of more than three (3) measures from Commercial Deemed Incentive subprogram.
4. CEA will develop processes to assist energy audit teams and customers identify facilities and services that will provide the greatest return on benefits from the audit. The IOUs may explore leveraging tools to complete energy audits, usage analysis, assessments and/or building performance benchmarking as the first step in determining a customer's need.
5. CEA may also enhance tracking and audit component capabilities to support customer needs analysis, reduce program application barriers, maximize recommendation follow up and streamlined audit report generation.

**b) List of Measures**

The CEA primarily offers non-resource, auditing services. It does not offer incentives, but ultimately influences the customer's implementation of energy efficiency, demand response, and self-generation opportunities in combination with incentive from the core commercial incentive programs (refer to the Commercial Deemed and Calculated Incentives sub-programs for specific information). However, each utility reserves the ability to offer incentives specific to CEA's individual service offerings.

**c) List Non-incentive Commercial Energy Advisor Services**

The Commercial Energy Advisor (CEA) sub-program is designed to deliver a coordinated and customer specific service. CEA features a statewide integrated demand side management customer specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer's need(s).

Such activities include, but are not limited to: energy management assessments, energy planning, marketing and outreach, baselining and benchmarking, project implementation support, technical support, energy savings calculations, process evaluations and report generation, and web-based energy resources.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**See Attachment A - Table 3** – refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**c) Program Design to Overcome Barriers**

CEA offers services that address corporate/management cultures that prevent successful implementation of comprehensive energy policies. These offerings help overcome customers' lack of awareness of DSM opportunities by providing a customer focused, comprehensive package of energy solutions designed specifically to motivate the customer to implement recommendations. Information such as cost/benefit analysis (i.e. ROI or simple payback) and identification of appropriate IOU incentive and/or finance programs can significantly enhance the financial benefit of the energy saving recommendation. CEA also provides customers with tools to measure the effects of implemented energy savings actions on their bottom line.

CEA brings together audits and related services to implement energy saving activities.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

	Program Target by 2013	Program Target by 2014
Number of Audits	635	790

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**e) Advancing Strategic Plan goals and objectives**

The CEA is designed to promote DSM coordination and the integration strategies of the Strategic Plan. Foremost are recognition of the linkage between energy and environmental policy and the importance of integrating energy efficiency, demand response and distributed generation to support California's plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the CEA include:

- Facilitate all State-Owned and Leased Buildings having a Retro-Commissioning option

By offering a dedicated retro-commissioning program a mechanism is created whereby IOUs can facilitate the achievement of this goal as a coordinated effort with the IOU Government and Institutional Partnership Programs.

- Strengthen Tools and Practices for Building Commissioning

Based on the IOUs' experience with managing the Retro-commissioning program, lessons learned and best practices can be integrated into the 2013-2014 offering. To increase market adoption of these program best practices, the IOUs will work in cooperation with the California Commissioning Collaborative to disseminate relevant information to the retro-commissioning community and services may be extended to all segments as deemed appropriate by each IOU.

- Identify New and Improved Tools and Strategies to Reduce Energy Consumption in commercial facilities

Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the benchmarking, CEI, NRA and RCx, demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, commercial customer processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing facilities contribute to California's zero net energy goals. Once implemented, recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- State/Local Governments and Major Corporations Commit to Achieve EE Targets

CEA's offerings will seek to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop an actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

- Develop Tools to Reduce Energy in Commercial Facilities

As part of the implementation of specific CEA offerings, the IOUs will partner with energy industry peers, industry associations, and DOE/CPUC-sponsored labs and consultants to enhance the use of existing tools and explore new tools to help commercial customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

- EPA EnergyStar Portfolio Manager Benchmarking Tool.
- Management Standard for Energy SME2000-2008.
- DOE Superior Energy Performance.
- ISO-50001.

- Develop Business Models to Deliver Energy Management Solutions

CEA's offerings will address the fundamental purpose to influence decision making practices from commercial customers to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the agricultural market sector.

In addition, CEA's offerings promote acceptable practices of accounting, auditing, and evaluation by:

- Offering integrated and focused audits, benchmarking, savings calculation assistance for retrofit and retro-commissioning opportunities, and simplifying the audit-to-project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action.
- Guiding and supporting customers as they implement technologies, processes and practices to achieve deeper energy efficiency savings.
- Long term energy planning support.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**6. Program Implementation**

- a) Assess and identify the best way to support the use of CEC's BEARS tool.
- b) Enhanced current benchmarking workshops and continue providing benchmarking and AB 1103 technical support through established and new channels.
- c) Emphasize and support integration in emerging technologies and deeper energy savings opportunities.
- d) In coordination with incentive programs, identify ways to streamline the end to end process for customers wanting to participate in utility energy saving programs.
- e) Continuation of Statewide IOU coordination

**a) Statewide IOU Coordination**

**i. Program name:** Commercial Energy Advisor

**ii. Program delivery mechanisms**

CEA will employ a variety of delivery mechanisms or channels. Most of CEA's offering will use IOU customer energy efficiency staff and contractors, service and sales representatives, website and/or marketing and outreach efforts. Other delivery channels may also be developed.

In addition, where applicable, Utility customer account representatives or program management staff will support this activity within the statewide commercial sector, as well as third parties, government partnerships, and local programs.

**iii. Incentive levels**

Not applicable.

**iv. Marketing and outreach plans**

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs.

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost effectiveness of reaching customer groups.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

CEA's energy recommendations will continue to recognize the regulations required by other bodies. For example, information about GHG reductions resulting from

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

AB 32 may be incorporated into the customer recommendations and to factor into the project's cost-effectiveness and water conservation information will be included in the reports as appropriate.

Program offerings will collaborate and support the CEC's AB 1103 mandate by assisting customer with technical and awareness activities. CEA will advance the introduction of the BEARS and California Rating Tool where reasonable.

CEA recognizes the efforts of the CEC's Green Building Initiative programs, DOE's "ISO plant certification" programs, EPA EnergyStar Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs and will leverage such activities to the customer's benefit.

**b) Program delivery and coordination**

The sub-program will be coordinated with the following activities, as applicable:

**i. Emerging Technologies (ET) Program**

The IOU CEA Management Team will stay abreast of and incorporate relevant emerging technologies into audit recommendations as appropriate.

**ii. Codes and Standards Program**

CEA implementation will include information about pending new codes and standards that may affect planning or prioritization of retrofit or new construction projects. Audits reports will include customer recommendations that are consistent with current governing codes.

**iii. WE&T efforts**

CEA implementation will integrate with WE&T efforts, as needed, by providing CSI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches, as required.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**iv. Program-specific marketing and outreach efforts (budget provided in Table 1)**

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs.

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost effectiveness of reaching customer groups.

**v. Non-energy activities of the program**

Integrated audits are a key tool for identifying non-energy opportunities for specific customers. These opportunities will be pursued whenever possible.

**vi. Non IOU programs**

CEA reports will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. CEA will partner with programs offered by CEC, ARB, Air Quality Management Districts, ENERGY STAR, and other government and quasi-governmental agencies to capitalize on opportunities to develop co-branded program information and marketing collateral target to commercial sector customers, as opportunities present themselves.

With respect to water conservation, utility program managers will continue to partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects (ESPM, BEARS, California Rating Tool, Water Agencies and others).

**vii. CEC**

CEA implementation will continue collaboration efforts with the CEC and seek to promote adoption of new technologies developed through the CEC's processes and to educate customers to demonstration, research and/or pilot projects. Specific EA offerings will encourage recommendations addressing new technologies, processes, and methods, as identified in CEC projects, which will enable customers to achieve energy efficiency "stretch" goals that produce significant energy savings beyond an established baseline in a cost-effective manner.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**viii. CEC work on codes and standards**

CEA will not be implemented with a direct linkage to codes and standards efforts. Although CEA will reflect code and standards regulation in its energy savings calculations as deemed appropriate.

**ix. Non-utility market initiatives**

Education about federal tax incentives for energy efficiency investments is an example of non-utility information and guidance that CEA offerings will provide to customers. In addition, the IOUs will participate in state and national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

**c) Best Practices**

The IOUs will continue to leverage best practices and lessons learned at regularly scheduled statewide program management meetings. These meetings are forums to discuss program design and implementation issues, and as appropriate provide statewide collaborated guidance in RFP solicitations and awareness of program offerings so customers operating multiple facilities across IOU service territories receive the same customer experience.

Other best practices approaches apply the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the market sectors. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach will continue through the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

**d) Innovation**

For 2013-2014, the IOUs are identifying and evaluating program processes to increase effectiveness, simplification and increase the benefits the program delivers. Each IOUs set of lessons learned from these efforts will be shared and implemented to enhance energy savings benefits to all California IOU customers.

CEA will engage in a process of continuing improve as a new standard way of packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

**e) Integrated/Coordinated Demand Side Management**

CEA will provide a comprehensive approach for integrated audit services. Its services will have the flexibility of meeting every level of a customer's audits needs from integrated comprehensive audits to targeted or focused audits, which centers on specific systems or processes, to assessments or general walk through audits or online "do-it-yourself" audits (currently for small business customers), which when properly applied can assist in identifying the areas of a customer's greatest energy interest, financial capabilities of the customer's ability to invest in improving its energy use, and identification of other programs that can be brought into the discussion to motivate a customer to move forward with the energy saving plan.

The scope of services offered can coordinate the audit to look for retrofit or retro-commissioning opportunities; with benchmarking tools, or long term planning. Audit reports can present a truly integrated analysis to customers, seamlessly providing them with information and recommendations regarding energy efficiency, distributed-generation, demand response, greenhouse gas emissions and water energy savings, Customers will be referred to other IOU programs that will help them implement the recommendations resulting from the audit report and thus will be given a complete picture of their energy usage and options for reducing costs and using energy more efficiently.

**f) Integration Across Resource Types**

CEA will focus on DSM integration.

CEA implementation will include information on Non-IOU programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IOU EA managers will partner with the appropriate programs, when applicable, with government agencies to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers.

Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote CEA offerings, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, utility program managers will collaborate with the

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

local water districts to produce marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects.

**g) Pilots**

CEA services may consider the development of test markets especially in the introduction of new energy benchmarking or saving tools.

**h) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues.

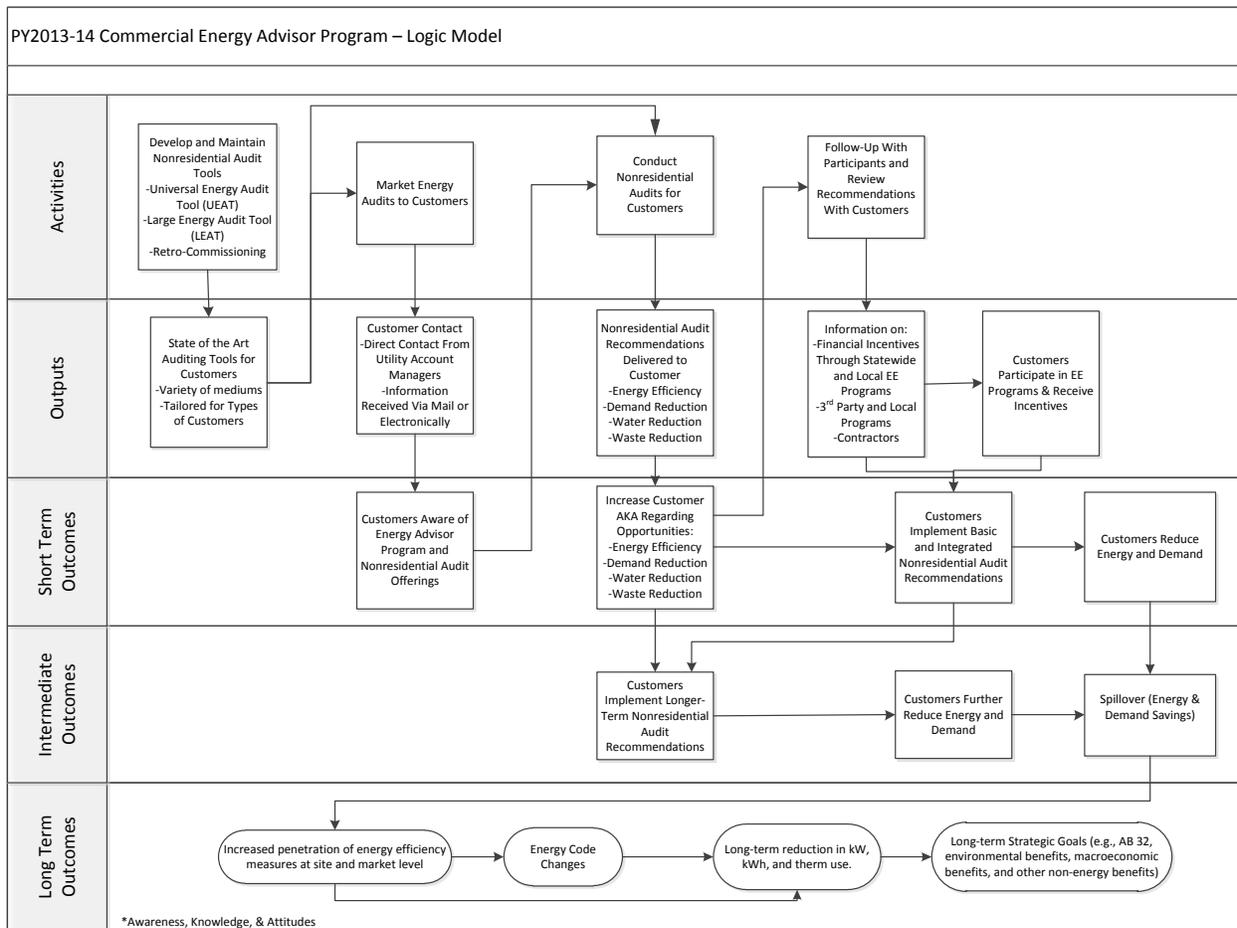

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 7. Diagram of Program

Please see the core program diagram.

## 8. Program Logic Model

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Program Name: Commercial Calculated Incentives, Core Sub-program**  
**Program ID: SCG - 3710**  
**Program Type: Statewide Core Program**

**2. Projected Program Budget Table**

**Table 1 – reference the overarching program for budget details**

**3. Projected Program Gross Impacts Table – by calendar year**

**Table 2 – reference the overarching program for savings details**

**4. Program Description**

**a) Describe Program**

The statewide Commercial Calculated Incentives sub-program provides customers technical and calculation assistance, as well as incentives based on calculated savings, to influence the design and installation of energy efficient equipment and systems in both retrofit and added load applications.

The Commercial Calculated Incentives sub-program is utilized for projects where a rebate is not available through the statewide Deemed program, where project conditions require customized calculations to provide the most accurate savings estimates, or where a project has interactive effects that are best captured through whole building or whole system modeling. Because calculated savings estimates are based on actual customer operating conditions, pre-inspections (for retrofit projects) and post-inspections are typically required as part of each utility's project documentation.

An important element of the Commercial Calculated Incentives sub-program is the design assistance and calculation assistance provided by the IOUs to influence customers to select the most efficient design and equipment options. For both retrofit and added load projects, IOUs work with the customer and their project team to evaluate their proposed projects and provide a report recommending efficient design alternatives and detailing energy savings, CO2 reductions, and calculated incentives available for exceeding Title 24 code or industry standard practice baselines as appropriate. This information is also available to customers through the nonresidential Audit offering. The combination of technical support and the availability and commitment of approved utility incentive funds is an essential driver to overcome key customer barriers, including lack of technical resources and lack of capital for energy efficiency projects.

Customers and project sponsors (contractors, design teams, vendors, ESCOs) participating in the Commercial Calculated Incentives sub-program may also opt to complete their own calculations for submittal to the IOUs for review and approval. For this purpose, consistent statewide calculators are publically available to customers for use if desired. The statewide utility-created and maintained CCT Calculator can be used for retrofits and is available

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

online and through CDs. For whole building construction projects, IOUs accept both Energy Pro, available for license, and the utility-sponsored EQEST, available for free on the statewide Energy Design Resources website [www.energydesignresources.com](http://www.energydesignresources.com).

Depending on whether a project is a retrofit or added load project, and on whether Title 24 is triggered for a particular project, different baselines are applied to capture appropriate project savings. For retrofit projects, incentives are capped at 50% of the total project costs. For added load projects, incentives are capped at 50% of the total project cost.

**b) List of Measures**

A broad range of measures is eligible for the Commercial Calculated Incentives Program. The current incentives are summarized in the following table. The incentives for these measures are standard across the utilities participating in the statewide Commercial Calculated Incentives Program.

The following measure categories are eligible for Calculated Incentives:

- Refrigeration
- Gas measures

**c) List Non-incentive Commercial Energy Advisor Services**

The Commercial Calculated Incentives sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical and calculation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd the project through the process.

**5) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude “draft” metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

**b) Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 4 – Refer to the overarching program for market transformation metrics (See Section 1a.5.a)

**c) Program Design to Overcome Barriers**

The Statewide Commercial Calculated Incentives sub-program offers customers incentives to implement energy efficiency measures that have been identified primarily through standard utility energy efficiency audits, in-depth facility/process assessments or retro-commissioning studies.

Other avenues used to identify energy efficiency opportunities include Programs that provide Education and Outreach, Workforce Education and Training, or through IOU Emerging Technologies Programs.

The Commercial Calculated Incentives Sub-program addresses and eliminates a significant number of barriers to energy efficiency for commercial customers such as:

- A high percentage of the time, developers, building owners, building managers and building contractors build or retrofit to current standards (i.e., Title 24). On the Architect and Engineering Firm side, design engineers specify what they know or what they are familiar with. The Commercial Calculated Incentives sub-program encourages or

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

rewards developers, building owners, building managers, contractors, and A&E Firms to “push the efficiency envelope” and exceed Title 24 requirements, or to exceed industry accepted baseline standards when retrofitting existing buildings or systems by providing up-to-date information on emerging technologies and providing incentives to bridge the “chasm” which typically prevent emerging technologies from being adopted by the market.

- In several instances, high efficiency Emerging Technologies are viable, but are unknown to facility owners and system designers and thus, are slow to penetrate the market, causing energy efficiency opportunities to be “lost.” The Commercial Calculated Incentives sub-program helps speed market penetration and associated energy savings for Emerging Technologies by offering, when appropriate, “premium” incentives for emerging technologies that are “proven” but not widely employed in the markets for which they are intended (e.g., solid state lighting, advanced lighting controls).
- Across all nonresidential customer segments, a significant barrier mentioned is “Access to Information”. This can be a lack of awareness of operating “best practices”, lack of awareness of energy efficiency opportunities, difficulty accessing industry relevant technical assistance, inadequate availability of qualified industry specialists or lack of personnel resources to fully assess a building, system or process. Also, in many instances, customers are not sure of how a specific energy efficiency project will impact their emissions, resource consumption or waste discharge streams.
- Multi-tenant buildings have a unique and significant barrier. Most typically referred to as the principal-agent or tenant-landlord split incentive, this issue is characterized by the natural separation of tenant energy efficiency savings and capital expenditures by building owners. The commercial program will incorporate market research and/or market tests to better understand potential programmatic offerings that can help reduce the barrier. Some examples of strategies that might warrant testing include combinations of education and creative tenant/landlord incentives or credits for centralized system or building shell upgrades.

These barriers are overcome by providing:

- Highly skilled Energy Management Professionals that perform basic and integrated facility assessments;
- IOU Workforce Education and Training seminars through the Energy Centers;
- Web-based information and energy management tools that assist with identifying DSM opportunities;
- In-depth plant or system assessments such as the assessments jointly provided by the IOU’s and the U.S. Department of Energy (DOE), that focus on improving production and optimizing energy efficiency;
- Incentives based on energy savings quantified through technical assessments or basic audits that help customers overcome internal financial hurdle rates;

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Incentive mechanisms that reward implementation of advanced technologies;
- Integrated solutions that conserve energy and reduce GHG emissions; and
- Statewide CCT Estimator that provides energy savings calculation for most popular and common retrofit projects and measures, assists in filling out program applications, and simplifies its processing.

The Commercial Calculated Incentives sub-program delivers a consistent message statewide to commercial customers about the benefits, energy savings and GHG reductions that efficient technologies and “best operating practices” offer. This eliminates the barrier often run into by commercial customers of getting incorrect or out-of-date information from local networks.

The Commercial Calculated Incentives sub-program not only brings IOU incentive information to customers, but in many instances also provides additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, Tax incentives or other local sources of project funding.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

Program Name	Program Target by 2013	Program Target by 2014
Projects	TBD	TBD

**e) Advancing Strategic Plan Goals and Objectives**

The unifying objective of the Strategic Plan is to employ market transforming strategies to encourage marketplace adoption of energy efficient measures to a point that public investment in energy efficiency is no longer necessary (Section 1, page 4). The Calculated Incentives sub-program will support this effort by employing two of the five market transformation policies identified in the Strategic Plan. Specifically, the Program will offer “carrots” in the form of financial incentives to help pull the marketplace towards energy efficiency. The Calculated Incentives sub-program will also provide education and informational resources through marketing and program outreach efforts. Therefore, these program elements will work in concert to transform the market towards sustained, long-term energy savings.

The program will help to achieve the following near-term strategic goals as identified in Chapter 3 of the Strategic Plan:

- 2-3: Ensure compliance with minimum Title 24 codes – The Calculated Incentives sub-program only provides incentives for projects that exceed current Title 24 minimum

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

baselines. Incentive mechanisms will be created to ensure deeper levels of energy reductions, potentially including implementation of the Office of the Future Consortium's Phase 2 recommendations, "The 25% Solution", which seek to reduce energy usage 25 percent below Title 24-2005 baselines.

- 2-5: Develop tools and strategies to reduce energy consumption in commercial buildings – The Calculated Incentives sub-program directly supports this effort by collecting data and conducting energy use and efficiency studies that, when collected over multiple IOU service territories, will be very helpful in supporting statewide efforts to establish a robust and useful knowledge base for the commercial sector.
- 2-7: Develop business models that deliver integrated energy management solutions – The Calculated Incentives sub-program will implement incentive mechanisms that will reward comprehensive energy management and "energy efficiency projects" such as incentives for reaching certain stretch goals that produce significant energy savings beyond an established baseline.
- 2-8: Improve utilization of plug load technologies – The existing incentive structure pays for energy reductions through plug load measures. Additional incentives that encourage greater penetration of plug load technologies may be developed.

**6) Program Implementation**

a) Statewide IOU Coordination

The Statewide IOU Coordination process, described in detail in the Statewide Commercial Energy Efficiency Program, will ensure continuous improvement and consistent implementation of all of the sub-programs. The discussion below will focus on how the IOUs will coordinate the Commercial Calculated Incentives sub-program specifically.

The Statewide IOU Coordination process for the Commercial Calculated Incentives sub-program will be as follows:

- Hold Regular Program Manager Meetings – The Commercial Calculated Sub-program managers from each of the IOUs will meet on a regular basis. The sub-program managers will unify, to the extent possible, the implementation of program aspects such as Program name, Program delivery mechanisms, Incentive levels, Marketing and outreach plans, and IOU program interactions. The sub-program managers will also discuss new innovations and develop solutions to overcoming implementation challenges. Therefore, the regular meetings will focus on issues specific to the Commercial Calculated Sub-program only.
- Designate an IOU Program "Lead" – One of the sub-program managers that participates in the regular meetings will be the designated Calculated Program IOU "Lead". The IOU lead will represent the sub-program at the regular Statewide Steering Committee meetings.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Participate in Regular Steering Committee Meetings – The IOU lead will be responsible for attending the regular Steering Committee Meetings and sharing Calculated Incentives sub-program innovations, experiences and challenges that have the potential to impact multiple sub-programs or the core Commercial Energy Efficiency Program as a whole.
- Adopt Program Enhancements - Once the Steering Committee agrees that a specific innovation or implementation policy has merit on a statewide level; the IOU lead will distribute the information to the Commercial Calculated Sub-program managers by email or at the next regular meeting for adoption and integration. Therefore, the IOU lead will act as a conduit feeding Commercial Calculated Sub-program-specific information up to the statewide Steering Committee and distributing measures for adoption back to the Commercial Calculated Sub-program managers.
- Evaluate Program Enhancements – To complete the adaptive management loop, the Commercial Calculated Sub-program managers will track the success of the adopted statewide enhancement or implementation policy and report any challenges or concerns at the regular Commercial Calculated Incentives sub-program meeting. The IOU lead will report any challenges that transcend the Commercial Calculated Incentives sub-program to the Steering Committee, who will determine whether further course corrections are needed.

By following the process stated above, the Calculated Incentives sub-program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the three year implementation cycle. Sub-program innovations and challenges will also feed productively into the higher-level Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.

The coordination and unity of all program aspects, such as Program name, Program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions, will be handled through this statewide coordination framework. However, these aspects will start off at a high level of statewide consistency. In rare cases, there will be IOU-specific deviations. Such instances where one IOU will favor a different approach than the other IOUs will be called out in italicized text throughout the Calculated Incentives sub-program.

Additional areas of program coordination include:

**i. Program Name :** Commercial Calculated Incentives

**ii. Program Delivery Mechanisms**

The Commercial Calculated Incentives sub-program for will be delivered consistently across IOUs using the same application materials and energy savings calculation to ensure consistency. Both retrofit and added load projects for commercial customers are eligible for incentives.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**iii. Incentive Levels**

Incentives will be at \$1.00/therm, capped at 50% of project cost.

The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division and market direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program.

**iv. Marketing and outreach plans**

In 2013-2014, the IOUs will continue to target customers for calculated incentives based upon segmentation research and messaging. Large Commercial customers make up a significant portion of the audience for Calculated Incentives and these customers will not be targeted by the SW ME&O campaign. Due to the complexity of aligning Calculated Incentives with customer operations and highly individualized energy management needs, the sales cycle for these deeper retrofit measures tends to be longer and require significant one-to-one contact at the local level. Customer workshops and other account management support are all important parts local marketing and the consultative selling process for Commercial Calculated Incentives.

The Commercial Calculated Incentives sub-program will be marketed through IOU Account Executives, as well as through third-party programs, trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by Account Executives, Demand Response Program outreach, phone and e-mail support will be provided.

The IOUs plan to monitor and optimize local marketing campaigns and when possible, will share best practices and coordinate efforts for statewide consistency.

**v. IOU program interactions**

The Commercial Calculated Incentives Sub-program managers will partner with the appropriate programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to co-brand program information and marketing collateral with this sector's customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

by or interested in more than one resource issue, comprehensive information that discusses all resource efficiency issues will benefit the customer to the mutual advantage of the single resource programs.

With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Commercial Calculated Sub-program incentives for energy efficient equipment that may also reduce air and GHG emissions.

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that utilize the Commercial Calculated Incentives infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program Delivery and Coordination**

The program will be coordinated with the following activities:

**i. Emerging Technologies program**

The long-term EE vision of California can only be attained through the long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the sub-program will consider higher initial incentives for technologies being newly introduced to the market place through the Emerging Technologies Program. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. In addition, portfolio staff actively works to incorporate promising emerging technologies from IOU or CEC-funded projects.

**ii. Codes and Standards program**

The program relies on the Codes and Standards program to maintain an updated and relevant list of measures that will support savings. As Codes and Standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into codes and standards. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

bundling will be made to ensure the latest cost effective technologies/services made available as these technologies transition from research and development to the mainstream.

**iii. WE&T**

WE&T is a portfolio of education and training programs that showcase energy efficient equipment found on the list of measures offered in the program. The education and training takes place through energy centers, technology test centers, and education and training program offerings. In addition to providing the education and training the classes also address how customers engage the energy efficiency program offerings relative to the class. An Energy Efficiency representative will be present at appropriate classes to provide detailed information on the application process to the relevant Energy Efficiency program.

Specific workforce development efforts supporting the Commercial Calculated Incentives sub-program which include training on topics, not limited to as follows:

- Audits – Training will be developed in an effort to promote a consistent approach and format to facility audits.
- Financing
- Soft skills and Business training (including customer service, sales, and marketing).
- Benchmarking
- Program-specific training – Training will be developed to promote increased familiarity with the program’s eligibility requirements, application, processes, etc).
- IDSM

The IOUs will explore voluntary incentive-based approaches to encourage contractors and other industry professionals to complete the full bundle of Commercial – Calculated workforce development training. For professionals who complete the pre-requisite courses and pass a high-road skill standards test, such approaches may include (as applicable):

- Allowing marketing or advertising differentiation;
- An incentive bonus; and/or
- Providing preference to these professionals during bid evaluation process.

Commercial – Calculated workforce development training will be coordinated with the statewide IOU WE&T program. In addition to the trainings described above, SW IOU WE&T programs will continue to offer building-block courses that educate professionals on the concepts that form the foundation of Commercial calculated programs. Those concepts include:

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Green building techniques;
- Codes and standards (Title-24);
- Lighting and HVAC technologies;
- Energy cost management; and
- Food service equipment.

Contractor recruitment efforts will be conducted primarily by SW WE&T program implementers through:

- The network of contractors already participating in EE programs;
- Direct outreach through industry organizations with locally active memberships (e.g. IHACI, U.S.G.B.C., IFMA, AIA, BOMA, etc.);
- Workforce development departments (to target unemployed general contractors); and
- Community Based Organizations with a proven track-record of effective outreach to the hard-to-reach workforce.

**iv. Program-specific marketing and outreach efforts**

Market outreach to raise awareness of EE programs available will use a number of strategies, including:

- Account representatives will make a regular and consistent customer calling effort to key customers within this sector;
- Utility representatives, Energy Efficiency program management representatives, and field engineers will be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the Commercial Market Sector;
- Attendance at the key trade shows for each high priority sub-segment within the Commercial Market Sector;
- Utility-sponsored training events at the IOUs Customer Training Centers and other convenient locations within the IOUs service territory;
- Online content and integration of marketing materials and campaigns with online tools such as audits and other energy demand and usage assessments
- Hosting of utility-sponsored Webinars that provide sub-segment training and program adoption; and
- Written collateral pieces that provide an overview of the IOUs Energy Efficiency programs will be linked into the appropriate IOU DSM web page.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**v. Non-energy activities of program**

Integrated Energy Audits (described in the Commercial Energy Advisor sub-program) is the primary vehicle to promote project solutions that look across the various IOU DSM program offerings, as well as complementary options available through other entities (e.g., water agencies).

**vi. Non-IOU Programs**

The Program will continue to engage with Air Quality Management Districts, CEC, ARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**vii. CEC**

As of June 2012, PIER no longer exists. However, the program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and projects in coordination with the CEC.

**viii. CEC work on codes and standards**

Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

**ix. Non-utility market initiatives**

The program will support, educate customers, and facilitate such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, ISO 50001 California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**c) Best Practices**

IOUs will continue working collaboratively on modifications to program Policies and Procedures to address ongoing changes in customer expectations, market conditions and program flexibility. Such changes have been and will be targeting ease of program understanding and participation, measures eligibility, increase of customer economic benefits and policy restrictions that will be identified as barriers to participation. IOUs are implementing such process based on market studies conducted on the subject and preceding discussion of the policy change. Among modifications that would be potentially discussed and implemented are incentive caps, redesign of measure/equipment early retirement according to the CPUC concept and other.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

IOUs are planning to explore appropriate consolidation of various calculating software such as CCT Calculator. Engage and other measure specific calculating tools to standardize our calculating methodology. This will ensure that calculations will be more uniformed and consistent amongst all stakeholders. This will not limit the use of nationally recognized standard DOE toolsets for certain measures. The IOUs also plan to continue exploration of emerging software tools that have the potential to enable significant advances in comprehensive energy efficiency at both the system and whole building levels.

IOUs are also planning to elaborate and utilize positive experience obtained using Savings By Design and Energy Design Resources tools and extend it to energy efficiency retrofit projects. Such tools substantially reduce application processing and review time, minimize number of hand-offs, not sacrificing accuracy of energy saving calculations.

Leveraging best practices from past program cycles, the Commercial Calculated Incentives sub-program information will also be made available through industry organizations such as The Building Owners and Managers Association (BOMA), and through advertising in industry and trade publications. Trade associations and vendor allies have historically delivered substantial energy savings through previous calculated program models.

**d) Innovation**

Innovative aspects of the program are aiming major program performance indicators such as accuracy of energy saving calculation, higher realization rate, overcoming energy efficiency barriers, reducing application processing time and administrative costs, and integrated energy management.

For the new program cycle California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During 2013-2014 program cycle new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance.

An additional example of innovation is aimed at the strategic plan's transformational vision and goals around energy user behavior, market transformation and deeper energy savings. PG&E intends to provide upfront payments for installation of system-level controls (e.g. lighting, HVAC etc.) and/or energy management and information systems (EMIS). Customers receiving the payments would be enrolled in a statistically based pre- and post-measurement evaluation of data, using whole building measurement and verification protocols, from which savings will be determined and claimed. Where possible, IOUs will use integrated approach to addressing DSM opportunities. Innovative aspects such as merging energy efficiency and demand response analysis and converting recommendations to projects under Retro-commissioning and/or Calculated program, processing and reviewing energy efficiency and demand response measures in a

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

single application, providing analytical information about applicable distributed generation solutions will maximize customer adoption rates for most cost-effective energy management opportunities.

The IOUs are planning to continue and enhance their core Retro-commissioning (RCx) program in multiple target markets. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments. Measures may involve resetting, repair or replacement of existing system controls and components, and in general are low-cost projects with simple payback periods of less than 4 years.

The RCx program is a key offering in the Calculated Sub-program. The audit components of the RCx program are also described in the non-residential audit section above. Enhanced RCx program elements will explore and may include but not be limited to:

- Innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- Continuous commissioning and monitoring-based commissioning;
- Solutions for small and medium commercial customers;
- Strategies to drive savings persistence;
- Appropriate alignment with retrofit activities;
- Overall program incentives, targeting, and delivery.

After energy audit is complete and applicable no-cost/low-cost measures are identified the scope of work will be handed-off to RCx implementer who, in-tum, will follow RCx program protocols, execute the scope of work (measure implementation, M&V plan, incentive payment for energy savings) and report final results to the core program office.

**e) Integrated/coordinated Demand Side Management**

As the primary incentive vehicle that customers have for implementing efficiency projects, the Commercial Calculated Incentives sub-program is the logical choice for implementing greater demand side integration. Appropriate incentive mechanisms will be developed and implemented during the 2013-2014 program cycle to reward customers who implement comprehensive DSM programs.

The first step on the path towards DSM integration may be to introduce incentives for kW demand reduction, which as shown in Section 4.b. This will provide additional incentives for demand reduction strategies such as lighting controls.

**f) Integration Across Resource Types**

Integration across resource types (e.g., energy, water, and air quality) will be explored. Examples include working with Water Agencies to co-promote Food Service appliances

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

that save water and energy and working with Air Quality Management Districts to co-promote Boilers and Water Heating measures that save energy and improve air quality.

**Water/Energy Nexus Strategy**

SoCalGas supports improving the efficiency of water systems as one of the most critical strategies to capture water/energy nexus benefits in the energy efficiency programs. SoCalGas plans to focus its efforts in areas that use gas engines as the energy source to deliver and treat water. For water agencies within SoCalGas' territory, we plan to issue an RFP to utilize a contractor to implement leak-loss detection and remediation and pressure management services applicable to storage, pumping and distribution through SoCalGas' core or Third Party Program. SoCalGas will explore new project ideas for the water/energy nexus, as well as the calculation of ancillary water benefits (e.g. "embedded" energy savings). SoCalGas will accelerate the expansion of cost-effective water-energy nexus programs by coordinating with the other utilities, water agencies, and municipalities to study the cost effectiveness and the embedded energy savings for water/energy efforts. Our intent is to continue to offer measures and services to the water sector through the "calculated" and audit programs. SCG will also explore for new direct energy measures that can be incented under the calculated program. Additionally, we will increase our efforts to capture the water-energy nexus and sustainability in the agriculture, industrial, and commercial segments.

**g) Commercial New Construction – Savings By Design**

As a single fuel utility, SoCalGas will work collaboratively in conjunction with the other IOUs to implement the SBD offerings statewide where SoCalGas jointly shares service territories. SoCalGas will not offer a standalone Whole Building Approach.

The Savings By Design (SBD) component aims for significant energy efficiency improvements in the nonresidential new construction industry, and is designed to overcome customer and market barriers to designing and building high performance facilities. Since 1999, SBD has provided statewide consistency, program stability and savings. SBD seeks to protect and preserve natural resources by advancing the design and construction of sustainable communities and promoting green building practices. The program is designed to overcome customer and market barriers to designing and building high performance facilities.

California's Title 24 requirements set some of the most stringent energy regulations in the nation. Exceeding these standard energy performance levels requires a high degree of design expertise, technical knowledge, and motivation. The requirements also can be complex and sometimes confusing. Because many in the design field are unaware of the potential savings from energy efficient design or perceive budgetary constraints, they are reluctant to implement energy-efficiency strategies. As a result, energy efficiency is often a lost consideration, abandoned in favor of pursuing the "lower initial cost" option. SBD

## **2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan**

strives to avoid lost opportunities by assisting customers in moving beyond initial cost considerations and towards the realization of long-term energy cost savings.

Through an integrated design approach (a whole building approach that encourages performance significantly better than Title 24 code by offering a variety of financial incentives) as well as a systems approach for simpler facilities where integrated opportunities are limited, SBD encourages energy efficiency and green building practices in new commercial buildings. These financial incentives are supplemented by a variety of other support activities, including feasibility studies and pilot projects, training and education, conferences and workshops, scholarships, and program marketing activities. In the 2013-2014 portfolio period, SBD will advance a broader palette of technical and financial resources to aid the proactive design of new facilities in accordance with the most cost-effective energy and resource efficiency standards. SBD will incorporate several new approaches towards integrated design and green building certification in support of the Strategic Plan.

SBD provides the nonresidential new construction industry with a broad palette of technical and financial resources to aid the design of new facilities in the most cost-effective energy and resource efficiency standards.

The SBD program will continue to offer two existing program components to its customers with new construction or major remodel/renovation projects, and will add a simplified approach for smaller projects.

- Whole-Building Approach or WBA (Integrated Design) - existing
- Systems Approach - existing
- Simplified Approach - new

SBD will offer financial support for design teams to undertake an integrated design process. Additionally, sustainability incentives will be offered to building owners to perform building commissioning during design and construction, and monitor building performance through End Use Monitoring. These sustainability incentives are designed to encourage new buildings to be as well designed as possible, be built as well as they are designed, and be operated as well as they are built.

The program will continue to incorporate new approaches for 2013-2014 to advance integrated design and green building certification in support of the Strategic Plan.

**Tools and Expertise:** California's Title 24 requirements establish some of the most stringent energy regulations in the nation. Exceeding these standard energy performance levels requires a higher level of design, technical assistance, and motivation. The requirements also can be very confusing. SBD provides the assistance, tools and expertise necessary to help customers and designers exceed compliance with the requirements and achieve long-term energy- and cost-savings.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Zero Net Energy Design Assistance:** To date there are very few Zero Net Energy Buildings in California. According to study published by the New Buildings Institute<sup>1</sup>, only twenty one buildings in the United States have a measured performance of zero energy. This information provides ample proof that ZNE buildings are extremely challenging to achieve and will continue to require substantial support from utility incentive programs. Savings By Design is best positioned to accomplish this task by encouraging higher levels of energy efficiency through higher levels of incentives. When successful, these buildings can be labeled as Zero Energy Capable Buildings (ZECB) that is one step from ZNE status. The missing component then is the self-generation component that is encouraged through other programs offered by the utilities. To get buildings to this ZEC state, Savings By Design will offer a soup to nuts whole building integrated design assistance, which would include analysis on natural ventilation, through energy efficiency, Computerized Fluid Dynamics, self-generation cost analyses, plug load analysis, building compliance analyses, and whole building energy modeling services.

**Long-Term Energy-Efficiency:** It has been firmly established in SBD program evaluations that the integrated design process, when implemented correctly, can lead to highly cost-effective energy savings for most projects. Because many in the design field are unaware of the potential savings, do not understand the design process, or perceive budgetary constraints, they are reluctant to implement energy-efficiency strategies. As a result, energy efficiency is often a lost consideration, abandoned in favor of pursuing the “lower initial cost” option. SBD strives to avoid lost opportunities by assisting customers in moving beyond initial cost considerations and towards the realization of long-term energy cost savings.

**Energy Design Resources:** Another key component of Savings By Design is Energy Design Resources (EDR). Energy Design Resources offers a valuable palette of energy design tools and resources that help make it easier to design and build energy-efficient commercial and industrial buildings in California. The goal of this effort is to educate architects, engineers, lighting designers, and developers about techniques and technologies that contribute to energy efficient nonresidential new construction. Additionally, design tools that reduce the time spent evaluating the energy use impact of design decisions are provided here at no cost.

**Comprehensive Integrated Building Design Training:** In conjunction with the Workforce Education and Training program, Savings By Design will proactively offer integrated building design training to architects, engineers and other design professionals. Training might encompass highly technical building modeling techniques for use in the selection of cost effective energy efficient measures. In addition, SBD will offer “lunch and learn” sessions to architectural and engineering firms interested in learning about utility energy efficiency programs.

---

<sup>1</sup> Getting to Zero 2012 Status Update: A First Look at the Costs and Features of Zero Energy Commercial Buildings

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

List of Measures

The Savings By Design Program aims to achieve the deep levels of market transformation described in California’s Strategic Plan, primarily by offering meaningful financial incentives directly to key participants in the building community. Incentives and/or assistance may be targeted to builders, designers, and energy analysts. Various organizations involved in developing green building and sustainability standards may also be actively supported.

In addition to providing the traditional sliding-scale incentives calibrated to energy savings exceeding standard energy performance code, SBD will offer a flat incentive for peak kW reduction and financial support for design teams to undertake an integrated design process. Additionally, sustainability incentives will be offered to building owners to perform building commissioning after construction, and/or establish and follow a building measurement and verification (M&V) plan after occupancy. These sustainability incentives are designed to encourage new buildings to be as well designed as possible, be built as well as they are designed, and be operated as well as they are built.

**Program Performance Metrics (PPMs)**

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Savings by Design Sub-program of the New Construction Statewide Program

**Table 3 – Program Performance Metrics**

**Sub-program: Savings By Design**

PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
1. Average site energy install, ex-ante (kBtu/sq ft-yr and demand (kW/sq ft) for participating commercial new construction by building type and climate zone	2b
2. Percentage of committed participating Whole Building Approach projects that are expected to reach a minimum of 40% less energy than	2b

Market Transformation Information

**Description of the non-residential new construction market**

Non-residential new construction is one of the BBEES programmatic initiatives to accelerate market transformation toward greater adoption of energy efficiency. Successful market transformation efforts in the commercial building market must occur at multiple levels across the design and construction supply chain and through building owners and building occupants. This transformation must establish the relevance of energy efficiency among market actors and institutionalize the high efficient building practices<sup>2</sup>.

According to a 2001 study on energy efficiency in new construction<sup>3</sup>, the non-residential building industry is a series of linked industries arrayed along a value chain. The study identified the following six major industry groups involved in this highly diverse market—providers of capital, developers, design delivery firms, community/political/regulatory interests, real estate service providers, and users. The market structure reflected in this study remains relevant for today’s non-residential new-construction market. An emerging group in this market structure is the design build firm. The design build firm offers a complete design and construction package to the entity pursuing a new project. The building development process brings these groups together to deliver a building product that meets capital, land, and user requirements. Developers orchestrate the development process and bring together the disparate groups during the various phases of the project build. Community, political, and regulatory interests shape what can be built through zoning, codes, review and other public processes. Real estate service providers offer marketing, sales, produced by architects, engineers, and contractors in the design and delivery group. The leasing, investment, management, and operations services represent the interests of many market actors. Building users are the firms and organizations that occupy the buildings on lease or owner-occupied bases.

The complex and interrelated linkages of the market participants need to be studied further as recommended by a recent SCE Savings By Design Market Characterization Study<sup>4</sup> (“CADMUS Study”). The utilities are interested in engaging in such work during this and subsequent program cycles. The utilities also draw upon available information, past Savings By Design evaluation studies, and the long experience of the program managers and staff to articulate the market transformation process for the non-residential

<sup>2</sup> [http://eec.ucdavis.edu/ACEEE/2002/pdfs/panel04/15\\_239.pdf](http://eec.ucdavis.edu/ACEEE/2002/pdfs/panel04/15_239.pdf)

<sup>3</sup> Market Structure and Energy Efficiency: The Case of New Commercial Buildings by Loren Lutzenhiser and Nicole Woolsey Biggart July 2001

<sup>4</sup> Commercial Building Market Characterization for Savings by Design Program Final Report June 20, 2011 Study ID: SCE0312.01

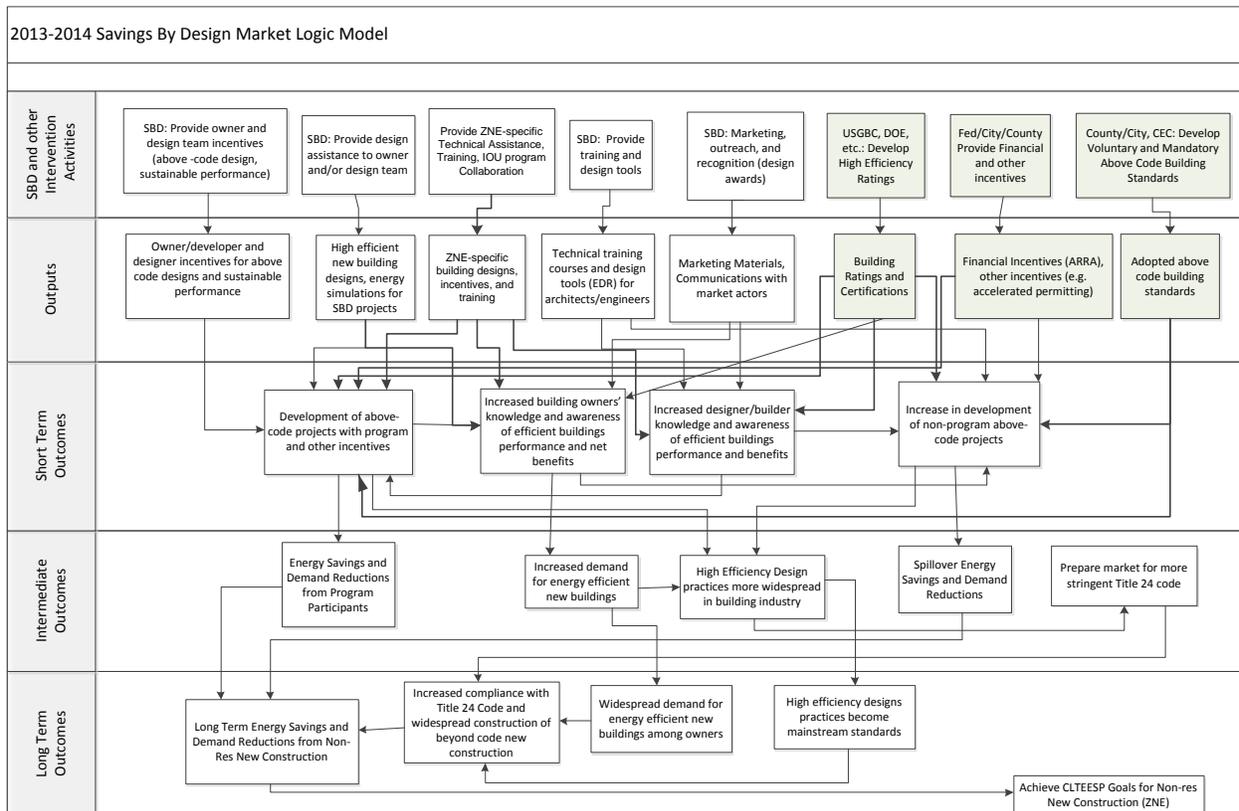

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

new construction market.

Finally, the new construction market value chain is slowly showing signs of interest in Zero Net Energy. As indicated earlier in the SBD PIP, New Buildings Institute (NBI) has found very few buildings in the nation that can be labeled as Zero Net Energy. NBI also found that a slightly larger number, although also very few as compared to existing building stock, can be labeled as ZNE capable (ZECB) buildings. From this perspective, Savings By Design will face ever increasing needs for expert consultations in unique ZNE projects, like Computerized Fluid Dynamics that analyzes a design for its effectiveness in a natural ventilation scenario. The emergence of ZNE in the commercial space will undoubtedly spawn new challenges and barriers in the new construction market.

### Program Logic model

Developing a program logic description can assure that everyone concerned with the program has a clear understanding of what the program seeks to achieve. Included below is the program logic that addresses specific program interventions related to market barriers, while acknowledging that multiple interactions in the market of various entities and market actors makes the non-residential new construction market quite complex. The full market depiction for the purpose of understanding the market transformation of this market will need to be developed with the input from the market stakeholders, CPUC, and other entities.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Evaluation plans, market transformation indicators and PPMs**

Due to the need to comply with the Decision’s timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects statewide evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

Summative evaluation: Market Effects. The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program “spillover” and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

**Market Transformation Indicators (MTIs)**

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in “Attachment H” are approved for this sub-program as applicable.

Attribution: Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Prah (MT Workshop, Nov 2011) suggest that declaring the program’s strategic intent through the market transformation initiative’s theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

The building industry in California continues to be pinned down in one of the worst slumps in decades. In a buyer’s market, builders are looking to differentiate themselves from competition. This presents a great opportunity for Savings By Design to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to meet the state’s and utilities’ goals for the reduction of greenhouse gas emissions and utility source demand.

Other SBD best practices include the following:

**Systems Approach**

The systems approach is a performance-based method utilizing energy analysis tools for energy modeling to analyze efficiency choices. This approach is used for projects that do not present sufficient opportunities to warrant the labor intensive assistance services offered through the WBA. The systems approach is designed to make it easy for designers to look at the interaction of systems within their project, rather than individual equipment or fixtures. The systems approach is used for simple facilities where integrated opportunities are limited, as well as projects where program intervention may come in too late in the design phase to effect sweeping programmatic changes to the design.

For 2013-2014, SBD will continue to offer the same incentives by measure end-use as the non-residential calculated retrofit program (known in 2006-2008 as Standard Performance Contract, or SPC).

**Traditional Incentives**

For 2013-2014, the statewide owner’s incentives for electrical energy savings offered by the WBA will start at \$0.10 per kWh at 10 percent better than Title 24 code and increase in a straight line to \$0.30 per kWh at 30 percent better than code. For projects that exceed 30 percent better than code, the electric incentive will be \$0.30 per kWh saved. The incentives will be capped at 75% of incremental cost or \$150,000, whichever is lower. For a limited number of projects, Utilities may decide to pay larger incentives if the projects are deemed worthy to receive the larger incentive.

If SBD provides design assistance services to a project that achieves high performance without incurring incremental equipment cost (due to the intrinsic benefits of the integrated

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

design process), an owner incentive will not be awarded due to the incremental cost cap. In these cases, SBD will still claim the resulting energy and demand savings.

**h) Local Element (Negotiated Incentive Option)**

SoCalGas will provide a local component which will include incentives for energy-efficient retrofits, systems new construction, or replacements of existing equipment at SoCalGas customer sites. Participants may be either customers or energy-efficiency service providers (EESP's) acting as project sponsors for activities at customer sites. To qualify, a project must save a minimum of 1,000,000 therms per year. Associated energy, resource such as water, sewerage and emissions, and Greenhouse gas (GHG) emissions savings will be considered when evaluating a project for funding. A project may consist of a single project at a single site, or may be aggregated from multiple projects belonging to a single customer, and may include a variety of measures.

This local element is designed to serve the largest non-residential customers within the SoCalGas service territory. Non-residential customers in this group are comprised of but not limited to the following industry sub-segments: Government/Utilities, Manufacturing/Processing Industries and Institutional. Each sub-segment has distinct energy use patterns, differences in equipment and facility design, and various management structures and decision-making processes. Because each industry sub-segment is unique, this option will use a customized, customer-focused approach. Participating customers, taking into account their individual energy and resource conservation opportunities as well as internal hurdle rates, will propose or "bid" to SoCalGas the incentive level needed to enable large EE and Resource savings projects. This ensures that this option will be adaptable to the unique needs of each market segment.

The program is designed to be flexible and cost effective: The project sponsor proposes a project and desired incentives. Incentives may cover up to 50% of the incremental project costs less any additional funding received from other sources. Measurement and verification (M&V) is required for all projects. As a performance-based incentive program, the approved M&V report will ultimately determine the energy savings for each project. The total sum of incentives paid for a project may not exceed the amount "bid" by the customer and agreed to by SoCalGas.

**i) Pilots**

Not applicable

**j) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues. However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics,
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

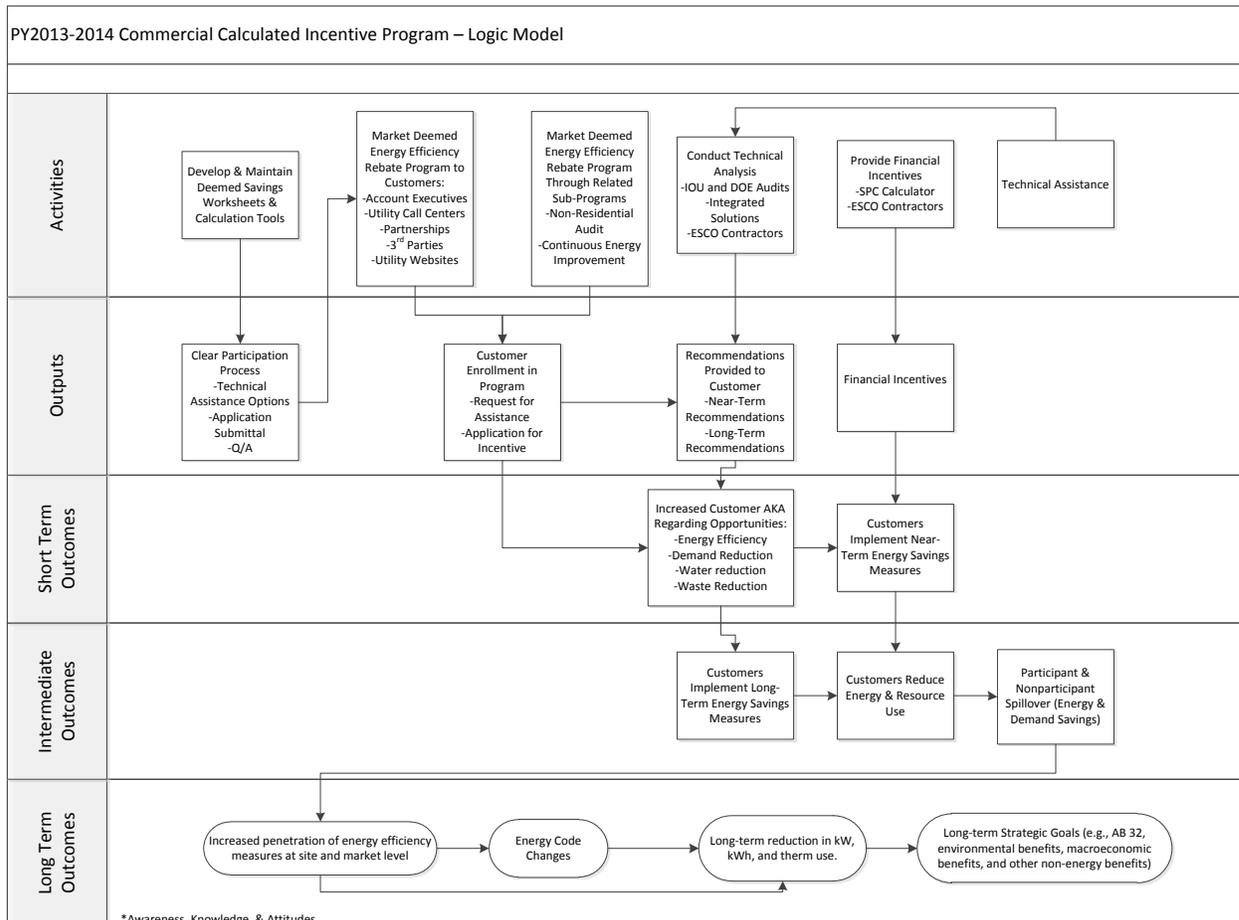

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 7. Diagram of Program

Please see the core program diagram.

## 8. Program Logic Model

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. As there were no revisions to the original logic model for the Commercial Calculated Incentives Program, this logic model is left unchanged.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name: Commercial Deemed Incentives, Core Sub-program**  
**Program ID: SCG - 3711**  
**Program Type: Statewide Core Program**

2. **Projected Program Budget Table**

**Table 1 – reference the overarching program for budget details**

3. **Projected Program Gross Impacts Table – by calendar year**

**Table 2 – reference the overarching program for savings details**

4. **Program Description**

a) **Describe program**

The statewide Commercial Deemed Incentives sub-program provides rebates for the installation of new energy efficient equipment. Deemed retrofit measures have prescribed energy savings and incentive amounts and are generally intended for projects that have well defined energy and demand savings estimates (i.e., T12 to T8 replacements). The Commercial Deemed Incentive mechanism is designed to help influence the installation of energy efficient equipment and systems in both retrofit and added load applications by reducing the initial purchase costs of such equipment and reducing the “hassle” of participating in utility rebate programs by offering a simple application process.

The Commercial Deemed Incentives sub-program directly addresses key market factors that lead to higher energy costs for California businesses. Providing a menu of prescribed common measures simplifies the process of reviewing project proposals and provides a "per-widget" rebate that reduces the cost of retrofitting outdated and inefficient equipment. This sub-program makes it attractive for customers to spend money in the short-run in order to achieve lower energy costs in the long-run.

b) **List of Measures**

The following measure categories are eligible for Commercial Deemed Incentives:

- Lighting
- Air conditioning equipment
- Food service equipment
- Refrigeration
- High efficiency water heating
- Plug load

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Audits are an important tool for marketing and increasing the uptake of EE measures. Nonetheless, an audit is not a prerequisite for deemed incentives. In fact, deemed incentives are specifically designed for ease of use, and the goal is to decrease, rather than increase, any administrative burden on customers opting for deemed incentives. Utilities are exploring higher deemed incentives for customers completing an audit as part of their application.

Deemed energy efficiency rebates for businesses will be part of the integrated strategy to promote energy efficiency with non-residential customers. The Statewide Commercial Deemed Team will hold regular conference calls and in-person meetings to share successes challenges, and best practices in delivering energy efficiency via deemed incentives. When appropriate, the Commercial, Industrial, and Agricultural segments will meet as a statewide entity to share successes challenges, and best practices in delivering energy efficiency to each market sector and associated sub-segments.

Commercial Deemed Incentives will work with the other sub-programs to design customer facing marketing materials that integrate EE offerings into a complete energy savings package that is focused on individual market segments.

**c) List of Non-incentive Commercial Energy Advisor Services**

The Commercial Deemed Incentives sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical consultation and application preparation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd through the process.

**5) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**See Attachment A - Table 3** – refer to the overarching program for quantitative baseline metrics

**b) Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**See Attachment A - Table 4** – refer to the overarching program for quantitative baseline metrics

**c) Program Design to Overcome Barriers**

The Statewide Commercial Deemed Incentives sub-program offers customers rebates to implement energy efficiency measures that have been identified primarily through standard utility energy efficiency audits, in-depth facility/process assessments or retro-commissioning studies. The sub-program is designed to help commercial customers overcome barriers to adopting energy efficiency program measures by reducing financial costs to the customers for the implementation of energy efficient measures that address major end-uses (e.g., lighting, HVAC, plug loads). Additionally, the easy-to-use online and paper application process reduces that hassle and transaction costs generally associated with commercial deemed incentives, where engineering calculations and pre- and post-monitoring may be required.

Furthermore, to ensure equity to all business customer segments, this program will continue to offer statewide-consistent, cost-offsetting itemized rebates to help customers with the cost of installing new energy efficient equipment.

Incentives and savings payouts will be based upon deemed measures in the DEER database or through work papers.

The Commercial Deemed Incentives sub-program delivers a consistent message statewide to commercial customers about the benefits, energy savings and GHG reductions that efficient technologies and “best operating practices” offer. This eliminates the barrier often run into by commercial customers of getting incorrect or out-of-date information from local networks.

The Commercial Deemed Incentives sub-program not only brings IOU incentive information to customers, but in many instances also provides additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, Tax incentives or other local sources of project funding.

In several instances, high efficiency Emerging Technologies are viable, but are unknown to facility owners and system designers and thus, are slow to penetrate the market, causing energy efficiency opportunities to be “lost.” The Commercial Deemed Incentives sub-program helps speed market penetration and associated energy savings for Emerging Technologies by offering “premium” incentives for emerging technologies that are “proven” but not widely employed in the markets for which they are intended (e.g., solid state lighting, advanced lighting controls).

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**d) Quantitative Program Targets**

The targets provide herein are best estimates, but nonetheless are forecasts.

**Table 5**

<b>Program Name</b>	<b>Program Target by 2013</b>	<b>Program Target by 2014</b>
Projects	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

The unifying objective of the Strategic Plan is to employ market transforming strategies to encourage marketplace adoption of energy efficient measures to a point that public investment in energy efficiency is no longer necessary (Section 1, page 4). The Deemed Incentives sub-program will support this effort by employing two of the five market transformation policies identified in the Strategic Plan. Specifically, the Program will offer “carrots” in the form of financial incentives to help pull the marketplace towards energy efficiency. The Deemed Incentives sub-program will also provide education and informational resources through marketing and program outreach efforts. Therefore, these program elements will work in concert to transform the market towards sustained, long-term energy savings.

The program will help to achieve the following near-term strategic goals as identified in Chapter 3 of the Strategic Plan:

- 2-3: Ensure compliance with minimum Title 24 codes – The Commercial Deemed Incentives sub-program only provides incentives for projects that exceed current Title 24 minimum baselines. Incentive rates will be created to encourage the implementation of advanced technologies (e.g., solid state lighting) to ensure deeper levels of energy reductions including implementation of the Office of the Future Consortium’s Phase 2 recommendations, “The 25% Solution”, which seek to reduce energy usage 25 percent below Title 24-2005 baselines.
- 2-5: Develop tools and strategies to reduce energy consumption in commercial buildings – The Commercial Deemed Incentives sub-program directly supports this effort by collecting data and conducting energy use and efficiency studies that, when collected over multiple IOU service territories, will be very helpful in supporting statewide efforts to establish a robust and useful knowledge base for the commercial sector.
- 2-7: Develop business models that deliver integrated energy management solutions – The Commercial Deemed Incentives sub-program will implement incentive mechanisms that will “reward comprehensive energy management retrofits” such as incentives for reaching certain stretch goals that produce significant energy savings

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

beyond an established baseline. Additionally the iBonus concept (see Section 6.e) will further encourage integrated solutions.

- 2-8: Improve utilization of plug load technologies – The existing incentive structure pays for energy reductions through plug load measures. Additional incentives that encourage greater penetration of plug load technologies may be required and will be developed to support technologies recommended by CEC, the Office of the Future Consortium.

**6) Program Implementation**

**a) Statewide IOU Coordination**

The Statewide IOU Coordination process, described in detail in the Statewide Commercial Energy Efficiency Program, will ensure continuous improvement and consistent implementation of all of the sub-programs. The discussion below will focus on how the IOUs will coordinate the Commercial Deemed Incentives sub-program specifically.

The Statewide IOU Coordination process for the Commercial Deemed Incentives sub-program will be as follows:

- Hold Regular Program Manager Meetings – The Deemed sub-program managers from each of the IOUs will meet on a regular basis. The sub-program managers will unify, to the extent possible, the implementation of program aspects such as Program name, Program delivery mechanisms, Incentive levels, marketing and outreach plans, and IOU program interactions. The sub-program managers will also discuss new innovations and develop solutions to overcoming implementation challenges. Therefore, the regular meetings will focus on issues specific to the Deemed sub-program only.
- Designate an IOU Program “Lead” – One of the sub-program managers that participates in the regular meetings will be the designated Deemed Program IOU “Lead”. The IOU lead will represent the sub-program at the regular Statewide Steering Committee meetings.
- Participate in Regular Steering Committee Meetings – The IOU lead will be responsible for attending the regular Steering Committee Meetings and sharing Commercial Deemed Incentives sub-program innovations, experiences and challenges that have the potential to impact multiple sub-programs or the core Commercial Energy Efficiency Program as a whole.
- Adopt Program Enhancements - Once the Steering Committee agrees that a specific innovation or implementation policy has merit on a statewide level; the IOU lead will distribute the information to the Deemed sub-program managers by email or at the next regular meeting for adoption and integration. Therefore, the IOU lead will act as a conduit feeding Deemed sub-program-specific information up to the statewide Steering Committee and distributing measures for adoption back to the Deemed sub-program managers.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Evaluate Program Enhancements – To complete the adaptive management loop, the Deemed sub-program managers will track the success of the adopted statewide enhancement or implementation policy and report any challenges or concerns at the regular Commercial Deemed Incentives sub-program meeting. The IOU lead will report any challenges that transcend the Commercial Deemed Incentives sub-program to the Steering Committee, who will determine whether further course corrections are needed.

By following the process stated above, the Commercial Deemed Incentives sub-program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the three year implementation cycle. Sub-program innovations and challenges will also feed productively into the higher-level Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.

The coordination and unity of all program aspects, such as Program name, Program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions, will be handled through this statewide coordination framework. However, these aspects will start off at a high level of statewide consistency. In rare cases, there will be IOU-specific deviations. Such instances where one IOU will favor a different approach than the other IOUs will be called out in italicized text throughout the Deemed Incentives sub-program.

**i. Program name:** Deemed Incentives

**ii. Program delivery mechanisms**

Deemed Incentives will be primarily delivered via paper or online application. Measures and incentive levels will be the same across IOUs, unless markets in the individual IOUs require adjustments based on research, communication with industry, and/or changes in the economic landscape.

**iii. Incentive Levels**

Incentive levels vary by measure type, but will be offered consistently across IOU service territory except where local market conditions necessitate different amounts. Higher incentive levels will be provided for Emerging Technologies to spur traction in the market as feasible. The level of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, therms, equipment cost, other market factors and cost effectiveness.

**iv. Marketing and outreach plans**

The Deemed Incentives sub-program will be marketed through IOU account executives, as well as through third-party programs, trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, Demand Response Program outreach, phone and e-mail support will be provided.

In 2013-2014, the IOUs will implement segmentation research and messaging.

Marketing campaigns will provide a wide range of action-oriented solutions targeted to “personas” identified through segmentation research. In addition, marketing efforts will be “bundled.” That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.

Marketing efforts will incorporate a variety of marketing tactics and activities to promote the solutions in the Deemed Incentives sub-program. Education, awareness and outreach efforts will rely on a combination of mass media and targeted communication channels to ensure that messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy-related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Additionally, IOUs may investigate piloting alternative channel marketing and outreach options that utilize community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. Local government partnerships, regional and community entities tend to interface with small businesses with some regularity; therefore, partnering with these organizations could prove to be a viable delivery option. A marketing and outreach campaign with Business Improvement Districts through our Local Government Partnerships, will serve to educate and increase engagement in a segment that is hard to reach.

**v. IOU program interactions**

The Deemed Incentives sub-program managers will partner with the programs as appropriate offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to co-brand program information and marketing collateral with this sector’s customers, to the extent possible. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, comprehensive information that discusses all resource efficiency issues will benefit the customer to the mutual advantage of the single resource programs.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Deemed sub-program incentives for energy efficient equipment that may also reduce air and GHG emissions.

**vi. Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that utilize the Deemed Incentives sub-program infrastructure. This will help ensure a consistent delivery of measure incentives and protect programs from undermining each other and detracting from achieving cost-effective energy savings.

**b) Program delivery and coordination**

**i. Emerging Technologies program**

To meet California's future energy efficiency goals, both in terms of overall usage and peak demand usage, new technologies and new applications of technology are needed. The Commercial Deemed Incentives sub-program will seek support from ETP's incubation and development of new technologies to meet the needs of the marketplace. ETP provides the pipeline of new technologies that the Commercial Deemed Incentives sub-program looks to incorporate to maintain a robust selection of energy savings equipment. The program will look to ETP to provide customers with technology information, validating effectiveness as an unbiased and neutral expert.

Deemed incentives will be primarily delivered via paper or online application. Measures will be the same across IOUs and incentive levels will also be aligned, unless markets in the individual IOUs require adjustments based on research, communication with industry, and/or changes in the economic landscape.

**ii. Codes and Standards program**

The Commercial Deemed Incentives sub-program relies on Codes and Standards to help maintain an updated and relevant list of measures that support savings. As codes and standards impact measures, the Commercial Deemed sub-program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into codes and standards. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward "low energy" or "zero net energy" buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) are made available as these technologies transition from research and development to the mainstream.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**iii. WE&T**

WE&T is a portfolio of training and information programs that showcase energy efficient equipment found on the list of measures offered in the Commercial Deemed Incentives sub-program. Dissemination of information takes place through energy centers, technology test centers, and information and training program offerings. During classes, time is dedicated to energy efficiency programs and how to participate. In 2013-2014, a program representative will be available to deliver the EE message and answer questions.

**iv. Program-specific marketing and outreach plans**

The Deemed Incentives sub-program will be marketed through IOU Account Executives, as well as through third-party programs, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by Account Executives, Demand Response Program outreach, phone and e-mail support will be provided.

The IOUs will continue to build on and refine marketing plans and strategies used in past portfolios in the 2013-2014 cycle. This will involve developing marketing plans to deliver targeted messages to specific customers that resonate with their values and needs with the goal of increasing the market uptake of deemed incentives. These plans will coordinate and create timelines for activities, present strategic campaigns, establish targets and metrics, and include a performance monitoring strategy.

The following will be used as marketing and outreach channels:

- Non-contracted equipment vendors are a key delivery channel of the Commercial Deemed Incentives sub-program. Emphasis will be placed on building awareness with more vendors in the territory and training vendors on how to participate effectively in the program.
- Community-based organizations (CBOs), faith-based organizations (FBOs), non-profit organizations, and non-government organizations (NGOs) with unique access and following are expected to be emphasized as delivery channels.
- Trade associations and industry networks
- Enabling partners (financial institutions, trade associations, service providers, law firms, environmental organizations)
- Unique channels that offer complementary value propositions from the customers' perspective (e.g., energy, water, materials management, recyclables, corporate citizenry).

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated among the IOUs utilizing the statewide coordination process described above.

**v. Non-energy activities of program**

Integrated Energy Audits (described in the nonresidential Audit sub-program) is the primary vehicle to promote project solutions that look across the various IOU DSM program offerings, as well as complementary options available through other entities (e.g., water agencies). The results of the ongoing Water Efficiency Pilot Program will identify potential opportunities to reduce water use and the potential for associated Energy Efficiency savings. Since some customers within the program sectors are major water users, this sector is well positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Programs.

**vi. Non-IOU program interactions**

The Commercial Deemed Incentives sub-program managers will partner with the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to co-brand program information and marketing collateral with this sector's customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, comprehensive information that discusses all resource efficiency issues will benefit the customer to the mutual advantage of the single resource programs.

With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Commercial Deemed Incentives sub-program incentives for energy efficient equipment that may also reduce air and GHG emissions.

**vii. CEC**

As of June 2012, PIER no longer exists. However, the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and project in coordination with the applied research of CEC..

**viii. CEC work on codes and standards**

Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**ix. Non-utility market initiatives**

The sub-program will support, educate customers, and facilitate such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**c) Best Practices**

To maximize program effectiveness, best practices in Program Design and Implementation will be employed and shared amongst IOUs. Areas of best practices for the Commercial Deemed Incentive sub-program approach include:

- Best practices in Program Design:
  - Regular communication amongst IOUs is critical to effective program design.
  - Identify qualifying products simply and effectively (Examples; ENERGY STAR®, CEE).
  - Seek input from industry in the development of new programs. The IOU programs are trying to change how an industry operates from manufacturer design to the customers purchasing and maintenance practices.
  - Industry participation increases program volume and speeds market transformation.
- Best practices in Program Implementation:
  - Strive to simplify messaging and participation for the customer. (Look for the ENERGY STAR label, purchase from a qualifying products list)
  - Understand the key motivators that drive an industry and use that information to market your program. Make certain outreach efforts make your program visible to your customers and the market that is catering to your customers.
  - Always communicate program marketing and advertising plans in advance to appropriate industry channels. Advanced notice allows industry partners an opportunity to leverage off of utility marketing efforts and reinforce the messaging we are trying to get across.
  - Statewide coordination is important as it makes it easier for national chains and manufacturers to understand and support IOU rebate programs. Statewide coordination also includes regular meetings to share industry contacts, marketing strategies and lessons learned. Coordinated statewide participation at relevant industry events has reduced administrative expenses through cost sharing arrangements.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**d) Innovation**

Innovative aspects of the program for 2013-2014 include persistent integration of new and emerging technologies into the program processes. This will manifest itself in an increased emphasis on plug load technologies (in support of the Strategic Plan) and by aligning rebates with the recommendations of the Office of the Future Consortium to help make their “25% Solution” a reality.

Additionally, incentive mechanisms that emphasize peak demand reduction, addresses current economic downturn and better motivate customers to participate in energy efficiency incentive programs will be pursued. During 2013-2014 program cycle new incentive structures will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance, including measure bundling incentives. The IOUs will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper energy savings.

Where possible, IOUs will use integrated approach to addressing DSM opportunities. Innovative aspects such as merging energy efficiency and demand response analysis and converting recommendations to projects under Retro-commissioning and/or nonresidential Audits, processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions will maximize customer adoption rates for most cost-effective energy management opportunities.

**e) Integrated/coordinated Demand Side Management**

Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other similarly related types of programs. While a successful program experience leads to repeat participation, there has been difficulty in cross pollinating similarly related types of programs with these candidates due to program-specific silos. To overcome the historic siloing of DSM, the Deemed Incentives sub-program will leverage lessons learned from SDG&E’s DSM efforts by offering comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that the two programs are at financial odds with one another, as both programs often reduce the potential for each other’s financial incentives. For example, energy efficiency may reduce the overall baseline by which the demand response program’s incentives are based upon. Since benefits from long term energy savings derived from technological measures outweigh the temporary demand reduction benefits derived from behavioral actions, the program will offer additional incentives for energy efficiency measures that enable demand

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

response when customers enroll, or are already enrolled, in demand response programs. In so doing, the program seeks to maximize the potential for both types of programs.

A secondary issue when integrating energy efficiency and demand response programs is that communications of both types of DSM program are often non-coordinated, since energy efficiency is typically technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer “event season” and wane throughout the remainder of the year. To overcome these differences, the program will offer Integrated and coordinated year-round marketing through consolidated applications, collateral, web sites, and events, where applicable. Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response programs in addition to energy efficiency programs.

The integration of energy efficiency and demand response programs presents several issues and, as stated previously, the sub-program seeks to overcome these issues by focusing on several tactics:

- Promotion and incentivizing of demand response enabling energy efficiency measures to ensure that energy efficiency is completed first to maximize potentials;
- Integrated and coordinated year-round marketing (e.g., applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g., customer size);
- Provide unified technical assistance through enhanced EE/DR Audits through the TA/TI Program to allow for cross-harvesting opportunities;
- Integrated presence on utility websites; and
- Regular coordination meetings between energy efficiency and demand response program management.

**f) Integration Across Resource Types**

Integration across resource types (e.g., energy, water, and air quality) will be explored. Examples include working with Water Agencies to co-promote Food Service appliances that save water and energy and working with Air Quality Management Districts to co-promote Boilers and Water Heating measures that save energy and improve air quality.

**g) Pilots**

Not applicable

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**h) EM&V**

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics,
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

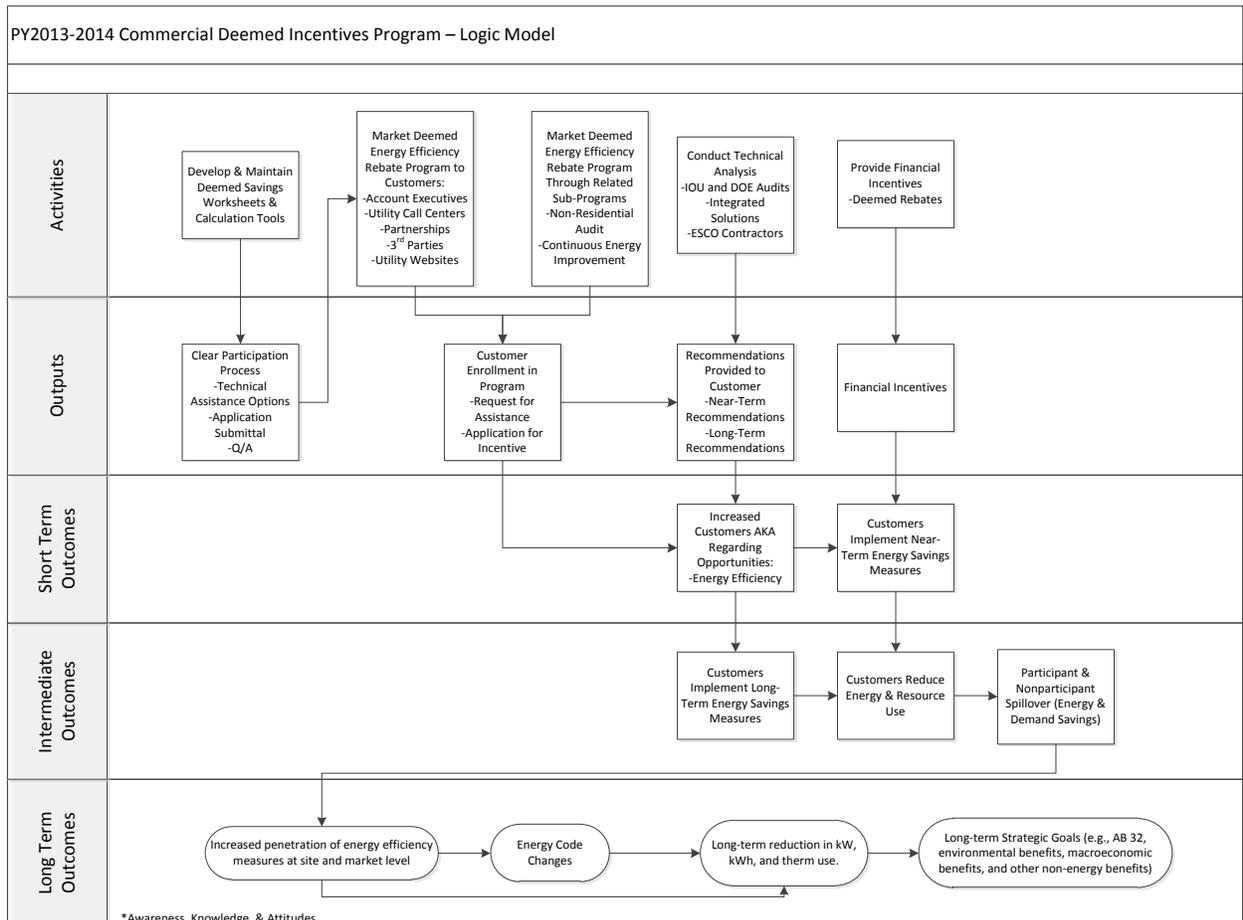

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 7. Diagram of Program

Please see the core program diagram.

## 8. Program Logic Model

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. As there were no revisions to the original logic model for the Commercial Deemed Incentives Program, this logic model is left unchanged.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name: Continuous Energy Improvement, core sub-program**  
**Program ID: SCG - 3709**  
**Program Type: Statewide Core Program**

2. **Projected Program Budget Table**

**Table 1 – reference the overarching program for budget details**

3. **Projected Program Gross Impacts Table – by calendar year**

**Table 2 – reference the overarching program for savings details**

4. **Program Description**

- a) **Describe Program**

The Commercial Continuous Energy Improvement (CEI) is a consultative service aimed at helping commercial customers engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution.

In 2013-14, CEI will be expanded to include select group of mid-sized non-residential customers. Available options to help target these customers may include an individualized, a small group, or a mass-market, remote deployment approach.

CEI will coordinate its services with the Commercial Energy Advisor sub-program offerings. CEI offers customers what can be considered the pinnacle of audit offerings guiding senior management to instill energy considerations in all management/business operational decisions and in long term energy planning.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Commitment**

CEI begins with a high-level management commitment to improving energy performance, which increasingly can be combined with other environmental and regulatory commitments that energy users are developing in response to market and political pressures. A corporate commitment sends the top-down message to employees, partners, shareholders and vendors that energy is a priority issue requiring attention – like safety – and also paves the way for establishing the required company resources required to implement the steps of CEI. These resources can include capital, personnel like energy champions or teams, or technical systems and software required for energy management.

Gaining true customer commitment can take time, but is critical. In implementation, utilities will formalize the Commitment phase with more intensive customers through a CEI participation agreement, which outlines the utility CEI services being offered as well as minimum customer expectations.

**Assessment**

Following Commitment, a comprehensive assessment is critical to identifying not only technical opportunities, but also systemic energy management practices and cultural shifts that can improve overall facility management practices and sustain continuous improvements towards long-term company targets. A component to the assessment will also include tools to help identify Energy Efficiency (EE) and Distributed Generation (DG) opportunities.

Based on screening criteria, utilities will offer comprehensive energy assessment services using vetted sources like (but not limited to) those described below, to develop a customer specific strategic energy plan.

- ENERGY STAR's Guidelines for Energy Management, housed on the ENERGY STAR website, provide step-by-step guidelines to support CEI in general, and also guide customers to ENERGY STAR's numerous assessment tools. This option is a low-cost resource for smaller and medium customers interested in CEI.
- Energy Management Assessment Tools such as Envinta's One-To-Five, Achiever, or Challenger software products offer professionally facilitated energy management assessment with company decision makers and explores management practices and company priorities to develop a CEI roadmap for energy goals and actions.
- Integrated Energy Audits provide an inventory of technical facility end-uses and energy efficiency, and self-generation investment opportunities. For a full description, see the Commercial Energy Advisor sub-program plan.

Benchmarking can measure the energy performance of a company, building, process, or piece of equipment against industry standards or comparable groupings. Benchmarking is a natural first step for the CEI process. Customers with multiple facilities find benchmarking useful to prioritize efficiency projects, track progress toward energy or GHG

## **2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan**

improvement goals or drive competition among similar benchmarked facilities. Units of measurement vary widely; for commercial buildings, the unit is energy used/square foot for a unit of time. Benchmarking can also be applied to other resources and environmental issues such as water use, CO<sub>2</sub>, and emissions.

### **CEI Planning**

Strategic energy planning involves setting energy goals and action plans around energy efficiency, demand response, and generation as appropriate. Planning for customers will typically involve Account Representatives and/or consultants. As is discussed in the Strategic Plan and in the Statewide Integration PIP, strategic planning can also include complementary non-energy considerations as well, such as GHG reduction, water efficiency, and waste-stream minimization, all which have embedded energy components.

Data and findings from a comprehensive customer assessment are critical in developing any comprehensive energy plan, including the results from technical audits or assessments, facility benchmarks, energy management assessments, and assessments of company priorities. This information is analyzed and used to develop realistic and achievable company goals and prioritized shorter-term tactics needed to achieve them. Energy plans should be living documents revisited and revised regularly.

Energy goals can vary widely and include elements such as resource utilization (“Company X will reduce its overall energy intensity by 3% over the next 3 years”), carbon reduction goals (“Company X will be carbon neutral by 2014”), or management oriented goals (“Company X will implement energy teams by 2013”). Goals can be stated in internal documents or can be made public through press releases as part of larger sustainability plans, which is increasingly important for large and public companies.

CEI will assist customers in developing and implementing action plans to execute the prioritized near-term activities in support of their company’s energy goals, as well as the resources, staff and schedule for tracking. Action plans typically includes activities such as:

- Prioritizing process systems or facilities based on benchmarking or company drivers,
- Identifying internal resources required to implement plans, and
- Developing project justification and incentive application documentation lists and detailed schedules.

### **CEI Implementation**

In the implementation stage, utilities partner with customers to identify technical support and utility and non-utility resources available to support implementation of projects, such as rebates, incentives, third party and government partnership programs, and state and national resources, including:

- Statewide Commercial Deemed Incentives

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Statewide Commercial Calculated incentives for new construction/tenant improvement, retrofit and retro-commissioning and/or repair
- Third-Party and Government Partnership programs (described in the statewide and local third-party filings)
- IOU and non-IOU financing options
- External and Internal engineer support

**CEI Evaluation and Modification**

In any continuous improvement program, evaluation is an ongoing process of comparing actual performance against company goals, targets and action plans. It may include:

- Repeating the benchmarking and system or facility baseline process annually,
- Assessing advancements in organizational and management practices that facilitate energy management improvements, or
- Evaluating cost savings per unit of product.

Regular evaluation will inform changes to goals and action plans moving forward.

**b) List of Measures**

CEI does not provide incentives to customers, but ultimately facilitates the customer's implementation of energy efficiency projects through incentive programs. However, depending on the outcome of the 2012 process evaluation, customer incentives may be offered.

**c) List Non-incentive Commercial Energy Advisor Services**

CEI is a non-resource program that provides comprehensive strategic energy planning and consulting services for commercial customers. These services include: energy management assessments, energy planning, baselining and benchmarking, project implementation support, customer recognition (e.g., "corporate sustainability awards"), and web-based energy resources.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

See Attachment A for Table 3 – Refer to the overarching program for metrics

**b) Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

**Table 4** – Refer to the overarching program for market transformation metrics

**c) Program Design to Overcome Barriers**

CEI is intended to address several market barriers that prevent wider adoption of energy efficiency practices. These barriers and the strategies to overcome them include:

- Lack of information – The CEI evaluation and modification process provides data that customers can use to reevaluate their commitment and/or modify their energy goals.
- Performance uncertainties – Through CEI’s comprehensive baselining and benchmarking assistance, customers will have access to real-time data that demonstrates how their facility is performing relative to their established goals.
- Organizational customs – The high-level customer commitment that is at the core of CEI increases the likelihood that corporate cultures that prevent successful implementation of comprehensive energy policies.

**d) Quantitative Program Targets**

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

Program Name	Program Target by 2013	Program Target by 2014
Number of Engagements	TBD	TBD

**e) Advancing Strategic Plan goals and objectives**

The program will help to achieve the following near-term strategic goals as identified in the Commercial chapter of the Strategic Plan:

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- 2-1: State/Local Governments and Major Corporations Commit to Achieve EE Targets

CEI seeks to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop a actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

- 2-2: Develop Tools to Reduce Energy in Commercial Buildings

As part of the implementation of CEI, the utilities will partner with energy industry peers, industry associations and Department Of Energy/CPUC sponsored labs and consultants, to enhance the use of existing tools, and develop new tools to assist commercial customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

- ENERGY STAR Portfolio Manager Commercial Benchmarking: Benchmarks customer facility against a national database of similar NAICS codes for an ENERGY STAR score (0-100), kBtu/sq ft-yr, lbs CO<sub>2</sub>/yr.
- Management Standard for Energy SME2000-2008
- DOE Superior Energy Performance
- ISO-50001

- 2-3: Develop Business Models to Deliver Energy Management Solutions

CEI's fundamental purpose is to achieve corporate level commitments from commercial customers to change their existing business models to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the commercial market sector.

## **6. Program Implementation**

### a) Statewide IOU Coordination

The Statewide IOU Coordination process will ensure continuous improvement and consistent implementation of all sub-programs. The discussion below will focus on how the IOUs will coordinate the CEI sub-program specifically. The Statewide IOU Coordination process for the CEI sub-program will be as follows:

- **Hold Regular Sub-program Manager Meetings** – The CEI sub-program managers from each of the IOUs will meet on a regular basis. The sub-program managers will

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

unify, to the extent possible, the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The sub-program managers will also discuss new innovations and develop solutions to overcoming implementation challenges.

- **Input to Program Sector Lead Meetings** – The CEI sub-program managers will communicate to their Program Sector Leads the CEI sub-program innovations, experiences, and challenges that have the potential to impact multiple sub-programs or the Program as a whole. When a specific innovation or implementation policy has merit on a Statewide-level, the Sector Lead will distribute the information to the CEI sub-program managers by e-mail for adoption and integration.
- **Evaluate Program Enhancements** – To complete the adaptive management loop, the CEI sub-program managers will track the success of the adopted Statewide enhancement or implementation policy and report any challenges or concerns at the monthly CEI sub-program meeting.

By following the process stated above, the CEI sub-program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the 2013-2014 program cycle. Sub-program innovations and challenges will also feed productively into the higher-level Program Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.

The coordination and unity of all program aspects will be handled through this statewide coordination framework. However, these aspects will start off at a high-level of statewide consistency. In some cases, there will be local IOU-specific deviations. Instances where certain IOUs favor a different approach than the other IOUs will be called out in italicized text.

- i. Program name:** Commercial Continuous Energy Improvement Program
- ii. Program delivery mechanisms**

As with other information and education sub-programs, CEI will be primarily delivered by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing and outreach efforts. Other delivery channels may also be developed.

Where applicable, the Utility's account representatives will support this activity within the statewide industrial sector, as well as third parties, government partnerships, and Utility local programs.

- iii. Incentive levels** - N/A. (CEI is a non-resource program).
- iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

CEI will be available to all commercial customers meeting certain eligibility criteria to justify the cost of the offering. Criteria will include, but not be limited to, customer energy use, complexity, number of facilities, energy decision-making structure, and environmental commitment or demonstrated motivation. Collateral materials such as fact sheets, how-to documents, Power Point slides, case studies, etc., will be produced and distributed during sales calls, public events, association meetings, and/or trade shows. In addition, sponsoring and/or holding recognition events that present customers with awards for achieving specific levels of efficiency, sustainability and/or integration will be explored as a means to promote greater levels of participation.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

CEI will include the CEC's Green Building Initiative program, DOE's "ISO plant certification" programs, EPA EnergyStar Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs as applicable.

**vi. Similar IOU and POU programs**

Over the next two years, the IOUs will seek to increase their interactions with the POUs as applicable to promote the CEI concept throughout the state. This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.

**b) Program delivery and coordination**

CEI includes the following coordination efforts:

**i. Emerging Technologies (ET) program**

CEI implementation will include identification and project development at specific customer sites with potential for Emerging Technologies program participation and demonstrations.

**ii. Codes and Standards program**

CEI implementation will include information about pending new Codes and Standards program that may affect planning or prioritization of retrofit or new construction projects.

**iii. WE&T efforts**

CEI implementation will integrate with WE&T efforts by providing CEI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

developing. IOUs will assess and support specialized **WE&T** training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

IOUs will also continue with **WE&T** coordination to bridge the linkages and integrate sector strategy approaches. Program costs will be shared with WE&T.

**iv. Program-specific marketing and outreach efforts**

CEI will be marketed through utility account executives, as well as through educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by account executives, outreach, phone and e-mail support will be provided.

In 2013-2014, marketing campaigns will provide a wide range of action-oriented solutions targeted to “personas” identified through segmentation research. In addition, marketing efforts will be “bundled.” That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment the IOUs will be better able to communicate with and serve customers.

Marketing efforts will incorporate a variety of marketing tactics and activities to promote the CEI sub-program. Education, awareness and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to help the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy-related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach will be coordinated among the IOUs utilizing the statewide coordination process described above.

**v. Non-energy activities of program**

CEI implementation will include non-energy activities such as recognition awards, local area or sector competitions, awareness campaigns, education about non-energy related LEED points and definitions, and use of computerized financial analysis tools and cost estimating and forecasting tools.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**vi. Non-IOU Programs**

CEI implementation shall include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies to support integrated efforts. The utility managers will partner with programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to develop co-branded program information and marketing collateral target to commercial-sector customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. Closer alignment with these other programs will be achieved in order to deliver the customer a more comprehensive solution. With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Commercial Calculated sub-program incentives for energy efficient equipment that may also reduce air emissions.

**vii. CEC Collaboration**

CEI implementation shall continually seek to promote the adoption of new technologies developed through the CEC research process and to expose customers to demonstration, research and/or pilot projects. The continuous improvement process envisioned by CEI will provide new equipment/processes, and methods that will enable customers to achieve energy efficiency “stretch” goals in a cost-effective manner.

**viii. CEC work on codes and standards**

The program will not be implemented with a direct linkage to codes and standards efforts. However, see Section 6.b.ii., above.

**ix. Non-utility market initiatives**

CEI will support Energy Management certification efforts (ANSI, ISO), engaging at the material level. Non-utility market initiatives such as education about federal tax incentives for energy efficiency investments is an example of a non-utility information and guidance that CEI sub program will provide customers.

**c) Best Practices**

CEI's approach applies the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the commercial market sector. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach can now be successfully implemented given the two-

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers.

**d) Innovation**

CEI is a new way of packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

**e) Integrated/coordinated Demand Side Management**

CEI includes project analysis and implementation support of recommendations of Statewide Integrated Energy Audits which provide customers with an inventory of facility end-use breakdown and energy efficiency, demand response and self-generation investment opportunities. Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other similar related programs, but because of siloing – thinking of programs as separate, unrelated efforts – this has proved difficult. To overcome the historic this, the CEI sub-program will leverage lessons learned from IDSM efforts by offering comprehensive, coordinated marketing and program delivery.

CEI is recognized as an integrated element by supporting the statewide IDSM program's goals and objectives, and the IOUs will increase IDSM messaging and coordination within CEI.

**f) Integration Across Resource Types**

CEI implementation shall include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies to support integrated efforts. IOU CEI sub-program managers will partner as appropriate with CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information, marketing collateral and financial incentive analysis with customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

In the effort to promote CEI, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, utility program managers will partner with the local water districts to produce co-branded marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects.

**g) Pilots**

N/A

**h) EM&V**

The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V Plan for 2013-2014 after the program implementation plans are filed. This may include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More detailed plans for process evaluation and other program-specific evaluation efforts cannot be developed until after the final program design is approved by the CPUC and in many cases after program implementation has begun, since plans need to be based on identified program design and implementation issues.

Once results of the 2010-2012 evaluations are ready, recommendations will be reviewed for modifying the CEI PIP accordingly.

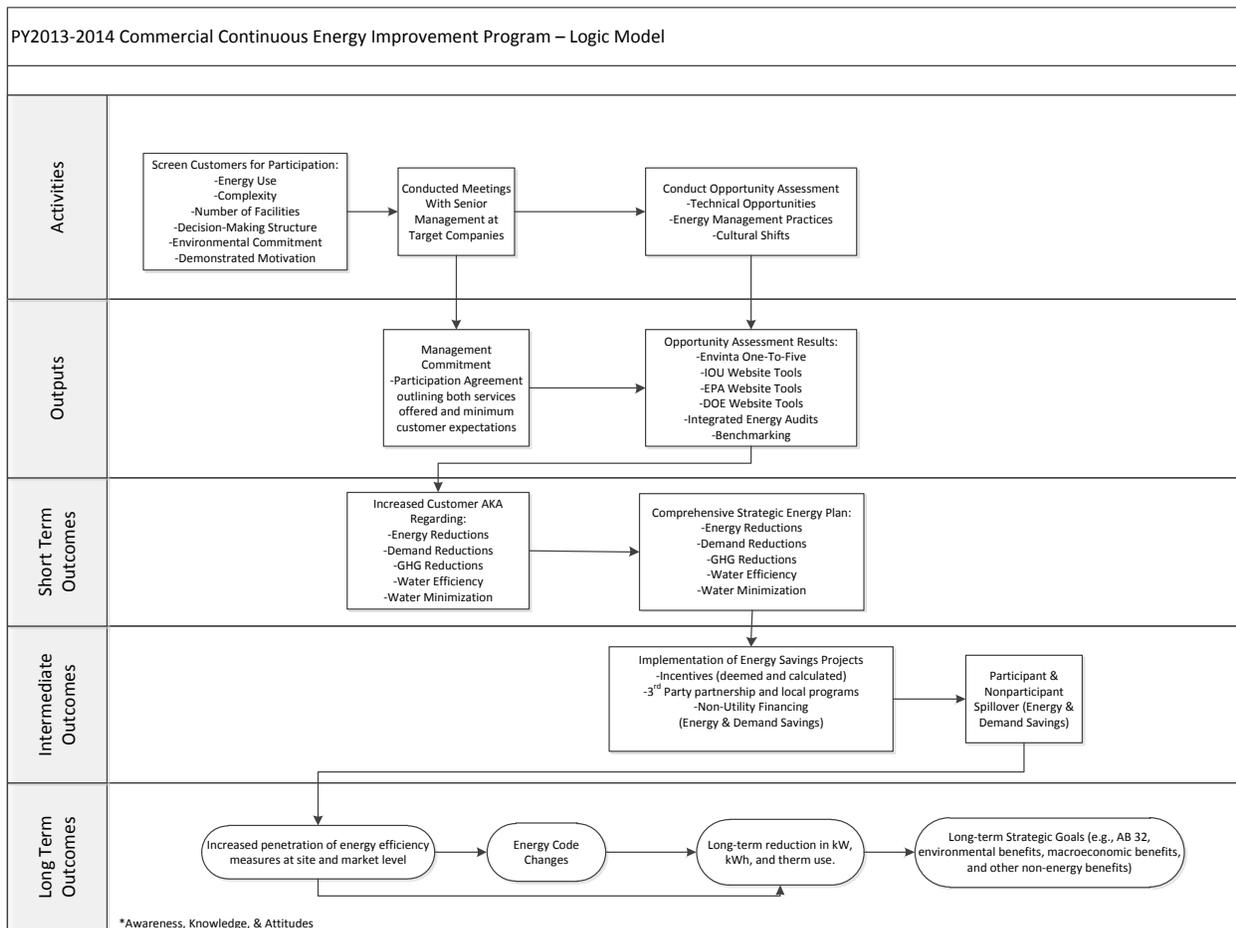

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 7. Diagram of Program

Please see the core program diagram.

## 8. Program Logic Model

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Continuous Energy Improvement Sub-program.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name: Commercial Nonresidential HVAC, core sub-program**  
**Program ID: SCG3712**  
**Program Type: Statewide Core Program**

**1. Projected Program Budget Table**

**Table 1 – reference the overarching program for budget details**

**2. Projected Program Gross Impacts Table – by calendar year**

**Table 2 – reference the overarching program for savings details**

**4. Program Description**

a) **Describe program**

The Nonresidential HVAC Sub-program is a statewide program that will continue the transformation process of California’s HVAC market to ensure that:

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- HVAC market business models for installing and maintaining heating and cooling systems change from commodity-based to value-added service business.

The IOUs are building towards this vision for HVAC by implementing a comprehensive set of strategies that builds on existing program, education, and marketing efforts and leverages relationships within the HVAC industry to transform the market towards a sustainable, quality driven market. Through this state-wide HVAC Sub-program and the Western HVAC Performance Alliance group of industry stakeholders, we will continue to gain a better understanding of the market response to our programs as well as the behavioral implications of the various market participants, and then actively revise/update strategies and programs accordingly, as guided by the California Long Term Energy Efficiency Strategic Plan (Strategic Plan).

Market transformation and direct energy savings and demand reductions will be achieved through a series of Sub-program elements that are summarized below:

**Upstream HVAC Equipment Distributor Incentive**

This sub-program element offers incentives to upstream market actors who sell qualifying high efficiency HVAC equipment. The logic that underscores this sub-program’s design is that a small number of upstream market actors are in a position to impact hundreds of

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

thousands of customers and influence their choice of equipment by increasing the stocking and promotion of high efficiency HVAC equipment. The upstream model cost-effectively leverages this market structure and existing relationships. The sub-program element also provides an online rebate application system to facilitate program participant sales and invoice tracking, which further reduces administrative costs as compared with paper application processing.

The upstream sub-program element is designed to adapt to market changes, and therefore the IOUs will continue working with relevant industry players to continually enhance the program to include new beyond-code upstream incentives.

**Nonresidential Quality Installation**

This sub-program element is applicable to installations of packaged HVAC systems, with a rated capacity up to 760,000 BTU/H. This sub-program element is based on the assumption that energy and demand savings are achievable through the application of QI in accordance with appropriate industry standards (e.g., ACCA, SMACNA and ASHRAE) applied to new commercial HVAC equipment.

This sub-program element intends to:

- Collaborate with EM&V efforts to quantify potential savings;
- Develop and implement a sub-program element focused on comprehensive, continuously improving installation activities that capture those savings and provide a high return on investment (ROI) to the end-user, thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan.

Nonresidential Quality Maintenance

**This sub-program element may represent one of the more creative aspects of the HVAC “Big Bold Energy Efficiency Strategy.” It is based on the assumption that there are energy and demand savings achievable through the regular application of quality maintenance (QM) procedures applied to existing nonresidential HVAC equipment. This sub-program element intends to implement a commercial maintenance program focused on comprehensive, continuously improving O&M activities that capture those savings and provide a high return on investment (ROI) to the end-user, thus driving the intense level of market transformation of the HVAC industry envisioned by the Strategic Plan.**

Equipment efficiencies are improved by applying diagnostic methods and the detailed HVAC inspection and maintenance tasks of American National Standards Institute (ANSI)/American Society of Heating, Refrigerating and Air Conditioning (ASHRAE)/Air Conditioning Contractors of America (ACCA) Standard 180.

The QM sub-program element is driven by Service Agreements between customers and contractors. The program incorporates training, marketing and incentives to help contractors understand and communicate the value of HVAC quality maintenance and energy efficiency. The program is also supported by commercial customer referrals from utility Sales and Service Representatives.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**The 2013-14 HVAC QM efforts will focus on continuous improvement, design enhancements, implementation barriers and collecting program data to help improve savings estimates.**

**b) List of Measures**

To achieve energy savings and the market transformation desired by the Strategic Plan, a variety of appropriate incentives is required to influence specific market actions. Incentives will be targeted to all levels of the HVAC value chain and will be available for equipment (Upstream) and services (Quality Installation and Quality Maintenance).

Additionally, in coordination with the Emerging Technologies Program, the Nonresidential HVAC QM program will continue to consider higher initial incentives for any HVAC emerging technologies that may be newly introduced to the marketplace via this sub-program. Once the new products have taken hold in the market place, any such incentives would be adjusted to reflect market conditions.

**Upstream HVAC Equipment Incentive**

Eligible measures may include packaged and split system air conditioners and heat pumps and other commercial HVAC equipment. Packaged units less than 65,000 Btu/hour are rated according to seasonal energy-efficiency rating (SEER) and steady state energy efficiency rating (EER). Units greater than 65,000 Btu/hour are rated according to EER and integrated part-load value (IEER). See the tables available on the program website [www.cainstantrebates.com](http://www.cainstantrebates.com) for current minimum qualifying efficiency ratings for each size category and corresponding incentive values.

Measure Category	Incentive Level (Not to Exceed)
<b>Air-Cooled Packaged and Split Systems &lt; 5.4 Tons of Cooling Capacity</b>	\$40 - \$450/ton
<b>Air-Cooled Packaged and Split Systems &gt;= 5.4 Tons of Cooling Capacity</b>	\$20 - \$150/ton
<b>Water- or Evaporative-Cooled Systems &gt;= 5.4 Tons of Cooling Capacity</b>	\$100 - \$300/ton
<b>Air-Cooled Chiller Equipment</b>	\$25 - \$90/ton
<b>Water-Cooled Chiller Equipment</b>	\$100 - \$300/ton
<b>Variable Refrigerant (VRF/VRV) Equipment</b>	\$100 - \$1,530/ton

Additional gas savings measures may be included in the program upon further evaluation of their viability and cost-effectiveness. New offering development evaluations will occur through ongoing IOU product development efforts and such continuous national efforts as the Consortium for Energy Efficiency's Commercial HVAC efforts.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Nonresidential Quality Installation**

At this point, providing a list of measures and incentive levels is premature, as a valid Quality Installation based Sub-program must be more fully planned and vetted through the Western HVAC Performance Alliance (WHPA), and since EM&V research under discussion through the HVAC EM&V Project Coordination Group (PCG) is needed to clarify a market-realistic baseline for the level of quality of HVAC installation services. This Sub-program will continue to be designed in 2013 for the 2013-2014 program cycle and therefore will not be providing incentives, at least not initially.

**Nonresidential Quality Maintenance**

Measure	Purpose	Incentive Level
<b>Customer Service Agreement Incentive</b>	Decrease customer's additional cost to upgrade to a QM Service Agreement. Keep the Service Agreement in place and units maintained by Contractor for 3 years	Up to \$3,836 per HVAC unit covered by agreement
<b>Contractor Service Agreement Incentive</b>	Compensate Contractors' for overhead costs related to Service Agreement sale and unit inventory.	\$75
<b>Contractor QM Tasks Incentive</b>	Reduce some of the additional costs of minor repairs that are required but don't receive incentives.	\$50
<b>Contractor EE Tasks Incentive</b>	Compensate Contractors' for completion of a specific set of tasks (see 4.1) required to bring the unit to minimum performance level (within 6 months of Service Agreement approval).  <b>EE Tasks Eligible for Incentives</b> Coil cleaning Fan Maintenance Refrigerant system test Refrigerant system service Economizer functional test Integrate economizer wiring Replace damper motor Replace controller/sensor Renovate linkage & other components Decommission economizer Replace thermostat Adjust thermostat schedule	Up to \$2,425 per HVAC unit

**c) List of Non-incentive Commercial Energy Advisor Services**

The Nonresidential HVAC sub-program will include a variety of non-incentive program services intended to support customers and contractors in achieving greater energy efficiency from HVAC upgrades and quality installations and quality maintenance. The list of such service includes:

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Education of the market on the value of selecting high-efficiency systems.
- Reports for customers of estimated energy savings, cost savings and carbon reductions for their HVAC systems treated under the program.
- Training for contractors on HVAC industry standards, sales and marketing of the value of those standards, and their implementation in the field.
- Education for customers on how HVAC industry standards can help them compare bids of contractor services and select those with high-road skills.
- Customer education about the benefits of establishing a long-term trust relationship with a qualified contractor, which can lead to future energy and cost savings, such as from better planning for future HVAC system replacements and the quality installation of those systems when replaced.
- Participating contractors can receive new business sales leads from utility company customer representatives.
- Improved comfort and indoor air quality for customers.

**5. Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Information**

The Nonresidential HVAC subprogram is a market transformation oriented program. See Section 7. below for market transformation information about the subprogram for 2013-2014 that replaces and enhances sections 5.a., 5.b. and 5.c. of the HVAC Program plan from 2010-2012, which had covered quantitative baseline and market transformation information, as well as program design to overcome barriers.

**b) Market Transformation Information**

See Section 7. below.

**c) Program Design to Overcome Barriers**

See Section 7. below.

**d) Quantitative Program Targets**

The program will achieve the following program targets:

**Table 5**

	Program Target for 2013	Program Target for 2014
<b>Ups tream HVAC Distributor Equipment Incentive</b>		
Tons of Equipment Cooling Capacity Incentivized	TBD	TBD
<b>Nonresidential Quality Installation (QI)</b>		

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Contractor Information Sessions	TBD	TBD
Participating Contractors	TBD	TBD
<b>Nonresidential Quality Maintenance</b>		
Commercial HVAC Systems Serviced	TBD	TBD
QM-Standard Service Agreements Signed	TBD	TBD
Participating Contractors that Sign at Least One QM-Standard Service Agreement	TBD	TBD

**e) Advancing Strategic Plan Goals and Objectives**

**Upstream HVAC Equipment Incentive**

- Support for Strategic Plan, HVAC Goal 1 to improve code compliance (and related SB454, which is now codified at Public Utilities Code Section 399.4)

HVAC distributors and manufacturers are not directly involved in the relevant code compliance market processes. However, they are supplying and helping with training contractors who are in the best position to ensure that quality installations occur, and who are often in a central role regarding permit compliance. The program will continue to engage these market actors for ideas and possible program modifications to enhance support of quality installations and permit compliance.

- Support for Strategic Plan, HVAC Goal 4 to improve market penetration of new climate-appropriate HVAC technologies

The Upstream HVAC sub-program element can serve as an incubator program for increasing the market penetration of promising HVAC technologies, in coordination with HVAC elements of the Emerging Technologies program.

The sub-program element will support improvement to HVAC equipment by providing incentives for various high-efficiency HVAC equipment categories. The eligible equipment categories are based primarily on the Consortium for Energy Efficiency HVAC specifications, which have multiple tiers designed to increase the market share of high-efficiency equipment. Furthermore, by leveraging the geographic area of the Upstream HVAC sub-program throughout California and other parts of the West, the result will be increased participation, which will lead to increased market share of high-efficiency equipment sufficient to argue for standards changes.

Both SMUD and NV Energy currently offer a similar Upstream HVAC program. The California Upstream HVAC Program will look to leverage these existing relationships in addition to engaging the DOE, Southwest Energy Efficiency Project

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

(SWEEP), Western Cooling Efficiency Center (WCEC), Western HVAC Performance Alliance (WHPA) and manufacturers to create a regional strategy to develop and increase the commercialization of new climate-appropriate HVAC technologies.

**Nonresidential Quality Installation**

The program will help to achieve the following near-term strategic goals as identified in Chapter 6 of the Strategic Plan:

- 2-3: Provide expanded QI/QM training – In order to participate in the program, contractors will be required to attend specific training sessions that introduce them to the appropriate industry standards.
- 2-4: Implement contractor accreditation program – Additional support will be made available through the sub-program to reinforce the WE&T Program's efforts toward increasing the level of technician certification.

**Nonresidential Quality Maintenance**

The program will help to achieve the following near-term strategic goals, as identified in Chapter 6 of the Strategic Plan:

- 2-1: Create a Statewide QI/QM Brand – QM will support the Energy Upgrade California branding as applicable.
- 2-2: Launch Statewide Brand – QM will support the Energy Upgrade California branding as applicable.
- 2-3: Provide expanded QI/QM training –HVAC service technicians will continue to be fully trained on the delivery of the measures promoted by the Program. Furthermore, feedback mechanisms will be utilized to continually evaluate technician performance to ensure that they are applying the information they are being taught in the QI/QM training. Nearly all economists and government leaders agree that negative impacts of the current worldwide financial crisis are likely to linger for years. Thus, the IOUs will work closely with the industry to reduce (and wherever possible eliminate) the direct costs of this transformative training to technicians and contractors who are willing and able to apply their skills and new tools to the task at hand.
- 2-4: Implement contractor accreditation program – Efforts will be made to promote NATE certification.
- 2-5: Develop standards for on-board diagnostic functionality – Evaluating the use of hand-held and other types of diagnostic systems in the field will help determine viable protocols for commercial applications.
- 2-6: Prioritize in-field diagnostic approaches – Conducting the appropriate level of research into existing diagnostic and verification approaches will provide the IOUs and the HVAC industry with the information necessary to target future efforts based on quantifiable energy efficiency benefits.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**6. Program Implementation**

**a) Statewide IOU Coordination**

The IOUs will jointly participate in California’s nonresidential HVAC efforts to achieve real market transformation. In order to accomplish this task, the IOUs will use the principles of adaptive management and follow a structured process to continuously update and enhance the program throughout the two-year implementation cycle. The process will be as follows:

- Designate an IOU Program Lead – The process for adaptive management will begin with each IOU designating an HVAC Program Lead. The lead will be the conduit through which information between IOUs will flow and will investigate new innovations, special accomplishments and challenges faced by sub-program managers and the managers of cross cutting statewide programs within their own IOU. Where such innovations or challenges intersect HVAC and show potential for improving the HVAC program, the Program Lead will present such information to a quarterly HVAC Program Management Team meeting.
- Hold HVAC Program Management Team Meetings – Meetings will be held at least quarterly, individual innovations and accomplishments experienced in one IOU will be transmitted to all IOUs. The HVAC Program Management Team will evaluate the innovations and accomplishments of the individual IOUs, hear ideas for course corrections and overcoming challenges, measure the HVAC program’s progress against statewide metrics and goals and prepare summations for presentation to the Western HVAC Performance Alliance.
- Adopt Program Enhancements – Once the HVAC Program Management Team agrees that a particular idea or innovation has merit on a statewide-level, each IOU program lead will distribute the information to their sub-program element managers for adoption and integration as appropriate. In some cases, it may be necessary to invite the sub-program element managers to the HVAC Program Management Team to get their feedback and ensure they receive the same message.
- Evaluate Program Enhancements Against Statewide Targets – To complete the adaptive management loop, the HVAC Program Management Team will track the program’s accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results<sup>55</sup>. The HVAC Program Management Team will determine whether future course corrections are needed, and if so, “activate” a fresh start of the adaptive management cycle to generate the improvements necessary to stay on track.

Additional areas of program coordination include:

- i. **Program name:** Nonresidential HVAC Sub-program

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**ii. Program delivery mechanisms**

The Nonresidential HVAC Sub-program is the umbrella activity that encompasses the three sub-program elements summarized above in Section 4.a. The IOUs will deliver the Sub-program through a combination of third-party vendors and internal administrative staff. The Sub-program will be delivered in collaboration with existing industry infrastructures in order to increase its overall effectiveness. Program guidance will be provided to the CPUC/IOUs through the Westem HVAC Performance Alliance as described below. The program will be targeted to consumers, contractors and distributors to create a push/pull dynamic that influences sustained market changes.

**iii. Incentive levels**

See Section 4.b above for more information on sub-program measures.

**iv. Marketing and outreach plans**

Specific outreach efforts will be made to the industry to keep them engaged with IOU programs and in the Strategic Plan process. On a macro level, this outreach will occur through the Westem HVAC Performance Alliance. On a micro level, each sub-program element has specific tactics in place to engage the industry in its own particular demand reduction, energy savings and market transformation objectives

The Upstream sub-program element will explore outreach activities to upstream market actors in other geographic areas that ship into and across service territories and will continue communication with the industry to see where additional collaboration can occur to maximize marketing and outreach resources.

The IOUs will continue to develop common outreach materials, with feedback from market actors to enhance their effectiveness. These marketing materials will only be available to participating contractors, and will leverage IOU and other statewide branding efforts.

**v. IOU program interactions**

The IOUs are engaged in ongoing collaboration with the CEC and other agencies via the Codes and Standards process and will be able to coordinate and communicate voluntary programs and incentives with mandatory codes that become enacted for the future. Increasing the communication regarding the Strategic Plan will allow all entities to move and plan towards the same objectives.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

In order to support the need for increased code compliance, the sub-program will continue to cooperate with CEC training and other compliance support activities targeted at local building departments. Such activities will also be used to promote the economic and performance benefits of QI/QM. The sub-program will also continue to coordinate its activities with IOU local government partnerships, third-party programs and Codes and Standards activities to ensure that code compliance becomes fully integrated into these programs.

**vi. Similar IOU and POU programs**

As mentioned in Section 5.e. above, the three IOUs and SMUD implement the same or very similar Upstream HVAC Equipment Incentive Program.

As a result of increased federal equipment efficiency standards, many utilities across the country have begun to offer service-based programs that independently offer measures such as RCA and Duct Sealing. It is expected that the HVAC QM Program could stimulate a paradigm shift by delivering a comprehensive suite of maintenance services that comply with ASHRAE/ACCA/ANSI Standard 180, designed to address the full range of efficiency measures available for commercial HVAC systems.

POUs manage many different types of HVAC programs. However, none of them seek to accomplish the aggressive market transformation goals being proposed by the IOUs. Via the Western HVAC Performance Alliance, the IOUs will continue seek to increase their interactions with the POUs to better align IOU and POU HVAC programs. This may involve increasing awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.

**b) Program Delivery and Coordination**

The program will be coordinated with the following activities:

**i. Emerging Technologies program**

The program is expected to interact extensively with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment and the advancement of energy efficient climate-appropriate HVAC technologies.

**ii. Codes and Standards program**

The responsibility for HVAC codes and standards issues has been given to the Statewide Codes and Standards Program. This ensures that the code-based solutions are consistent with that program's other activities. The Codes and Standards PIP describes the specific actions that the Program will employ to address HVAC.

As technologies advance and market penetration increases to an acceptable level, the

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

minimum threshold for eligibility in California can increase to lock in the higher efficiency levels and continue an upward level of efficiency for HVAC equipment.

Coordination of HVAC, Codes and Standards and Emerging Technologies activities will be realized through regular interactions of statewide program teams to discuss program integration and implementation issues.

**iii. WE&T efforts**

The workforce education and training needs for the HVAC industry will be managed through the Statewide IOU Workforce Training and Education (WE&T) Program umbrella. However, the WE&T activity will be coordinated with the statewide HVAC Sub-program activity to ensure that the individual efforts are complementary.

Participating contractors in the HVAC sub-program will be required to attend program-specific QM training in order to participate in the programs.

The IOUs will leverage relationships with upstream market actors established through this sub-program to extend the delivery of training modules developed through the HVAC elements of the statewide WE&T Program.

**iv. Program-specific marketing and outreach efforts**

The primary outreach vehicle between the Upstream sub-program element and program participants is via the website: [www.cainstantrebates.com](http://www.cainstantrebates.com) and other electronic communication (e.g., e-mail and newsletters). The cost of operating this website is shared between the participating IOUs and POUs. Additional marketing and outreach activities exist through personal contact between the program staff and program participants. Targeted QI/QM marketing materials can be distributed to contractors via these established upstream channels.

Marketing support will be available for participating HVAC service contractors in order to promote the Statewide QI/QM efforts. Such support may include exclusive promotion on IOU websites, brochures and other leave-behind materials that contractors can use to promote QI/QM and their involvement with the sub-program.

The Nonresidential HVAC sub-program will coordinate marketing activities with other offerings within the Commercial program to create a seamless customer experience.

**v. Non-energy activities of program**

The direct energy benefits of the program result from promotion of high efficiency HVAC systems and the quality installation and maintenance of new and existing

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

systems. Other activities will be required to support these energy savings goals. These activities include significant efforts in program design enhancements and coordination, technology evaluation and integration, contractor training and consumer marketing.

The program will continue to be active in a number of non-resource and market transformation activities that are required to ensure that the HVAC industry is fully involved in the development and implementation of the many tactics required to address the short and long term goals of the Strategic Plan. One such activity is the Western HVAC Performance Alliance (WHPA). The WHPA is necessary to keep the industry engaged in the Strategic Plan process and to provide guidance and support for the implementation of the various tactics required to transform the industry. Mindful that HVAC industry organizations are not traditionally structured, staffed or allocate resources to contribute the level of involvement envisioned by the Strategic Plan, the HVAC Convener's Report concluded that: *"The agencies and utilities should work together to ensure the working group is adequately funded to meet its responsibilities"*

The WHPA involves high-level HVAC industry stakeholders—such as manufacturers, distributors, contractors, associations, organized labor and influential end user/customers—to coordinate industry sponsorship of and participation in HVAC strategies. Membership also includes and is targeted at other key players, such as the CPUC, California Energy Commission, utilities, building owners/managers, university researchers, consumers, and the Federal Government.

As a communication and coordination entity for HVAC energy-saving collaboration among IOUs, ED, other state and local government entities, and a broad set of HVAC industry and market stakeholders, the WHPA is chartered 1) to champion (coordinate, guide, prioritize, track and facilitate the implementation and evolution of) the HVAC Action Plan in support of the Strategic Plan and 2) to provide thoughtful input into IOU HVAC Energy Efficiency (EE) Program efforts.

**vi. Non-IOU Programs**

The Upstream sub-program element, in collaboration with the ET Program, will leverage its involvement with the U.C. Davis Western Cooling Efficiency Center and other industry and academic efforts to continually evaluate and include new equipment technologies as they become more commercially viable.

The IOUs will take an active role in Consortium for Energy Efficiency (CEE) activities to ensure that California's quality needs are appropriately reflected in the ongoing CEE specification-setting efforts.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

The program will interact with the HVAC industry to develop and introduce increasingly stronger QM standards that ensure systems are operating in their most efficient state.

The Program will remain engaged with CEC, CARB, DOE and other government agencies responsible for regulating various aspects of HVAC equipment, services and training.

**vii. CEC**

The Program will interact extensively with the ET Program to ensure the proper focus on remote and on-board diagnostic equipment and climate-appropriate HVAC technology advancement and market adoption.

**viii. CEC work on codes and standards**

See Section 6.b.ii. above.

**ix. Non-utility market initiatives**

The tenets of QI and QM are being actively pursued by leaders in the HVAC industry itself. Air Conditioning Contractors of America (ACCA) has taken the lead in this national effort by developing various ANSI- recognized QI and QM standards. These standards have been widely adopted throughout the industry (e.g., AHRI, ASHRAE, CEE, ENERGY STAR, Utilities). Other organizations have also developed processes designed to improve the operating efficiency of HVAC systems (e.g., SMACNA, NCI). The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards that drive increased energy savings for customers.

**c) Best Practices**

The Statewide HVAC Program demonstrates several examples of programmatic best practices. First, the Program involves the HVAC industry in all aspects of the program including public policy, program design and implementation – both formally through the Western HVAC Performance Alliance and informally through various ad-hoc working groups. Industry involvement is a crucial step in achieving the desired market transformation goals. Second, the Program uses an adaptive management process, as described in Section 6.a, to ensure that the Program is responsive to the changing market environment. Included under this process are inter-utility coordination meetings between HVAC, Emerging Technologies and Codes and Standards program managers to ensure these three programs are well coordinated and implemented consistent with the goals of the Strategic Plan. The Program includes the appropriate level of focus on technology issues through the close involvement with the Emerging Technologies program to advance the

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

various technological and policy issues required to meet the deep energy savings and demand reduction goals desired by the Strategic Plan.

The use of industry-accepted design, construction and maintenance standards represents a quality-oriented best practice in air conditioning system installations and maintenance. Industry standards have been developed and vetted by national committees of industry experts and represent the best available information to use for program design. Additionally, networking through organizations such as CEE and the WHPA will provide opportunities for frequent feedback on QI and QM efforts being implemented within California and across the country.

In the Fall of 2007, ACEEE awarded the “Exemplary” Award to this Upstream sub-program element design. This essentially designated this Upstream program model as the highest performing program to promote HVAC equipment as compared to all programs across the United States.

**d) Innovation**

The Statewide Nonresidential HVAC Sub-program takes an innovative approach to program design through its implementation of a multi-faceted effort to engage all levels of the HVAC value chain. Each sub-program element under the umbrella and in those within the Residential HVAC Sub-program is designed to influence specific market changes. Within the sub-program elements, innovative techniques such as co-branded marketing and workforce training through existing industry channels will be employed to increase the program’s effectiveness. In addition, technical innovation is achieved specifically through the HVAC sub-program’s coordination with a dedicated advocacy effort to advance the state-of-the-art in vapor compression cooling and fault detection and diagnostics within the Emerging Technologies program.

A critical component of the Upstream sub-program element is its use of a web-based application and participation tool that provides transparency to both the program participants as well as the host IOU to be able to see what is occurring for applications that involve them. That this system allows participants to know the status in aggregate or down to a customer application level makes participation easy and efficient. For program participants, a paperless system is critical for ease of participation and for utilities there is reduction in cost per kWh saved from administrative costs over a paper review process. Designing and delivering the QI sub-program program element through active partnership with the industry will increase the likelihood of its success, as will the use of industry-accepted standards for QI as the foundation for activities.

The innovation of the QM sub-program element exists through the adoption of a comprehensive maintenance approach based on industry-accepted standards. A more comprehensive maintenance effort that delivers well-documented energy savings sets the standard for HVAC efficiency programs. Furthermore, delivering this program through active partnership with the industry will increase the likelihood of its success. Finally,

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

innovation results through a continuous improvement process that will be employed to evaluate the viability of offering additional incentives for installations that exceed established program standards.

**e) Integrated/coordinated Demand Side Management**

As with most HVAC oriented programs, the primary source of integration exists between energy efficiency and demand response activities. At a minimum, all marketing materials developed to support QI and QM sub-program elements will cross promote DR to educate customers on the availability of IOU DR programs. Required contractor training will be designed to include a discussion on DR programs and participating contractors will be required to deliver DR information as part of their customer sales efforts. The IOUs will also explore combined EE and DR opportunities within various HVAC distribution channels.

**f) Integration Across Resource Types**

The program can be designed to support CARB's efforts to regulate GHGs by providing consumer information on the phase-out of existing refrigerants and the move to zero ozone depletion potential (ODP) refrigerants with the customer's maintenance invoice. Such information will seek to influence the customer's adoption of newer equipment by explaining the likelihood of increased maintenance costs as existing refrigerants become less available.

**g) Pilots**

No pilot programs are planned as part of this sub-program effort, though activities associated with improving QI and/or QM may be piloted before full implementation to ensure more coherent market adoption on roll-out.

**h) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. To support the continuous improvement envisioned by the adaptive management process and to fully address the intricacies of the program design, appropriate EM&V activities will be conducted as coordinated by the HVAC EM&V Project Coordination Group (PCG) and overseen by the CPUC.

Routine evaluation: the Upstream sub-program element will utilize the online incentive application system to track the sale of high-efficiency equipment from year to year. Reports can then be created to show the percent of equipment incentivized in tons based on SEER or EER. These reports will be prepared every year and compared to the previous accomplishments, and will determine whether the program is achieving goals.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**7. Market Transformation Information**

**The Nonresidential HVAC subprogram is a market transformation oriented program. The following information replaces and enhances Sections 5.a., 5.b. and 5.c. above of the HVAC Program plan from 2010-2012, which had covered quantitative baseline and market transformation information, as well as program design to overcome barriers.**

**a) Summary of the market transformation objectives of the program:**

The Nonresidential HVAC Sub-program will continue the transformation process of California's HVAC market to ensure that:

- HVAC technology, equipment, installation, and maintenance are of the highest quality;
- Quality installation and maintenance practices are easily recognized and requested by customers;
- The HVAC value chain is educated and understands their involvement with energy efficiency and peak load reduction; and
- HVAC market business models for installing and maintaining heating and cooling systems change from commodity-based to value-added service business.

**b) Description of the market, including identification of the relevant market actors and the relationships among them:**

- The three central functions of heating, ventilating, and air-conditioning (HVAC) are interrelated, especially with the need to provide thermal comfort and acceptable indoor air quality within reasonable installation, operation, and maintenance costs. In modern buildings the design, installation, and control systems of these functions are integrated into one or more HVAC systems.
- The HVAC industry is a worldwide enterprise, with roles including operation and maintenance, system design and construction, equipment manufacturing and sales, and in education and research. The HVAC industry was historically regulated by the manufacturers of HVAC equipment, but regulating and standards organizations such as HARDI, ASHRAE, SMACNA, ACCA, Uniform Mechanical Code, and International Mechanical Code have been established to support the industry and encourage high standards and achievement.
- For very small buildings, contractors normally "size" and select HVAC systems and equipment on behalf of end-use customers. For larger buildings, building services designers and engineers, such as mechanical, architectural, or building services engineers analyze, design, and specify the HVAC systems, and specialty mechanical contractors build and commission them. Distributors stock equipment from

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

manufacturers in local regions and sell HVAC systems to contractors or building services companies. Building permits and code-compliance inspections of the installations are normally required for all sizes of buildings.

**c) Market characterization and assessment of the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies:**

Successful market transformation programs first and foremost need to be designed specifically to address market transformation. “The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)<sup>56</sup>” The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>57</sup>, but also reflects the CPUC’s directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful market transformation programs have involved multiple organizations, providing overlapping market interventions<sup>58</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities will continue to work with the CPUC and all stakeholders to help achieve market transformation while meeting the immediate energy, demand, and environmental needs.

Provided that HVAC is allotted sufficient EM&V funds, the statewide team will build on the growing body of HVAC research in California to ensure the relationships/dynamics among market actors, including identification of the key barriers and opportunities to advance demand side management technologies and strategies have been studied to inform future program decision-making.

**Key Barriers:**

**Lack of value proposition awareness**

- **Performance uncertainties:** Previous research has been conducted on the energy savings achievable through HVAC system maintenance measures such as RCA and Duct Sealing, but despite all this research many performance uncertainties still exist, and furthermore, this research has not been able to effectively demonstrate the full energy savings benefits of QI/QM;

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- End-use customers do not clearly recognize the loss of energy efficiency performance benefits of a HVAC system if it is not properly installed and maintained, and do not recognize without assistance the value over time of purchasing a high-efficiency system versus a standard-efficiency one.

Availability of higher-efficiency equipment

- Stocking patterns of equipment follow demand, and since customers do not yet well appreciate the value of energy efficiency, HVAC equipment stocking in local distribution centers tends toward lower price, standard-efficiency systems. Without program intervention until market transformation occurs, customers who want to purchase higher-efficiency systems suffer delays from waiting for systems to be shipped from other locations, or just select standard-efficiency systems to avoid delay.

Search costs for qualified QM and/or QI contractors

- Customers do not appreciate the energy efficiency benefits of QI and QM, and suffer from a lack of information, time, and resources to assess their own energy efficiency opportunities.

Commoditized business model practices

- Bounded rationality: It is logical to assume that the HVAC industry would want to take the necessary training required to deliver high quality service; however, market dynamics have not supported such logic as the industry has largely become commoditized and low price/low quality typically wins out. Equipment stocking patterns have followed this same dynamic, such that customers who may seek high-efficiency systems have had to wait for systems to be shipped from outside of California;

Organizational customs:

- The HVAC industry has largely become commoditized into an industry driven by low costs and quality where quality is assumed but not understood or valued by the customer. This is a result, in part, of contractors having minimal success in communicating the value of QI/QM to consumers and consumers not understanding the linkages between comfort and energy use.

- d) Description of the proposed intervention(s) and its/their intended results, including which barriers the intervention is intended to address:

Historically, the nonresidential retrofit programs directed toward customers and contractors have had very low uptake rates on high-efficiency HVAC systems, plus there is very little understanding in the market of the value of quality maintenance and installation services. Consequently, the critical foundation required for achieving HVAC market transformation consists of two main strategies:

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Continue to leverage the high level of participation in the Upstream sub-program element to ensure availability in the market and drive sales of high-efficiency equipment, and
- Build customer and contractor participation in the HVAC Quality Maintenance program element, since it is designed to provide an evergreen foundation across a broad customer base of existing HVAC users for achieving deep energy savings across HVAC and other programs.
- The QM program element incorporates training, marketing and incentives to help contractors understand and communicate the value of HVAC quality maintenance and energy efficiency.
- This program element is driven by Service Agreements between customers and contractors, establishing an on-going relationship of trust that also then enables better decisions to be made about replacement of equipment with high-efficiency systems and the proper quality installation of those systems.
- The resulting increase in market share of high-efficiency equipment and quality installation and maintenance services then allows increased levels of customer, installer, and distributor/manufacturer knowledge and interest in these systems, which should then make it easier to achieve further increases in the market share of these energy saving practices.

Program Intervention to Overcome Barriers

Lack of value proposition awareness

- By quantifying the energy efficiency benefits of QI/QM, the benefits of QI/QM (as well as those “premium” HVAC services that prove to exceed the ANSI QI/QM standards) will be better understood by program participants. It is our goal to discover the evidence, and expected return on investment (ROI), that customers will require to authorize payment for these measures when subsidies are removed. Via the Upstream sub-program element, the delivery process of information about high-efficiency units is streamlined. Delivery from distributors and manufacturers through contractors will provide consistent information on the benefits of energy efficiency and reduces the need for end user analysis, thus allowing more customers to see the benefits of implementing energy efficiency projects/measures;

Performance uncertainties:

- The innovative diagnostic methods and technologies used by the QM program element set it apart from tune-ups and other HVAC maintenance efforts. Program measures include a thorough site assessment and repairs well above and beyond routine HVAC unit maintenance. The methods provided allow contractors enrolled in

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

the program to precisely evaluate commercial customers' HVAC units and subsequently improve unit efficiency and realize energy savings.

Availability of higher-efficiency equipment

- The Upstream incentives ensure product availability to influence the decision maker at the time of purchase or service.

Search costs for qualified QM and/or QI contractors

- By encouraging contractors to promote the concepts and value of quality maintenance at the time of system installation, customers will be more likely to regularly maintain the system and be assured that the energy efficiency performance benefits of their new system will continue throughout the life of their system.

Commoditized business model practices

- Bounded rationality: The sub-program incentives and promotion of qualified participating contractors encourage the HVAC industry to want to take the necessary training required to deliver high quality service;

Organizational customs:

- The program effort is designed to help demonstrate the value proposition of a high quality contracting business and educating consumers on the energy benefits of QI/QM. Additionally, incentives to upstream market actors encourage the development and promotion of new energy-efficiency technologies and tiered incentive structure to build towards meeting future codes and standards changes.

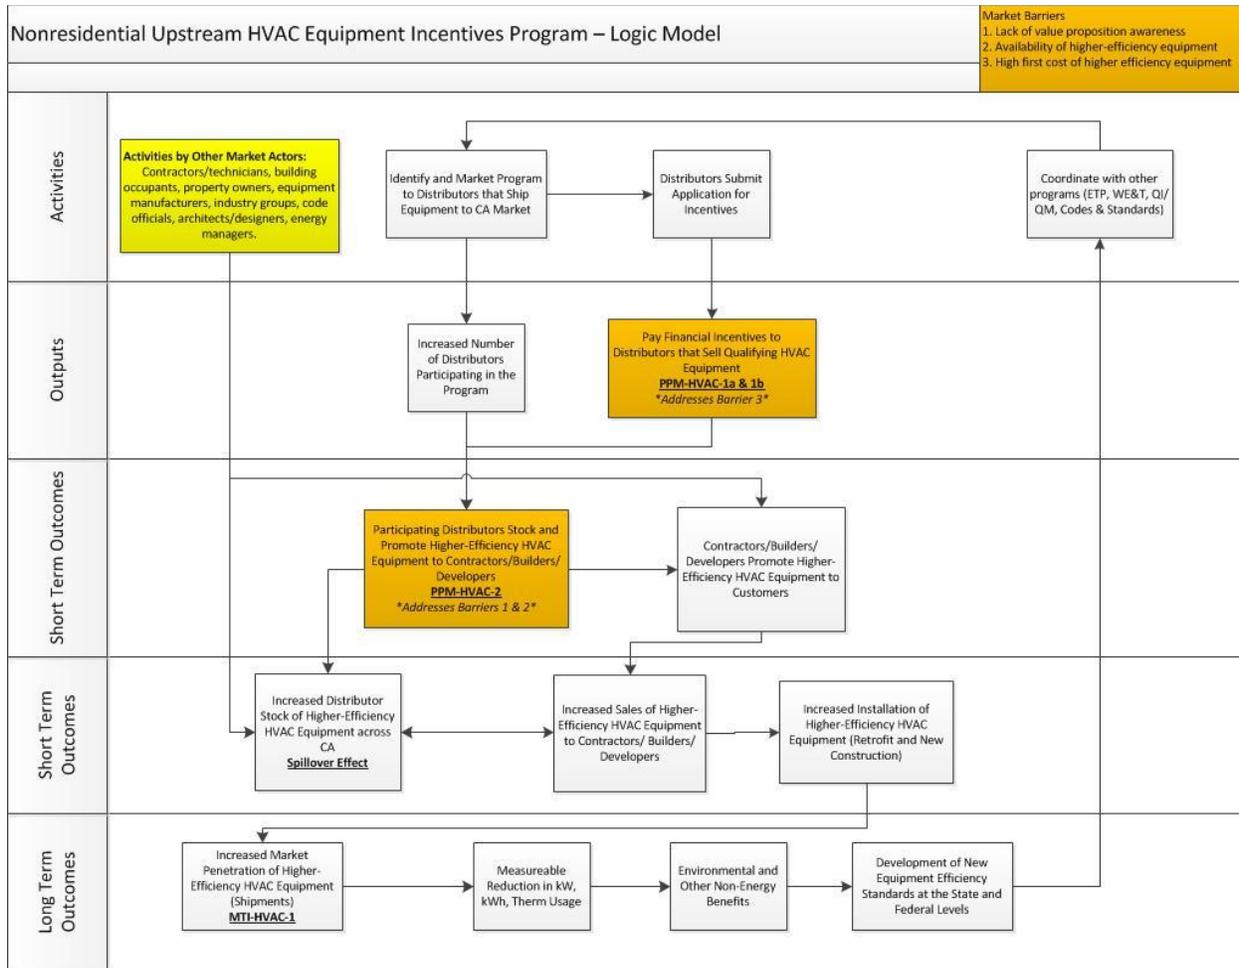

Additionally, several other issues could potentially influence sub-program design for Quality Installation, including:

- Other organizations have established processes and procedures for QI. These processes should be evaluated to determine how well they perform in comparison to minimum QI standards.
- Lack of industry consensus on QI standards and technical protocols
- Overcoming market barriers to exceeding Title 24 Standards
- Cost-effective constraints arising from limited savings for QI measures exceeding Title 24.
- Forging sustainable HVAC industry and market actor support.
- Addressing challenges in standard applicability across a range of commercial building types and HVAC systems.
- True energy savings measurement procedures.
- The WHPA “Road Map” noted that while of both the Title 24 and ACCA standards mandate distribution system evaluation and specify limits for allowable leakage, the Nonresidential QI committee concluded that:

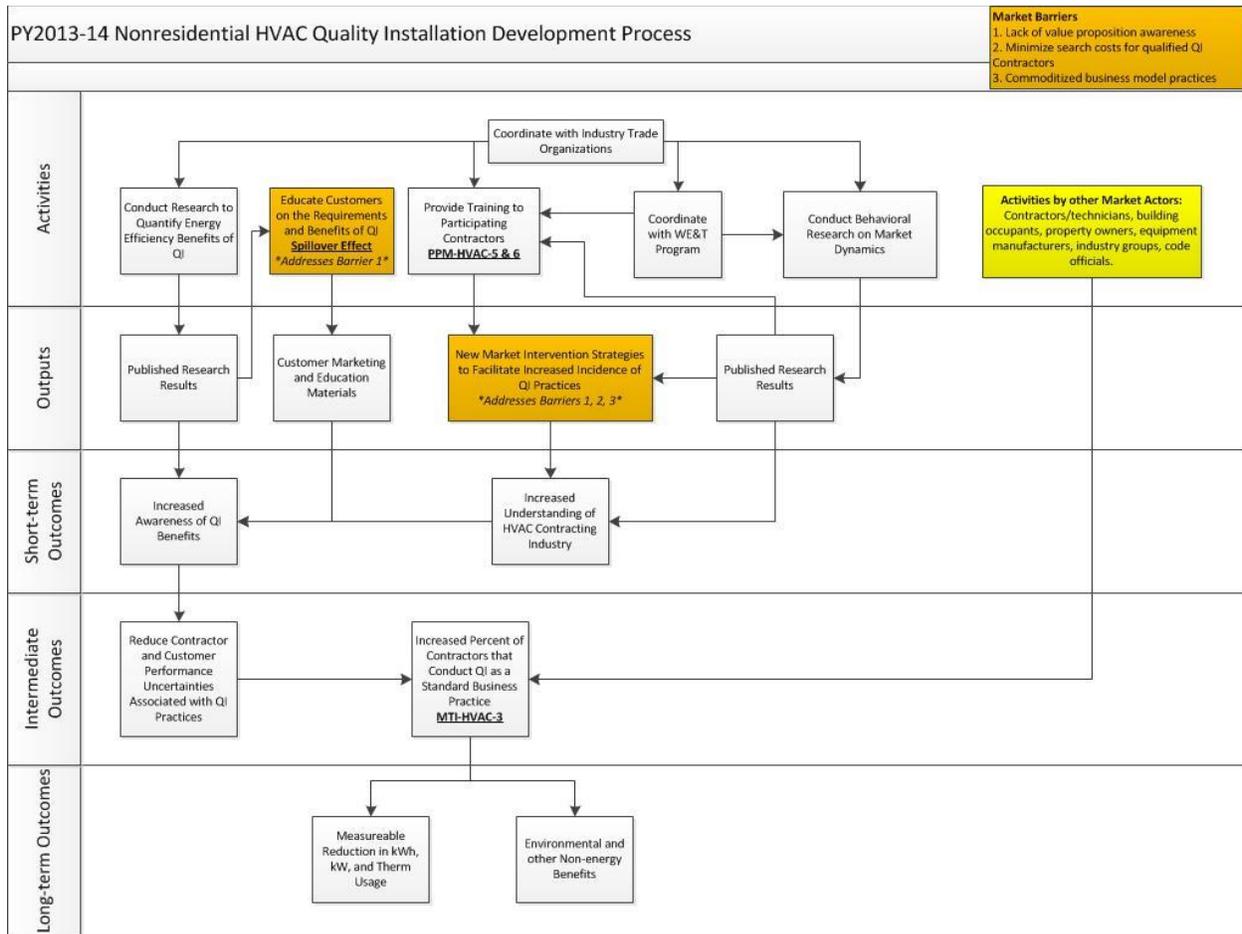

## 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

- “To date, no satisfactory method for performing these examinations has been found for a wide range of non-residential installations.” (WHPA Non-Residential Quality Installation Road Map, 2010, p. 2)

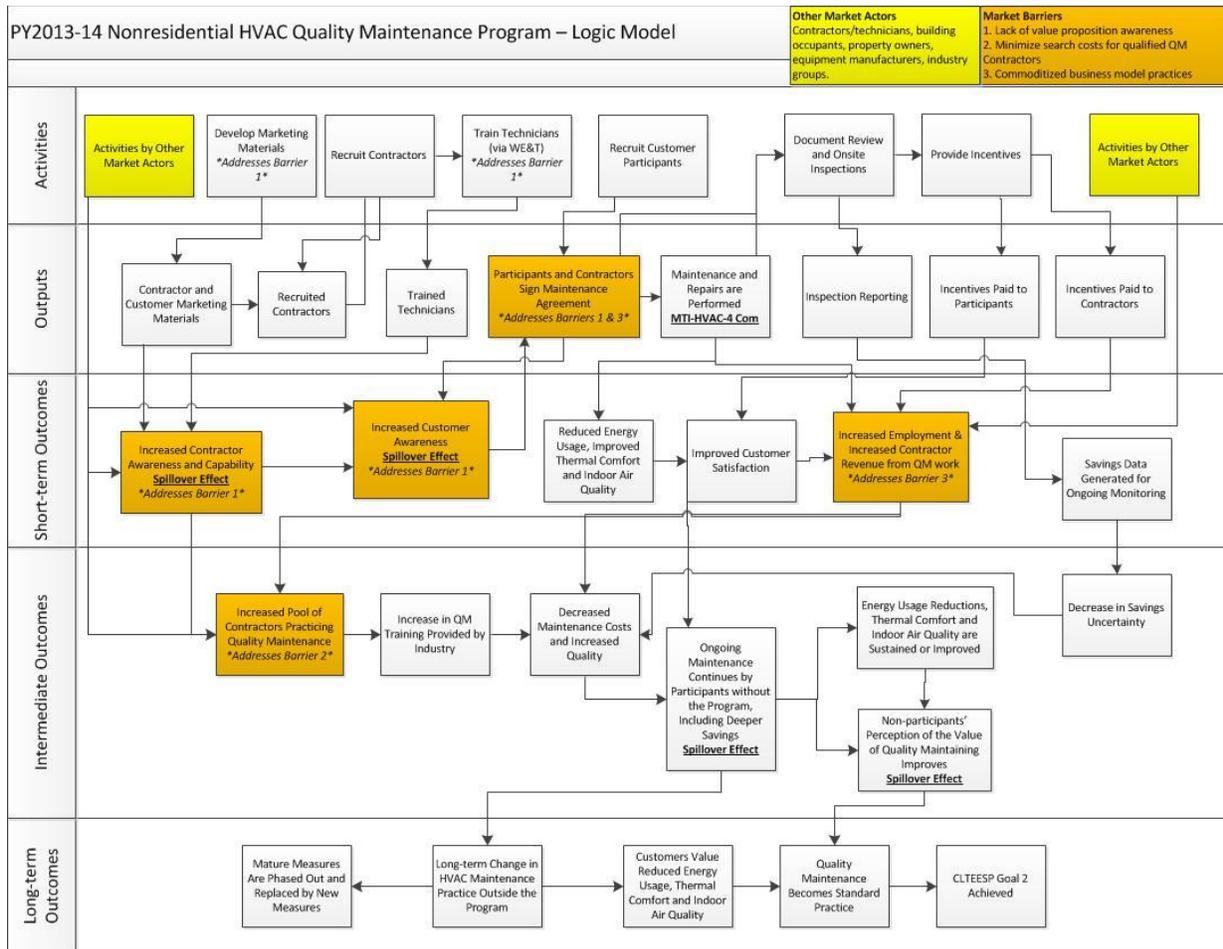

e) Program or market logic model that ensures a solid causal relationship between the proposed intervention(s) and its/their intended results:

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

f) Evaluation plans and corresponding Market Transformation Indicators and Program Performance Metrics based on the program logic model:

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the three elements of the Nonresidential HVAC Sub-program (Resolution E-4385, Appendix A, pp 35-36):

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**Table 3 – Program Performance Metrics**

<b>Program</b>	<b>Metric</b>	<b>Metric Type</b>
<i>Upstream HVAC</i>	1. (a) kW/ton incentivized in the program. (Note: Decrease in metric indicates positive progress), combined with (b) the number of units that are incentivized in the program vs. (c) number of units over 5.4 tons shipped to California as tracked through AHRI shipment data. (Assuming the availability of AHRI data.) <sup>1</sup>  <sup>1</sup> As is indicated within this PPM, the availability of item (c) in this PPM is not yet confirmed, since it is closely-held, proprietary third-party information. The IOU team is in discussions with AHRI about obtaining this data and to ascertain the statistical validity of what data would be provided; the IOU team will communicate with the ED about any issues regarding this data element before the first reporting period in Q1 2011 for 2010 information.	2a
	2. The distributor stocking percentage of units eligible for program. (Note: Assumes availability of individual distributor data and/or aggregated data from HARDL.) <sup>1</sup>  <sup>1</sup> The availability of this data is not yet confirmed, since it is closely-held, proprietary third-party information. The IOU team is in discussions with AHRI about obtaining this data and to ascertain the statistical validity of what data would be provided; the IOU team will communicate with the ED about any issues regarding this data element before the first reporting period in Q1 2011 for 2010 information.	2b
<i>Commercial Quality Installation</i>	1. Percentage of HVAC contracting companies that are participating in statewide commercial QI program as a share of the targeted market*  * "Target market" defined as C20 licensed HVAC contracting companies in CA.	2a

Market Transformation metrics should neither be used for short-term analyses nor for specific program analyses; rather, should focus on broad market segments. Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>59</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>60</sup>.

<sup>59</sup> California Public Utilities Commission Decision, D.98-04-063, Appendix A.

<sup>60</sup> California Public Utilities Commission (2008) *California Long Term Energy Efficiency Strategic Plan*, p. 5. Available at <http://www.californiaenergyefficiency.com/docs/EEStrategicPlan.pdf>

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

Markets are social institutions<sup>61</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>62</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>63</sup>. According to York<sup>64</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are three ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

Resolution E-4385 identified a preliminary list of objectives and market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms, and these MTIs were presented at a public workshop to allow for public comments and discussion before being finalized. Consistent with the outcome of that public workshop, MTIs for this subprogram are below.

**Table 4 – Market Transformation Indicators**

HVAC-1	Market share of energy efficient climate appropriate HVAC equipment.
HVAC-3	Percentage of all California Commercial HVAC installation contractors using Quality Installation guidelines (weighted by size).
HVAC-4- Commercial	Percentage of Commercial HVAC units (systems) serviced in IOU service territory under a QM Service Agreement.

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. To support the continuous improvement envisioned by the adaptive management process and to fully address the intricacies of the program design, appropriate EM&V activities will be conducted as coordinated by the HVAC EM&V Project Coordination Group (PCG) and overseen by the CPUC.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

1. **Program Name: Commercial Direct Install**  
**Program ID:**  
**Program Type: Statewide Core Program**

2) **Projected Program Budget Table**

Noted: PG&E's and SCG's Direct Install efforts are or may be delivered by third party bidders whose efforts are included in their 3<sup>rd</sup> Party Program implementation plans.

3) **Projected Program Gross Impacts Table**

Note: PG&E's Direct Install efforts are delivered by third party bidders whose efforts are included in the 3<sup>rd</sup> Party Program implementation plans.

4) **Program Description**

a) Describe Program

The Direct Install sub-program delivers free and low cost energy efficiency hardware retrofits through installation contractors to reduce peak demand and energy savings for small commercial customers. The program targets small businesses in a staged delivery approach that provides program services in specific geographic areas at different times allowing for a more concentrated, directed, and yet comprehensive program.

Note: PG&E's and SCG's Direct Installed (DI) sub-program is delivered through LGP and Third Party Channels. Specific descriptions and details of its DI program and offerings can be found in its respective LGP and Third Party PIPs.

b) List of Measures

Direct Install will implement selected measures at reduced or no or low cost to the customer. Low cost measure opportunities will be targeted to small commercial customers. Eligible measure types include but are not limited to:

- Gas Measures

c) List Non-incentive Commercial Energy Advisor

The sub-program provides a complete turnkey solution for the customer, including equipment purchasing, installation, clean-up and disposal. In addition, information about the installed measures is provided to the customer that explains the energy efficiency benefits they received and proper operation and maintenance practices to ensure sustained performance.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**5) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude “draft” metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

**b) Market Transformation Indicators (MTIs)**

See Section 1a.5.a.

**c) Program Design to Overcome Barriers**

Small businesses are a significant source of untapped energy-efficiency potential. The primary barriers to participation include limited capital resources, lack of expertise and understanding of the benefits of energy efficiency, a suspicion of the “free offer” and its legitimacy, and language and cultural barriers.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

In addition, the majority of these customers occupy short-term leased facilities. Consequently, there is also a split incentive barrier to adoption of energy efficiency improvements. Split incentives occur when the customer and owner do not own the same equipment they pay bills for (e.g., the landlord owns the HVAC equipment and the customer pays utility bills for it, or vice versa). The program makes every effort to address this situation with both the owner/property management company and the tenant to communicate the benefits and gain approval for program services. The no cost offering makes this acceptance of the retrofit easier for the tenant.

While these small customers may be eligible for other elements such as the itemized retrofit incentive, the primary barriers beyond some cost reduction to participation by very small and small commercial customers are not addressed by that program. The No-Cost/Low Cost Installation element addresses these barriers by providing all equipment and installation services at no or very little charge to the customer.

The program utilizes a collaborative team of internal and external stakeholders to conduct strategic program outreach and marketing. Working with our External Affairs Outreach group the Direct Install program has worked actively with a number of Business Improvement Districts and local governments during the current cycle to increase local community involvement and raise the program's profile among BID businesses. This effort will continue during the 2013-2014 cycle with a concerted effort to partner with Local Government Programs and multiple BIDs to increase the number of BID customers involved in the Direct Install program.

Additionally, the program has team members fluent in the languages spoken and familiar with the cultures in its territory to pro-actively working to bridge cultural and language barriers to understanding the benefits of energy efficiency, overcoming the suspicion of the "free offer" and its legitimacy.

**d) Quantitative Program Targets**

The Commercial Direct Installation Program has program targets defined within each direct install vendor contract.

**e) Advancing Strategic Plan goals and objectives**

In accordance with the Strategic Plan, this sub-program advances comprehensive energy efficiency, including:

- Integrating marketing and outreach to the commercial customer sector
- Integrating the approach to better maximize savings and minimize lost opportunities
- Identifying the most promising technologies that can play a role of providing multiple solutions, for energy efficiency.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

- Cross-promoting other energy efficiency (e.g., Workforce, Education & Training) and demand response programs.

**6) Program Implementation**

**a) Statewide IOU Coordination**

All California IOUs offer The Direct Install efforts. Specific areas of coordination include:

**i. Program name:** Commercial Direct Install

**ii. Program delivery mechanisms**

Third-party contractors will be used to perform program services such as customer outreach, survey existing equipment, explain and promote retrofits, and perform retrofit installations for customers and coordinates services performed by the Community-Based Organizations (CBOs).

**iii. Incentive levels**

The sub-program does not pay a rebate or incentive to the direct install customer. Payments are made to the direct install vendor who employs said incentives to reduce the cost of delivering energy efficiency services. The products and installation of products are at reduced cost or free to the customer.

**iv. Marketing and outreach plans**

The sub-program is designed to increase the adoption of energy-efficient measures by small and hard-to-reach commercial customers through offering energy efficiency assessments, energy efficient equipment and installation to small business customers at no or low cost. Marketing efforts undertaken will be targeted based on customer size and demographics. Program interactions include working closely with Faith Based and Community Based Organizations as job development partners, creating and providing jobs in addition to the contract deliverables. This provides a partnership in the community that otherwise would not have engaged.

Additionally, the Program utilizes a collaborative team of internal and external stakeholders to conduct strategic program outreach and marketing. Working with our External Affairs Outreach group the Direct Install program has worked actively with a number of Business Improvement Districts and local governments during the current cycle to increase local community involvement and raise the program's profile among BID businesses. This effort will continue during the 2013-2014 cycle with a concerted effort to partner with Local Government Programs and multiple BIDs to increase the number of BID customers involved in the Direct Install program.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**v. IOU program interactions**

The sub-program will coordinate its activities with local government partnerships and External Affairs in order to leverage existing infrastructures (e.g., Chambers of Commerce and Business Improvement Districts) that provide outreach to small business customers.

**vi. Similar IOU and POU programs**

Not applicable

**b) Program delivery and coordination**

Direct Install contractors are selected using a competitive bid process to ensure cost-effective delivery of services. All customer outreach, existing equipment surveys, explanation and promotion of retrofits and installation of retrofits for customers will be delivered by the contractors.

The IOU Program Management staff provides a customer contact list to the Direct Install contractors. Using this list the contractors will contact the customer to set up an appointment to assess and install the recommended measures at no cost to the customer. In cases where a customer name is not shown on the list (for example, a new business that opened after the list was generated), the contractor confirms their eligibility before performing a survey. Contractors have the main responsibility for contacting eligible customers, but also work with appropriate CBO/FBO and local government partnerships to reach customers.

After completing the energy survey, the contractors must discuss the recommendations with the customer and explain which measures are recommended for upgrade and/or replacement. The contractor must then ask the customer whether to proceed with the retrofit:

The contractor typically installs the equipment within a few days of obtaining permission to proceed. After completing the installation, the contractor must do two things:

1. Perform an on-site post-verification of the installation. The test must ensure that all retrofit work is completed and in compliance with all applicable statutes, acts, ordinances, regulations, codes and standards of the federal, state and local governmental agencies having regulatory jurisdiction.
2. If a customer has any complaint about work done through the Program, the Contractor is ultimately responsible for handling it.

Any advertising or marketing material that the contractor uses must be approved by the Program manager in advance. All customer communications must be presented in the customer's primary language whenever possible and appropriate categories).

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**i. Emerging Technologies program**

Not applicable; this program does not seek to influence emerging technologies.

**ii. Codes and Standards program**

Not applicable; this program is not directly involved with the Codes and Standards, but is indirectly involved insofar as Title 20/24 requirements dictate minimum efficiency standards.

**iii. WE&T efforts**

Direct Install contractors will be required to provide customers with informational materials on statewide and local WE&T opportunities. In addition, the Direct Install program (through its contractor delivery network) offers an opportunity for achieving one of the primary goals of Workforce Education & Training – providing energy efficiency jobs for low income and disadvantaged workers. The linkage between Direct Install and the Statewide WE&T efforts will be made stronger as the WE&T program coalesces.

**iv. Program-specific marketing and outreach efforts**

Program outreach occurs by working closely with local governments, Faith Based and Community Based Organizations. Marketing and outreach efforts focus on the energy efficiency benefits of the equipment installed, proper operation and maintenance and cross-promotion of DR activities. (Specific IOU budget information for this marketing activity is provided in Table 1.)

**v. Non-energy activities of program**

As a turnkey program, Direct Install contractors are responsible for outreach efforts, equipment specification, equipment procurement, equipment installation, job-site clean-up, equipment disposal and post-installation inspection.

**vi. Non-IOU Programs**

Direct Install will leverage the efforts of other philanthropic, faith-based and community-based organizations to achieve additional energy savings. These efforts will be further defined as the program design details are developed and third-party contracts are negotiated.

**vii. CEC**

Not applicable; see Section 6.b.i.

**viii. CEC work on codes and standards**

Not applicable; see Section 6.b.ii.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**ix. Non-utility market initiatives**

Not applicable

**c) Best Practices**

Direct Install Programs were successfully offered during the 2010-2012 program cycle. Best practices were derived from these programs and include:

- Keep messaging and participation simple for the customer.
- Understand the key motivators that drive an industry and use that information to market the program.
- Make the program visible to targeted customers.
- Contact targeted customers through identified organizations and associations,
- Maintain a high level of customer service by providing customers with assistance with vendor management and other no cost, low cost recommendations.
- Identify qualifying products simply and effectively.

**d) Innovation**

As the market matures with information regarding energy efficiency, many small businesses are expressing an interest in the adoption of emerging technologies, such as solid state lighting, and demand response enabling technologies. The IOU Direct Install Program Management team will continually evaluate these technologies and incorporating them into the program delivery model including potential customer co-pay into the program.

IOUs will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper savings.

**e) Integrated/coordinated Demand Side Management**

The Direct Install model provides a great opportunity to market other DSM (i.e., DR and CSI) to traditionally hard-to-reach customers. The program will make every effort to do so; however, it is acknowledged that these small business customers likely do not have the resources (both financial and personnel) to actively pursue participation in such programs (especially CSI). To help bridge this resource gap, DSM promotional materials will describe all known non-IOU programs that offer tax credits/rebates/financing for solar PV systems. Information on DR programs and rate alternatives/changes appropriate to the small-business customer class will also be provided.

**2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan**

**f) Integration across resource types**

Promotional materials described in Section 6.e will also include information on water energy savings. In addition, such water savings measures (e.g., low flow faucets) may be evaluated for inclusion in the program delivery.

**g) Pilots**

Not applicable

**h) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues. However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics,
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

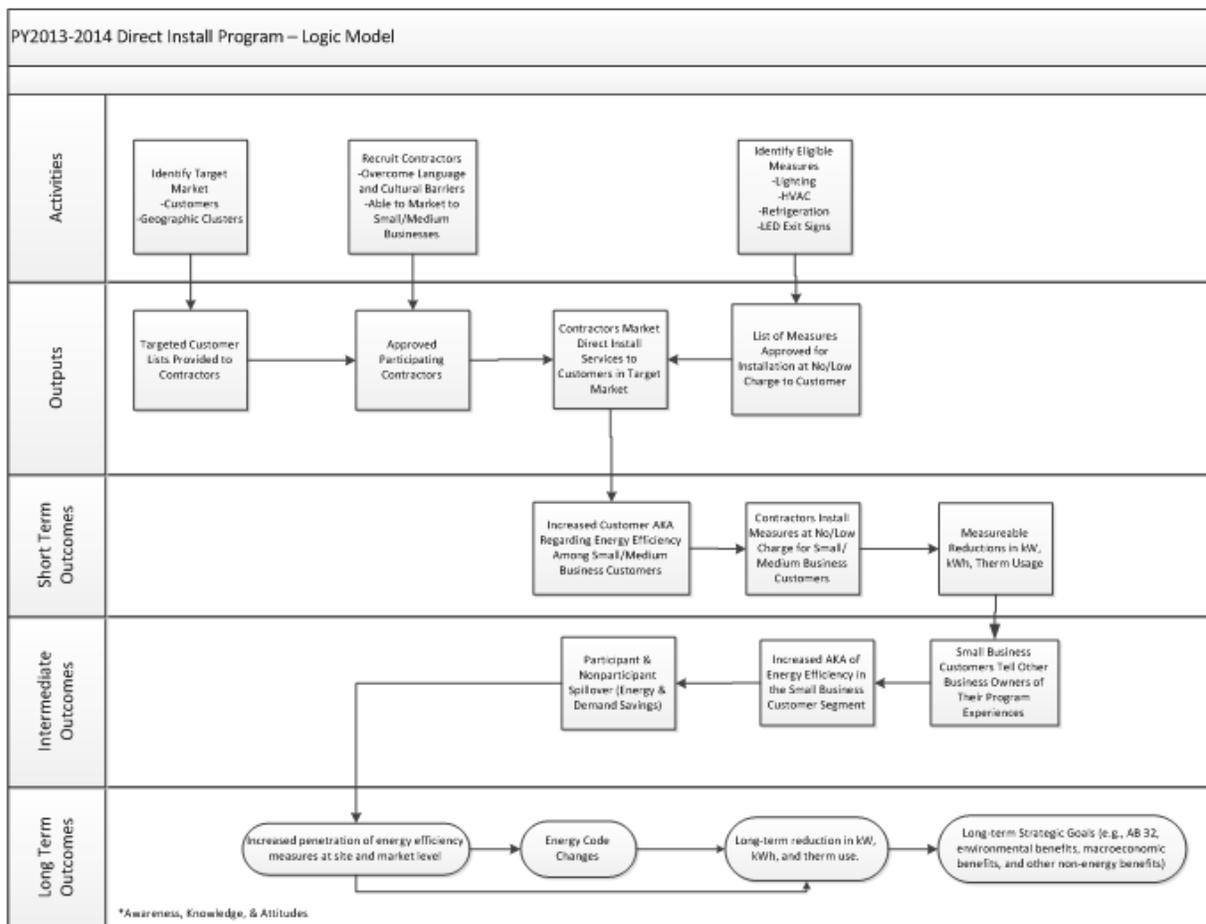

# 2013-2014 Energy Efficiency Programs Statewide Commercial Energy Efficiency Program Program Implementation Plan

## 7. Diagram of Program

Please see the core program diagram.

## 8. Program Logic Model

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Direct Install Sub-program.

Note: The projected program budget and savings impacts shown on Tables 1 and 2 were approved in PG&E's 2010-2012 EE Compliance Advice Letter 3065-G-A&B/3562-E-A&B effective January 1, 2010, per the Energy Division's disposition letter dated October 21, 2010.

**4.) Program Description**

**a) Describe Program**

Formatted: Font: Bold

The Statewide Commercial Energy Efficiency Program offers California's commercial customers a statewide-consistent suite of products and services to overcome the market barriers to optimized energy management. The program targets integrated energy management solutions, including energy efficiency, demand response (DR), and distributed generation, through strategic energy planning support; technical support services, such as facility audits, and calculation and design assistance; and financial support through rebates, ~~and~~ incentives, and financing options.

Formatted: Indent: Left: 0.25"

Targeted end users include all commercial sub-segments such as distribution warehouses, office buildings, hotels, motels, restaurants, schools, trade schools, municipalities, universities, colleges, hospitals, retail facilities, entertainment centers, and smaller customers that have similar buying characteristics.

Formatted: Indent: Left: 0.25", Tab stops: Notat 0.5"

The Statewide Commercial Energy Efficiency Program includes ~~five-six~~ core statewide sub-program elements, including Commercial Customer Services, Energy Advisor, Commercial Calculated Incentives, Commercial Deemed Incentives, Continuous Energy Improvement, and nonresidential Audits, Nonresidential HVAC Direct Install, Deemed Rebates and the Calculated support services and incentives. Each utility IOU offerings also include offers local program elements, such as third party programs, and local government partnerships that complement and enhance this core offering for their region have close ties to Business Improvement Districts (BIDs). Per CPUC directives, the IOUs will strengthen their relationships with local BIDs and develop opportunities for BIDs to participate in the marketing and delivery of direct install and deemed commercial incentives. In addition to the above sub-programs, the utilities will consider one or more demonstrations of a comprehensive whole building approach (WBA) to commercial building energy efficiency. This approach may make available the tools and resources necessary for customers to pursue and integrate multiple customized measures. This approach may also include deployment of energy management and information systems in demonstration projects that can be used to quantify and analyze energy savings based on various forms of measured performance data, including interval meter data. As described below, and in complete detail in the Commercial sub-program descriptions. Together these These elements offerings are designed to not only overcome the traditional market barriers to energy efficiency, but also attain deeper energy savings use efficiency to, advance demand response and through distributed generation opportunities uniquely suited to the Commercial segment.

Formatted: Indent: Left: 0.25", Tab stops: Notat 0.5"

Description of the Commercial Energy Efficiency sub-programs:

Formatted: Indent: Left: 0.25", Tab stops: Notat 0.5"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

- ~~The Commercial Customer Services Program~~ Energy Advisor (CCSPEA) brings together under one program all audit services offered to support customer education and participation in energy efficiency, ~~demand response~~ and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities. These services include Benchmarking, Online Energy Audit Tool, CEI, Nonresidential Audits, Pump Efficiency Services, Retro-commissioning (RCx) and coordination with CEI as described below. ~~Benchmarking is a non-resource initiative designed to educate and motivate customers to benchmark their facilities. It offers technical support and hands on workshops providing customers with information that enables them to complete a benchmarking assessment of their buildings. The program also features an automated benchmarking service which uploads customer energy data to their Energy Star Portfolio Manager profile.~~
- The Commercial Calculated Incentives program offering provides standardized incentives for customized and integrated energy efficiency/DR projects for retrofit, and RCX projects, ~~and projects while also offers comprehensive~~ providing technical and design assistance ~~for each. It overcomes information, technical, and financial barriers. Because it provides a e~~Customized calculation method that can consider system and resource interactions, it will be the preferred approach for supporting the integrated, whole system, and multi-resource management strategies of the Strategic Plan and concurrently overcome technical and financial barriers. ~~New Construction e~~Calculated savings ~~are covered under for~~ the Savings By Design Program, as described in the Statewide Program are achieved through the commercial New-new Construction construction Program component.
- The Commercial Deemed ~~rebate~~-Incentives Program offering provides utility representatives, equipment vendors, and customers an easy-to-use mechanism to cost-effectively subsidize and encourage adoption of mass market efficiency measures through fixed incentive amounts per unit/measure.
- Continuous Energy Improvement (CEI) is a consultative service which targets long-term and strategic energy planning. CEI is designed to reintroduce the importance of energy management by transforming the market and to help reduce energy intensity through a comprehensive energy management approach. CEI will address technical and management opportunities for commercial customers while creating sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution. ~~non-resource sub-program that describes the strategic planning tools and resources which lay the groundwork for long term integrated energy planning and serve as a launching platform for other utility and non-utility programs and services. Through analysis, benchmarking, long term goal setting, project implementation support,~~

Formatted: Indent: Left: 0.31", Tab stops: 0.56", List tab + Notat 1" + 1.25"

Formatted: Indent: Left: 0.31", Tab stops: Notat 1" + 1.25"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

performance monitoring, and ultimately energy management certification, CEI aims to transform the market from a “project to project” approach to a continuous improvement pathway. In support of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), a CEI approach also sets the stage for non-energy resource integration, such as greenhouse gas reduction, water conservation strategies, and regulatory compliance. Nonresidential Audits (NRA), including basic audits, Integrated Audits, and Retro Commissioning (RCX) audits, provide an inventory of technical project opportunities and financial analysis information that can be used to populate a customer’s short or long term energy plan, and overcome both informational and technical customer barriers.

- The Nonresidential HVAC Program delivers a comprehensive set of upstream strategies that are built on education, marketing efforts and leveraged relationships within the HVAC industry geared to transform the market towards a sustainable, quality driven market.
- The Direct Install rebate offering provides small business customers ~~that have a small peak demand~~ the opportunity to have a third-party contractor retrofit existing systems to energy efficient systems at no cost to the customer. However, PG&E and SoCal-Gas’s Direct Install rebate offering is delivered through its Local Government Partnerships (LGP) and Third Party programs for small business.

Formatted: Indent: Left: 0.25", Tab stops: Notat 1" + 1.25"

Formatted: Tab stops: Notat 1.25"

When developing program metrics and targets for each sub-program element, each utility will consider market potential as available, past program participation rates, market progress, current economic conditions, work-paper and baseline updates, and customer mix and penetration. Statewide coordination and planning will facilitate inter-utility sharing of successes, lessons learned, and best practices in the pursuit of those targets and metrics.

Statewide coordination and planning between utility program planning staff, utility functional departments, government agencies, municipalities and other key partners and stakeholders will also be critical to the advancement of the Strategic Plan. Leveraging national and state initiatives, tools and resources to manage energy and resources – including greenhouse gasses (GHG), air quality, and water – is a critical path to optimizing the potential for California’s commercial customer segments to thrive. ~~As described in full in PIP Section 6b, t~~ The Statewide Commercial Energy Efficiency Program design includes the staged integration and coordination with existing non-utility programs, initiatives, and existing regulations today. ~~This design is aimed to and later will~~ drive or support advancements in integrated resource planning, energy management certification, industry benchmarking, workforce education and training, and sharing of industry best practices.

The commercial customer markets are uniquely suited to integrated energy strategies. Load management opportunities and demand response have had great success and show additional potential. Opportunities for distributed generation from biogas, biomass, solar, fuel cells, and wind will be supported through this plan in support of state renewable

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

energy targets, state GHG reduction efforts under AB32, and support of emerging carbon markets and offset programs. Utilities are also using integrated energy strategies to test DSM as a means to address T&D constraints in local areas. Consistent with California's preferred loading order, however, the utilities will continue to aggressively market and support energy efficiency first, as California's most cost-effective energy resource, while also being mindful of the customer's ultimate interests and goals.

**b) List of Measures**

Formatted: Font: Bold

Technologies addressed through this program effort are varied, and include, but are not limited to, lighting, HVAC, refrigeration, food service equipment, and boilers, ~~vertical transportation, motors, and plug load controls.~~ ~~Different incentive levels will be those aligned with the Calculated and Deemed sub programs.~~

**c) List of Non-incentive Commercial Customer Services Energy Advisor Services**

Formatted: Font: Bold

Formatted: Font: Bold

Formatted: Font: Bold

The Statewide Commercial Energy Efficiency Program will include a wide variety of non-incentive program services intended to support customer strategic planning, educate and train customers and the workforce about energy efficiency, and provide customized technical and project support. The service list includes:

- Integrated Building Design Assistance~~Basic audits~~
- Whole Building, Individual Systems, and Simplified Approaches~~Integrated audits~~
- Integrated design training for architects, engineers and owners
- Partnerships and collaboration with industry groups like the California Council of American Institute of Architects, California Energy Commission, among others~~RCx audits~~
- Zero Net Energy Design Services, like consultation services, student design competitions, research activities, 2010-2012 pilot success adoptions
- Energy Design Resources and Savings By Design – internet portals
- Software tools and expertise

Nonresidential HVAC

- Education of the market on the value of selecting high-efficiency systems
- Reports for customers of estimated energy savings, cost savings and carbon reductions for their HVAC systems treated under the program
- Training for contractors on HVAC industry standards, sales, and marking of the value of those standard, and their implementation in the field
- Education for customers on how

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

**55.) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators**

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>2</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>3</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>4</sup>. Markets are social institutions<sup>5</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing behavior, attitudes, and market supply chains<sup>6</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>7</sup>. According to York<sup>8</sup>, “Market transformation is not likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are three ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.”

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the

evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate - particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>9</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>10</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>11</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>12</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. "The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)<sup>13</sup>" The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>14</sup>, but also reflects the CPUC's directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.

Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>15</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look

forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin's guide for MT program developers<sup>16</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.

Attitudinal change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer attitudes, knowledge and awareness (AKA) of energy efficiency. In order to gauge an attitudinal based metric for this sector a battery of questions probing AKA among customers would have to be created and used to scale AKA. Examples of AKA would include knowledge of energy efficiency lighting and other specific measures. Evaluators could also draw from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale would need to be selected by the MT collaborative. The baseline response pattern to the AKA scale would need to be established early during the program cycle. Customers could be surveyed on an annual basis and changes in their AKA tracked along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed. In addition, the suggested metrics also include a behavioral metric.

In addition, behavioral change is an important part of any market transformation effort. This change may be tracked with a battery of questions that probes customer past behavior and intentions about energy efficiency. In order to gauge ~~an~~ behavioral based metric for this sector a battery of questions about energy efficient behaviors could be used to create a scale of Energy Behavior. Evaluators could also draw questions about specific behaviors from customer surveys used in past program evaluation studies to determine whether any response patterns would be a useful indicator of market transformation, moving forward. The dimensions of any scale would need to be selected by the MT collaborative. The behaviors that could be probed include maintenance behaviors to keep EE measures operating correctly, and behaviors that maximize energy efficiency of existing equipment. Customers could be surveyed early in the program cycle and their responses on the scale could serve as the baseline for subsequent behavioral change. Customers could be probed annually and their Energy Behavior change measured along the scale. Responses of customers for a particular sub-program could be pulled out for separate analysis, as needed.

**Program Performance Metrics (PPMs)**

Formatted: Font: Bold

Formatted: Indent: Left: 0.13"

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Commercial Energy Efficiency Program (Resolution E-4385, Appendix A, pp 32-33):

**Table 3**

SW PROGRAM / Sub-Program	PROGRAM PERFORMANCE METRIC (PPM)	Metric Type
<b>COMMERCIAL / INDUSTRIAL / AGRICULTURAL COMBINED</b>		
* Data to be reported in disaggregate form by SW program (commercial, industrial, and agricultural)		
	*1. Number and percent (relative to all eligible customers) of commercial, industrial and agricultural customers participating in sub-programs (NRA, Deemed, Calculated, and CEI) by NAICS code, by size (+/- 200 kW per yr or +/- 50K therms per yr), and by Hard to Reach (HTR)**  ** "HTR" is as defined in the EE Policy Manual  <b>Comment:</b> No comments	2a
<b>Continuous Energy Improvement (CEI)</b>	*1. Number and percent of commercial, industrial, and agricultural CEI participants that meet short-term (2010-2012) milestones as identified by their long term energy plans.  <b>Comment:</b> No comments	2a
	*2. Lessons learned, best practices, and plan to ramp up the CEI program are developed. (Y/N)  <b>Comment:</b> IOUs confirmed with ED that this is a 2b metric	2b
	*3. Number and percent of commercial, industrial and agricultural customers that created an energy plan via CEI will be tracked by program.  <b>Comment:</b> No comments	2a
<b>Non-Residential Audit Program</b>	*1. Number and percent of commercial, industrial, and agricultural customers receiving non-residential audits by NAICS and SIC code.	2b

**b) Market Transformation Indicators (MTIs)**

Formatted: Font: Bold

Formatted: Indent: Left: 0.06", Tab stops: 0.19", List tab + Notat 0.5"

Formatted: Indent: Left: 0.06"

As stated above, market transformation draws heavily upon diffusion of innovation theory, with the state of a market characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects. Therefore it is problematic, if not impractical, to offer internal annual milestones towards market transformation sectors and specific program activities.

As a consequence, it is not appropriate to offer more than broad and general projections. Any targets provided in the following table are nothing more than best guesstimates, and are subject to the effects of many factors and market forces outside the control of program implementers.

Formatted: Fontcolor: A uto

Formatted: Fontcolor: A uto, Not Highlight

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in "Attachment H" are approved for this sub-program as applicable. Per Resolution E 4385 identifies a preliminary list of objectives and a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms. These MTIs will bewere presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. The Resolution further directs the Joint Utilities to work collaboratively with Energy Division staff to select a subset of these MTIs for data collection, tracking and reporting as part of the 2010-2012 energy efficiency evaluation, monitoring and verification (EM&V) activities. Per the Assigned Commissioner's Ruling dated \_\_\_\_\_, following are the MTIs approved for the Commercial Customer Services Energy Advisor and Deemed Incentives sub programs. (need text approved after an ACR is issued)

**c) Program Design to Overcome Barriers**

Formatted: Font: Bold

Formatted: Indent: Left: 0"

Formatted: Indent: Left: 0.06"

The ~~2010-2012~~2013-2014 Statewide Commercial Energy Efficiency Program builds on past program successes and best practices to overcome both common and unique barriers to efficiency in the segment, ~~including:~~

Among Commercial-commercial customers, there are many market barriers to energy efficiency offerings:

Formatted: Indent: Left: 0.13", Tab stops: 0.06", Left

- Commercial customers are a highly diverse and geographically disperse customer class widespread sector, which requires utilities to develop a large number of differentiated incentive offerings for a variety of distribution channels dependent on regional resources for information,
- There is a general lack of awareness of the benefits of energy efficiency, and uncertainty and skepticism over long-term energy and cost savings.
- Energy efficiency improvements are not perceived to add value and marketability of properties.
- Efficient design alternatives can be lost in low-cost bidding scenarios.
- Small business customers are, such as franchisees, are generally regarded as 'hard to reach' and are traditionally less likely to install EE technologies than larger customers due to lack of time, resources, financial sophistication and familiarity with energy efficiency, among other reasons, geographic, ethnic, and other market barriers.
- Building owners, especially landlord owners<sup>17</sup>, tend to focus on want to minimize minimizing capital costs associated with new construction, building renovation, tenant improvements and building retrofits. first cost for new buildings as well as for renovation.
- For multi-tenant buildings, landlord-owned property owners often have little incentive to pursue energy efficiency measures due to ubiquitous "triple net" leasing terms that pass through utility costs to tenants, while tenants may be deterred either by short lease terms relative to project payback or by contractual restrictions regarding leased space improvements. management buildings, property managers operate differently from owners because the building is their business. Decision making is more complex, with emphasis on building value and Return on Investment (ROI) rather than lower operating costs. They also depend on complex legal agreements, and building and tenant turn over.
- Breaking the tenant landlord barrier for implementing efficiency measures is a critical step to market penetration.
- Energy efficiency improvements are not perceived to add value and marketability of properties

Formatted: Indent: Left: 0.13", Tab stops: 0.38", Left + Notat 1"

<sup>17</sup> For properties where the landlord owns the equipment and the lessee pays the bills, there is currently minimal incentive for the customer or the landlord to invest in EE

2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan

Formatted: Centered

- Institutional owners are often constrained by rigid boundaries separating capital development and operating budgets and are limited by lowest-bid regulations for capital projects.
- ~~There is a general lack of awareness of the benefits of energy efficiency, and uncertainty and skepticism over long-term energy and cost savings.~~
- Some activities ~~like such as~~ Healthcare and Biotech also face strong regulatory ~~issues~~ challenges to be with being integrated in ~~the~~ energy efficiency offerings (for example: the Office of Statewide Health Planning and Development (OSHPD) and California Division of Occupational Safety and Health (CAL-OSHA)).
- In some activities like High-Tech and Hospitality, international competition drives short-term survival attitudes versus a long-term continuous improvement approach. In addition franchises have additional barriers to overcome such as Franchise owner approval.
- ~~Efficient design alternatives can be lost in low-cost bidding scenarios.~~
- Whole system opportunities are missed by individual equipment vendors, many of which are only specific equipment types or building systems.
- Customers are often not aware of systems operating optimally efficiency degradation or failure in building systems or equipment.
- Customers may be reluctant to invest in new energy savings technologies over concerns regarding product quality, reliability or obsolescence.
- Performance issues resulting from improper equipment installation, maintenance and poor owner/operator education create customer dissatisfaction with energy efficiency measures.

Formatted: Indent: Left: 0.13", Tab stops: 0", Left + 0.38", Left + 1.25", Left + Notat 1"

By uniquely approaching constituent vertical market sub segments, this Commercial Energy Efficiency Program will better serve commercial customers while gaining efficiency and consistency in the delivery of the programs. This targeted and focused approach will mitigate the indicated EE adoption barriers as follows:

Formatted: Indent: Left: 0.13"

- Program applications and processes will be simplified and made more consistent. There will be a central core incentive/rebate offering, with service-specific riders added as needed. This will enable customers to better understand the program delivery process. Program verification processes will also be made more consistent so that the customer is touched fewer times for multiple offerings.

Formatted: Indent: Left: 0.13", Tab stops: Notat 1"

- When appropriate, IOUs will deliver information to customers in a way that bundles relevant EE, DR and other DSM programs and services. For example, the IOUs will develop print and electronic Case Studies that feature customers who have implemented integrated solutions in order to address their energy management needs. A package of program bundles will be made available so that typical offerings for a sub segment will be grouped together. This will minimize lost opportunities as a more comprehensive program and service offering will be readily available for customers.

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.13", Tab stops: Notat 1"

2013-2014 Energy Efficiency Programs  
Statewide Commercial Energy Efficiency Program  
Program Implementation Plan

Formatted: Centered

- Marketing outreach efforts will be more focused on customer sub-segments rather than programs, which should lead to improved customer adoption for all programs. Utilities will continue to foster strategic partnerships with industry associations such as Building Owners and Managers Association (BOMA), Department of General Services (DGS), Green Building Council, Air-Conditioning, Heating, and Refrigeration Institute (AHRI), American Society of Heating, Refrigerating, and Air-conditioning Engineers (ASHRAE), Manufacturers Trade Associations, and specific sub-segment professional association as California Hospital Association (CHA), California Society for Healthcare Engineering (CSHE), ~~International~~ Society for Pharmaceutical Engineering (ISPE), to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users.
- Program bundling will be configured so that customers will have greater flexibility in how they enroll; however, the program bundles will be packaged so that customers will be encouraged to take a more comprehensive approach to EE.
- The utilities will consider one or more demonstrations of a comprehensive whole building approach (WBA) to commercial building energy efficiency. This approach may make available the tools and resources necessary for customer to pursue and integrate multiple customized measures. This approach may also include the deployment of energy management and information systems in demonstration projects that can be used to quantify and analyze energy savings based on various forms of performance data, including interval meter data.
- Multi-tenant buildings have a unique and significant barrier. Most typically referred to as the principal-agent or tenant-landlord split incentive, this issue is characterized by the natural separation of tenant energy efficiency savings and capital expenditures by building owners. The commercial program will incorporate market research and/or market tests to better understand potential programmatic offerings that can help reduce the barrier. Some examples of strategies that might warrant testing include combinations of education and creative tenant/landlord incentives or credits for centralized systems or building shell upgrades, incentives for sub-metering, and plug load control technologies.
- Because program offerings will be bundled, especially through the Continuous Energy Improvement Program, the program eligibility requirements will be made more consistent, leading to fewer areas where customers are not served.
- For public sector customers, existing federal and state programs and mandates will be leveraged.
- Utilities will expand the ~~On-Bill~~ Statewide EE Financing-Finance Program, which offers unique benefits to government departments by allowing them to retain rebates and cost savings from EE projects without having to upstream these financial benefits to the General Fund.
- ~~This triggers and expedites EE project adoption.~~ The Statewide Finance PIP includes plans to explore and develop additional finance tools to facilitate the adoption of integrated projects.

Formatted: Indent: Left: 0.06", Hanging: 0.31", Tab stops: 0.38", Left + Notat 1"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

- Coordination with other parties will be enhanced so that related programs (e.g., water conservation, reduction in greenhouse gas (GHG emissions, LEED™) are clearly and concisely communicated to customers, which should improve participation in all offerings.
- During the ~~2010-2012~~2013-2014 period, as part of AB 1103 requirements, utility data to be used for benchmarking buildings will be provided by the IOUs to the EPA for facility owners' use. ~~While providing this data will meet the intent of the law, a new offering will be added (the Energy Benchmarking Program) that will allow customers to learn the process and methodology for setting up their own benchmarks. This~~ ~~The existing energy benchmarking offering~~ will give customers the information required to understand how their buildings perform and how the improvements they make can be tracked. ~~It will be associated with Retro-Commissioning services, focusing on operation improvements and allowing many projects to be funded through operating budgets, overcoming a common financial barrier related to capital budget approvals.~~

Formatted: Indent: Left: 0.19", No bullets or numbering

- ~~To overcome barriers to advanced lighting control adoption, consideration will be given for systems installed by The the California Advanced Lighting Controls Training Program (CALCTP) certified contractors. The CALCTP is a team made up of the IOUs, POUs, contractor and labor organizations, community colleges and other interested stakeholders. The goal is to promote the proper design, installation and commissioning of advanced lighting controls through training and certification of contractors. CALCTP is being piloted in 2010 and will be expanded into a full fledge program in 2010-11. CALCTP addresses specific market barriers preventing increased adoption of advanced lighting controls by ensuring a qualified contractor base is available for customers interested in lighting retrofits. Additional consideration will be given to including additional lighting incentives for systems installed by certified contractors. CALCTP also supports Statewide Workforce Education & Training activities by partnering with local community colleges and labor organizations to deliver the training.~~

**d) Quantitative Program Targets**

**e) Advancing Strategic Plan goals and objectives**

Many activities under the Commercial Statewide Portfolio advance the goals, strategies, and objectives of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan). Details on these actions are provided in the tables found in the Commercial sub-program descriptions. The examples below highlight some of the Portfolio strategies that align with the Strategic Plan:

- **Integration:** To encourage greater use of IDSM, IOUs will

Formatted: Indent: Left: 0.25", Tab stops: 0.5", Left + 0.69", Left + Notat 1"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

- Offer customers solutions that integrate site-specific and optimized packages of comprehensive energy efficiency, demand response, solar and combined heat and power and thermal storage opportunities.
- Develop an active cooperation network among the different stakeholders, such as corporate and local managers, OSHPD, engineering firms, service companies, architects, and vendors.
- Create customized long-term plans with large corporations connecting corporate and local levels integrating energy efficiency, DR, self-generation and renewables.
- Implement integrated local integrated marketing campaigns that leverage multiple tactics and multiple communications to present customers with a holistic view of EE and other DSM programs and service offerings.
- New energy efficiency delivery methods: To take advantage of the significant opportunities offered by information, behavior-change strategies and training as delivery channels for increasing energy efficiency, utilities will:
  - Drive expanded involvement of the California Commissioning Collaborative in developing statewide measurement and verification protocols and professional training and accreditation programs for the ~~retro-commissioning~~retro-commissioning industry
  - Champion adoption of stringent codes and standards within the industry.
  - Publish baselines, best practices and calculation tools to facilitate the dissemination of information and to help customers select and evaluate energy efficient solutions.
- Financing and Funds Leveraging: To overcome cost barriers to energy efficiency, the IOUs will:
  - Offer on bill financing
    - Create customer awareness and educate customers about standardized statewide EE financing and develop additional finance strategies for the commercial section.
    - ~~Create new~~Continue incentives for on-peak demand reduction related to retrofits and retro-commissioning.
    - Partner with integrators like Siemens, Trane to aggregate energy efficiency with other building improvements, such as security, safety, waste management, and IT.
    - Analyze the green vision of the corporations to align energy plans towards their objectives
- Advanced Adoption of New Products: IOUs will create demand for advanced, energy-saving products—such as lighting and HVAC—by expanding incentives to include both financial incentives and technical assistance while partnering for advanced systems,

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

~~working~~ closely with Emerging Technologies to bring new technologies through development to the market, and strengthening relationships with vendors.

- **Workforce Development:** To expand their role in creating and meeting the demand for a robust energy efficiency workforce, the IOUs will:
  - Support the development of new and innovative programs to influence commercial trade schools to teach about the financial incentives, tools, protocols, partnerships, expert analysis, and implementation support services that promote commercial building energy efficiency and optimum load management.
  - Engage various industry and energy-wise stakeholders to expand their current intellectual knowledge and coordinate education/training opportunities through the WE&T program, outreach through ME&O, and coordination with research and technology.
  - Expand the CALCTP initiative to create additional opportunities for lighting contractors to become certified in the proper installation of advanced lighting control systems.
- **ZNE Commercial Buildings:** To help make ZNE a reality in the commercial sector, utilities will:
  - Integrate successful ZNE strategies and activities proven through program and/or pilot projects during the 2010-2012 program cycle. The commercial program, particularly Savings By Design, will absorb and enhance existing programmatic elements aimed at delivering ZNE best practices to the market place, potentially including but not limited to:
    - Project consultations that pair projects with experts capable of driving unique designs to ZNE;
    - Provide education opportunities to key architectural, engineering, and other design professionals (see WE&T plans);
    - Continue successful design competition elements aimed at ZNE design in the student and professional communities; and
    - Explore cost effective ZNE solutions that consider the intersection of building and community energy use
  - Facilitate benchmarking and constant improvement by supporting the initiative recently launched by the DOE and Lawrence Berkeley Laboratory.
  - Explore joining or ~~Continue~~ continue a leadership position in the national Office of the Future Consortium (“Consortium”) which was established to help shape and inform the research and product development of individual component products that have the ability to communicate with each other, are interoperable, and that create a system that will meet defined performance standards for a described office space type. The recent publication of the 25% Solution is intended to identify significant reductions in energy used by lighting, plug loads and HVAC systems using a comprehensive “Systems” approach that also improves lighting quality and

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

air conditioning/heating performance. The efforts of the Consortium will be fully integrated into the Commercial Calculated and Deemed incentive programs to create a delivery mechanism that supports the path to ZNE buildings.

**6. Program Implementation**

**a) Statewide IOU Coordination**

**i. Program name:**

i. Statewide Commercial Energy Efficiency Program

**ii. Program Delivery Mechanisms**

The Statewide Commercial Energy Efficiency Program will coordinate on a statewide level to ensure the program is continuously updated and enhanced throughout the ~~three-year implementation~~ 2013-2014 program cycle. In addition, the ~~five-six~~ Commercial sub-programs will be coordinated on a statewide level to align by unify the implementation of program aspects such as P program name, Program-program delivery mechanisms, Incentive-incentive levels, Marketing-marketing and outreach plans, and IOU program interactions. (For a detailed description of each of these program aspects and how they will be coordinated statewide, please refer to the Commercial sub-program descriptions). The two coordination systems (one for the broad programmatic level and one designed for the sub-program level) will interact with and support one another. The broad, high-level coordination effort will be described below, focusing on how the IOUs will work together to effect the continuous improvement of the Statewide Commercial Energy Efficiency Program.

The Statewide IOU coordinated effort ~~Coordination process~~ for the Statewide Commercial Energy Efficiency Program will be as follows:

- Designate an IOU Program “Lead” – The coordination process will begin with each IOU designating a Statewide Commercial Energy Efficiency Program “lead.” The IOU lead will represent one Commercial sub-program, investigating new innovations, special accomplishments, and challenges experienced by sub-program managers in all IOUs. Where such innovations or challenges show potential for impacting the Statewide Commercial Energy Efficiency Program across multiple sub-programs or the statewide program as a whole, the IOU lead will present such information to a quarterly Steering Committee meeting.
- Hold Periodic Steering Committee Meetings – The Commercial Steering Committee will be comprised of all designated IOU leads (including at least one lead for each of the ~~six~~ five sub-programs), and possibly other contributing stakeholders identified by the IOUs. At the ~~quarterly~~ quarterly Steering Committee meetings, individual innovations, challenges, and accomplishments experienced in one IOU or by one sub-program

Formatted: Indent: Left: 0.56"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

will be transmitted to all IOUs. The Steering Committee will evaluate these individual IOU and sub-program experiences, hear ideas for course corrections and overcoming challenges, replicate successful innovations for consistency statewide, resolve differences in implementation to stay unified, and measure the Commercial Energy Efficiency Program's progress against statewide metrics and goals.

- Adopt Program Enhancements – Once the Steering Committee agrees that a particular implementation policy or innovation has merit on a statewide level, each IOU lead will distribute the information to their sub-program managers for adoption and integration. Therefore, the IOU lead will act as a conduit, feeding sub-program information up to the statewide Steering Committee and distributing measures for adoption back to the sub-program managers. This feedback loop will assure consistency and unity in programmatic improvements across the IOUs. In some cases, it may be necessary to invite the sub-program managers to the Steering Committee meeting to get their feedback and ensure they receive the same message.
- Evaluate Program Enhancements Against Statewide Targets – To complete the adaptive management loop, the Steering Committee will track the program's accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The Steering Committee will determine whether further course corrections are needed, and if so, rely on the above coordination process to generate the improvements necessary to stay on track.

The high-level focus of this statewide coordination effort will enable the capture of new innovations and opportunities for program improvement, correct program weaknesses that reveal themselves during implementation, and ensure achievement of statewide targets across IOU service territories. Therefore, statewide focus on program unity and continuous program improvement over the course of the ~~three-two~~ year 'transition period' ~~implementation cycle~~ will be assured.

**iii. Incentive Levels**

Formatted: Font: Bold

Incentives for commercial customers will be provided through both prescriptive and customized approaches. Refer to the Commercial Deemed and Calculated Incentive sub-program descriptions for information regarding specific incentive levels.

**iv. Marketing outreach plans**

Formatted: Font: Bold

Local commercial marketing strategy will focus on helping customers understand the relevance of EE programs and services and enabling customers to take actions that are appropriate to their needs -- including one-time measures such as rebates as well as deeper retrofits. This local EE marketing strategy will be coordinated through a variety of channels and tactics, with the intent of reaching customers at the right place and at the right time to drive increased participation and ongoing engagement.

Formatted: Indent: Left: 0.62"

The IOUs will continue to develop an in-depth segmentation of the commercial market.

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the commercial sub-program plans. Local outreach to SMB customers will also leverage a new Statewide ME&O campaign that will focus on creating awareness and educating customers about energy management and integrated DSM.

Formatted: Fontcolor: A:uto

~~The IOUs are currently developing an in-depth segmentation of the commercial market. The results of this customer segmentation will support the development of targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs. Such delivery channels will likely include increased customer outreach through trade and community-based associations, third parties, government partnerships and core IOU programs. More specific marketing information is provided in each of the commercial sub-program plans.~~

v. **IOU program interactions with the California Energy Commission (CEC), Air Resources Board (ARB), Air Quality Management Districts, local government programs, other government programs as applicable**

Formatted: Font: Bold

Formatted: Indent: Left: 0.44", Hanging: 0.19", Tab stops: 0.63", Left + Not at 0.62" + 1.75"

The Commercial Energy Efficiency Program will scan the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to share program information and marketing collateral with commercial customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. Refer to the Commercial sub-program descriptions for more specific information on linkages with other government programs.

vi. **Similar IOU and POU programs**

Formatted: Font: Bold

Several of the initiatives described herein (i.e., California Advanced Lighting Controls Training Program and Office of the Future Consortium) are joint efforts with the other California IOUs and POUs, as well as other domestic and international utilities. In addition to these joint efforts, local third-party programs that address niche opportunities within the commercial market segmented will be implemented in each of the IOUs service territory. These various efforts will be coordinated to ensure a consistent approach in terms of program message, delivery and measure incentives (as appropriate).

b) **Program delivery and coordination**

Formatted: Font: Bold

i. **Emerging Technologies program**

Formatted: Font: Bold

Formatted: Indent: Hanging: 0.06", Tab stops: Not at 1.75"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

The long-term energy efficiency vision of California can only be attained through the continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the program will consider higher initial incentives for emerging technologies being newly introduced to the market place. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. Portfolio staff actively works with statewide emerging technologies staff to identify new emerging technologies, support evaluation and demonstration, develop and promote case studies, and market results to applicable customers with the goals of total market penetration and eventual movement into code. The Commercial Energy Efficiency Program is currently working to support a diverse list of emerging technologies including advanced building system controls, and LED lighting technologies, forklift battery chargers, commercial refrigeration advancements, commercial refrigeration design enhancements, and solar thermal applications (hot water).

Formatted: Indent: Left: 0.5"

**ii. Codes and Standards**

Formatted: Font: Bold

The program commercial offering relies on the Codes and Standards program to help maintain an updated and relevant list of measures that will support savings. As Codes codes and Standards standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into code. The Programs program coordinate with the Codes and Standards Planning & Coordination sub-program will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 20 and 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward "low energy" or "zero net energy" buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) made available as these technologies transition from 1) R&D to 2) Emerging technologies to 3) Incubation to 4) Mainstream. In the Commercial Energy Efficiency Program, current work focuses on transitioning the market to accept new Title 24 code changes, and incorporating best practices and advanced energy efficiency practices into that marketing and outreach effort.

Formatted: Indent: Left: 0.44"

**iii. WE&T Efforts**

Formatted: Font: Bold

WE&T efforts support the education and training of a robust network of industry trade allies, vendors, engineers, design teams and others who can support the market transformation strategies of the Strategic Plan. For the Commercial Energy Efficiency Program, WE&T efforts will focus in the near term on supporting national ANSI Energy Management Certification and the ISO 50001 Energy Management System development efforts, as outlined in the Strategic Plan. Programs will closely coordinate with key stakeholders to ensure that California is poised to adopt this national standard and be a

Formatted: Indent: Left: 0.5", Firstline: 0.13", Tabstops: 0.38", List tab + 0.44", Left + 0.56", Left + 0.69", Left + Notat 0.63" + 1.75"

**Program Implementation Plan**

Formatted: Centered

leader in this effort. Specifically, prerequisite trainings will be offered in DOE systems trainings to lay the groundwork for certification level trainings.

The education and training takes place through energy centers, technology test centers, and education and training program offerings.

Formatted: Indent: Left: 0.5"

**iv. Program-specific marketing and outreach efforts:**

Formatted: Font: Bold

Integrated and program-specific marketing efforts will complement and work in coordination with statewide ME&O to increase awareness, provide education, and drive ongoing engagement and participation in DSM programs and services among nonresidential customers. When appropriate, individual programs will be targeted to customers or industries based on segmentation data and strategy, however, such individual program-specific efforts will be part of a larger integrated approach to customer outreach to Commercial customers.

Formatted: Indent: Left: 0.69", Firstline: 0", Tab stops: 0.75", List tab + Notat 0.63" + 1.75"

Formatted: Indent: Left: 0.56"

Formatted: Indent: Left: 0.56", Firstline: 0"

The integrated Statewide ME&O effort will focus on creating awareness and educating SMB customers about energy management and the local ~~campaign~~ campaign will focus on the ways that customers can engage and take action to participate in EE as well as other integrated DSM offerings.

Formatted: Indent: Left: 0.56", Tab stops: 0.94", Left

-To address the diverse commercial customers segments, utilities will continue to foster strategic partnerships with trade association and industry groups to engage in a multi-faceted approach to marketing energy efficiency practices and programs to targeted users. Specific efforts will include:

Formatted: Indent: Left: 0.56"

- Attending trade association meetings and providing information in monthly newsletters.
- Close partnerships with key industry associations, and participation in their annual conferences, with an effort to develop conference speaking engagements.
- Targeted integrated education and training to specific market sectors to support peer-to-peer interactions and industry advancement.
- Ads and articles, with program information and case studies, in trade magazines.
- Online content and integration of marketing materials and campaigns with online tools such as audits and other energy demand and usage.
- Targeted customer efforts through assigned account representatives, technical solutions engineers and program engineers, third parties, and government partnerships.
- Telephone and web-based customer support and outreach.

Formatted: Indent: Left: 0.63", Tab stops: 0.88", List tab + Notat 1" + 1.25"

Formatted: Indent: Left: 0.56", Hanging: 0.31", Tab stops: 0.63", List tab + 0.88", List tab + 0.94", List tab + Notat 1" + 1.25"

**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

**Formatted:** Centered

- Market sector specific collateral that drives customers to account representatives and websites for additional support.

**v. Non-energy activities of program**

**Formatted:** Font: Bold

Integrated Energy Audits ~~and Retro-commissioning~~ (described in the Commercial Customer Services-Energy Advisor nonresidential Audit sub-program) and Continuous Energy Improvement are the primary vehicles to promote project solutions that look across the various IOU DSM program offerings, as well as complementary options available through other entities (e.g., water agencies). ~~The results of the ongoing Water Efficiency Pilot Program will identify potential opportunities to reduce water use and the potential for associated Energy Efficiency savings. Since some customers within the program sectors are major water users, this sector is well positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Programs.~~

**Formatted:** Indent: Left: 0.63", Firstline: 0.38", Tabstops: 0.63", List tab + 0.75", Left + 0.88", Left + Notat 1"

**vi. Non-IOU Programs**

**Formatted:** Font: Bold

In addition to the interactions with local, state and national programs, there are a variety of programs that will be coordinated with and leveraged in support of the Program objectives. These include:

**Formatted:** Indent: Left: 0.63", Firstline: 0.38"

- Connecting customers with the CA Climate Action Registry
- AB32 support through CO2 tracking in program resources
- Regulatory program coordination, including EPA air quality standards, water quality standards, and new refrigerant regulations
- Non-utility financing resources, including from water utilities, industry and private banking, state and federal incentives, funds, grants, and loan products to support energy and other resource management objectives
- ~~Water/Energy efforts within California~~
- ~~ANSI standard (see CEI section)~~
- ISO international energy management standards (see CEI section)

**Formatted:** Indent: Left: 0.63", Firstline: 0", Tabstops: 0.88", List tab + Notat 1" + 1.25"

The Program will continue to engage with Air Quality Management Districts, CEC, CARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**Formatted:** Indent: Left: 0.63", Tabstops: 0.63", List tab

**1. CEC**

**Formatted:** Font: Bold

~~1. work on PIER with Environmental Protection Indicators for California (EPIC)~~

**c) Best Practices**

Formatted: Font: Bold

As described in prior sections, the Commercial Energy Efficiency Program reflects the best of each utility program's successful components of statewide Commercial Energy Efficiency Program offerings, and introduces new elements from other utilities and national efforts as well. Best practices include:

- ~~Benchmarking as an appropriate easy first step for customers to assess their energy baseline.~~
- ~~A Continuous Energy Improvement approach that transforms the market and reduces energy intensity while pursuing technical and management opportunities.~~
- Development of a prioritization process, leveraging the CEI sub program, that works to identify the most significant upgrade potential based on building and ownership characteristics. This process will help guide customers to a building integrated approach leveraging all of the available utility programs for a customer segment rather than only pursuing the "low hanging fruit". The utilities will continuously educate the various delivery channels on the importance of the building integrated approach and how to increase customer participation at a whole building level.
- Technical Assistance: The IOUs recognize the need for a personalized, full service approach when providing technical assistance to customers –from audits to design and technical assistance, presentation of recommendations, resources to develop a long term plan, and the potential of project management assistance with financial incentives.
- Vendor Partnerships: This strategy will be coupled with vendor support and educational workshops and classes to provide the full breath of support customers may

Formatted: Centered

need to influence their decision to implement energy efficient equipment and practices.

- Statewide Coordination: The IOU program representatives will meet on a quarterly basis to improve program operations by sharing successes and areas of operational concerns.
- Leveraging Local Commercial sector: Resources such as industry associations, trade associations, and facility management associations will be leveraged.

**d) Innovation**

Formatted: Font: Bold

Significant innovative aspects of the Commercial Energy Efficiency Program offering include:

**i. Integration**

Formatted: Font: Bold

- Benchmarking will provide customers with an easy and low cost way to assess and monitor their energy use. Continuous Energy Improvement will foster a long-term energy management approach
- Integrated Energy Assessments provide targeted customers with integrated solutions in efficiency, DR, and DG, and advise customers on other sustainability practices such as water conservation opportunities, CO2 reduction potential or other programs references.
- IOUs will link customers with the California Climate Registry to support carbon footprinting of a customer's plant.

Formatted: Indent: Left: 0.5", Hanging: 0.06", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Start at: 1 + Alignment: Right + Aligned at: 0.75" + Indent at: 1"

Formatted: Indent: Left: 0.5", Tab stops: Not at 1"

**ii. Marketing**

Formatted: Font: Bold

- The Customer segmentation work currently underway will support development of new, super targeted integrated marketing and outreach plans outlining multiple delivery channels that target customers based on their needs.
- IOUs will examine opportunities in the "MUSH" segments (municipalities, universities, colleges, schools and hospitals) for focused offerings in conjunction with all the segmentation plans being deployed.
- Closer coordination with third parties, government partnerships, core programs, and other delivery channels will optimize portfolio performance.
- Utilities will increase outreach to new trade and community-based associations, leveraging best practices identified in ACEEE study of utility Commercial Energy Efficiency Programs.
- Energy Design Resources, developed statewide by IOUs, will be expanded as a web-based hub of commercial and food processing best practice information, training, modeling and performance tracking tools.

Formatted: Indent: Left: 0.5", Hanging: 0.06", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Start at: 1 + Alignment: Right + Aligned at: 0.75" + Indent at: 1"

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

- Expanded workforce education and training efforts with vendors, design teams, industry association members and other key market actors will help overcome many customer informational and transactional barriers
- Training will be provided on modeling and quantifying savings opportunities through tools such as eQUEST and Energy Pro.

**iii. Implementation**

Formatted: Font: Bold

- Utilities will coordinate process improvements for statewide programs to ease participation barriers.
- SMB-targeted local marketing will leverage the heightened levels of awareness and education that the IOUs expect to result from the Statewide ME&O campaign.

Formatted: Indent: Left: 0.5", Firstline: 0", Numbered+ Lev el: 1 + NumberingStyle: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.75" + Indentat: 1", Tab stops: 0.56", Left

Formatted: Indent: Left: 0.5", Tab stops: 0.75", Left + Notat 1"

**iv. Deeper Energy Savings**

Formatted: Font: Bold

- Utilities will seek to deliver deeper energy savings to our customers through bundling of measures, continuous energy improvement, innovative auditing, and/or whole approaches.
- Utilities will explore other mechanisms to more highly reward comprehensive energy management retrofits, e.g. premium incentives for bundled measures coupled with an energy audit.
- Utilities will enhance current finance offerings by standardizing statewide financing and exploring innovative tools to leverage additional funding sources.
- Utilities will evaluate approaches which bundle various equipment and technologies to encourage customer adoption of long and short-term payback IDSM measures.
- Utilities will seek to motivate owners and operators of large facilities to undertake improvements through presenting compelling return on investment (ROI) or Payback based business cases to top decision-makers, while strengthening the skills and knowledge of building operators.
- Utilities are considering a number of different, innovative approaches to achieve deeper energy savings; including a whole building approach that integrates both customized retrofit and retro-commissioning in a single, performance-based program offering.

**e) Integrated/coordinated Demand Side Management**

Formatted: Font: Bold

An integrated portfolio is cost effective, captures program delivery efficiencies, and serves the needs and wants of customers, who prefer a single, informed utility point of contact who can help inform and prioritize their energy investment decisions based on their unique needs. To that end, the statewide utilities and the Statewide Commercial

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

Energy Efficiency Program have made tremendous progress in advancing integrated solutions:

- Marketing: In marketing integration, the IOUs are placing major emphasis on getting the right message to the right customer at the right time. Advanced customer segmentation is being used to develop detailed integrated marketing and outreach plans which outline multiple tactics, delivery channels and key messages to target to specific customers based on their specific needs. The account representatives, who serve as the key customer point of contact, will be attending an integrated sales strategy and training program to ensure consistent delivery of portfolio offerings.
- Education and training – especially workshops organized around a customer segment – provides an ideal situation to integrate customer energy solutions. Utilities will build on past successes to provide integrated workshops to restaurants, retailers, office building facility managers, lodging, and warehouses. The workshop topics generally start with “analysis” resources and methods, and move on to “conservation”, “efficiency”, “demand response”, then “generation” topics and resources. These workshops provide opportunities for utilities to cross-sell solutions and share key information with other utility departments.
- As appropriate, Workforce Education and Training will also cover integrated energy and system solutions, which will be increasingly important as Critical Peak Pricing matures. For example, the California Advanced Lighting Controls Training Program addresses both the energy efficiency and demand response capabilities through the proper design, specification and installation of lighting system controls.
- The availability of a Continuous Energy Improvement approach, especially for the largest, most strategic customer accounts, will facilitate a thoughtful, integrated energy plan and will allow utilities to stay engaged in supporting the progress of that plan.
- Integrated Energy Audits combine funds and resources of energy efficiency and demand response programs to provide integrated recommendations to customers that emphasize energy management in proper sequence, in support of the California Loading Order: ~~Permanent reductions will be achieved through energy efficiency first, and then through demand response.~~ Incentives from both programs can help reduce payback cost and support advanced energy management decisions. Demand response opportunities will be targeted in the larger facilities, especially as part of monitoring-based retro-commissioning efforts where the controls to facilitate demand response efforts would be installed. Additionally, any energy efficiency audits required for participation in distributed generation programs will be expanded to include DR opportunities ~~when appropriate, and thus address the three facets of DSM integration.~~
- Emerging Technologies and CEC-~~PIER~~ collaboration is expected to include initiatives and market acceleration assistance for market-ready products in the general categories of day lighting, lighting, HVAC, controls, and building envelope improvements.

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

**f) Integration across Resource Types**

Formatted: Font: Bold

California's Commercial sectors face a multitude of environmental, regulatory, and financial (Landlord owned, capital outlay) challenges that impede the adoption of new energy efficiency technologies. In addition, new regulations aimed at improving air quality, water quality and reducing toxic environmental pollutants are proving to be expensive and disruptive to business as usual, and in many cases will have the impact of increasing energy use in compliance.

The Commercial Energy Efficiency Program proposes to leverage these challenges to coordinate with the regulating agencies and the programs they are operating in order to support mutually advantageous program designs, customer incentives, marketing opportunities, and implementation opportunities.

Utilities will pursue opportunities to partner with water agencies to offer joint energy and water incentives in support of ~~for~~ projects that reduce both resources, which ultimately reduces project costs and improves payback. ~~payback and decrease project costs.~~

Where applicable, the Program program will integrate topics like LEED certification into targeted customer workshops, marketing and communications, building on a strong track record from the 2006-8 program cycle.

Third party programs at the utilities will further integrate resources. These third party programs will focus on specific customer segments offering a complete project package that will include integration aspects.

Formatted: Font: Bold

**g) Pilots**

During the course of the ~~three~~two-year cycle, initiatives may be created based on the needs of the commercial customers.

The IOU's intend on implementing methods to gather and retain more detailed performance and usage data on a pilot basis to determine more effective methods and to achieve savings. Exploring incentives for sub-metering is an option as is expanding the tool library in lieu of incentives. For example, an "Office of the Future" activity is currently being reviewed for 2010. The program focuses on a partnership with property owners and managers to influence the tenant improvement process and facilitates tenant related actions. This project will implement the current and future recommendations of the Office of the Future Consortium as they demonstrate the path to ZNE buildings.

**h) EM&V**

Formatted: Font: Bold

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues. The IOUs plan to work together and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided here.

Because the segment approach is a significant change from recent commercial sector core programs, a preliminary process evaluation will be conducted during the first program year to determine how well the new program elements are operating, and to obtain recommendations on how to improve program operations. After the beginning of the last program year, a full process evaluation will address researchable issues based on the program theory and logic model. These issues will include, but not be limited to, the following:

1. Whether program incentive levels for the deemed savings and the calculated savings elements are sufficient, not enough, or more than necessary to motivate program participation, while minimizing free ridership.
2. Whether the direct install element is penetrating the intended markets.
3. Whether the integrated energy audit element is inducing customers to take advantage of other program offerings, like the rebates.
4. Whether the continuous energy improvement element is successful in getting corporate commitments to an EE strategic plan.
5. How well the commercial sector activities are supporting the Strategic Plan.
6. How well the core commercial activities are coordinated with other nonresidential program offerings, to leverage resources.
7. How well program marketing supports and complements the marketing efforts of other IOU demand side management programs.

To address these issues, the following major evaluation tasks will be completed:

- Logic model and program theory. The logic model and program theory will establish a starting point for all evaluation activities. The structure of the logic

**2013-2014 Energy Efficiency Programs**  
**Statewide Commercial Energy Efficiency Program**  
**Program Implementation Plan**

Formatted: Centered

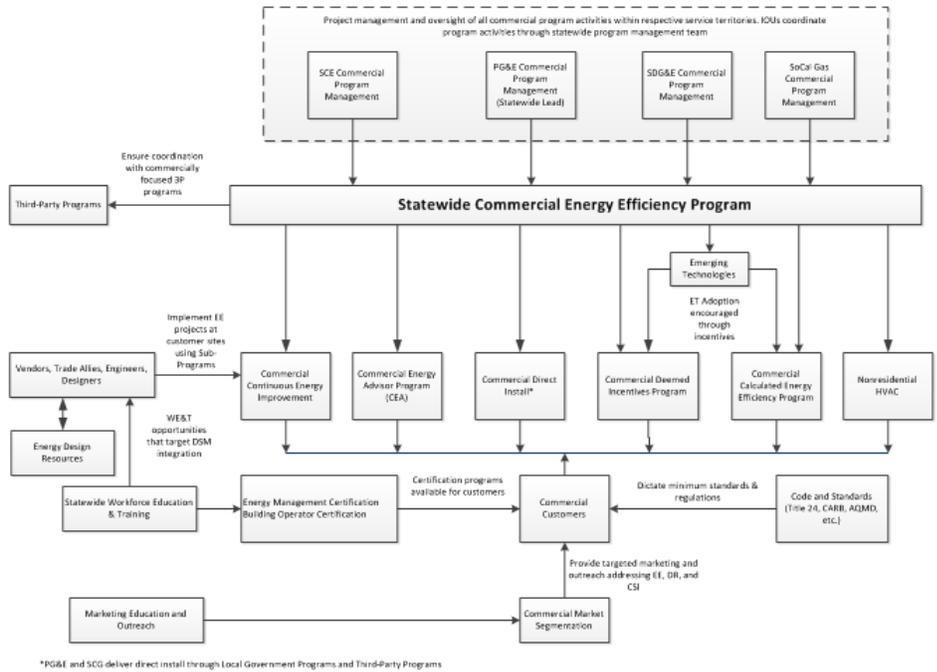

model, which links program activities and expected outcomes, will be a useful instrument for identifying specific program assumptions that can be tested using a survey or other primary data collection activities. The original logic model in the PIP will be refined to reflect the Commission approved program "as built."

- In depth interviews. In depth interviews will be conducted with program managers and other key staff members. Program staff members will clarify program goals and gauge program progress, provide valuable insight into daily operations, and proposed research topics to be addressed during the evaluation. The coordinated activities of the Account Management personnel and the EE Program Managers will be an important focus of this redesigned program approach.
- Participant survey. The primary data collection instrument will be a participant survey, fielded over the phone. Some will be conducted in person for selected key customers with large savings, complex projects, and multiple sites. The surveys will explore the participant experience with program services and address the research issues identified by the logic model.
- Program specific data collection and review. Another key evaluation activity will involve a comprehensive review of all program documents. In particular, this evaluation will assess the effectiveness of the program's marketing materials and will identify which specific recommendations have been implemented.

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. Below is the approved logic model for the Commercial Energy Efficiency Program.

# 4) Program Description

## a) Describe Program

The Statewide Investor Owned Utilities (IOUs) have created the Customer Services Commercial Energy Advisor sub-program (CCSPEA) to bring together under one program all services offered to support customer education and participation in energy efficiency, demand response and self-generation energy reducing opportunities and benefits, along with awareness of greenhouse gas and water conservation activities.

CCSPEA was created to provide a streamlined and coordinated assignment of right-sized customer solutions. The key is to start the process with an initial analysis of a customer's needs, determination from the analysis which audit will service the customer with the highest cost/benefit, identify additional program support and key indicators that will motivate the customer to implement energy saving recommendations

The utilities anticipate the restructuring of CCSPEA will affect the way audits are provided. CCSPEA will enhance the IOUs' ability to match customers' need(s) with the right audit service. This will result in an increased cost-effective delivery of these audit services with an increased expectation for customer adoption/installation of provided customer specific recommendations.

In its offerings, CCSPEA will place an emphasis in deep energy saving measures and emerging technologies where appropriate. When the technologies and customer opportunities are correctly aligned, the customer will become more open to the benefits these technologies offer to their business and will therefore increase their acceptance and adoption.

Together the CCSPEA offerings will work to support the achievement of Strategic Plan objectives across all non-residential segments.

The IOUs believe this approach is the best way to influence market transformation, serve customers' needs, and increase adoption of DSM solutions.

Formatted: No bullets or numbering

Formatted: Indent: Left: 0.25", Hanging: 0.38", Tab stops: 0.19", List tab + 0.63", Left + Notat 0.5"

The CCSPEA package consists of six (6) distinct offerings:

- **Benchmarking** is the first step for a customer to begin to understand the energy use of their building. Benchmarking is an initiative designed to educate and motivate customers to measure and track the energy use of their facilities, educate customers of the benefits of benchmarking their facilities and how they can track the impact of energy savings after implementing energy saving measures. To support the customer's efforts, the IOUs will offer technical support, hands-on workshops that will provide customers with information on how to benchmark, how benchmarking can be used as an energy management tool and what to do next after benchmarking.  
The IOUs will develop or continue benchmarking initiatives that supports the customers' ability to comply with AB1103's benchmarking requirements (upon its implementation), utilizing ENERGY STAR Portfolio Manager and IOU supported Automated Benchmarking Services.

The IOUs will also continue to offer customers technical support ranging from email and phone hotlines, hands-on workshops and web-based benchmarking educational and instructional materials.

Support will continue to identify, evaluate and make information disposable about other benchmarking tools available.

The primary focus for benchmarking activities will continue to be centered on commercial buildings (in alignment with the target building type of AB 1103).

- **Online Energy Audit Tool (Small Business):** The online audit tool is an enhanced, customer friendly "do-it-yourself" web-based audit tool targeting small business customers. The online audit tool offers an integrated auditing approach providing energy efficiency, demand response and self-generation recommendation and education.<sup>1</sup>

With large numbers of small business customers in each IOU's service territory, it is necessary to offer and test different cost-effective strategies that can help small business customers maximize their energy use.

The IOUs will confirm their implementation timelines and once their tool is rolled out, they will initiate a continuous improvement cycle to ensure the benefits and features of the tool are meaningful for customers use. As the timing is appropriate, the IOUs will initiate marketing campaigns to raise small business customer awareness of the tool's availability and benefits.

---

<sup>1</sup> The online energy audit tool is a continuation of the Universal Energy Audit Tool (UEAT) from the 2010-2012 program cycle and is also referred to in the Commercial Energy Efficiency Program logic diagram)

Formatted: Indent: Left: 0.25"

Per the Final Transition Period Decision, IOU implementation timelines occurring beyond 2012 are listed below. Note: PG&E implemented its Residential tool, in compliance with CPUC directives, in Q1 2012.

Formatted: Fontcolor: A auto

Formatted: Indent: Left: 0"

Audit Type	Description	IOU	Small Business	Residential
Online Energy Audit Tool	The web-based energy audit tool (also known as the Progressive Energy Audit Tool) provides Small Business and Residential customers with a customized audit designed to help customers understand their business and/or home energy use. The tool provides concrete customer suggestions about ways to maximize their energy efficiency (EE), demand response (DR) and distributed-generation opportunity.	SCG	Q2 2013	Q4 2012
		SDG&E	Q2 2013	Q4 2012
		PG&E	Q4 2012	Q1 2012
		SCE	Q1 2012	Q1 2012

- Continuous Energy Improvement (CEI)** Continuous Energy Improvement (CEI) is a consultative service aimed at helping customers (utilities will target CEI services in line with market segment potential in their service territories and resource availability) engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices which address energy savings, reduction of greenhouse gas emissions and water conservation, through high-level energy commitments from executive and board-level management.

CEI offers customers the pinnacle of audit offerings guiding executive management to levels of energy management self-actualization that makes energy and environmental issues a consideration in all management/business operational decisions and in long term energy planning. For additional information about CEI, please consult the [CEI Program Implementation Plan](#).

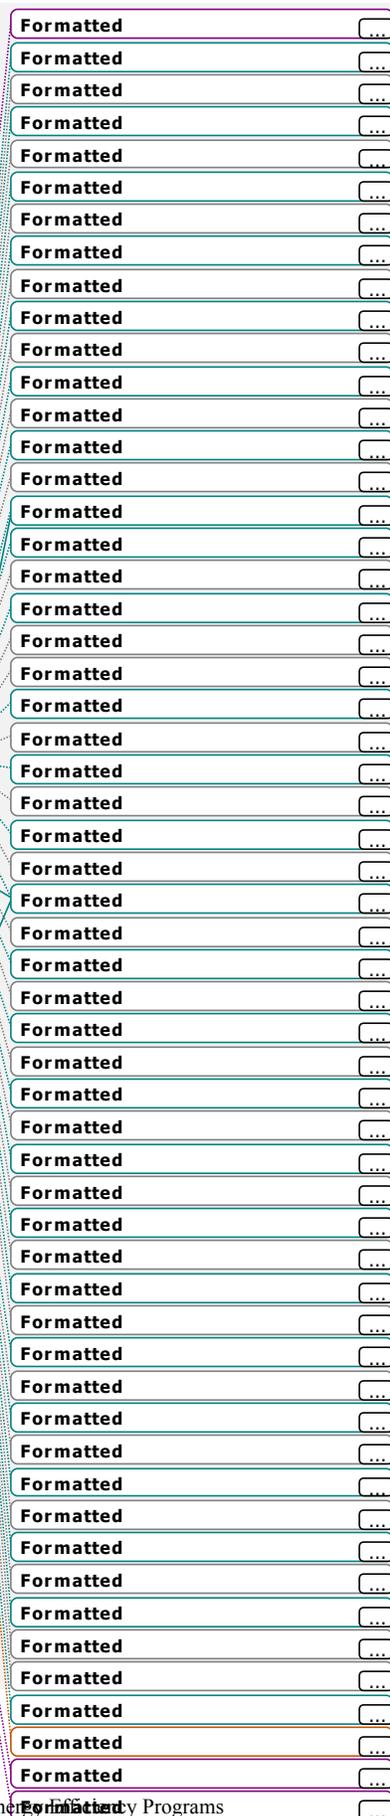

- **Non-Residential Audits (NRA)** for the Transition Period will provide [Integrated Comprehensive Energy Audits \(ICEA\)](#) that focus on customer energy savings, cost/benefits, and the targeted delivery of financial and technical assistance. Audit information must communicate complex information in a simple and understandable way to enable customers in identifying energy efficiency, demand response and distributed generation opportunities. Audits use “ex ante” deemed and calculated methodologies for energy savings analysis information.

As stated above, NRA offers two (2) categories of audits – basic and integrated.

Audit Type	Description	Detail	SCG	SDG&E	PG&E	SCE
Integrated Customer Comprehensive e-Energy Audit	The ICEAT audit is a customized audit specifically designed to help customers understand and identify their facility’s energy use and provide concrete suggestions to maximizing energy efficiency (EE) demand response (DR), and distributed-generation opportunity as defined by the customer’s need.	Phone	YES	YES	YES	YES
		Online (Web-Based)	YES	YES	YES	YES
		Onsite	YES	YES	YES	YES

This program cycle, emphasis will be given on meeting requirements of the California Long Term Energy Efficiency Strategic Plan (Strategic Plan), streamlining the audit process increasing its efficiency, lessening complexity, and increasing the effectiveness of influencing customer implementation actions through actions such as integration of the demand response technical audit component directly into NRAs offerings. In addition, the IOUs will investigate ways to implement meaningful financial measurements such as return on investment (ROI) and/or simple payback metrics. The key is ensuring financial tools selected provide the customers with meaningful information by ensuring cost assumptions are appropriate to the customer. Also, NRA will assume the audit and budget responsibilities for Demand Response’s technical audit services, as applicable. It is intended that these audits will be a critical component of the integrated comprehensive audit service offering.

- **Pump Efficiency Services** is designed to help commercial customers make informed decisions about improving inefficient pumping systems and operations through recommendations derived from pump test audit or direct observations of processes.

Pumping of water is estimated to account for more than 80% of the electric load and 73% of the natural gas requirement in California in the agricultural segment-, and this load is growing as the state's water users increase their reliance on pumping water to meet their needs. Pumping is also estimated to account for 20 to 25% of energy usage within the nation.

The Pump Efficiency Services program element, implemented by a team of trained in house or third party contractors, aims to overcome key informational, technical, and financial barriers to pump optimization by offering pump tests, retrofit incentives, and targeted education, training and technical support for customers and pump companies. Each IOUs database of pump test results will be used in the near-term to target pumps in need of retrofit as a means to capture savings. However, pump performance data aggregation at the statewide level will contribute to the development of metrics and targets for pump improvements, in support of a statewide pumping focus across segments, in agriculture, commercial and industrial, supporting their strategies and objectives.

The IOUs will continue to offer pump testing services at no or low cost and pumping system efficiency workshops through their energy education centers or other event opportunities.

#### Retro-commissioning:

- The IOUs are planning to continue and enhance their core Retro-commissioning (RCx) programs. RCx is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments.

The RCx element is designed to optimize existing building or system performance by identifying operational deficiencies and making necessary adjustments to correct the deficiency. RCx is offered to agricultural, commercial and/or industrial customers based on the market segment potential and resources of the respective IOU. The range of projects may involve measures which reset, repair or replace existing system controls and components. Simple paybacks for these measures are usually short in duration and must meet customer expectations. Through the RCx assessment report, comprehensive projects are identified and referred to other sub-programs for completion (i.e., Commercial Calculated and Deemed Incentives). Energy savings from projects identified through RCx will be claimed in the Commercial Calculated Incentives sub-program.

Enhanced RCx program elements will explore and may include but not be limited to:

- innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- Continuous commissioning and monitoring-based commissioning;
- Solutions for small and medium commercial customers;
- Strategies to drive savings persistence;
- Appropriate alignment with retrofit activities;
- Overall program incentives, targeting, and delivery.

The RCx program is a key offering in the Commercial Calculated sub-program and a more detailed description of the program is provided.

Formatted: Indent: Left: 0.5", Tab stops: 0.5", Left

The CCSPEA strategy focuses on simplifying the way audits are provided to customers. Through various assessment functions, the IOUs will work with the customer to identify the best, most cost-effective solution and the one with the greatest potential to motivate the customer to implement energy saving solutions (i.e. primarily EE, DR, and SG).

It is anticipated CCSPEA will allow the expansion of audit serves across diverse class of customers, potentially across all segments and will interconnect the customer with the wide and diverse range of programs offered. From a customer perspective, the impact on customer time and resources will be reduced, the audit analyses will include DSM, greenhouse gas reduction information, provide water conservation recommendation all in a single report. The resulting report will identify comprehensive solutions that will simplify the customer decision-making process.

The primary program objectives for 2013-2014 are:

- Support the Strategic Plan by offering integrated audits across a wide selection that address the full spectrum of energy solutions, including energy efficiency, demand response, and distributed generation (California Solar Initiative and distributed generation) focusing on customer facilities as defined by each IOU's market potential and resource availability.
- Provide a focus on the "MUSH" market (municipalities, universities, colleges, schools, and hospitals) to test ideas for deeper energy savings efforts.
- The continuation of delivering high value audit reports to the customer. Audit reports will be designed in such a way that they will provide the customer with information which motivates them to implement energy efficiency, demand response and consider renewable generation options.
- Enhance efforts to identify and provide financial analyses focused on deeper energy savings and technologies. Identify ways different financial metrics, such as return on investment (ROI) and/or simple payback, can be provided where the values presented have meaning to the customer.
- The IOUs will explore and evaluate the potential of enhanced customer incentive options that are contingent on a customer's receiving an audit prior to applying to incentive programs.
- Incorporate new and/or emerging technologies appropriate for the customer's facility.
- Develop and implement enhancements to current benchmarking workshops (targeting commercial buildings) and continue providing benchmarking and AB 1103 technical support through established and new delivery channels.
- Encourage statewide consistency by offering a similar energy audits with the ultimate goal of offer customers the best energy management practices and technologies.

Formatted: Indent: Left: 0.25", Tab stops: 0.31", List tab + Not at 0.75"

- Review and evaluate the CEC's Building Energy Asset Rating System tool (BEARS) once the CEC has completed developing the tool. The successful implementation of testing the new BEARS audit tool will depend on its timely release. BEARS is currently slated for completion at the end 2012. If the release of the BEARS tool is significantly delayed then the implementation of a successful pilot will also be delayed.

- Enhance the CCSPEA' offerings by including activities such as, but not limited to:

1. The highlighting of emerging technologies and deep energy savings opportunities and providing education on long term energy planning/project management strategies (in coordination with the Commercial CEI program).
2. Will continue existing water saving services and develop Leak detection services and strategies which will offer the service to customers in all customer segments as determined by the IOUs to provide customer benefits and cost-effective to administer. The services will, be offered through the use of audit teams, in house and/or contracted, and may be required as a service in the delivery of all integrated comprehensive audits.
3. CCSPEA will play a key role in exploring options regarding identifying deep energy savings, promotion of emerging technologies and providing the proper support to those customers who take advantage of more than three (3) measures from Commercial Deemed Incentive subprogram.
4. CCSPEA will develop processes to assist energy audit teams and customers identify facilities and services that will provide the greatest return on benefits from the audit. The IOUs may explore leveraging tools to complete energy audits, usage analysis, assessments and/or building performance benchmarking as the first step in determining a customer's need.
5. CCSPEA may also enhance tracking and audit component capabilities to support customer needs analysis, reduce program application barriers, maximize recommendation follow up and streamlined audit report generation.

The Nonresidential Audits sub-program features Basic Audits, Integrated Audits, and RCx audits. These audits consist of a technical survey of energy utilization throughout the customer facility, thereby providing a system view of equipment and processes that consume energy. In this holistic system view, four discrete components of the California Long Term Energy Efficiency Strategic Plan—Energy Conservation, Energy Efficiency, Demand Reduction, and Self Generation—are blended and evaluated in various combinations. Utilities are increasingly considering including other resources in audits such as water and GHG; planned training will increase focus integration of a range of energy and non-energy options. These various combinations will be reviewed for their societal benefits, logical order, and customer benefits, and then presented to the customer in the recommendations section of the Integrated Energy Audit (IEA) final report.

The table below summarizes the features, target segment, estimated cost, and funding model for each audit type.

Estimated Avg. Audit Cost	Funding Model
\$2000—\$3000	PPP and Procurement Funds.

Formatted: Left: 1", Right: 1", Width: 8.5", Height: 11"

Formatted Table

The technical assistance provided through the audit products help customers overcome barriers, including lack of technical resources and cost barriers, and guide customers to relevant IOU incentive and/or finance programs and beneficial non-IOU programs. Integrated audits for large customers summarize the effect of utility incentives on the first cost and lifecycle benefits of energy efficiency actions.

Cost effectiveness calculations enable the customer to make financial decisions to implement projects. Integrated audits for large customers will include ROI/IRR and payback with and without incentives. Current remote auditing tools provide customers with a simple payback calculation. The forthcoming Universal Energy Audit Tool (UEAT) will also have calculations for payback and simplified ROI. As a further enhancement, IOUs will explore the applicability of adding more detailed ROI calculations to UEAT.

To support the core utility programs, Nonresidential Audits will provide Savings Calculation Assistance (SCA), targeted to specific end uses and systems, to support a seamless customer experience. IOU engineers or contracted energy engineering firms will help customers submit accurate, technically complete nonresidential retrofit applications. This assistance will speed the process and reduce expensive, time-consuming rework later in the process.

RCx assessments offer a systematic process to identify and correct operational problems or inherent repair and maintenance deficiencies that waste energy. Unlike retrofits, which focus on equipment replacement, or O&M, which focuses on routine maintenance, RCx focuses on identifying and correcting problems that may not be readily identified through other channels. O&M items with an effective useful life greater than 3 years will also be identified through this assessment. Additionally, opportunities often exist to optimize existing systems to operate more efficiently than originally designed with minimal new capital outlay. Building on early RCx implementation for commercial segments, the program offering is being expanded into the Agriculture and Food Processing markets.

RCx will be offered as a bundle of products and services. RCx service providers will perform several tasks to identify measures. These tasks include, but are not limited to:

- Initial energy benchmarking
- Collecting data to quantify the owner's operational requirements
- Performing detailed on-site RCx assessments to evaluate operational deficiencies and/or operational optimization opportunities inclusive of improved and enhanced preventive maintenance and repair programs
- Defining measures and quantifying implementation costs and savings
- Assisting customers with measure implementation
- Verifying completion of measures

- ~~Providing post-installation documentation and training as well as other activities in support of persistence~~
- ~~Conducting post-project energy benchmarking~~

~~IOUs will discuss and consider various options for customer engagement in energy audits and implementation of energy efficiency, demand response, and distributed generation recommendations. Such options may include co-payments, rewards, case studies, and additional incentives to promote desired outcomes.~~

~~The primary program objectives are to:~~

- ~~Support the Strategic Plan by offering integrated audits that address the full spectrum of energy solutions, including energy efficiency, demand response, and distributed generation (California Solar Initiative and distributed generation);~~
- ~~Build upon established popularity and increased demand for audits to supplement delivery channel marketing efforts;~~
- ~~Implement innovative processes and establish an infrastructure that will distinguish NRA from past programs;~~
- ~~Maintain state-wide consistency by offering the same set of energy audits and using them as instrument to offer customer best energy management practices and projects; and~~
- ~~Offer additional products and services to bridge the gap between educating customers about energy and environmental issues and taking action. Guide and support customers as they implement technologies, processes and practices to achieve energy efficiency goals.~~
- ~~Provide a channel to recommend new and/or emerging technologies appropriate for the customer's facility (e.g., solid state lighting, lighting controls, and demand control ventilation).~~

**b) List of Measures**

The CCSPEA primarily offers non-resource, auditing services. It does not offer incentives, but ultimately influences the customer's implementation of energy efficiency, demand response, and self-generation opportunities in combination with incentive from the core commercial incentive programs (refer to the Commercial Deemed and Calculated Incentives sub-programs for specific information). However, each utility reserves the ability to offer incentives specific to CCSPEA's individual service offerings. The nonresidential Audit sub-program is a service program that does not offer measures/incentives, but provides an avenue for implementing measures through core commercial incentive programs (refer to the Commercial Deemed and Calculated sub-programs for specific information).

**Formatted:** Indent: Left: 0.25", Tab stops: 0.06", Left

**c) List Non-incentive Commercial ~~Customer Services~~ Energy Advisor Services**

All activities conducted under the nonresidential Audit sub-program are non-resource that with no associated incentives. Such activities include: marketing and outreach, retrofit project scoping, technical assistance, incentive application assistance, savings calculation assistance. The Commercial ~~Customer Services~~ Energy Advisor (CEA) sub-program (~~CSP~~) is designed to deliver a coordinated and customer specific service. CCSPEA features a statewide integrated demand side management customer specific solution that promotes energy efficiency, demand response, distributed generation and emerging technologies as appropriate to the customer's need(s).

Such activities include, but are not limited to: energy management assessments, energy planning, marketing and outreach, baselining and benchmarking, project implementation support, technical support, energy savings calculations, process evaluations and report generation, and web-based energy resources.

Formatted: Font: Bold

Formatted: Indent: Left: 0.25"

## 5.) Program Rationale and Expected Outcome

### a) **Quantitative Baseline and Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

See Attachment A - Table 3 – refer to the overarching program for quantitative baseline metrics

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude “draft” metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

### b) **Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program

Formatted: Font: Bold

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.5"

Formatted: Font: Bold

level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP. See Section 1a.5.a.

**c) Program Design to Overcome Barriers**

Formatted: Font: Bold

The Commercial CSPEA offers services that address corporate/management cultures that prevent successful implementation of comprehensive energy policies. These offerings help overcome customers' lack of awareness of DSM opportunities by providing a customer focused, comprehensive package of energy solutions designed specifically to motivate the customer to implement recommendations. Information such as cost/benefit analysis (i.e. ROI or simple payback) and identification of appropriate IOU incentive and/or finance programs, programs can significantly enhance the financial benefit of the energy saving recommendation. Commercial CSPEA also provides customers with tools to measure the effects of implemented energy savings actions on their bottom line.

Formatted: Indent: Left: 0.5"

CCSPEA brings together audits and related services to implement energy saving activities. The nonresidential Audit sub-program will help overcome customer's lack of awareness of DSM opportunities by providing comprehensive energy solutions that the customer can implement through relevant IOU incentive and/or finance programs. The audit results summarize the cost/benefit of identified projects and include the effect of utility incentives on the first cost of the facility upgrade. The sub-program also addresses the hassle or transaction costs that prevent customers from acting upon the audit recommendation. This barrier is reduced through the Savings Calculation Assistance, which facilitates the customer's completion of an incentive program application for their project(s).

**d) Quantitative Program Targets**

Formatted: Font: Bold

The targets provided herein are best estimates, but nonetheless are forecasts.

**Table 5**

e) **Advancing Strategic Plan goals and objectives**

Formatted: Font: Bold

The CCSPEA is designed to promote DSM coordination and the integration strategies of the Strategic Plan. Foremost are recognition of the linkage between energy and environmental policy and the importance of integrating energy efficiency, demand response and distributed generation to support California's plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the CCSPEA include:

- Facilitate all State-Owned and Leased Buildings having a Retro-Commissioning option

By offering a dedicated retro-commissioning program a mechanism is created whereby IOUs can facilitate the achievement of this goal as a coordinated effort with the IOU Government and Institutional Partnership Programs.

- Strengthen Tools and Practices for Building Commissioning

Based on the IOUs' experience with managing the Retro-commissioning program, lessons learned and best practices can be integrated into the 2013-2014 offering. To increase market adoption of these program best practices, the IOUs will work in cooperation with the California Commissioning Collaborative to disseminate relevant information to the retro-commissioning community and services may be extended to all segments as deemed appropriate by each IOU.

- Identify New and Improved Tools and Strategies to Reduce Energy Consumption in commercial facilities

Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the benchmarking, CEL, NRA and RCx, demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, commercial customer processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing facilities contribute to California's zero net energy goals. Once implemented, recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.

Formatted: Indent: Left: 0.5", Tab stops: 0.5", List tab

Formatted: Tab stops: 0.5", List tab

● State/Local Governments and Major Corporations Commit to Achieve EE Targets

CCSPEA's offerings will seek to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop an actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

Formatted: Indent: Left: 0.25", Tab stops: Notat 0.75"  
Formatted: Tab stops: 0.5", List tab  
Formatted: Indent: Left: 0.5", Tab stops: 0.5", List tab

● Develop Tools to Reduce Energy in Commercial Facilities

As part of the implementation of specific CCSPEA offerings, the IOUs will partner with energy industry peers, industry associations, and DOE/CPUC-sponsored labs and consultants to enhance the use of existing tools and explore new tools to help commercial customers reduce initial energy usage at their facilities, then continue to operate their facilities in an efficient manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

Formatted: Indent: Left: 0.25", Tab stops: Notat 0.75"  
Formatted: Tab stops: 0.5", List tab  
Formatted: Indent: Left: 0.5", Tab stops: 0.5", List tab

- EPA EnergyStar Portfolio Manager Benchmarking Tool.
- Management Standard for Energy SME2000-2008.
- EPICDOE Superior Energy Performance.
- ISO-50001.

Formatted: Indent: Left: 0.5", Firstline: 0", Tab stops: 0.69", Left

● Develop Business Models to Deliver Energy Management Solutions

CCSPEA's offerings will address the fundamental purpose to influence decision making practices from commercial customers to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the agricultural market sector.

Formatted: Indent: Left: 0.5", Tab stops: 0.5", List tab  
Formatted: Indent: Left: 0.25", Tab stops: Notat 0.75"  
Formatted: Tab stops: 0.5", List tab

In addition, CCSPEA's offerings promote acceptable practices of accounting, auditing, and evaluation by:

Formatted: Indent: Left: 0"

- Offering integrated and focused audits, benchmarking, savings calculation assistance for retrofit and retro-commissioning opportunities, and simplifying the audit-to-project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action.
- Guiding and supporting customers as they implement technologies, processes and practices to achieve deeper energy efficiency savings.
- Long term energy planning support.

Formatted: Indent: Left: 0.69"  
Formatted: Indent: Left: 0.44", Bulleted + Level: 1 + Alignedat: 0.25" + Tab after: 0.5" + Indentat: 0.5", Tab stops: 0.69", List tab + Notat 0.5"

The nonresidential Audit sub-program is designed to promote DSM coordination and the integration strategies of the Strategic Plan. Foremost are recognition of the linkage between energy and environmental policy and the importance of integrating energy efficiency, demand

Formatted: Indent: Left: 0"

response and distributed generation to support California's plan to reduce greenhouse gas emissions.

Specific near-term strategies proposed by the Strategic Plan that are addressed by the nonresidential Audits sub-program include:

~~2-1: Ensure all State Owned and Leased Buildings are Retro-commissioned—By offering a dedicated retro-commissioning program a mechanism is created whereby IOUs can facilitate the achievement of this goal as a coordinated effort with the IOU Government and Institutional Partnership Programs.~~

~~2-5: Strengthen Tool and Practices for Building Commissioning—Based on the IOUs experience with managing the 2006-08 Retro-commissioning program, lessons learned and best practices can be integrated into the 2010-2012 offering. To increase market adoption of these program best practices, the IOUs will work in cooperation with the California Commissioning Collaborative to disseminate relevant information to the retro-commissioning community.~~

~~2-5: Identify New and Improved Tools and Strategies to Reduce Energy Consumption in Commercial Buildings—Starting with energy conservation and proceeding to distributed generation and demand response opportunities, the audits demonstrate to the customer a comprehensive, site-wide solution for near and longer term energy consumption and clearly state the positive greenhouse gas effects of their actions. Addressing customer energy needs through long-term solutions allows consideration of technologies and projects that benefit the state and planet for a decade or longer (e.g., HVAC systems, industrial processes and equipment, facility envelope upgrades and enhancements). Recommendations for retrofit opportunities within existing commercial building stock contribute to California's zero-net energy goals. Recommendations for operation and maintenance (O&M) practices on on-going commissioning will ensure that customer facilities continue to operate in an efficient manner.<sup>4</sup>~~

In addition, nonresidential Audits promote acceptable practices of accounting, auditing, and evaluation by:

- ~~● Offering targeted audits, savings calculation assistance and simplifying the audit to project documentation process to bridge the gap between educating customers about energy solutions to environmental issues and taking action.~~
- ~~● Guiding and supporting customers as they implement technologies, processes and practices to achieve energy efficiency savings.~~

~~Energy saving results will be achieved by providing comprehensive follow-up with customers who have received an energy audit. Follow-up will include targeted, end-use energy analysis and implementation of "audit to project" conceptual work.~~

<sup>4</sup> Note that recommended O&M solutions will be linked with Quality Maintenance principles established by the Statewide Residential and Commercial HVAC Program, thus supporting many of the goals of Chapter 6 of the Strategic Plan.

## 6.) Program Implementation

- a) Assess and identify the best way to support the use of CEC's BEARS tool.
- b) Enhanced current benchmarking workshops and continue providing benchmarking and AB 1103 technical support through established and new channels.
- c) Emphasize and support integration in emerging technologies and deeper energy savings opportunities.
- d) In coordination with incentive programs, identify ways to streamline the end to end process for customers wanting to participate in utility energy saving programs.
- a)e) Continuation of Statewide IOU cCoordination

### a) Statewide IOU Coordination

#### i. Program name: Commercial Customer Services ProgramEnergy Advisor

—

#### —Program delivery mechanisms

#### ii.

CCSPEA will employ a variety of delivery mechanisms or channels. Most of CCSPEA's offering will use IOU customer energy efficiency staff and contractors, service and sales representatives, website and/or marketing and outreach efforts. Other delivery channels may also be developed.

In addition, where applicable, Utility customer account representatives or program management staff will support this activity within the statewide commercial sector, as well as third parties, government partnerships, and local programs.

#### iii. Incentive levels

Not applicable./A

#### iv. Marketing and outreach plans

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs.

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost effectiveness of reaching customer groups.

#### v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable

CCSPEA's energy recommendations will continue to recognize the regulations required by other bodies. For example, information about GHG reductions resulting from AB 32 may be incorporated into the customer recommendations and to factor into the project's cost-effectiveness and water conservation information will be included in the reports as appropriate.

Formatted: Indent: Left: 0.9"

Program offerings will collaborate and support the CEC's AB 1103 mandate by assisting customer with technical and awareness activities. CCSPEA will advance the introduction of the BEARS and California Rating Tool where reasonable.

C

Formatted: Normal, Indent: Left: 0.9", Don't keep with next

CSPEA recognizes the efforts of the CEC's Green Building Initiative programs, DOE's "ISO plant certification" programs, EPA EnergyStar Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs and will leverage such activities to the customer's benefit.

a) Statewide IOU Coordination

Formatted: Font: Bold

**Maintaining state wide consistency in offering the same set of energy audits allows customers to benefit from the collective experience of the IOUs and receive best energy management practices. Specific areas of coordination include:**

- ~~Development of an integrated audit tool and methodology: Currently, Remote Audits provided by the IOUs include education on various energy solutions. In an effort to enhance the offering, the IOUs will coordinate in the development and piloting of the. The tool will enable residential and small commercial customers to conduct their own energy audits from the comfort of their home or office by logging onto the statewide IOU Web portal. It will be the primary tool to provide energy conservation, energy efficiency, demand response and distributed generation information to customers with load less than 200 kW.~~
- ~~Implementation of IEAs (i.e., accounting guidance, regulatory interpretation).~~
- ~~Development of marketing, outreach and education strategy.~~
- ~~Strategies to support the Strategic Plan and various market transformations.~~
- ~~Development of innovative audit approaches (i.e., retro-commissioning).~~
- ~~Inter-utility coordination through regularly scheduled meetings to address concerns and problems that may develop during program cycle.~~

- ~~RFP process for development of audit tools: This process will focus on consultants that have developed a simplified process that allows for better understanding of energy efficiency technologies.~~

**b) Program delivery and coordination**

The sub-program will be coordinated with the following activities, as applicable:

Formatted: Indent: Left: 0.25"

**i. Emerging Technologies (ET) Program**

Formatted: Font: Bold

The IOU CCSPEA Management Team will stay abreast of and incorporate relevant emerging technologies into audit recommendations as appropriate. Constant two-way communication between the Emerging Technologies program and the Nonresidential Audits sub-program will accelerate implementation of initiatives for demonstrating promising new EE technologies and practices. Additionally, auditors will be enabled to seek potential applications among targeted customer segments so that ET may gauge potential for promising technologies. Incentives are available for customers who install emerging technologies under the Calculated sub-program.

**ii. Codes and Standards Program**

Formatted: Font: Bold

CCSPEA implementation will include information about pending new codes and standards that may affect planning or prioritization of retrofit or new construction projects. Audits reports will include customer recommendations that are consistent with current governing codes. The Nonresidential Audits Program will work closely with Codes and Standards to recommend appropriate technologies and products to customers.

**iii. WE&T efforts**

Formatted: Font: Bold

C  
CSPEA implementation will integrate with WE&T efforts, as needed, by providing CSI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.

Formatted: Indent: Left: 1"

IOUs will also continue with WE&T coordination to bridge the linkages and integrate sector strategy approaches, as required. To maximize its reach, the Nonresidential Audits sub-program, in conjunction with utility training centers, will offer training to interested third-party personnel and publicly owned utilities to develop a workforce that will implement energy efficiency products and practices. As an energy efficiency expert, PG&E can leverage the knowledge and experience it has built up over the years by sharing

Formatted: Space After: 0 pt

that information with other interested parties throughout California. PG&E's successful efforts over the past twenty plus years are evidenced by the industry that has sprung up to support existing audits and other educational efforts. Many third party engineering firms focus a large portion of their business on supplying the technical resources required by existing IDSM programs. To support the substantial ramp up of goals envisioned by the strategic plan, PG&E can increase the workforce available to California by increasing its training efforts.

**Formatted:** Indent: Left: 1", Don't adjust space between Latin and Asian text, Don't adjust space between Asian text and numbers

**iv. Program-specific marketing and outreach efforts (budget provided in Table 1)**

Formatted: Font: Bold

A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the IOUs in order to maximize effectiveness, integrate offerings, and as appropriate refer customers to relevant DSM programs.

Formatted: Indent: Left: 1"

Additionally, IOUs may investigate piloting alternative channel marketing, such as social media tools, and outreach options that might include community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. IOUs may investigate and test efforts to leverage relationships with trade associations as a way to increase cost effectiveness of reaching customer groups.

In 2013-2014, CSPEA marketing campaigns will provide a wide range of action-oriented solutions targeted specific segments and sub-segments of business customers. In addition, as

Formatted: Indent: Left: 0.88"

A broad range of marketing activities will be used to promote audits and increase customer engagement, including actions recommended in past EM&V studies to enhance program performance. Such activities include direct personal marketing through Account Representatives and energy efficiency staff at customer facilities, education and training events, regional meetings, conferences and trade shows as well as through traditional marketing approaches such as web channels and integrated marketing collateral. Audits will also be an integral piece of Continuous Energy Improvement customer engagement, identifying the technical opportunities that can be used to populate energy action plans. As appropriate, marketing activities will be coordinated between IOUs and between DR and Distributed Generation departments within PG&E.

The central message in promoting audits will be that they provide customers a technical roadmap to reduce costs and improve performance, and that they identify utility and financial resources available to support projects.

To aid in future project targeting and marketing efforts, audit recommendations will be placed in a centralized audit database to enable follow up through appropriate delivery channels. Aggregated audit results and recommendations will also enhance ongoing market segmentation efforts.

**v. Non-energy activities of the program**

Formatted: Font: Bold

Integrated audits are a key tool for identifying non-energy opportunities for specific customers. These opportunities will be pursued whenever possible.

Formatted: Font: Bold

**vi. Non IOU programs**

CCSPEA reports will include information on Non-IOU Programs to expose customers to funding, such as from air or water agencies, to support integrated

Formatted: Indent: Left: 0.88"

efforts. CCSPEA will partner with programs offered by CEC, ARB, Air Quality Management Districts, ENERGY STAR, and other government and quasi-governmental agencies to capitalize on opportunities to develop co-branded program information and marketing collateral target to commercial sector customers, as opportunities present themselves.

With respect to water conservation, utility program managers will continue to partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects (ESPM, BEARS, California Rating Tool, Water Agencies and others).

~~**Over the next three years, the IOUs will seek to increase their interactions with the POUs to better align IOU and POU nonresidential Audits programs. This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.**~~

vii. ~~**CEC work on PIER with EPIC**~~

CCSPEA implementation will continue collaboration efforts with the CEC and seek to promote adoption of new technologies developed through the CEC's processes and to educate customers to demonstration, research and/or pilot projects. Specific CSPEA offerings will encourage recommendations addressing new technologies, processes, and methods, as identified in CEC projects, which will enable customers to achieve energy efficiency "stretch" goals that produce significant energy savings beyond an established baseline in a cost-effective manner. See Section 6.b.1

Formatted: Font: Bold

Formatted: Indent: Left: 0.88"

Formatted: Font: Bold, Highlight

Formatted: Font: Bold

Formatted: Font: 12 pt, Not Highlight

**viii. CEC work on codes and standards**

Formatted: Font: Bold

CCSPEA will not be implemented with a direct linkage to codes and standards efforts. Although CCSPEA will reflect code and standards regulation in its energy savings calculations as deemed appropriate. See Section 6.b.ii

**ix. Non-utility market initiatives**

Formatted: Font: Bold

Education about federal tax incentives for energy efficiency investments is an example of non-utility information and guidance that CCSPEA offerings will provide to customers. In addition, the IOUs will participate in state and national efforts to develop and/or improve benchmarking tools and services that can be used by customers to better facilitate their adoption of sustainable energy management practices.

Not applicable; this is not a focus of this sub-program.

**c) Best Practices**

Formatted: Font: Bold

The IOUs will continue to leverage best practices and lessons learned at regularly scheduled statewide program management meetings. These meetings are forums to discuss program design and implementation issues, and as appropriate provide statewide collaborated guidance in RFP solicitations and awareness of program offerings so customers operating multiple facilities across IOU service territories receive the same customer experience.

Formatted: Indent: Left: 0.5"

Other best practices approaches apply the principles of well-known business continuous improvement programs, such as Lean Six Sigma and ISO standards, to facility and plant energy management, in order to achieve widespread adoption of long-lasting sustainable energy management practices in the market sectors. As stated above, these principles are: (1) Commitment, (2) Assessment, (3) Planning, (4) Implementation, (5) Evaluation, and (6) Modification. This approach will continue through the two-year program cycle for 2013-2014, allowing longer-term and deeper project development engagement with customers. One focus of the Nonresidential Audits program will be to improve the adoption rate of energy efficiency and demand side management audit recommendations made to IOU customers. As such, staff will provide comprehensive support and establish an extended follow up plan as follows:

- Customers who complete an online mass market audit (using the Universal Energy Audit Tool or UEAT) will be targeted for follow up through all available communication channels.
- Mailings and call scripts will be personalized for each customer and will reference specific audit recommendations, based on the customer's online audit report.
- Following on-site audits, assigned account managers, who are either target market experts or assigned account managers, will contact customers to discuss each recommendation and elicit customer feedback or commitments to implement measures.

The Nonresidential Energy Audits Program design is based on EM&V study results. Statewide IDSM program performance will be continually enhanced by iterative evaluations of EM&V study results. Lessons learned will be incorporated into best practices protocols, and EM&V results will be evaluated to identify delivery channels and measures that yield the highest energy savings.

**d) Innovation**

Formatted: Font: Bold

For 2013-2014, the IOUs are identifying and evaluating program processes to increase effectiveness, simplification and increase the benefits the program delivers. Each IOUs set of lessons learned from these efforts will be shared and implemented to enhance energy savings benefits to all California IOU customers.

Formatted: Indent: Left: 0.5"

CCSPEA will engage in a process of continuing improve as a new standard way of packaging energy efficiency, demand response and self-generation products and services, aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that includes addressing both technical and management opportunities.

Formatted: Indent: Left: 0.5"

Depending on the outcome of the 2012 process evaluation, CEI may consider customer incentives to accelerate project implementation (including IDSM projects), and reward customer for implementing strategic energy management.

Formatted: Indent: Left: 0.5"

IOUs will discuss and consider various options for customer engagement in energy audits and implementation of energy efficiency, demand response and distributed generation recommendations. Such options may include co-payments, rewards, case studies, and additional incentives.

Integration with RCx

Energy efficiency measures recommended in audit reports comprise three categories defined by their relative cost for implementation: no cost, low cost, and capital projects. Integrated audits are a primary source of leads for potential RCx projects that assist customers with implementation of no cost and low cost EE measures. On the other hand, RCx contractors can also share their findings with the large targeted customer program and can recommend that customers pursue a full Integrated Audit before embarking on RCx efforts. In the 2010-2012 Nonresidential Audits sub program, cross-training and coordination between the two programs will be increased to encourage optimum effectiveness in achieving an integrated offering of retrofit and RCx projects.

Enhanced Resources

The IOUs will provide information and resources to customers, such as contractor lists, financial resources, and technical assistance, to make it easier for customers to take action in response to audit recommendations. Much of this information is available on IOU websites. Further, the IOUs will upgrade web resources to include such features as case studies, technical assistance for selected measures, and savings calculators.

### Universal Energy Audit Tool

To implement the integrated audits for customers smaller than 200 kW, the IOUs are developing a Web-based audit (do-it-yourself or auditor-performed) that includes education on various demand-side management solutions. The UEAT will enable customers to conduct their own energy audits from the comfort of their home or office by logging onto the PG&E website. It will be the primary tool to provide energy conservation, energy efficiency, demand response, and solar/self-generation information and analyses to customers with less than 200 kW load. Customers will supply account information or a zip code, or telephone number, which will calibrate the tool for their specific microclimate. UEAT will specifically address potential measures that qualify for rebates and incentives and provide simple payback information. By implementing such features in UEAT, PG&E will extend the integration concept to broader audience, including residential customers.

Additional questions, presented through the latest online graphical interface, will provide robust customization of customer energy use (e.g., based on type of business, type of residential building, hours of operation, number of inhabitants). Audit reports will be available to customers through e-mail or U.S. mail delivery. PG&E plans to make modifications to its current audit tools, if technically feasible, as an interim solution until launch of the UEAT and to meet the requirements of solar audits under SB-1 and integrated program offerings.

Supporting integration, UEAT will provide preliminary calculations for technical feasibility and sizing of solar systems. This analysis will consider the impact of energy efficiency implementations. For more detailed analysis of solar systems, the tool will refer customers to the Statewide California Solar Initiative Calculator. When appropriate for particular measures, the UEAT will refer to other available tools, such as the SPC calculator, EQuest, and DOE 2.

The UEAT will provide a portfolio of audits that are easily accessible to PG&E program managers. It will provide them with unified data resources, a central repository of recommendations and algorithms, and an interface to enable customization of energy audit formats to meet specific customer needs.

Historical data from the UEAT, from previous energy audits and efficiency projects implemented at their own facilities, will be accessible to all residential and nonresidential PG&E customers and to auditors via Web-based tools. The data repository for UEAT will be designed in a format that complies with M&V requirements, and the data will be available to M&V consultants. As a table-driven software tool, UEAT allows customers/users to select measures most compelling to their situation.

All IOUs are discussing developing UEAT as a joint effort to ensure statewide consistency.

### New Technologies

To boost the number of quick turnaround audits to customers and increase participation in deemed rebates, PG&E will use new technologies (i.e., wireless and PDA based checklists) to enhance productivity while targeting specific customer needs.

#### Engineering Support

The IOUs will contract with energy engineering firms to help medium and large customers, who will benefit from an enterprise wide plan for staged implementation of IDSM recommendations, develop IDSM implementation plans. Specialized engineering firms will supplement the customer's site and business specific knowledge with IDSM specific know-how. Together, the consultant and client will build a successful plan that results in an optimum installation of energy efficient equipment and processes that enhance the customer's productivity and competitiveness.

#### e) **Integrated/ Coordinated Demand Side Management**

CCSPEA will provide a comprehensive approach for integrated audit services. Its services will have the flexibility of meeting every level of a customer's audits needs from integrated comprehensive audits to targeted or focused audits, which centers on specific systems or processes, to assessments or general walk through audits or online "do-it-yourself" audits (currently for small business customers), which when properly applied can assist in identifying the areas of a customer's greatest energy interest, financial capabilities of the customer's ability to invest in improving its energy use, and identification of other programs that can be brought into the discussion to motivate a customer to move forward with the energy saving plan.

The scope of services offered can coordinate the audit to look for retrofit or retro-commissioning opportunities; with benchmarking tools, or long term planning. Audit reports can present a truly integrated analysis to customers, seamlessly providing them with information and recommendations regarding energy efficiency, distributed-generation, demand response, greenhouse gas emissions and water energy savings, Customers will be referred to other IOU programs that will help them implement the recommendations resulting from the audit report and thus will be given a complete picture of their energy usage and options for reducing costs and using energy more efficiently. The Nonresidential Audit sub-program is a core strategy of the IOU's integrated customer approach, featuring energy conservation, energy efficiency, time of use management, demand response and self generation, blended and evaluated in various combinations. These combinations are reviewed for their logical order, customer benefits, and societal benefits. Based on the customer's technical opportunities, as well as stated needs and wants, the auditor will craft an integrated solution that is tailored to customer specific business needs and requirements. The report's recommendations are optimized to achieve reduced energy consumption, reduced environmental impacts and increased productivity.

IOU programs offering additional technical assistance and project incentives, such as the Calculated sub-program, third party programs, demand response incentives or distributed

Formatted: Body Text Indent, Indent: Left: 0.5", Don't adjust space between Latin and Asian text, Don't adjust space between Asian text and numbers

Formatted: Font: Bold

Formatted: Indent: Left: 0.5"

generation incentives will be highlighted to encourage follow through on measure recommendation adoption.

The audit process, final report presentation, and follow up activities aim to minimize disruptions of customer core business activities while maximizing the benefits of audit recommendations and integrating with all applicable programs. For example:

- After an integrated audit is completed, eligible no cost/low cost energy conservation measures will be transferred to the Retro-commissioning (RCX) program for follow up.
- Capital investment measures selected by a customer will become subject to a more rigorous calculation of energy savings under the Calculated Sub-Program's Saving Calculation Assistance (SCA) service, which may later accompany the application for a project filed with the calculated retrofit program.
- Demand Response measures will be evaluated for their applicability for daily use (they may eventually become an energy efficiency measure), load-shifting, and occasional response to demand response events.
- Eligible Demand Response measures accepted by the customer for implementation would be included in the same application as energy efficiency measures for a potential incentive under the Technology Incentive program for Demand Response.
- Distributed generation opportunities and benefits will be presented to the customer along with references to respective incentive programs and resources.

Formatted: Normal, Indent: Left: 0.5", No bullets or numbering

Utilities understand the importance of the integrated solutions and benefits of measure recommendations to the customer. Current tools already indicate greenhouse gas benefits associated with recommendations. IOUs will explore adding modules to the UEAT tool to consider water conservation, GHG reduction, waste management, and other modules will be incorporated into an enhanced version of UEAT. IOUs are currently developing curriculum to provide training to enhance the integration skills of IDSM auditors.

The Nonresidential Audit sub-program will continue to provide targeted support to the Commercial, Industrial, and Agricultural programs by developing sector experts among the engineering firms, as well as by developing market sector specific intelligence into the UEAT. For large integrated audits, auditors will team with Account Representative and program specific project managers to ensure robust support is available to serve the customer's technical and programmatic needs.

The utilities will continue to partner with Government Partnerships by offering Integrated Audits to qualified governmental agencies as it has during the 2006-2008 Program. In the future this effort will increase the number of regional, county and city aggregated audits to establish a strategic plan for these customers and better integrate DR and self generation with energy conservation and energy efficiency. These customers often have multiple accounts that do not meet the demand threshold for on-site audits on their own, but when aggregated they can constitute one of the largest energy consumers in the area.

~~As appropriate, the IOUs will also provide training and guidance to Third Party program implementers to broaden their audit focus beyond their program offering in order to identify potential in other end use systems. In this way PG&E will minimize inefficient and redundant customer visits. Expanding the scope of third party program audits will provide customers with additional opportunities through combinations of equipment upgrades in conjunction with other third party program vendors.~~

~~All large Integrated Audits will provide leads to appropriate Third Party programs based on audit report recommendations. The new Integration Desk will provide this centralized service for the LTC, while the UEAT will provide potential opportunities via automated selection based on survey input.~~

f) **Integration Across Resource Types**

CCSPEA will focus on DSM integration.

CCSPEA implementation will include information on Non-IOU programs to expose customers to funding, such as from air or water agencies, to support integrated efforts. IOU CSPEA managers will partner with the appropriate programs, when applicable, with government agencies to capitalize on opportunities to share program information, marketing collateral, and financial incentive analysis with customers.

Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, CEI will provide information about the mutual benefit of combining complementary resource programs.

In the effort to promote CCSPEA offerings, IOUs will seek out customers interested in complementary resource programs such as provided by water and air quality agencies. With respect to water conservation, utility program managers will collaborate with the local water districts to produce marketing collateral, attend trade shows, and co-release brochures, for programs with interactive water and energy effects. A comprehensive audit marketing plan will be aligned and coordinated with the marketing plans for each of the resource programs in order to maximize effectiveness, integrate offerings, and appropriate refer customers to relevant DSM programs. PG&E will also look to partner with interested public and governmental bodies to proactively promote energy efficiency and environmental green actions, in partnership with programs such as the local government partnerships and green communities. As noted above, an extensive training program is being planned to hone the ability of auditors to integrate other resources into energy audits.

The Nonresidential Audits sub program will serve as the foundation for integrated offerings by offering a truly integrated audit to customers, seamlessly providing them information and recommendations around energy efficiency, distributed generation,

Formatted: Font: Bold

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.5"

demand response, green programs, such as the ClimateSmart program, and other relevant programs.

Marketing collateral and messages for energy efficiency will be integrated with other PG&E programs. Through additional market segmentation and feedback from customers, PG&E will further adjust approaches based on the varied needs of targeted customers.

Services from the Nonresidential Audits program may also be available to low income energy efficiency and third party program staff and customers.

**g) Pilots**

Formatted: Font: Bold

CCSPEA services may consider the development of test markets especially in the introduction of new energy benchmarking or saving tools.  
Not applicable

**h) EM&V**

Formatted: Font: Bold

Formatted: Normal, Indent: Left: 0.25", Don't keep with next

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many cases, after the program implementation has begun, since the plans need to be based on identified program design and implementation issues. The utilities plan to work together and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics,
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

PY2013-2014 Commercial Energy Efficiency Program – Logic Model

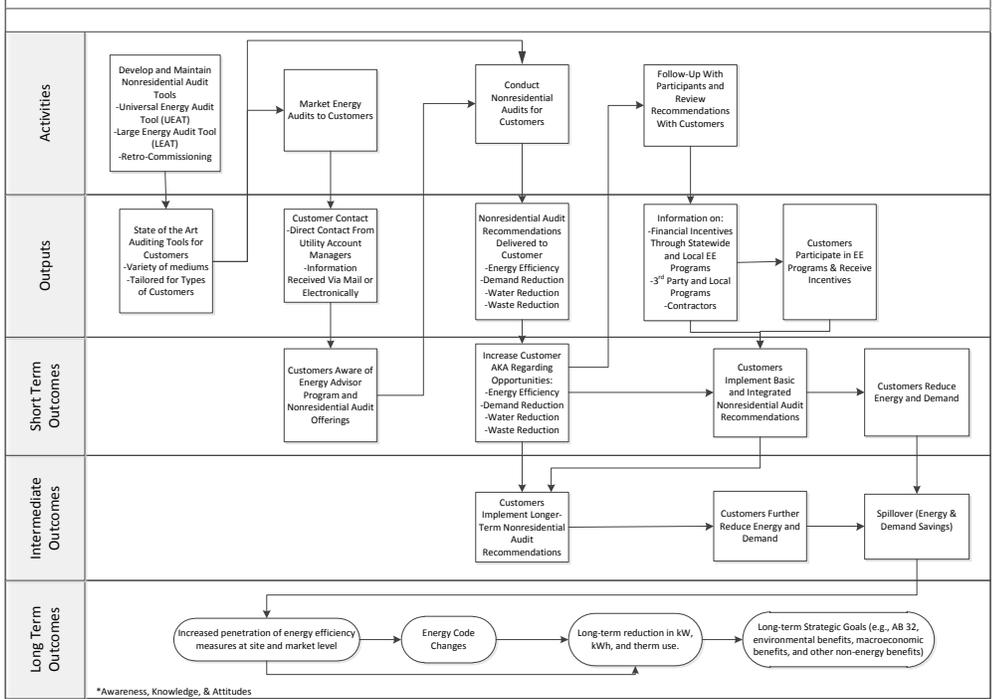

Formatted: Heading1

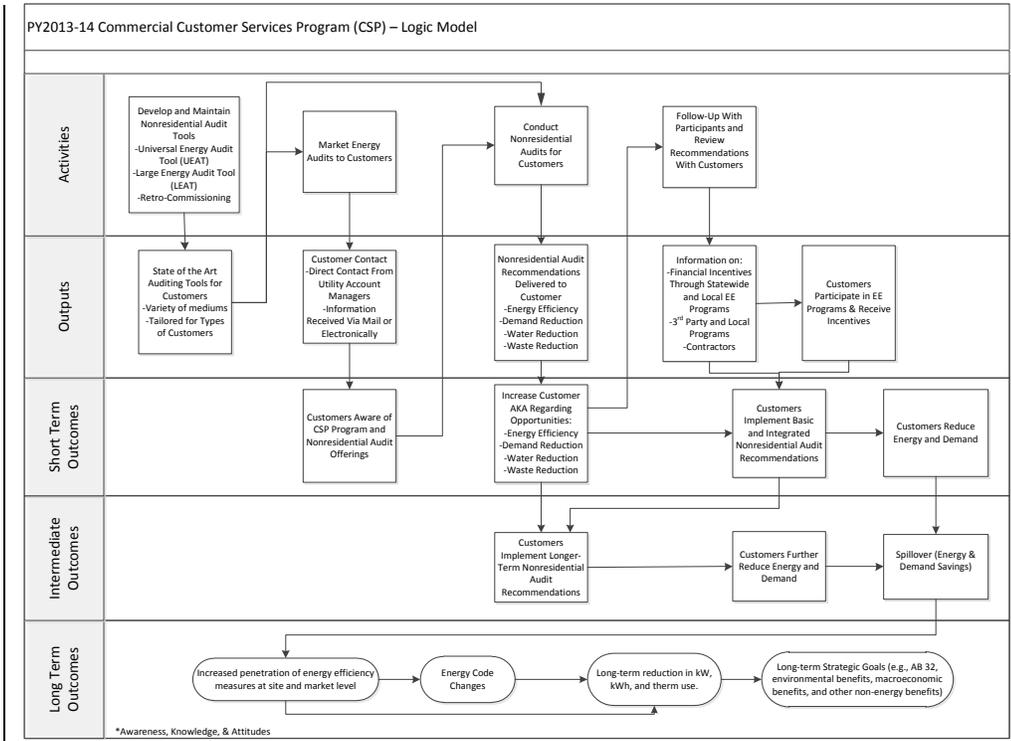

**8.2) Program Logic Model**

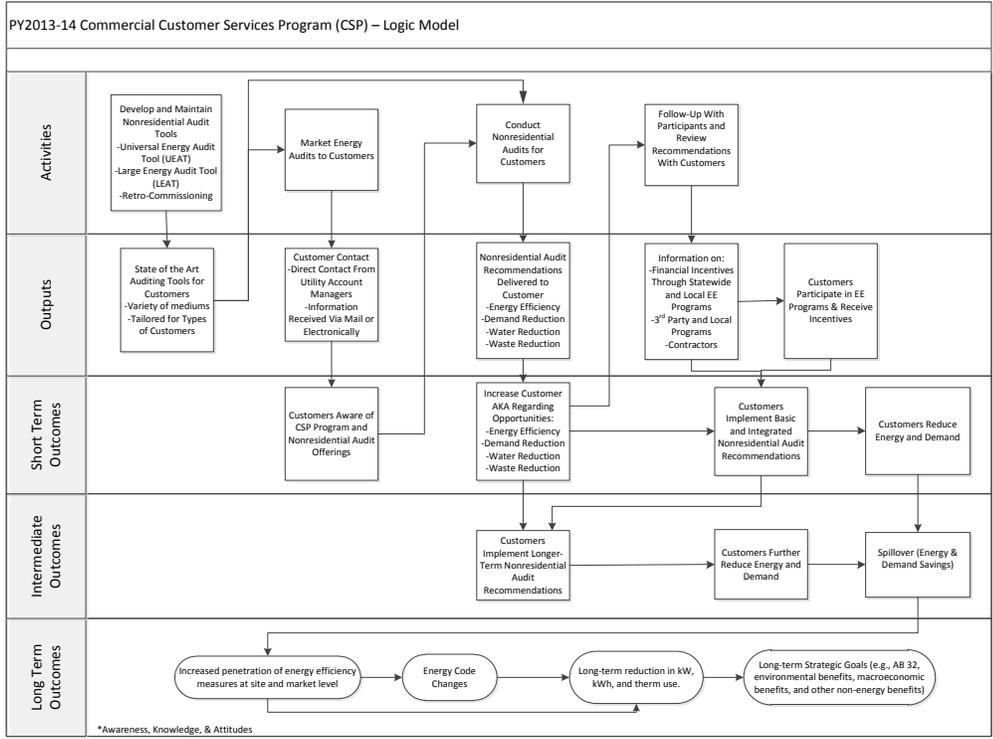

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. ~~Below is the approved logic model for the Commercial Energy Efficiency Program.~~

---

PY2013-14 Commercial Energy Advisor Program – Logic Model

|

Formatted: Heading1, Tab stops: Not at 3.17"

~~1e)~~ Program Name: Commercial Calculated Incentives, Core S sub-program  
Program ID: SCG - 3710  
Program Type: Statewide Core Program

## 2. Projected Program Budget Table

~~T~~ Table 1 – reference the overarching program for budget details

## 3. Projected Program Gross Impacts Table – by calendar year

~~Table 2 – reference the overarching program for savings budget details–~~

## 4. 4) Program Description

### a) Describe Program

The statewide ~~non-residential~~ Commercial Calculated Incentives sub-program provides customers technical and calculation assistance, as well as incentives based on calculated savings, to influence the design and installation of energy efficient equipment and systems in both retrofit and added load applications.

The Commercial Calculated Incentives sub-program is utilized for projects where a rebate is not available through the statewide Deemed program, where project conditions require customized calculations to provide the most accurate savings estimates, or where a project has interactive effects that are best captured through whole building or whole system modeling. Because calculated savings estimates are based on actual customer operating conditions, pre-inspections (for retrofit projects) and post-inspections are typically required as part of each utility's project documentation.

An important element of the Commercial Calculated Incentives sub-program is the design assistance and calculation assistance provided by the IOUs to influence customers to select the most efficient design and equipment options. For both retrofit and added load projects, IOUs work with the customer and their project team to evaluate their proposed projects and provide a report recommending efficient design alternatives and detailing energy savings, CO2 reductions, and calculated incentives available for exceeding Title 24 code or industry standard practice baselines as appropriate. This information is also available to customers through the nonresidential Audit offering. The combination of technical support and the availability and commitment of approved utility incentive funds is an essential driver to overcome key customer barriers, including lack of technical resources and lack of capital for energy efficiency projects.

Customers and project sponsors (contractors, design teams, vendors, ESCOs) participating in the Commercial Calculated Incentives sub-program may also opt to complete their own calculations for submittal to the IOUs for review and approval. For this purpose, consistent statewide calculators are publically available to customers for use if desired. The statewide

**Formatted:** Indent: Left: 0.13", Hanging: 0.13", Tabstops: 0.44", Left + 0.5", Left

**Formatted:** Font: Bold

utility-created and maintained [CCT SPC](#) Calculator can be used for retrofits and is available online and through CDs. For whole building construction projects, IOUs accept both Energy Pro, available for license, and the utility-sponsored EQEST, available for free on the statewide Energy Design Resources website [www.energydesignresources.com](http://www.energydesignresources.com).

Depending on whether a project is a retrofit or added load project, and on whether Title 24 is triggered for a particular project, different baselines are applied to capture appropriate project savings. For retrofit projects, incentives are capped at 50% of the total project costs. For added load projects, incentives are capped at 50% of the ~~in~~total ~~remental~~ project cost.

## b) **List of Measures**

[A broad range of measures is eligible for the Commercial Calculated Incentives Program. The current incentives are summarized in the following table. The incentives for these measures are standard across the utilities participating in the statewide Commercial Calculated Incentives Program.](#)

[The following measure categories are eligible for Calculated Incentives:](#)

- ~~— Lighting~~
- [AC & Refrigeration](#)
- ~~— Motors and others~~
- [Gas measures](#)

~~▲ The Calculated Incentives sub-program is a resource program that offers financial incentives for energy efficiency projects involving the installation of new, high-efficiency equipment or systems. The more kWh or therms saved by the energy efficiency project, the higher the incentive payment will be. The incentive options offered by the Calculated sub-program have seen high participation due to the program's flexibility in customizing appropriate energy efficiency solutions for a diverse range of customers. Below is a listing of all calculated measures grouped by measure category for all IOUs. Specific measures for each IOU are provided in the attached E3.~~

Formatted: Font: Bold

c) **List Non-incentive Commercial Customer Services Energy Advisor Services**

Formatted: Indent: Left: 0.13"

Formatted: Font: Bold

The Commercial Calculated Incentives sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical and calculation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd the project through the process.

5) **Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

Formatted: Font: Bold

Formatted: Indent: Left: 0.13"

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude “draft” metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

**b) Market Transformation Indicators (MTIs)**

Formatted: Font: Bold

Formatted: Indent: Left: 0.38"

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 4 – Refer to the overarching program for market transformation metrics (See Section 1a.5.a-)

**c) Program Design to Overcome Barriers**

Formatted: Font: Bold

The Statewide Commercial Calculated Incentives sub-program offers customers incentives to implement energy efficiency measures that have been identified primarily through

standard utility energy efficiency audits, in-depth facility/process assessments or retro-commissioning studies.

Other avenues used to identify energy efficiency opportunities include Programs that provide Education and Outreach, Workforce Education and Training, or through IOU Emerging Technologies Programs.

The Commercial Calculated Incentives ~~sub~~Sub-program addresses and eliminates a significant number of barriers to energy efficiency for commercial customers such as:

- A high percentage of the time, developers, building owners, building managers and building contractors build or retrofit to current standards (i.e., Title 24). On the Architect and Engineering Firm side, design engineers specify what they know or what they are familiar with. The Commercial Calculated Incentives sub-program encourages or rewards developers, building owners, building managers, contractors, and A&E Firms to “push the efficiency envelope” and exceed Title 24 requirements, or to exceed industry accepted baseline standards when retrofitting existing buildings or systems by providing up-to-date information on emerging technologies and providing incentives to bridge the “chasm” which typically prevent emerging technologies from being adopted by the market.
- In several instances, high efficiency Emerging Technologies are viable, but are unknown to facility owners and system designers and thus, are slow to penetrate the market, causing energy efficiency opportunities to be “lost.” The Commercial Calculated Incentives sub-program helps speed market penetration and associated energy savings for Emerging Technologies by offering, when appropriate, “premium” incentives for emerging technologies that are “proven” but not widely employed in the markets for which they are intended (e.g., solid state lighting, advanced lighting controls).
- Across all nonresidential customer segments, a significant barrier mentioned is “Access to Information”. This can be a lack of awareness of operating “best practices”, lack of awareness of energy efficiency opportunities, difficulty accessing industry relevant technical assistance, inadequate availability of qualified industry specialists or lack of personnel resources to fully assess a building, system or process. Also, in many instances, customers are not sure of how a specific energy efficiency project will impact their emissions, resource consumption or waste discharge streams.
- Multi-tenant buildings have a unique and significant barrier. Most typically referred to as the principal-agent or tenant-landlord split incentive, this issue is characterized by the natural separation of tenant energy efficiency savings and capital expenditures by building owners. The commercial program will incorporate market research and/or market tests to better understand potential programmatic offerings that can help reduce the barrier. Some examples of strategies that might warrant testing include combinations of education and creative tenant/landlord incentives or credits for centralized system or building shell upgrades.

These barriers are overcome by providing:

**Formatted:** Indent: Left: 0.25", Tab stops: 0.5", List tab + Notat 0.75" + 1"

**Formatted:** Indent: Left: 0.25", Space After: 12 pt, Line spacing: At least 13 pt, Bulleted + Level: 1 + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75", Tab stops: 0.5", List tab + Notat 0.75"

**Formatted:** Font: 12 pt

**Formatted:** Indent: Left: 0.25", Tab stops: 0.5", List tab + Notat 0.75" + 1"

**Formatted:** Indent: Left: 0.38"

- Highly skilled Energy Management Professionals that perform basic and integrated facility assessments;
- IOU Workforce Education and Training seminars through the Energy Centers;
- Web-based information and energy management tools that assist with identifying DSM opportunities;
- In-depth plant or system assessments such as the assessments jointly provided by the IOU's and the U.S. Department of Energy (DOE), that focus on improving production and optimizing energy efficiency;
- Incentives based on energy savings quantified through technical assessments or basic audits that help customers overcome internal financial hurdle rates;
- Incentive mechanisms that reward implementation of advanced technologies;
- Integrated solutions that conserve energy and reduce GHG emissions; and
- Statewide SPECCT Estimator that provides energy savings calculation for most popular and common retrofit projects and measures, assists in filling out program applications, and simplifies its processing.

Formatted: Indent: Left: 0.5", Tab stops: 0.75", Left + Not at 1"

Formatted: Indent: Left: 0.5", Tab stops: Not at 1"

Formatted: Indent: Left: 0.38"

The Commercial Calculated Incentives sub-program delivers a consistent message statewide to commercial customers about the benefits, energy savings and GHG reductions that efficient technologies and “best operating practices” offer. This eliminates the barrier often run into by commercial customers of getting incorrect or out-of-date information from local networks.

The Commercial Calculated Incentives sub-program not only brings IOU incentive information to customers, but in many instances also provides additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, Tax incentives or other local sources of project funding.

#### **d) Quantitative Program Targets**

Formatted: Font: Bold

The targets provided herein are best estimates, but nonetheless are forecasts.

Formatted: Indent: Left: 0.13"

**Table 5**

<u>Program Name</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>Projects</u>	<u>TBDxx</u>	<u>TBDxx</u>

Formatted Table

Formatted: Left

Formatted: Indent: Left: 0.13"

Formatted: Font: Bold

#### **e) Advancing Strategic Plan Goals and Objectives**

Formatted: Indent: Left: 0.19"

The unifying objective of the Strategic Plan is to employ market transforming strategies to encourage marketplace adoption of energy efficient measures to a point that public investment in energy efficiency is no longer necessary (Section 1, page 4). The Calculated Incentives

sub-program will support this effort by employing two of the five market transformation policies identified in the Strategic Plan. Specifically, the Program will offer “carrots” in the form of financial incentives to help pull the marketplace towards energy efficiency. The Calculated Incentives sub-program will also provide education and informational resources through marketing and program outreach efforts. Therefore, these program elements will work in concert to transform the market towards sustained, long-term energy savings.

The program will help to achieve the following near-term strategic goals as identified in Chapter 3 of the Strategic Plan:

- b) 2-3: Ensure compliance with minimum Title 24 codes – The Calculated Incentives sub-program only provides incentives for projects that exceed current Title 24 minimum baselines. Incentive mechanisms will be created to ensure deeper levels of energy reductions, potentially including implementation of the Office of the Future Consortium’s Phase 2 recommendations, “The 25% Solution”, which seek to reduce energy usage 25 percent below Title 24-2005 baselines.
- e) 2-5: Develop tools and strategies to reduce energy consumption in commercial buildings – The Calculated Incentives sub-program directly supports this effort by collecting data and conducting energy use and efficiency studies that, when collected over multiple IOU service territories, will be very helpful in supporting statewide efforts to establish a robust and useful knowledge base for the commercial sector.
- d) 2-7: Develop business models that deliver integrated energy management solutions – The Calculated Incentives sub-program will implement incentive mechanisms that will “reward comprehensive energy management retrofits” and “energy efficiency projects” such as incentives for reaching certain stretch goals that produce significant energy savings beyond an established baseline.
- e) 2-8: Improve utilization of plug load technologies – The existing incentive structure pays for energy reductions through plug load measures. Additional incentives that encourage greater penetration of plug load technologies may be developed, required and will be developed to support technologies recommended by PIER, the Office of the Future Consortium.

## 6) Program Implementation

### a) Statewide IOU Coordination

The Statewide IOU Coordination process, described in detail in the Statewide Commercial Energy Efficiency Program, will ensure continuous improvement and consistent implementation of all of the sub-programs. The discussion below will focus on how the IOUs will coordinate the Commercial Calculated Incentives sub-program specifically.

The Statewide IOU Coordination process for the Commercial Calculated Incentives sub-program will be as follows:

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.25", Bulleted+ Level: 1 + Aligned at: 0.5" + Tab after: 0.75" + Indent at: 0.75", Tab stops: 0.5", List tab + Not at 0.75"

Formatted: Indent: Left: 0.38"

- Hold Regular Program Manager Meetings – The ~~Calculated sub-program~~Commercial Calculated Sub-program managers from each of the IOUs will meet on a regular basis. The sub-program managers will unify, to the extent possible, the implementation of program aspects such as Program name, Program delivery mechanisms, Incentive levels, Marketing and outreach plans, and IOU program interactions. The sub-program managers will also discuss new innovations and develop solutions to overcoming implementation challenges. Therefore, the regular meetings will focus on issues specific to the ~~Calculated sub-program~~Commercial Calculated Sub-program only.
- Designate an IOU Program “Lead” – One of the sub-program managers that participates in the regular meetings will be the designated Calculated Program IOU “Lead”. The IOU lead will represent the sub-program at the regular Statewide Steering Committee meetings.
- Participate in Regular Steering Committee Meetings – The IOU lead will be responsible for attending the regular Steering Committee Meetings and sharing Calculated Incentives sub-program innovations, experiences and challenges that have the potential to impact multiple sub-programs or the core Commercial Energy Efficiency Program as a whole.
- Adopt Program Enhancements - Once the Steering Committee agrees that a specific innovation or implementation policy has merit on a statewide level; the IOU lead will distribute the information to the ~~Calculated sub-program~~Commercial Calculated Sub-program managers by email or at the next regular meeting for adoption and integration. Therefore, the IOU lead will act as a conduit feeding ~~Calculated sub-program~~Commercial Calculated Sub-program-specific information up to the statewide Steering Committee and distributing measures for adoption back to the ~~Calculated sub-program~~Commercial Calculated Sub-program managers.
- Evaluate Program Enhancements – To complete the adaptive management loop, the ~~Calculated sub-program~~Commercial Calculated Sub-program managers will track the success of the adopted statewide enhancement or implementation policy and report any challenges or concerns at the regular Commercial Calculated Incentives sub-program meeting. The IOU lead will report any challenges that transcend the Commercial Calculated Incentives sub-program to the Steering Committee, who will determine whether further course corrections are needed.

**Formatted:** Indent: Left: 0.38", Tab stops: 0.63", List tab + Notat 0.75" + 1"

**Formatted:** Indent: Left: 0.38", Tab stops: 0.63", Left + 1.19", List tab + Notat 0.75" + 1"

By following the process stated above, the Calculated Incentives sub-program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the three year implementation cycle. Sub-program innovations and challenges will also feed productively into the higher-level Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.

**Formatted:** Indent: Left: 0.38"

The coordination and unity of all program aspects, such as Program name, Program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions, will be handled through this statewide coordination framework. However, these aspects will start off at a high level of statewide consistency. In rare cases, there will be IOU-specific deviations. Such instances where one IOU will favor a different approach

than the other IOUs will be called out in italicized text throughout the Calculated Incentives sub-program.

Additional areas of program coordination include:

**i. Program Name :**

**i. Commercial** Calculated Incentives

**ii. Program Delivery Mechanisms**

The **Commercial** Calculated Incentives sub-program for will be delivered consistently across IOUs using the same application materials and energy savings calculation to ensure consistency. Both retrofit and added load projects for commercial customers are eligible for incentives.

**iii. Incentive Levels**

Incentives will be as follows:

- Lighting, \$0.05/kWh and \$100/kW
- Air Conditioning & Refrigeration I, \$0.15/kWh and \$100/kW
- Air Conditioning & Refrigeration II, \$0.09/kWh and \$100/kW
- Other, \$0.09/kWh and \$100/kW
- Therms, at \$1.00/therm, capped at 50% of project cost.

The IOUs are exploring innovative means of improving the Calculated Incentive sub-program based on Energy Division and market direction. One possible method to comply with the Energy Division's guidance to "achieve deeper energy savings retrofits and packages of measures" is to institute a scaled incentive mechanism that would provide higher incentives for more comprehensive projects. The IOUs are soliciting input from stakeholders and may institute a scaled incentive mechanism for the Calculated Incentive sub-program.

**iv. Marketing and outreach plans**

The In 2013-2014, the IOUs will continue to target customers for calculated incentives based upon segmentation research and messaging. Large Commercial customers make up a significant portion of the audience for Calculated Incentives and these customers will not be targeted by the SW ME&O campaign. Due to the complexity of aligning Calculated Incentives with customer operations and highly individualized energy management needs, the sales cycle for these deeper retrofit measures tends to be longer and require significant one-to-one contact at the local level. Customer workshops and other account management support are all important parts local marketing and the consultative selling process for Commercial Calculated Incentives.

Formatted: Font: Bold

Formatted: Font: Bold

The Commercial Calculated Incentives sub-program will be marketed through IOU Account Executives, as well as through third-party programs, trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by Account Executives, Demand Response Program outreach, phone and e-mail support will be provided.

The IOUs plan to monitor and optimize local marketing campaigns and when possible, will share best practices and coordinate efforts for statewide consistency.

Formatted: Indent: Left: 1"

~~In 2010-2012, the IOUs will implement segmentation research and messaging. Marketing campaigns will provide a wide range of action-oriented solutions targeted to "personas" identified through segmentation research. In addition, marketing efforts will be "bundled". That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.~~

~~Marketing efforts will incorporate a variety of marketing tactics/activities to promote the Calculated Incentives sub-program. Education, awareness and outreach efforts will rely on a combination of mass media communication channels and targeted communication channels to ensure the messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.~~

~~The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated among the IOUs utilizing the statewide coordination process described above.~~

Formatted: Font: Bold

#### v. IOU program interactions

The Commercial Calculated Incentives ~~sub~~Sub-program managers will partner with the appropriate programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to co-brand program information and marketing collateral with this sector's customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated

by or interested in more than one resource issue, comprehensive information that discusses all resource efficiency issues will benefit the customer to the mutual advantage of the single resource programs.

With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers ~~Calculated sub-program~~Commercial Calculated Sub-program incentives for energy efficient equipment that may also reduce air and GHG emissions.

**vi. Similar IOU and POU programs**

Formatted: Font: Bold

The IOUs will be delivering many third-party programs that utilize the Commercial Calculated Incentives infrastructure. This will ensure a consistent delivery of measure incentives to ensure that programs do not cannibalize each other and detract from achieving cost-effective energy savings.

**b) Program Delivery and Coordination**

Formatted: Font: Bold

The program will be coordinated with the following activities:

**i. Emerging Technologies program**

Formatted: Font: Bold

The long-term EE vision of California can only be attained through the long-term and continuous development, verification, and acceptance of new technologies into the market. The achievement of long-term goals requires new technology as well as information, training and market development to maximize the EE benefits of cutting edge technologies. In recognition of the importance of emerging technologies, the sub-program ~~will consider higher initial incentives for technologies being newly introduced to the market place through the Emerging Technologies Program. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. is poised to adopt the efficiency potential of new technologies through its programs.~~ will consider higher initial incentives for technologies being newly introduced to the market place through the Emerging Technologies Program. Once the new products have taken hold in the market, the incentives will be adjusted to reflect market conditions. In addition, portfolio staff actively works to incorporate promising emerging technologies from IOU or PIERCEC-funded projects.

Formatted: Indent: Left: 0.62", Tab stops: Not at 1"

Formatted: Indent: Left: 0.75"

Formatted: Font: 12 pt

Formatted: Font: 12 pt

**ii. Codes and Standards program**

Formatted: Font: Bold

The program relies on the Codes and Standards program to maintain an updated and relevant list of measures that will support savings. As Codes and Standards impact measures, the program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into codes and standards. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward

Formatted: Indent: Left: 0.68", Tab stops: 0.81", List tab + Not at 0.75" + 1"

Formatted: Indent: Left: 0.75"

“low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., solid state lighting LEDs) made available as these technologies transition from research and development to the mainstream.

### iii. **WE&T**

WE&T is a portfolio of education and training programs that showcase energy efficient equipment found on the list of measures offered in the program. The education and training takes place through energy centers, technology test centers, and education and training program offerings. In addition to providing the education and training the classes also address how customers engage the energy efficiency program offerings relative to the class. An Energy Efficiency representative Ambassador will be present at appropriate all relative classes to provide detailed information on the application process to the relevant Energy Efficiency program.

Specific workforce development efforts supporting the Commercial Calculated Incentives sub-program which include training on topics, not limited to as follows:

- Audits – Training will be developed in an effort to promote a consistent approach and format to facility audits.
- Financing
- Soft skills and Business training (including customer service, sales, and marketing).
- Benchmarking
- Program-specific training – Training will be developed to promote increased familiarity with the program’s eligibility requirements, application, processes, etc).
- IDSMS

The IOUs will explore voluntary incentive-based approaches to encourage contractors and other industry professionals to complete the full bundle of Commercial – Calculated workforce development training. For professionals who complete the pre-requisite courses and pass a high-road skill standards test, such approaches may include (as applicable):

- Allowing marketing or advertising differentiation;
- An incentive bonus; and/or
- Providing preference to these professionals during bid evaluation process.

Commercial – Calculated workforce development training will be coordinated with the statewide IOU WE&T program. In addition to the trainings described above, SW IOU WE&T programs will continue to offer building-block courses that educate professionals on the concepts that form the foundation of Commercial calculated programs. Those concepts include:

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.68", Tab stops: 0.81", Left + 1.25", List tab + Not at 0.75" + 1"

**Formatted:** Indent: Left: 0.81"

- [Green building techniques](#);
- [Codes and standards \(Title-24\)](#);
- [Lighting and HVAC technologies](#);
- [Energy cost management](#); and
- [Food service equipment](#).

[Contractor recruitment efforts will be conducted primarily by SW WE&T program implementers through:](#)

- [The network of contractors already participating in EE programs](#);
- [Direct outreach through industry organizations with locally active memberships \(e.g. IHACI, U.S.G.B.C., IFMA, AIA, BOMA, etc.\)](#);
- [Workforce development departments \(to target unemployed general contractors\); and](#)
- [Community Based Organizations with a proven track-record of effective outreach to the hard-to-reach workforce.](#)

**iv. Program-specific marketing and outreach efforts**

Market outreach to raise awareness of EE programs available will use a number of strategies, including:

- Account representatives will make a regular and consistent customer calling effort to key customers within this sector;
- Utility representatives, Energy Efficiency program management representatives, and field engineers will be available to provide additional expertise;
- Participation and membership in one or two key trade associations affiliated with each high priority sub-segment within the Commercial Market Sector;
- Attendance at the key trade shows for each high priority sub-segment within the Commercial Market Sector;
- [Utility-sponsored training events at the IOUs Customer Training Centers and other convenient locations within the IOUs service territory](#);
- [Online content and integration of marketing materials and campaigns with online tools such as audits and other energy demand and usage assessments](#)
- Hosting of utility-sponsored Webinars that provide sub-segment training and program adoption; and
- Written collateral pieces that provide an overview of the IOUs Energy Efficiency programs will be linked into the appropriate IOU DSM web page.

v. **Non-energy activities of program**

Integrated Energy Audits (described in the Commercial nonresidential Audit Customer Services Energy Advisor sub-program) is the primary vehicle to promote project solutions that look across the various IOU DSM program offerings, as well as complementary options available through other entities (e.g., water agencies). ~~The results of the ongoing Water Efficiency Pilot Program will identify potential opportunities to reduce water use and the potential for associated Energy Efficiency savings. Since some customers within the program sectors are major water users, this sector is well positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Programs.~~

**Formatted:** Font: Bold  
**Formatted:** List Paragraph, Indent: Left: 0.63", Hanging: 0.13", Tab stops: 0.5", Left + Notat 1"

vi. **Non-IOU Programs**

The Program will continue to engage with Air Quality Management Districts, CEC, ARB, DOE, water agencies, and other government agencies responsible for regulating the various aspects and operations of customer facilities participating in the programs, as appropriate and feasible.

**Formatted:** Font: Bold

vii. **CEC work on PIER with EPIC**

As of June 2012, PIER no longer exists. However, The the Program program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER projects in coordination with the applied technology research of EPICCEC. The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.81", Tab stops: 1.44", Left

ix. **Non-utility market initiatives**

The sub-program will support, educate customers, and ~~or enforce~~ facilitate such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, ISO 50001 California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

**Formatted:** Font: Bold  
**Formatted:** Indent: Left: 0.68", Tab stops: 0.81", Left + 1.38", List tab + Notat 0.75" + 1"  
**Formatted:** Indent: Left: 0.88"

c) **Best Practices**

IOUs will continue working collaboratively on modifications to program Policies and Procedures to address ongoing changes in customer expectations, market conditions and program flexibility. Such changes have been and will be targeting ease of program understanding and participation, measures eligibility, increase of customer ~~economical~~ economic benefits and policy restrictions that will be identified as barriers to

**Formatted:** Font: Bold

participation. IOUs are implementing such process based on market studies conducted on the subject and preceding discussion of the policy change. Among modifications that would be potentially discussed and implemented are incentive caps, redesign of measure/equipment early retirement according to the CPUC concept and other.

IOUs are planning to ~~consolidate~~ explore appropriate consolidation of various calculating software such as ~~CCT Calculator, SPC Software~~, Engage and other measure specific calculating tools to standardize our calculating methodology. This will ensure that calculations will be more uniformed and consistent amongst all stakeholders. This will not limit the use of nationally recognized standard DOE toolsets for certain measures. The IOUs also plan to continue exploration of emerging software tools that have the potential to enable significant advances in comprehensive energy efficiency at both the system and whole building levels.

IOUs are also planning to elaborate and utilize positive experience obtained using Savings By Design and Energy Design Resources tools and extend it to energy efficiency retrofit projects. Such tools substantially reduce application processing and review time, minimize number of hand-offs, not sacrificing accuracy of energy saving calculations.

Leveraging best practices from past program cycles, the Commercial Calculated Incentives sub-program information will also be made available through industry organizations such as The Building Owners and Managers Association (BOMA), and through advertising in industry and trade publications. Trade associations and vendor allies have historically delivered substantial energy savings through previous calculated program models.

#### **d) Innovation**

Formatted: Font: Bold

Innovative aspects of the program are aiming major program performance indicators such as accuracy of energy saving calculation, higher realization rate, overcoming energy efficiency barriers, reducing application processing time and administrative costs, and integrated energy management.

For the new program cycle California IOUs have implemented a new incentive structure that emphasizes peak demand reduction, addresses current economic downturn and better motivates customers to participate in energy efficiency incentive programs. During ~~2010-2012~~2013-2014 program cycle new incentive structure will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance.

An additional example of innovation is aimed at the strategic plan's transformational vision and goals around energy user behavior, market transformation and deeper energy savings. PG&E intends to provide upfront payments for installation of system-level controls (e.g. lighting, HVAC etc.) and/or energy management and information systems (EMIS). Customers receiving the payments would be enrolled in a statistically based pre- and post-measurement evaluation of data, using whole building measurement and verification protocols, from which savings will be determined and claimed.

Where possible, IOUs will use integrated approach to addressing DSM opportunities. Innovative aspects such as merging energy efficiency and demand response analysis and converting recommendations to projects under Retro-commissioning and/or Calculated program, processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions will maximize customer adoption rates for most cost-effective energy management opportunities.

The IOUs are planning to continue and ~~expand-enhance its their~~ core Retro-commissioning (RCx) program in multiple target markets. ~~Retro-commissioning RCx~~ is a systematic process for optimizing an existing building or system's performance by identifying operational deficiencies and making necessary adjustments ~~to correct the system~~. Measures may involve resetting, repair or replacement of existing system controls and components, and in general are low-cost projects with simple payback periods of less than 4 years.

The RCx program is a key offering in the Calculated Sub-program. The audit components of the RCx program are also described in the non-residential audit section above. Enhanced RCx program elements will explore and may include but not be limited to:

- Innovative approaches to measure identification, automated baseline capabilities, and savings quantification;
- Continuous commissioning and monitoring-based commissioning;
- Solutions for small and medium commercial customers;
- Strategies to drive savings persistence;
- Appropriate alignment with retrofit activities;
- Overall program incentives, targeting, and delivery.

Formatted: Indent: Left: 0.5", Tab stops: 0.63", Left + 1.06", List tab + Not at 0.75"

After energy audit is complete and applicable no-cost/low-cost measures are identified the scope of work will be handed-off to RCx implementer who, in-turn, will follow RCx program protocols, execute the scope of work (measure implementation, M&V plan, incentive payment for energy savings) and report final results to the core program office.

**e) Integrated/coordinated Demand Side Management**

Formatted: Font: Bold

As the primary incentive vehicle that customers have for implementing efficiency projects, the Commercial Calculated Incentives sub-program is the logical choice for implementing greater demand side integration. Appropriate incentive mechanisms will be developed and implemented during the ~~2010-2012~~2013-2014 program cycle to reward customers who implement comprehensive DSM programs.

The first step on the path towards DSM integration ~~may be~~ to introduce incentives for kW demand reduction, which as shown in Section 4.b ~~will be available immediately~~. This will provide additional incentives for demand reduction strategies such as lighting controls.

**f) Integration Across Resource Types**

Formatted: Font:Bold

Integration across resource types (e.g., energy, water, and air quality) will be explored. Examples include working with Water Agencies to co-promote Food Service appliances that save water and energy and working with Air Quality Management Districts to co-promote Boilers and Water Heating measures that save energy and improve air quality.

**g) Water/Energy Nexus Strategy**

Formatted: Indent:Left: 0.5"

Formatted: Font:Bold

Formatted: Indent:Left: 0.5"

SoCalGas supports improving the efficiency of water systems as one of the most critical strategies to capture water/energy nexus benefits in the energy efficiency programs. SoCalGasSCG plans to focus its efforts in areas that use gas engines as the energy source to deliver and treat water. For water agencies within SoCalGasSCG's territory, we plan to issue an RFP to utilize a contractor to implement leak-loss detection and remediation and pressure management services applicable to storage, pumping and distribution through SoCalGas'EG's core or 3<sup>rd</sup> Third Party Program. SoCalGasEG will explore new project ideas for the water/energy nexus, as well as the calculation of ancillary water benefits (e.g. "embedded" energy savings). SoCalGasEG will accelerate the expansion of cost-effective water-energy nexus programs by coordinating with the other utilities, water agencies, and municipalities to study the cost effectiveness and the embedded energy savings for water/energy efforts. Our intent is to continue to offer measures and services to the water sector through the "calculated" and audit programs. SCG will also explore for new direct energy measures that can be incented under the calculated program.

Additionally, we will increase our efforts to capture the water-energy nexus and sustainability in the agriculture, industrial, and commercial segments.

**g) Commercial New Construction – Savings By Design**

Formatted: Indent:Left: 0.75"

Formatted: Indent:Left: 0.25",Numbered+Level:1 + NumberingStyle:a, b, c, ... + Start at: 7 + Alignment:Left + Alignedat: 0.5" + Indentat: 0.75"

Formatted: Font:NotBold

As a single fuel utility, SoCalGas will work collaboratively in conjunction with the other IOUs to implement the SBD offerings statewide where SoCalGas jointly shares service territories. SoCalGas will not offer a standalone Whole Building Approach.

Formatted: Fontcolor: A uto

Formatted: Indent:Left: 0"

Formatted: Indent:Left: 0.5"

The Savings By Design (SBD) component aims for significant energy efficiency improvements in the nonresidential new construction industry, and is designed to overcome customer and market barriers to designing and building high performance facilities. Since 1999, SBD has provided statewide consistency, program stability and savings. SBD seeks to protect and preserve natural resources by advancing the design and construction of sustainable communities and promoting green building practices. The program is designed to overcome customer and market barriers to designing and building high performance facilities.

California's Title 24 requirements set some of the most stringent energy regulations in the nation. Exceeding these standard energy performance levels requires a high degree of design expertise, technical knowledge, and motivation. The requirements also can be

Formatted: Indent:Left: 0.5"

complex and sometimes confusing. Because many in the design field are unaware of the potential savings from energy efficient design or perceive budgetary constraints, they are reluctant to implement energy-efficiency strategies. As a result, energy efficiency is often a lost consideration, abandoned in favor of pursuing the “lower initial cost” option. SBD strives to avoid lost opportunities by assisting customers in moving beyond initial cost considerations and towards the realization of long-term energy cost savings.

Through an integrated design approach (a whole building approach that encourages performance significantly better than Title 24 code by offering a variety of financial incentives) as well as a systems approach for simpler facilities where integrated opportunities are limited, SBD encourages energy efficiency and green building practices in new commercial buildings. These financial incentives are supplemented by a variety of other support activities, including feasibility studies and pilot projects, training and education, conferences and workshops, scholarships, and program marketing activities. In the 2013-2014 portfolio period, SBD will advance a broader palette of technical and financial resources to aid the proactive design of new facilities in accordance with the most cost-effective energy and resource efficiency standards. SBD will incorporate several new approaches towards integrated design and green building certification in support of the Strategic Plan.

Formatted: Indent: Left: 0.5"

SBD provides the nonresidential new construction industry with a broad palette of technical and financial resources to aid the design of new facilities in the most cost-effective energy and resource efficiency standards.

The SBD program will continue to offer two existing program components to its customers with new construction or major remodel/renovation projects, and will add a simplified approach for smaller projects.

- Whole-Building Approach or WBA (Integrated Design) - existing
- Systems Approach - existing
- Simplified Approach - new

Formatted: Indent: Left: 0.63"

SBD will offer financial support for design teams to undertake an integrated design process. Additionally, sustainability incentives will be offered to building owners to perform building commissioning during design and construction, and monitor building performance through End Use Monitoring. These sustainability incentives are designed to encourage new buildings to be as well designed as possible, be built as well as they are designed, and be operated as well as they are built.

Formatted: Indent: Left: 0.5"

The program will continue to incorporate new approaches for 2013-2014 to advance integrated design and green building certification in support of the Strategic Plan.

**Tools and Expertise:** California’s Title 24 requirements establish some of the most stringent energy regulations in the nation. Exceeding these standard energy performance levels requires a higher level of design, technical assistance, and motivation. The requirements also can be very confusing. SBD provides the assistance, tools and expertise

Formatted: Indent: Left: 0.5"

necessary to help customers and designers exceed compliance with the requirements and achieve long-term energy- and cost-savings.

**Zero Net Energy Design Assistance:** To date there are very few Zero Net Energy Buildings in California. According to study published by the New Buildings Institute<sup>1</sup>, only twenty one buildings in the United States have a measured performance of zero energy. This information provides ample proof that ZNE buildings are extremely challenging to achieve and will continue to require substantial support from utility incentive programs. Savings By Design is best positioned to accomplish this task by encouraging higher levels of energy efficiency through higher levels of incentives. When successful, these buildings can be labeled as Zero Energy Capable Buildings (ZECB) that is one step from ZNE status. The missing component then is the self-generation component that is encouraged through other programs offered by the utilities. To get buildings to this ZEC state, Savings By Design will offer a soup to nuts whole building integrated design assistance, which would include analysis on natural ventilation, through energy efficiency, Computerized Fluid Dynamics, self-generation cost analyses, plug load analysis, building compliance analyses, and whole building energy modeling services.

Formatted: Indent: Left: 0.5"

**Long-Term Energy-Efficiency:** It has been firmly established in SBD program evaluations that the integrated design process, when implemented correctly, can lead to highly cost-effective energy savings for most projects. Because many in the design field are unaware of the potential savings, do not understand the design process, or perceive budgetary constraints, they are reluctant to implement energy-efficiency strategies. As a result, energy efficiency is often a lost consideration, abandoned in favor of pursuing the “lower initial cost” option. SBD strives to avoid lost opportunities by assisting customers in moving beyond initial cost considerations and towards the realization of long-term energy cost savings.

**Energy Design Resources:** Another key component of Savings By Design is Energy Design Resources (EDR). Energy Design Resources offers a valuable palette of energy design tools and resources that help make it easier to design and build energy-efficient commercial and industrial buildings in California. The goal of this effort is to educate architects, engineers, lighting designers, and developers about techniques and technologies that contribute to energy efficient nonresidential new construction. Additionally, design tools that reduce the time spent evaluating the energy use impact of design decisions are provided here at no cost.

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.5"

**Comprehensive Integrated Building Design Training:** In conjunction with the Workforce Education and Training program, Savings By Design will proactively offer integrated building design training to architects, engineers and other design professionals. Training might encompass highly technical building modeling techniques for use in the selection of cost effective energy efficient measures. In addition, SBD will offer “lunch and learn” sessions to architectural and engineering firms interested in learning about utility energy efficiency programs.

<sup>1</sup> Getting to Zero 2012 Status Update: A First Look at the Costs and Features of Zero Energy Commercial Buildings

List of Measures

Formatted: Underline

The Savings By Design Program aims to achieve the deep levels of market transformation described in California’s Strategic Plan, primarily by offering meaningful financial incentives directly to key participants in the building community. Incentives and/or assistance may be targeted to builders, designers, and energy analysts. Various organizations involved in developing green building and sustainability standards may also be actively supported.

In addition to providing the traditional sliding-scale incentives calibrated to energy savings exceeding standard energy performance code, SBD will offer a flat incentive for peak kW reduction and financial support for design teams to undertake an integrated design process. Additionally, sustainability incentives will be offered to building owners to perform building commissioning after construction, and/or establish and follow a building measurement and verification (M&V) plan after occupancy. These sustainability incentives are designed to encourage new buildings to be as well designed as possible, be built as well as they are designed, and be operated as well as they are built.

Formatted: Indent: Left: 0.38"

Program Performance Metrics (PPMs)

Formatted: Indent: Left: 0.5"

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.

Below are the approved PPMs and metric types for the Savings by Design Sub-program of the New Construction Statewide Program

Table 3 – Program Performance Metrics

Sub-program: Savings By Design

<u>PROGRAM PERFORMANCE METRIC (PPM)</u>	<u>Metric Type</u>
<u>1. Average site energy install, ex-ante (kBtu/sq ft-yr and demand (kW/sq ft) for participating commercial new construction by building type and climate zone</u>	<u>2b</u>
<u>2. Percentage of committed participating Whole Building Approach projects that are expected to reach a minimum of 40% less energy than 2008 T24 codes requirements</u>	<u>2b</u>

## Market Transformation Information

### Description of the non-residential new construction market

Non-residential new construction is one of the BBEES programmatic initiatives to accelerate market transformation toward greater adoption of energy efficiency. Successful market transformation efforts in the commercial building market must occur at multiple levels across the design and construction supply chain and through building owners and building occupants. This transformation must establish the relevance of energy efficiency among market actors and institutionalize the high efficient building practices<sup>2</sup>.

According to a 2001 study on energy efficiency in new construction<sup>3</sup>, the non-residential building industry is a series of linked industries arrayed along a value chain. The study identified the following six major industry groups involved in this highly diverse market—providers of capital, developers, design delivery firms, community/political/regulatory interests, real estate service providers, and users. The market structure reflected in this study remains relevant for today’s non-residential new-construction market. An emerging group in this market structure is the design build firm. The design build firm offers a complete design and construction package to the entity pursuing a new project. The building development process brings these groups together to deliver a building product that meets capital, land, and user requirements. Developers orchestrate the development process and bring together the disparate groups during the various phases of the project build. Community, political, and regulatory interests shape what can be built through zoning, codes, review and other public processes. Real estate service providers offer marketing, sales, produced by architects, engineers, and contractors in the design and delivery group. The leasing, investment, management, and operations services represent the interests of many market actors. Building users are the firms and organizations that occupy the buildings on lease or owner-occupied bases.

The complex and interrelated linkages of the market participants need to be studied further as recommended by a recent SCE Savings By Design Market Characterization Study<sup>4</sup> (“CADMUS Study”). The utilities are interested in engaging in such work during this and subsequent program cycles. The utilities also draw upon available information, past Savings By Design evaluation studies, and the long experience of the program managers and staff to articulate the market transformation process for the non-residential new construction market.

Finally, the new construction market value chain is slowly showing signs of interest in Zero Net Energy. As indicated earlier in the SBD PIP, New Buildings Institute (NBI) has found very few buildings in the nation that can be labeled as Zero Net Energy. NBI also

<sup>2</sup> [http://eec.ucdavis.edu/ACEEE/2002/pdfs/panel04/15\\_239.pdf](http://eec.ucdavis.edu/ACEEE/2002/pdfs/panel04/15_239.pdf)

<sup>3</sup> Market Structure and Energy Efficiency: The Case of New Commercial Buildings by Loren Lutzenhiser and Nicole Woolsey Biggart July 2001

<sup>4</sup> Commercial Building Market Characterization for Savings by Design Program Final Report June 20, 2011 Study ID: SCE0312.01

Formatted: Indent: Left: 0.13", Firstline: 0.38", No bullets or numbering

found that a slightly larger number, although also very few as compared to existing building stock, can be labeled as ZNE capable (ZECB) buildings. From this perspective, Savings By Design will face ever increasing needs for expert consultations in unique ZNE projects, like Computerized Fluid Dynamics that analyzes a design for its effectiveness in a natural ventilation scenario. The emergence of ZNE in the commercial space will undoubtedly spawn new challenges and barriers in the new construction market.

### Program Logic model

Developing a program logic description can assure that everyone concerned with the program has a clear understanding of what the program seeks to achieve. Included below is the program logic that addresses specific program interventions related to market barriers, while acknowledging that multiple interactions in the market of various entities and market actors makes the non-residential new construction market quite complex. The full market depiction for the purpose of understanding the market transformation of this market will need to be developed with the input from the market stakeholders, CPUC, and other entities.

Formatted: Indent: Left: 0.5", No bullets or numbering  
Formatted: Indent: Left: 0.5"

### Evaluation plans, market transformation indicators and PPMs

Due to the need to comply with the Decision's timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects

Formatted: Indent: Left: 0.38", No bullets or numbering  
Formatted: Indent: Left: 0.56"

statewide evaluation plan be developed during the formulation of the Joint EM&V Plan as described in section “18.1. Evaluation Budget” in Decision R.09-11-014. Until then, we suggest the following approach:

Summative evaluation: Market Effects. The market transformation program’s theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program’s scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program “spillover” and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.

The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program’s direct outputs.

#### Market Transformation Indicators (MTIs)

Per Resolution E-4385, a subset of market transformation indicators (MTIs) for statewide energy efficiency programs and subprograms were presented at a public workshop on November 7, 2011, to allow for public comments and discussion before being finalized. Per Energy Division Guidance on June 19, 2012, the MTIs to be found in “Attachment H” are approved for this sub-program as applicable.

Attribution: Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Prah (MT Workshop, Nov 2011) suggest that declaring the program’s strategic intent through the market transformation initiative’s theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self-report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a “preponderance of evidence” approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a “Shared Mission” of meeting the CPUC’s very aggressive Strategic Plan goals. We

Formatted: Indent: Left: 0.38"

do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

The building industry in California continues to be pinned down in one of the worst slumps in decades. In a buyer's market, builders are looking to differentiate themselves from competition. This presents a great opportunity for Savings By Design to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to meet the state's and utilities' goals for the reduction of greenhouse gas emissions and utility source demand.

Other SBD best practices include the following:

#### Systems Approach

The systems approach is a performance-based method utilizing energy analysis tools for energy modeling to analyze efficiency choices. This approach is used for projects that do not present sufficient opportunities to warrant the labor intensive assistance services offered through the WBA. The systems approach is designed to make it easy for designers to look at the interaction of systems within their project, rather than individual equipment or fixtures. The systems approach is used for simple facilities where integrated opportunities are limited, as well as projects where program intervention may come in too late in the design phase to effect sweeping programmatic changes to the design.

For 2013-2014, SBD will continue to offer the same incentives by measure end-use as the non-residential calculated retrofit program (known in 2006-2008 as Standard Performance Contract, or SPC).

#### Traditional Incentives

For 2013-2014, the statewide owner's incentives for electrical energy savings offered by the WBA will start at \$0.10 per kWh at 10 percent better than Title 24 code and increase in a straight line to \$0.30 per kWh at 30 percent better than code. For projects that exceed 30 percent better than code, the electric incentive will be \$0.30 per kWh saved. The incentives will be capped at 75% of incremental cost or \$150,000, whichever is lower. For a limited number of projects, Utilities may decide to pay larger incentives if the projects are deemed worthy to receive the larger incentive.

If SBD provides design assistance services to a project that achieves high performance without incurring incremental equipment cost (due to the intrinsic benefits of the integrated design process), an owner incentive will not be awarded due to the incremental cost cap. In these cases, SBD will still claim the resulting energy and demand savings.

#### h) Local Element (Negotiated Incentive Option)

SoCalGas will provide a local component which will include incentives for energy-efficient retrofits, systems new construction, or replacements of existing equipment at

**Formatted:** Indent: Left: 0.38"

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.5"

SoCalGas customer sites. Participants may be either customers or energy-efficiency service providers (EESP's) acting as project sponsors for activities at customer sites. To qualify, a project must save a minimum of 1,000,000 therms per year. Associated energy, resource such as water, sewerage and emissions, and Greenhouse gas (GHG) emissions savings will be considered when evaluating a project for funding. A project may consist of a single project at a single site, or may be aggregated from multiple projects belonging to a single customer, and may include a variety of measures.

This local element is designed to serve the largest non-residential customers within the SoCalGas service territory. Non-residential customers in this group are comprised of but not limited to the following industry sub-segments: Government/Utilities, Manufacturing/Processing Industries and Institutional. Each sub-segment has distinct energy use patterns, differences in equipment and facility design, and various management structures and decision-making processes. Because each industry sub-segment is unique, this option LNRP will use a customized, customer-focused approach. Participating customers, taking into account their individual energy and resource conservation opportunities as well as internal hurdle rates, will propose or "bid" to SoCalGas the incentive level needed to enable large EE and Resource savings projects. This ensures that LNRP this option will be adaptable to the unique needs of each market segment.

The program is designed to be flexible and cost effective: The project sponsor proposes a project and desired incentives. Incentives may cover up to 450% of the incremental project costs less any additional funding received from other sources. Measurement and verification (M&V) is required for all projects. As a performance-based incentive program, the approved M&V report will ultimately determine the energy savings for each project. The total sum of incentives paid for a project may not exceed the amount "bid" by the customer and agreed to by SoCalGas.

**i) Pilots**

Not applicable

**ii) EM&V**

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many cases, after the program implementation has begun, since the plans need to be based on identified program design and implementation issues. The utilities plan to work together and with

PY2013-2014 Commercial Energy Efficiency Program – Logic Model

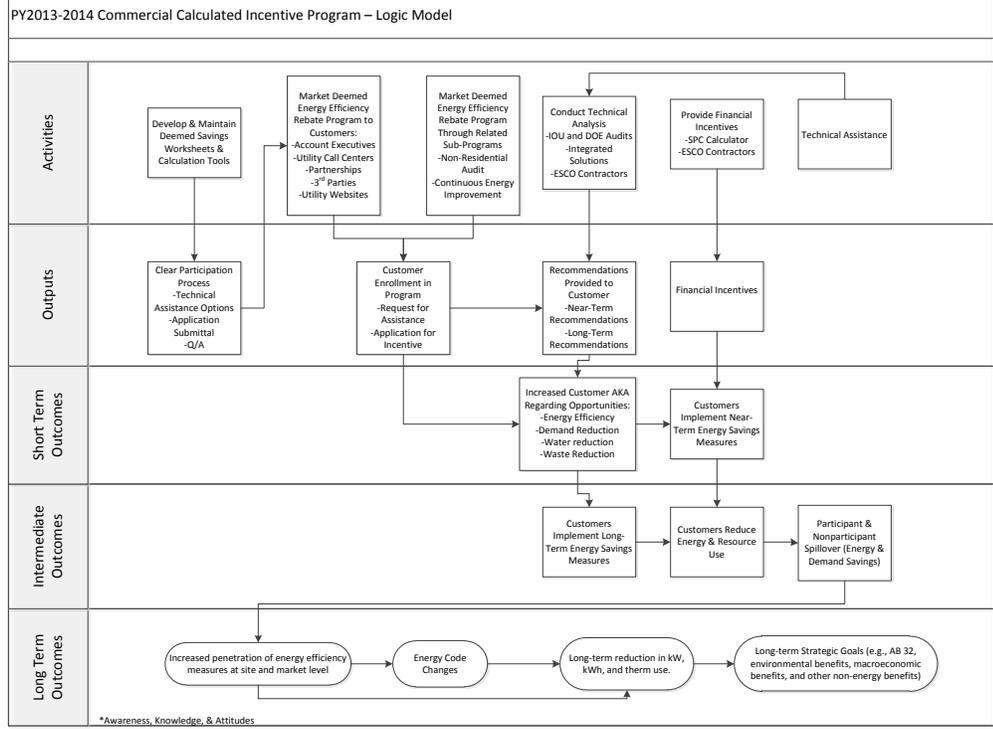

\*PG&E and SCG deliver direct install through Local Government Programs and Third-Party Programs

## 8. Program Logic Model

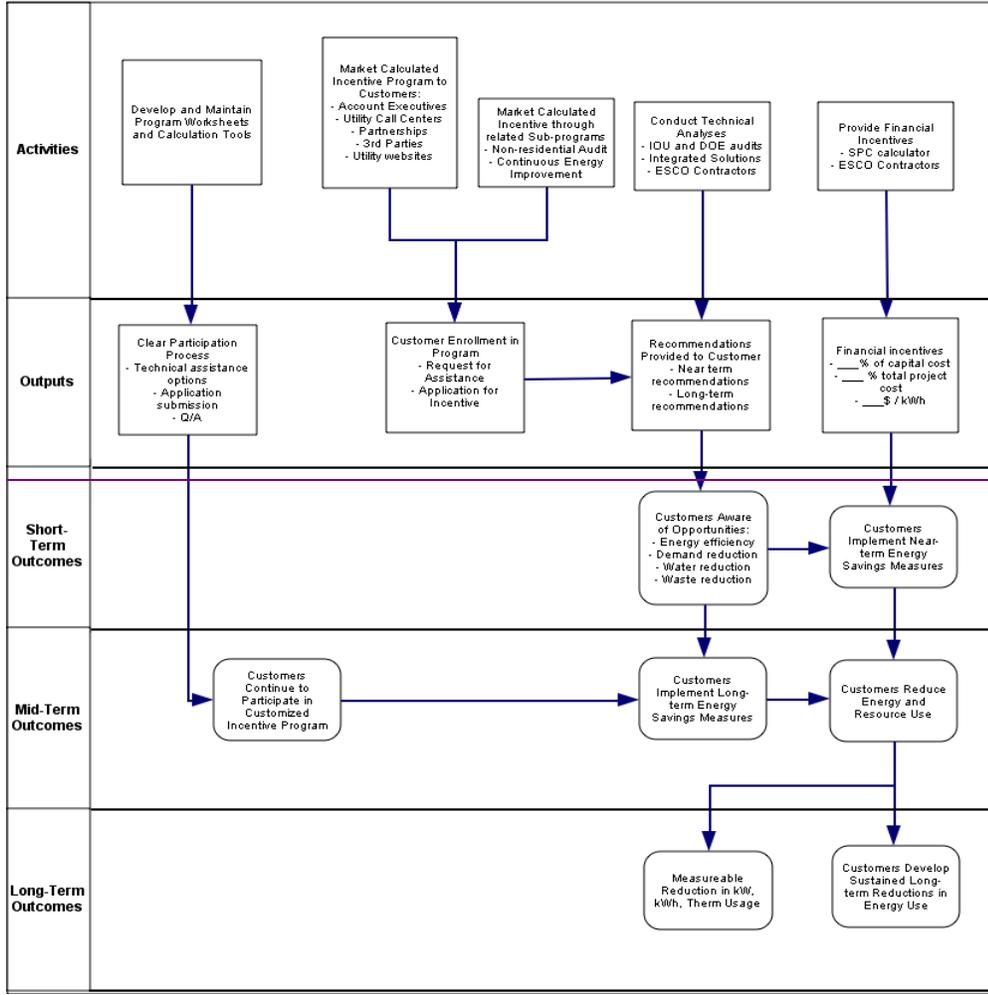

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. As there were no revisions to the original logic model for the [Commercial](#) Calculated Incentives Program, this logic model is left unchanged.

**4) Program Description**

**Describe Program**

- Formatted: Heading1, Don't keep with next
- Formatted: Heading1, No bullets or numbering, Don't keep with next
- Formatted: Heading1, Tab stops: Not at 0.5"

The Savings By Design (SBD) sub-program aims for significant energy efficiency improvements in the nonresidential new construction industry, and is designed to overcome customer and market barriers to designing and building high performance facilities. Since 1999, SBD has provided statewide consistency, program stability and savings. SBD seeks to protect and preserve natural resources by advancing the design and construction of sustainable communities and promoting green building practices. The program is designed to overcome customer and market barriers to designing and building high performance facilities.

Formatted: Heading1, Indent: Left: 0", Tab stops: Not at 0.5"

California's Title 24 requirements set some of the most stringent energy regulations in the nation. Exceeding these standard energy performance levels requires a high degree of design expertise, technical knowledge, and motivation. The requirements also can be complex and sometimes confusing. Because many in the design field are unaware of the potential savings from energy efficient design or perceive budgetary constraints, they are reluctant to implement energy efficiency strategies. As a result, energy efficiency is often a lost consideration, abandoned in favor of pursuing the "lower initial cost" option. SBD strives to avoid lost opportunities by assisting customers in moving beyond initial cost considerations and towards the realization of long-term energy cost savings.

Formatted: Heading1, Indent: Left: 0"

Through an integrated design approach (a whole building approach that encourages performance significantly better than Title 24 code by offering a variety of financial incentives) as well as a systems approach for simpler facilities where integrated opportunities are limited, SBD encourages energy efficiency and green building practices in new commercial buildings. These financial incentives are supplemented by a variety of other support activities, including feasibility studies and pilot projects, training and education, conferences and workshops, scholarships, and program marketing activities. In the 2013-2014 portfolio period, SBD will advance a broader palette of technical and financial resources to aid the proactive design of new facilities in accordance with the most cost-effective energy and resource efficiency standards. SBD will incorporate several new approaches towards integrated design and green building certification in support of the Strategic Plan.

Formatted: Heading1, Indent: Left: 0", Tab stops: Not at 0.5"

Formatted: Heading1, Indent: Left: 0", Tab stops: Not at 0"

SBD provides the nonresidential new construction industry with a broad palette of technical and financial resources to aid the design of new facilities in the most cost-effective energy and resource efficiency standards.

Formatted: Heading1, Indent: Left: 0", Tab stops: Not at 0.25" + 0.5"

Formatted: Heading1, Indent: Left: 0"

The SBD program will continue to offer two existing program components to its customers with new construction or major remodel/renovation projects, and will add a simplified approach for smaller projects.

- Whole-Building Approach or WBA (Integrated Design) – existing
- Systems Approach – existing
- Simplified Approach – new

Formatted: Heading1, No bullets or numbering, Tab stops: Not at 1.25"

SBD will offer financial support for design teams to undertake an integrated design process. Additionally, sustainability incentives will be offered to building owners to perform building commissioning during design and construction, and monitor building performance through End Use Monitoring. These sustainability incentives are designed to encourage new buildings to be as well designed as possible, be built as well as they are designed, and be operated as well as they are built.

The program will continue to incorporate new approaches for 2013-2014 to advance integrated design and green building certification in support of the Strategic Plan.

Tools and Expertise: California's Title 24 requirements establish some of the most stringent energy regulations in the nation. Exceeding these standard energy performance levels requires a higher level of design, technical assistance, and motivation. The requirements also can be very confusing. SBD provides the assistance, tools and expertise necessary to help customers and designers exceed compliance with the requirements and achieve long-term energy and cost savings.

Zero Net Energy Design Assistance: To date there are very few Zero Net Energy Buildings in California. According to study published by the New Buildings Institute<sup>24</sup>, only twenty one buildings in the United States have a measured performance of zero energy. This information provides ample proof that ZNE buildings are extremely challenging to achieve and will continue to require substantial support from utility incentive programs. Savings By Design is best positioned to accomplish this task by encouraging higher levels of energy efficiency through higher levels of incentives. When successful, these buildings can be labeled as Zero Energy Capable Buildings (ZECB) that is one step from ZNE status. The missing component then is the self-generation component that is encouraged through other programs offered by the utilities. To get buildings to this ZEC state, Savings By Design will offer a soup to nuts whole building integrated design assistance, which would include analysis on natural ventilation, through energy efficiency, Computerized Fluid Dynamics, self-generation cost analyses, plug load analysis, building compliance analyses, and whole building energy modeling services.

Long-Term Energy Efficiency: It has been firmly established in SBD program evaluations that the integrated design process, when implemented correctly, can lead to highly cost-effective energy savings for most projects. Because many in the design field are unaware of the

potential savings, do not understand the design process, or perceive budgetary constraints, they are reluctant to implement energy efficiency strategies. As a result, energy efficiency is often a lost consideration, abandoned in favor of pursuing the "lower initial cost" option. SBD strives to avoid lost opportunities by assisting customers in moving beyond initial cost considerations and towards the realization of long-term energy cost savings.

<sup>24</sup> Getting to Zero 2012 Status Update: A First Look at the Costs and Features of Zero Energy Commercial Buildings

Energy Design Resources: Another key component of Savings By Design is Energy Design Resources (EDR). Energy Design Resources offers a valuable palette of energy design tools and resources that help make it easier to design and build energy-efficient commercial and industrial buildings in California. The goal of this effort is to educate architects, engineers, lighting designers, and developers about techniques and technologies that contribute to energy-efficient nonresidential new construction. Additionally, design tools that reduce the time spent evaluating the energy use impact of design decisions are provided here at no cost.

Comprehensive Integrated Building Design Training: In conjunction with the Workforce Education and Training program, Savings By Design will proactively offer integrated building design training to architects, engineers and other design professionals. Training might encompass highly technical building modeling techniques for use in the selection of cost-effective energy-efficient measures. In addition, SBD will offer "lunch and learn" sessions to architectural and engineering firms interested in learning about utility energy efficiency programs.

#### b) List of Measures

The Savings By Design Program aims to achieve the deep levels of market transformation described in California's Strategic Plan, primarily by offering meaningful financial incentives directly to key participants in the building community. Incentives and/or assistance may be targeted to builders, designers, and energy analysts. Various organizations involved in developing green building and sustainability standards may also be actively supported.

In addition to providing the traditional sliding-scale incentives calibrated to energy savings exceeding standard energy performance code, SBD will offer a flat incentive for peak kW reduction and financial support for design teams to undertake an integrated design process. Additionally, sustainability incentives will be offered to building owners to perform building commissioning after construction, and/or establish and follow a building measurement and verification (M&V) plan after occupancy. These sustainability incentives are designed to encourage new buildings to be as well-designed as possible, be built as well as they are designed, and be operated as well as they are built.

#### e) List of Non-Incentive Customer Services Energy Advisor

The Saving By Design Program will be active in a number of non-incentive areas as well. Several non-incentive customer service energy advisor components are incorporated in the sub-programs, including the following:

- Technical support to energy analysts and design teams
- Economic modeling/measure selection support to builders and construction managers
- DSM coordination (PV, DR, AML, ET) for builders to maximize demand-side reductions

- Feasibility studies and pilot program components as needed to develop new approaches to more effectively engage new and targeted non-residential market segments
- Training and resource enhancements (WE&T and Statewide Websites)
- Conferences and workshops to develop tools and concepts that will help the program expand its educational efforts
- Educational institution collaboration; sustainability lectures to students

## 5) Program Rationale and Expected Outcome

### a) Quantitative Baseline and Market Transformation Information

Market Transformation (MT) metrics should neither be used for short-term analyses nor for specific program analyses. Rather, should focus on broad market segments.

Market transformation is embraced as an ideal end state resulting from the collective efforts of the energy efficiency field, but differing understandings of both the MT process and the successful end state have not yet converged. The CPUC defines the end state of MT as “Long-lasting sustainable changes in the structure or functioning of a market achieved by reducing barriers to the adoption of energy efficiency measures to the point where further publicly-funded intervention is no longer appropriate in that specific market.”<sup>25</sup> The Strategic Plan recognizes that process of transformation is harder to define than its end state, and that new programs are needed to support the continuous transformation of markets around successive generations of new technologies<sup>26</sup>.

Market transformation programs differ from resource acquisition programs on 1) objectives, 2) geographical and 3) temporal dimensions, 4) baselines, 5) performance metrics, 6) program delivery mechanisms, 7) target populations, 8) attribution of causal relationships, and 9) market structures<sup>27</sup>. Markets are social institutions<sup>28</sup>, and transformation requires the coordinated effort of many stakeholders at the national level, directed to not immediate energy savings but rather to intermediary steps such as changing

behavior, attitudes, and market supply chains<sup>29</sup> as well as changes to codes and standards. Resource acquisition programs rely upon the use of financial incentives, but concerns have been raised that these incentives distort true market price signals and may directly counter market transformation progress<sup>30</sup>. According to York<sup>31</sup>, “Market transformation is not

likely to be achieved without significant, permanent increases in energy prices. From an economic perspective, there are three ways to achieve market transformation: (1) fundamental changes in behavior, (2) provide proper price signals, and (3) permanent subsidy.<sup>22</sup>

The question of what constitutes successful transformation is controversial because of a Catch-22: Market transformation is deemed successful when the changed market is self-sustaining, but that determination cannot be made until after program interventions are ended. Often, however, the need for immediate energy and demand savings or immediate carbon-emissions reductions will mean that program interventions may need to continue, which would interfere with the evaluation of whether MT is self-sustaining. Market transformation success has also been defined in terms of higher sales of efficient measures than would have otherwise occurred against a baseline absent of program interventions. The real world, however, provides no such control condition. Evaluators must estimate these baselines from quantitative factors such as past market sales that may be sparse and/or inaccurate—particularly for new products. Evaluations must also defer to expert judgments on what these baselines may have been as well as on the degree of successful market transformation<sup>23</sup>. Due to the subjective nature of these judgments, it is imperative that baselines as well as milestone MT targets be determined and agreed upon through collaborative discussion by all stakeholders, and these targets may need periodic revision as deemed necessary by changing context.

Market transformation draws heavily upon diffusion of innovation theory<sup>24</sup>, with the state of a market usually characterized by adoption rate plotted against time on the well-known S-shaped diffusion curve. In practice, however, the diffusion curve of products may span decades<sup>24</sup>. Market share tracking studies conducted 3, 5 or even 10 years after the start of an MT program may reveal only small market transformation effects<sup>25</sup>. The ability to make causal connections between these market transformation effects and any particular program's activities fades with time, as markets continually change and other influences come into play.

These challenges mentioned above are in reference to programs that were specifically designed to achieve market transformation; and these challenges are only compounded for programs that were primarily designed to achieve energy and demand savings. However, since the inception of market transformation programs almost two decades ago, many

~~lessons have been learned about what the characteristics of successful MT programs are. First and foremost, they need to be designed specifically to address market transformation. “The main reason that (most) programs do not accomplish lasting market effects is because they are not designed specifically to address this goal (often because of regulatory policy directions given to program designers.)”<sup>36</sup> The Strategic Plan recognizes that regulatory policies are not yet in place to support the success of market transformation efforts<sup>37</sup>, but also reflects the CPUC’s directive to design energy efficiency programs that can lay the groundwork for either market transformation success or for codes and standards changes.~~

~~Above all else, the hallmark of a successful market transformation program is in the coordination of efforts across many stakeholders. The most successful MT programs have involved multiple organizations, providing overlapping market interventions<sup>38</sup>. The Strategic Plan calls for coordination and collaboration throughout, and in that spirit the utilities look forward to working with the CPUC and all stakeholders to help achieve market transformation while meeting all the immediate energy, demand, and environmental needs. Drawing upon lessons learned from past MT efforts, the Energy Center of Wisconsin’s guide for MT program developers<sup>39</sup> suggests that the first step is not to set end-point definitions, progress metrics or goals. Rather, the first steps include forming a collaborative of key participants. As the Strategic Plan suggests, these may include municipal utilities, local governments, industry and business leaders, and consumers. Then, with the collective expertise of the collaborative, we can define markets, characterize markets, measure baselines with better access to historical data, and define objectives, design strategies and tactics, implement and then evaluate programs. The collaborative will also provide insights that will set our collective expectations for the size of market effects we can expect, relative to the amount of resources we can devote to MT. No one organization in the collaborative will have all the requisite information and expertise for this huge effort. This truly needs to be a collaborative approach from the start.~~

#### Program Performance Metrics (PPMs)

~~On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric~~

~~Company for 2010-2012 statewide energy efficiency programs and sub-programs. The Commission gave each PPM a metric type which indicated the reporting frequency: Metric type 2a indicates that the IOUs should report on the metric on an annual basis (unless indicated otherwise). Metric type 2b indicates the IOUs should report on the metric at the end of the program cycle.~~

**b) Market Transformation Information**

**Description of the non-residential new construction market**

**Non-residential new construction is one of the BBEES programmatic initiatives to accelerate market transformation toward greater adoption of energy efficiency. Successful market transformation efforts in the commercial building market must occur at multiple levels across the design and construction supply chain and through building owners and building occupants. This transformation must establish the relevance of energy efficiency among market actors and institutionalize the high efficient building practices<sup>40</sup>.**

**According to a 2001 study on energy efficiency in new construction<sup>41</sup>, the non-residential building industry is a series of linked industries arrayed along a value chain. The study identified the following six major industry groups involved in this highly diverse market— providers of capital, developers, design-delivery firms, community/political/regulatory interests, real estate service providers, and users. The market structure reflected in this study remains relevant for today’s non-residential new construction market. An emerging**

group in this market structure is the design build firm. The design build firm offers a complete design and construction package to the entity pursuing a new project. The building development process brings these groups together to deliver a building product that meets capital, land, and user requirements. Developers orchestrate the development process and bring together the disparate groups during the various phases of the project build. Community, political, and regulatory interests shape what can be built through zoning, codes, review and other public processes. Real estate service providers offer marketing, sales, produced by architects, engineers, and contractors in the design and delivery group. The leasing, investment, management, and operations services represent the interests of many market actors. Building users are the firms and organizations that occupy the buildings on lease or owner-occupied bases.

The complex and interrelated linkages of the market participants need to be studied further as recommended by a recent SCE Savings By Design Market Characterization Study<sup>42</sup> (“CADMUS Study”). The utilities are interested in engaging in such work during this and subsequent program cycles. The utilities also draw upon available information, past Savings By Design evaluation studies, and the long experience of the program managers and staff to articulate the market transformation process for the non-residential new construction market.

Finally, the new construction market value chain is slowly showing signs of interest in Zero Net Energy. As indicated earlier in the SBD PIP, New Buildings Institute (NBI) has found very few buildings in the nation that can be labeled as Zero Net Energy. NBI also found that a slightly larger number, although also very few as compared to existing building stock, can be labeled as ZNE-capable (ZECB) buildings. From this perspective, Savings By Design will face ever increasing needs for expert consultations in unique ZNE projects, like Computerized Fluid Dynamics that analyzes a design for its effectiveness in a natural ventilation scenario. The emergence of ZNE in the commercial space will undoubtedly spawn new challenges and barriers in the new construction market.

#### Market characterization, key barriers and DSM opportunities

Through collaboration with a wide array of market actors and provision of technical support, training, and financial incentives, SBD is positioned to help reduce many of the

most prevalent barriers to building greater levels of high efficiency nonresidential new construction. Although the 2011 Cadmus study referenced in this Market Transformation section was conducted for the Southern California Edison service territory, it is assumed that some of the broader determinations are likely to be common to all IOU service territories. Some key market barriers identified in the 2011 Cadmus study for SCE include the following:

Lack of information among new building owners and designers/builders of beyond code energy efficiency benefits and opportunities to achieve such benefits

Lack of financing options for high efficiency buildings

<sup>42</sup> Commercial Building Market Characterization for Savings by Design Program Final Report June 20, 2011 Study ID: SCE0312.01

- Uncertainty in projected performance of efficient buildings
- Split Incentives

The Cadmus study also identifies other obstacles to energy efficiency in nonresidential buildings that include the following:

- Upfront costs, including energy modeling costs and green certification costs
- Capital constraints
- Lack of sub metering in multiple tenant buildings
- Added difficulty getting plans through review process

The findings below from the Cadmus study allude to factors that may drive increased DSM opportunities in the nonresidential new-building market:

- Increasing desire among owners to reduce building utility costs as a component of operating costs, particularly in the current market with higher vacancy rates
- Building energy codes such as CALGreen and rating systems such as Energy Star and LEED are significant motivators for building owners that want to market the buildings as promoting “sustainability”
- Benefit-cost analyses based on energy modeling and economic analysis is often effective in convincing the new building owner of the long-term benefits of energy efficiency
- Increasingly building owners and tenants are driven by company core values or views of social responsibility to reduce energy usage and greenhouse gas emissions
- Market actors that are developing buildings for their own occupancy or to lease are more likely to invest in highly efficient building.

Finally, Zero Net Energy projects perhaps present the best opportunity for DSM, because energy efficiency can be driven into all aspects of a building, i.e. lighting, plug loads, HVAC and envelope. While this may be true, there can also be significant challenges, both technological and financial, to encouraging the building community to develop these projects. Some barriers include:

- Lack of comprehensive software tools to enable design
- Lack of expertise in the architectural and engineering community to offer these services to owners and developers
- Significant first costs for energy efficiency and for renewable generation
- A desire on the owners’ or organizations’ part to pursue a ZNE facility
- Overcoming the technological challenges to design and build multi-story ZNE facilities

- Proposed SBD interventions to address market barriers and intended results
- While most of the proposed market support mechanisms are well-known SBD approaches, the intent of the SBD market interventions are to redirect its efforts on multiple levels to

Formatted

engage market actors and integrate energy efficiency into the mechanisms the building market is already using. The market-based approach for the program is to focus specifically on targeted sectors in the building industry to understand the sector's business processes, motivations, and barriers and to develop specific strategies to motivate the interest and investment in energy efficiency.

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Southern California Edison's 2011 CADMUS Study analysis of 2004-2008 building construction data on square footage of new floor space completions indicates that the SBD has enrolled between 19% and 28% of the new floor space added each year. The program's penetration in the market exceeded 20% for six categories of buildings over the period 2006 through 2008.

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Currently, Pacific Gas and Electric is pursuing a market characterization study and its information will added to this MT section if available by the next PIP update. The program will address the following market barriers:

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt

Formatted: Font: 12 pt, NotSuperscript/ Subscript

a) Lack of Information in the building owner community and building industry to pursue EE design and construction practices

Formatted: Font: 12 pt

Formatted: Font: 12 pt, NotSuperscript/ Subscript

The SBD program is well positioned to inform architects, energy analysts, and builders about the benefits of incorporating energy efficiency early into the design process for new buildings. Through design assistance services and training opportunities, the program will work with market actors in the building industry to adopt Integrated Building Design practices and increase the technical knowledge base for energy efficient design across the industry. In addition to the design assistance, SBD provides incentives to building owners and designers to buy down some of the costs of pursuing above code designs and to encourage further use of the efficient design practices.

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Lack of information about the energy efficiency benefits also prevails in the renovations and retrofits building market. The building facility manager and building engineer typically pushes for energy efficiency and have a big influence on the owner's decision; however, these market actors are hard to reach for participation in energy efficiency programs. It is much more difficult to get in at the design phase of these projects which, combined with cost, makes it harder to influence owners to install non-lighting measures. The challenge is finding ways to inform such potential participants early enough about the Program, learn about future projects, and find points of entry. Again, the utilities' SBD staffs will aim to reach these and other hard to reach areas and continue to take steps in 2013-14 to engage in projects earlier.

Formatted: Font: 12 pt

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Another hard to reach segment is the building owners, the majority of whom do not understand the full extent of potential savings, program opportunities, and cost savings that can be achieved. Energy modeling is often what is needed to convince owners to make efficiency changes by educating the owner on the long-term financial benefits and the upfront cost effectiveness after making adjustments for rebates, and showing how energy efficiency affects the bottom line. A collaborative approach is needed between the owner, contractor, and architect early in the design process. The program's outreach efforts can inform these players on the benefits of energy efficiency improvements through focusing on

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Heading1

Formatted: Font: 12 pt, NotSuperscript/ Subscript

the utility bill savings produced by such improvements and the resulting competitive advantage of energy efficient buildings in the market as the businesses continue to look for ways to trim costs.

Formatted: Font: 12 pt, NotSuperscript/ Subscript

b) Uncertainty in projected savings

Formatted: Heading1,Widow/O rpharcontrol, A djustspace betweenLatin and A siantext, A djustspace betweenA siantext and numbers

This barrier is related to lack of information in terms of savings that result from the energy efficient new construction buildings. Through the Design Assistance Services, SBD provides or assists in developing building performance simulations that are capable of estimating lifecycle energy savings benefits of efficient building design. The 2011 Cadmus Study showed that such analysis was beneficial in the early decision making for a new efficient building. This performance uncertainty barrier is also being addressed by the California Energy Commission (CEC) and DOE that has collaborated with other out-of-state research entities to develop and market innovative performance testing and diagnostic tools and training for commissioning agents and building owners. Additionally, rating systems such as LEED and Energy Star work to address this market barrier by setting guidelines that send signals to the market about expected building performance for efficient buildings.

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt, NotSuperscript/ Subscript

e) Split Incentive

Formatted: Font: 12 pt

Energy efficiency is often not a priority in buildings built to lease either because of the split incentive between owner and occupant and the situation depends on who pays the utility bills. Leased buildings present barriers to energy efficient operations and efficiency upgrades and the reason for this lies in the lease structure and issues related to sub-metering. If the tenants split the utility bill or if spaces are sub-metered and paid for by the occupant, the owner will be less inclined to consider efficient performance of the building in early project decision making because much of the operations cost is borne by the tenant.

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt, NotSuperscript/ Subscript

Formatted: Font: 12 pt, NotSuperscript/ Subscript

In the 2013-2014 transition cycle, IOUs will be engaging in pilot activities within the SBD framework that seeks to uncover innovative ways of addressing the barrier. The "Office of the Future" pilot activities will work with building owners and tenants to identify areas where outreach, training, and incentives — both financial and non-financial — will be offered for motivate investments in reducing the portions of the energy usage paid for by occupants. In an important step, SBD has moved to increase the incentives offered for those projects that include an M&V component in their projects that would entail monitoring end uses.

Formatted: Font: 12 pt

Program Logic model

Formatted: Font: 12 pt, NotSuperscript/ Subscript

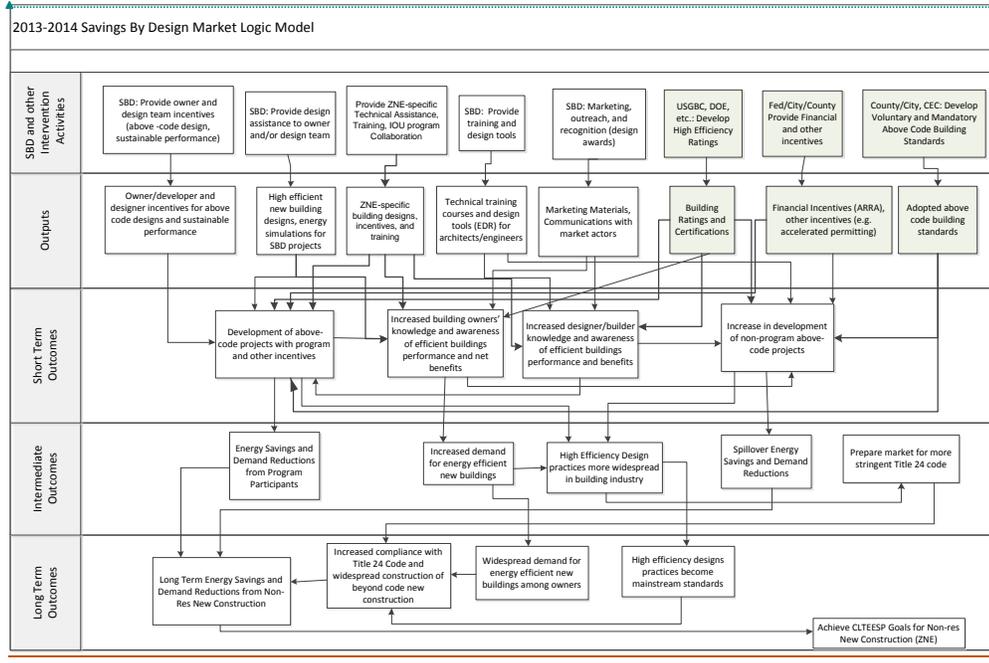

Developing a program logic description can assure that everyone concerned with the program has a clear understanding of what the program seeks to achieve. Included below is the program logic that addresses specific program interventions related to market barriers, while acknowledging that multiple interactions in the market of various entities

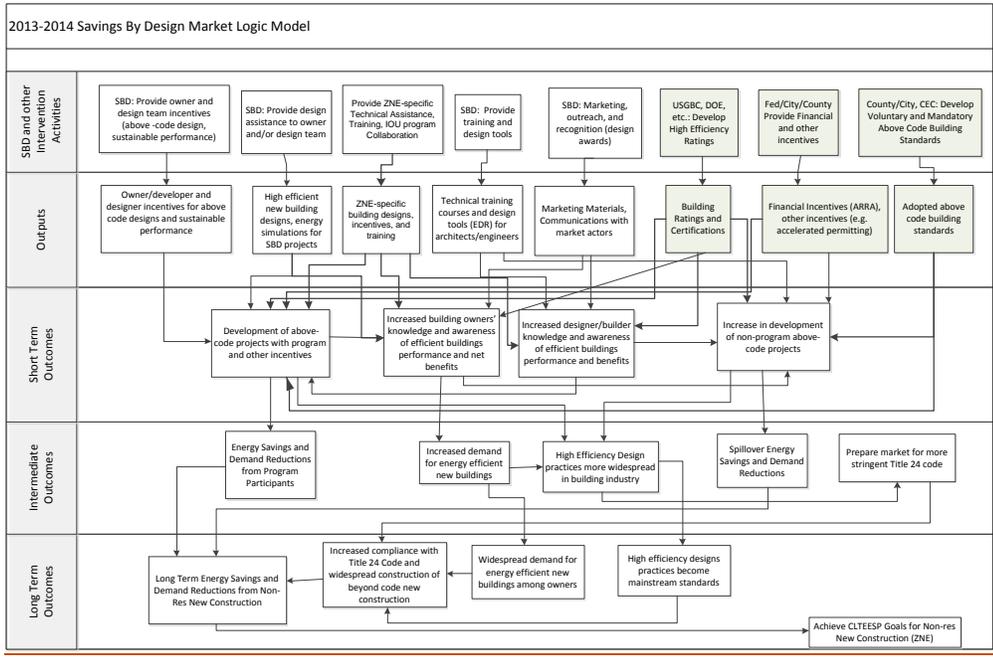

Formatted: Heading1,Widow/O rpharcontrol, A djustspace betweenLatin and A siantext, A djustspace betweenA siantext and numbers

Formatted: Font: 12 pt, NotSuperscript/ Subscript

**and market actors makes the non-residential new construction market quite complex. The full market depiction for the purpose of understanding the market transformation of this market will need to be developed with the input from the market stakeholders, CPUC, and other entities.**

Formatted: Font: 12 pt

Evaluation plans, market transformation indicators and PPMs

**Due to the need to comply with the Decision's timeline for filing the 2013-2014 PIP, and our desire to comply with earlier Decisions that call for gathering stakeholder input in informing market transformation efforts, we suggest that a full market effects statewide evaluation plan be developed during the formulation**

**of the Joint EM&V Plan as described in section "18.1. Evaluation Budget" in Decision R.09-11-014. Until then, we suggest the following approach:**

**Summative evaluation: Market Effects. The market transformation program's theory and logic model will be used to guide the evaluation efforts. The scope of the market effects study should be defined by the MT program's scope. The timeline for specific market effects that are to be evaluated should be defined by the MT program theory. Among other indicators, the program theory may specify changes in market characteristics that can be evaluated, such as 1) Spillover, 2) attitudes, awareness and knowledge, 3) reductions in specific market barrier, 4) current pricing and product availability, and 5) other market milestones. We will make the following distinction between program "spillover" and market effects: spillover is energy savings not directly tracked by the program, whereas market effects are broader and would include spillover as well as meaningful changes in the structure or functioning of the market.**

**Formatted:** Heading1, Indent: Left: 0", Widow / O rpharcontrol, A djustspace between Latin and A siantext, A djustspace between A siantext and numbers

**Formatted:** Font: 12 pt, Not Bold, Not Superscript/Subscript

**Formatted:** Font: 12 pt, Not Superscript/ Subscript

**Formatted:** Font: 12 pt, Not Superscript/ Subscript

**Formatted:** Font: 12 pt, Not Superscript/ Subscript

**Formatted:** Font: 12 pt

The formative evaluation of a market transformation program is typically performed at the intervention (i.e. program) level. The methods are the same as would be used in a program process evaluation, and would include interviews with program staff, participants and non-participants as well as an assessment of the program's direct outputs.

<u>PROGRAM PERFORMANCE METRIC (PPM)</u>	<u>Metric Type</u>
<u>1. Average site energy install, ex ante (kBtu/sq ft-yr and demand (kW/sq ft) for participating commercial new construction by building type and climate zone</u>	<u>2b</u>
<u>2. Percentage of committed participating Whole Building Approach projects that are expected to reach a minimum of 40% less energy than 2008 T24 codes requirements</u>	<u>2b</u>

Market Transformation Indicators (MTIs)

Market transformation indicator results shall be reported, as available, by Energy Division or the IOUs, depending upon who conducts the necessary market studies. (Res. 4385, 12/2/10)

Attribution: Outside of California, most guidelines for evaluating market transformation acknowledge that it is very difficult to attribute market effects to any single program, and nearly impossible to partition out the respective contributions of several coordinated programs on market effects and market transformation. In California, the Framework (Sebold et al., 2001) emphasized that attribution of market effects to programs bears further research. Others (Rosenberg & Hoefgen, 2009; Keating & Prael (MT Workshop, Nov 2011) suggest that declaring the program's strategic intent through the market

transformation initiative's theory and logic model is key to establishing future claim on transformation effects. The methods proposed by Rosenberg & Hoefgen (2009) for attributing market effects to individual programs include a number of approaches, all of them qualitative: self report of spillover and free ridership; cross-sectional comparisons with other geographic regions; structured expert judging; and case studies. But attribution using a "preponderance of evidence" approach would likely be expensive and still yield arguable results. Attribution by nature focuses on individual program efforts, and we believe the market transformation evaluation discourse should be focused on the overlapping synergy among all programs and influences in the market. We realize we all have a "Shared Mission" of meeting the CPUC's very aggressive Strategic Plan goals. We do not wish to not invest resources in teasing apart which program entity contributed how much, but instead will plan to focus on whether all the market forces across the State of California have succeeded in transforming the market.

c) Program Design to Overcome Barriers

The Savings By Design program will address the following barriers, some of which are common across the different market segments:

- Building Code Changes: Effective January 1, 2010, California's Title 24 standards have been revised and updated. Financing: Financing of energy efficiency upgrades continues to be a barrier in achieving full savings potential. This is critically important for the small and medium size builders who have limited access to capital financing. To this end, SBD will begin to explore ways to leverage the EE Statewide Financing Program established in the 2013-2014 Transition Period.
- Small Project Market Penetration: SBD has historically achieved very high penetration rates with mid-sized and especially large new construction projects. However, barriers continue to exist to deeply penetrating the small project market due to extensive level of design assistance required in SBD projects. To help overcome this, SBD will expand the use of a web-based simplified system for projects that meet the above criteria.
- Program Presentation: Gaining a full understanding of program offerings can be difficult for some customers, especially in the case of nonresidential building participants. Collaboration with demand response and distributed generation programs, as appropriate, to combine program offerings into a customer friendly and easy to navigate suite of materials is essential for effective communication of integrated offerings.

The building industry in California continues to be pinned down in one of the worst slumps in decades. In a buyer's market, builders are looking to differentiate themselves from competition. This presents a great opportunity for Savings By Design to assist builders in overcoming cost barriers, minimizing lost opportunities, and working collaboratively to meet the state's and utilities' goals for the reduction of greenhouse gas emissions and utility source demand.

d) Quantitative Program Targets

SBD aims to achieve the following broad program targets:

Table 5

<u>Savings By Design</u>	<u>2013 Target</u>	<u>2014 Target</u>

<u>SBD Sub Program — Incentives Delivered</u>		

Formatted: Indent: Left: 0.38"

e) Advancing Strategic Plan goals and objectives

The SBD Program is designed to enable the achievement of several goals and strategies identified in the Strategic Plan. Additionally, the SBD Program will facilitate implementation of the mandates of AB32 (California Global Warming Solutions Act) for carbon reduction, as well as the State of California's Green Building Initiative. The State of California's Green Building Initiative<sup>43</sup> requires that state agencies, departments, and other entities under the direct executive authority of the Governor, cooperate in taking measures to reduce grid-based energy purchases for state-owned buildings by 20 percent by 2015, through cost-effective efficiency measures and distributed generation technologies.

Commercial building owners are also encouraged to take aggressive action to reduce electricity usage by retrofitting, building, and operating the most energy- and resource-efficient buildings by taking measures described in the Green Building Action Plan.

SBD supports the voluntary portions of this legislation through improved new construction in the commercial sector as well as the mandates in the government sector.

The California Global Warming Solutions Act of 2006 (AB 32) created a state-mandated program to reduce greenhouse gas (GHG) emissions in California to 1990 levels by 2020, specifically including emissions of GHG from the generation of electricity delivered and consumed in the state.

SBD supports efforts to enhance the public's understanding of AB 32 by relating the carbon reduction effects of energy efficiency programs to program participants.

The Strategic Plan spells out a variety of strategies to address energy reduction in California for homes, offices, factories, and farms. SBD advances CLTEESP's comprehensive energy efficiency goals with:

- Integrated design approach
- Support of commissioning and End Use Monitoring
- Support training activities

With respect to commercial new buildings, the Strategic Plan calls for laying out a path to zero net energy by 2030; it envisions a dramatic growth of innovative technologies, and enhanced building design and operating practices through a combination of whole building programs, technology development, market pull, professional education, targeted financing and incentives, and codes and standards. Specifically, the Strategic Plan lays out the following goal for Commercial New Construction.

Formatted: Indent: Left: 0.13"

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Heading2, Indent: Left: 0.38", No bullets or numbering, Keep with next, Tab stops: Not at 1.25"

Formatted: Heading2, Indent: Left: 0.38", Keep with next

<sup>43</sup> Per Executive order S-20-04, dated December 14, 2004, [http://www.energy.ca.gov/greenbuilding/documents/executive\\_order\\_s-20-04.html](http://www.energy.ca.gov/greenbuilding/documents/executive_order_s-20-04.html)

~~Goal #1: Commercial new construction will increasingly embrace zero-net energy performance (including clean, on-site distributed generation), reaching 100% penetration of new starts in 2030.~~

**Formatted:** Heading2, Indent: Left: 0.38", No bullets or numbering, Keep with next, Tab stops: Not at 1.25"

~~SBD utilizes a holistic integrated design approach that reduces market barriers and results in high performance buildings. Examples of this integrated design include:~~

**Formatted:** Heading2, Indent: Left: 0.38", Keep with next, A djustspace between Latin and A siantext, A djustspace between A siantext and numbers

- ~~— Architect and engineer training;~~
- ~~— Energy Design Resources;~~
- ~~— Case studies;~~
- ~~— Energy efficiency integration awards;~~
- ~~— Design team incentives;~~
- ~~— Commissioning and End Use Monitoring Kickers~~

**Formatted:** Heading2, Indent: Left: 0.38", No bullets or numbering, Keep with next, A djustspace between Latin and A siantext, A djustspace between A siantext and numbers

~~Further, the elements of SBD are designed to advance the Strategic Plan's comprehensive energy efficiency goals. By offering a set of tools and expertise, as well as financial incentives (traditional sliding scale incentives tied to building design performance, peak reduction incentives that encourage load reduction, Design Team Incentives that ensure intervention at early design phases) that support long-term energy efficiency improvements, as well as training and education to the design professionals and architects, SBD plans to accelerate commercial building design practices towards ZNE by offering increased incentives and design assistance for innovative buildings and through case studies to show case ZNE projects. SBD will partner with green focused organizations and local governments to advance the ZNE concept. The IOUs will leverage the IOU partnership programs to meet with, inform and advise local governments and other key entities of activities and opportunities to participate in ZNE pilots, as well as lessons learned. These strategies and the IOU action plans are further elaborated in the SBD PIP for Savings By Design), as well as in the Statewide Commercial PIP~~

**Formatted:** Heading2, Indent: Left: 0.38", Keep with next, A djustspace between Latin and A siantext, A djustspace between A siantext and numbers

~~The State of California's Green Building Initiative<sup>44</sup> requires that state agencies, departments, and other entities under the direct executive authority of the Governor cooperate in taking measures to reduce grid-based energy purchases for state-owned buildings by 20 percent by 2015, through cost effective efficiency measures and distributed generation technologies. Commercial building owners are also encouraged to take aggressive action to reduce electricity usage by retrofitting, building, and operating the most energy and resource-efficient buildings by taking measures described in the Green Building Action Plan. SBD supports the voluntary portions of the Green Building Initiative through improved new construction in the commercial sector as well as the mandates in the government sector.~~

**Formatted:** Heading2, Indent: Left: 0.38", Keep with next

## ~~6) Program Implementation~~

~~SBD plans to undertake a variety of marketing and outreach activities, which could include the following:~~

**Formatted:** Heading2, Indent: Left: 0.38", Keep with next, Tab stops: Not at 0.75"

<sup>44</sup> Per Executive order S-20-04, dated December 14, 2004, [http://www.energy.ca.gov/greenbuilding/documents/executive\\_order\\_s\\_20\\_04.html](http://www.energy.ca.gov/greenbuilding/documents/executive_order_s_20_04.html)

### Cross Promotion

For 2013–2014, SBD program information will be included with marketing materials of other programs/services as appropriate. This will extend the reach of the program and reduce customer confusion as to program availability.

### Partnership Synergies

Savings By Design has established close relationships and memberships with other groups involved with the commercial new construction industry. These relationships make it possible to provide comprehensive services to our customers. These groups include:

- American Institute of Architects (AIA)
- California Council of American Institute of Architects (CAIACC)
- Illuminating Engineering Society (IES)
- American Society of Heating and Refrigeration Engineers (ASHRAE)
- United States Green Building Council (USGBC)
- Green Building Consultants
- Collaborative for High Performance Schools (CHPS)
- California Commissioning Collaborative (CCC)
- California Energy Commission (CEC)

SBD seeks out partnerships and opportunities to help educate building owners, building design teams, and other industry participants in order to promote whole building, energy efficient, sustainable design in new construction.

### Awards Sponsorship

SBD co-sponsors (with AIA California Council) the annual Energy Efficiency Design Awards. These awards are designed to raise the awareness of successful high performance facilities within the design professions.

### Internet

Comprehensive information about SBD can be found on [savingsbydesign.com](http://savingsbydesign.com). In addition, SBD case studies are posted on the Energy Design Resources ([energydesignresources.com](http://energydesignresources.com)) website. In the future, Web Based Training (WBT) might be considered for both websites mentioned above.

Utility websites will continue to advance Savings By Design by providing Utility specific program information.

### Print Media

Articles and press releases submitted to specialty publications targeting developers, building owners and design professionals.

### Outreach

SBD will continue to seek out speaking opportunities at conferences and provide “Lunch and Learns” for architects and engineers. In addition, Utilities will consider holding and

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next, Tab stops: Not at 0.75"

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next, Tab stops: Not at 0.75"

attending conferences to promote and build awareness surrounding their energy efficiency programs, although this might only be offered when resources permit.

Non energy activities of the program

SBD will be engaged in a number of non energy activities, including the following:

- Market characterization studies conducted through the Evaluation, Measurement and Verification programs
- Feasibility studies and pilot program components as needed to develop new approaches to more effectively engage new and targeted market segments.
- Training and resource enhancements in concert with the Energy Design Resources component Conferences and workshops to develop tools and concepts that will help the program expand its educational efforts to encompass sustainability issues, and work towards coordinated delivery of Demand Response, self generation, water conservation, and enhanced gas savings.
- Scholarships for students to attend the UC/CSU's Sustainability Conferences. The annual conference presents the architectural students with the rare opportunity to see first hand that sustainability issues are growing in importance. Sponsoring Scholarships also provides SBD with a participatory role on a panel that answers questions regarding the SBD program and the compliance characteristics of potential customer projects. In addition, as part of this conference, SBD will sponsor a student design competition through funding from Energy Design Resources.
- Educational Institution Collaboration will help ensure the development of curricula and adequate preparation of students for opportunities in energy efficiency. Sustainability lectures to students are also expected to help in their development.

Subcontractor Activities

Including other industry experts in certain program implementation processes enhances and extends the value of program benefits that customers can receive. In recognition of this, appropriate consultants will be selected through competitive bidding processes for some or all of the following activities:

- Project specific energy simulation design assistance for WBA projects.
- Integrated energy design support, such as charrette facilitation and process training.
- Program marketing and delivery in technically specialized, hard to reach industries.
- Complex computational analyses required for the achievement of Zero Net Energy projects, as called for in the Strategic Plan.

a) Statewide IOU Coordination

The IOUs will jointly participate in California's efforts to achieve real market transformation in the commercial new construction market segment. In order to accomplish this task, the IOUs will use the principles of adaptive management and follow a structured process to continuously update and enhance the Sub programs throughout the three year implementation cycle. The process will include the following key elements:

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Indent: Left: 0.13"

Formatted: Heading2, Indent: Left: 0.38", Keep with next

- Designate an IOU Program Lead: Each IOU will designate a Lead for Savings by Design. The leads will investigate new innovations, special accomplishments and challenges faced by the Sub-program within their own IOU. Where such innovations or challenges offer some potential for improving the Savings By Design Program, the Program Leads will present such information in regularly scheduled New Construction Program Management Team meetings.
- Hold Savings By Design Program Management Team Meetings: At this regularly scheduled meeting, individual innovations and accomplishments experienced in one IOU will be presented to all IOUs. The team will evaluate the innovations and accomplishments of the individual IOUs, consider ideas for course corrections and overcoming challenges, measure the Savings By Design Program's progress against statewide metrics and goals.
- Adopt Program Enhancements: Once the Savings By Design Program Management Team agrees that a particular idea or innovation has merit on a statewide level, the leads will disseminate the information to their constituents for adoption and integration.
- Evaluate Program Enhancements Against Statewide Targets: To complete the adaptive management loop, the Program Management Team will track the program's accomplishment of statewide targets and goals to ensure that adopted program enhancements are generating their intended results. The Program Management Team will determine whether future course corrections are needed, and if so, "activate" a fresh start of the adaptive management cycle to generate the improvements necessary to stay on track.
- Additional areas of program coordination include the following:
- Program names: The Savings By Design name will continue to be used by all the IOUs uniformly and used in their communications consistently. This will ensure better communication across the utility service territories and ensure uniformity and long-term continuity of program offerings.
- Program delivery mechanisms: The SBD Program is deployed through the sub-program activities discussed in more detail later in this PIP and summarized above in Section 4.a. The IOUs will deliver these SBD through a combination of delivery channels such as account executives/managers, third-party vendors and internal program management staff. The program will be delivered using existing industry infrastructure and the individual utility's organizational structure, in order to enhance their local effectiveness.
- Incentive levels: To the extent possible, the IOUs will retain uniformity in the incentive structure of the sub-programs.
- IOU program interactions: Strategy [1-2] outlined in the Strategic Plan is to create a better linkage between the CEC's Title 24 compliance efforts with the IOUs' energy efficiency programs. In order to achieve the market transformation goals of the Strategic Plan, the Program Management Team will ensure coordination with the efforts of the CEC, Codes and Standards and Emerging Technology.

**Formatted:** Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

b) Program delivery and coordination

The Savings By Design program will be coordinated with the following statewide and local activities. The individual IOUs are responsible for ensuring communication and cooperation with the entities listed below on an as-required basis. The Program

**Formatted:** Heading2, Indent: Left: 0.38", Keep with next

**Formatted:** Indent: Left: 0.13"

**Formatted:** Heading2, Indent: Left: 0.38", Keep with next

Management Team will ensure such communication occurs on a regular basis from a statewide perspective.

— Emerging Technologies program

Coordination of Savings By Design Program with the Codes and Standards and Emerging Technologies activities will be realized through the Program Management Team (consisting of the appropriate program managers from the four IOUs) that meets on a regular basis to discuss program integration and implementation issues. The SBD sub-program is expected to interact extensively with the ET Program to ensure new and emerging technologies are showcased and/or piloted, including any ZNE promoting technical potential studies and roadmaps.

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

— Codes and Standards program

Close coordination with the Statewide Codes and Standards team is essential for tracking and implementing changes initiated by the Title 24 standards. The Savings By Design Program goals are closely tied to Title 24 standards, and it is imperative to track and implement changes to the program on an as-needed basis. Savings By Design, Codes and Standards and Emerging Technologies activities will be coordinated through the Program Management Team.

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

— Workforce Education & Training efforts

The workforce education and training (WE&T) needs for the Savings By Design program are unique to the industry and close coordination with WE&T will be necessary. SBD program staff will coordinate with the WE&T program management team to ensure its training and education needs are met.

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

— Program specific marketing and outreach efforts

Each utility will develop and execute specific marketing and outreach plans to engage the industry in its own particular market transformation objectives. The Program Management Team will explore opportunities for extracting synergies in developing collateral materials, common program websites that could be utilized by builders and designers, exchange of builder contact information, joint presentations at trade shows, expos, and other industry events.

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

— Non IOU Programs

The Program will remain engaged with CEC, DOE and other government agencies responsible for various aspects of New Construction in California.

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

— Non utility market initiatives

California utilities have established relationships with a number of other groups in the building industry. The Savings By Design Program will continue to seek out and coordinate synergies with, but not limited to, the following groups:

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

— Environmental Protection Agency (EPA)

— California Building Industry Association (CBIA)

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

~~Green Building Consulting Organizations (Build It Green, California Green Builder, Global Green)~~

~~IQUs are keenly interested in the efforts of Green Building organizations that are engaged in developing industry-wide qualification standards, and will coordinate with the relevant organizations to ensure appropriate standards are developed and adopted.~~

#### ~~e) Best Practices~~

~~The Statewide Savings By Design Program demonstrates several examples of programmatic best practices. The team continues to utilize information from the process evaluations of the 2006-08 programs. Interviews with various market actors and focus groups from the design community had yielded several recommendations to improve the program. Based on that feedback, several enhancements will continue to be offered in the 2013-2014 Transition Period. Some of these are providing early design charrettes to explore “out of the box” ideas, promoting high efficiency standards (LEED certification), expanding energy credits for unconventional measures, establishing tracks for cutting edge projects, providing early design team incentives, and expanding the incentives for commissioning and M&E projects.~~

~~Additionally, SBD will extend the potential of targeted approaches to market segments or industries where alternative interventions may be more effective than the traditional design assistance/incentive approach. A customized approach will focus on market segments such as hospitals and clean room facilities, and other market segments as identified.~~

~~The Statewide Savings By Design team has completed process evaluations of the 2006-2008 programs and is currently participating in the 2013-2014 process evaluation. Based on interviews with various market actors and focus groups from the design community in the 2006-2008 program cycle, several consistent themes emerged on recommendations to improve the program. Consequently, several enhancements were added to the program.~~

#### ~~Process Evaluation Recommendations:~~

- ~~Provide Early Energy Charrettes—The objective of the charrette would be to review all of the potential energy efficiency aspects of the project, and to explore all feasible “out of the box” ideas that could conceivably be incorporated into the project at an early stage.~~
- ~~Promote High Efficiency—Participants were skeptical about LEED and its value, yet they all acknowledged that higher levels of energy efficiency were valuable.~~
- ~~Expand Credit for Unconventional Efficiency Measures—As SBD becomes increasingly ambitious, it will become necessary to update the analysis methods to credit measures that lie outside the T-24 compliance domain, for example, natural ventilation and un-air-conditioned buildings.~~
- ~~Establish Track for Cutting-Edge Projects—Some of the designers suggested that there be a track specifically established to encourage cutting-edge projects that significantly diverge from conventional energy efficiency solutions, and which could demonstrate substantial new opportunities for advanced energy efficiency.~~

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Indent: Left: 0.13"

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Heading2, Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering, Keep with next

- Provide Early Design Team Incentive Payment— Designers value the design team incentives and would like to have them earlier in the design process. Because the typical design team incentives arrive so late, often years after the extra design effort was expended, the link between the reward and the behavior it encourages is lost. If it were easier for designers to receive a portion of the incentive earlier, it would likely be more influential and give SBD a more prominent role in their projects.
- Expand Incentives— Incentives could encourage both commissioning activities and the end use monitoring of projects. Commissioning especially is perceived as adding costs, so incentives are offered to offset the perception.
- Benchmarking— Newly constructed buildings do not have one year’s worth of data to effectively utilize the Energy Star Portfolio Manager benchmarking tool. Consequently, SBD will funnel completed projects into benchmarking programs that exist at individual IOUs, where the buildings will be queued for benchmarking after one year’s data are available. Feedback from these follow up evaluations will be shared with the building owner and the other IOUs.

Implementation of some of these recommendations is discussed below or in the Innovations section.

Other SBD best practices include the following:

**Whole Building Approach**

The Whole Building Approach (WBA) is SBD’s preferred avenue for achieving energy efficiency in new construction because it enables a design team to consider integrated, optimized energy efficiency solutions. This customized approach requires a high level of building energy simulation and interactive feedback, which generally leads to much more efficient design decisions. The key to maximizing energy choices, using this type of collaborative effort, is intervention at the earliest phase of building design.

**Systems Approach**

The systems approach is a performance based method utilizing energy analysis tools for energy modeling to analyze efficiency choices. This approach is used for projects that do not present sufficient opportunities to warrant the labor intensive assistance services offered through the WBA. The systems approach is designed to make it easy for designers to look at the interaction of systems within their project, rather than individual equipment or fixtures. The systems approach is used for simple facilities where integrated opportunities are limited, as well as projects where program intervention may come in too late in the design phase to effect sweeping programmatic changes to the design.

Formatted: Heading2, Indent: Left: 0.38", No bullets or numbering, Keep with next

Formatted: Heading2, Indent: Left: 0.38", Keep with next

Formatted: Indent: Left: 0.38"

For 2013–2014, SBD will continue to offer the same incentives by measure end use as the non-residential calculated retrofit program (known in 2006–2008 as Standard Performance Contract, or SPC).

#### **Traditional Incentives**

For 2013–2014, the statewide owner’s incentives for electrical energy savings offered by the WBA will start at \$0.10 per kWh at 10 percent better than Title 24 code and increase in a straight line to \$0.30 per kWh at 30 percent better than code. For projects that exceed 30 percent better than code, the electric incentive will be \$0.30 per kWh saved. The incentives will be capped at 75% of incremental cost or \$150,000, whichever is lower. For a limited number of projects, Utilities may decide to pay larger incentives if the projects are deemed worthy to receive the larger incentive.

If SBD provides design assistance services to a project that achieves high performance without incurring incremental equipment cost (due to the intrinsic benefits of the integrated design process), an owner incentive will not be awarded due to the incremental cost cap. In these cases, SBD will still claim the resulting energy and demand savings.

#### **Alternative Delivery Methods and Targeted Approaches**

SBD will continue to build on the successful Alternative Delivery Method, which invites third-party market players to implement program goals in specific hard-to-reach niches such as facilities with dominant refrigeration loads. For 2013–2014, the program will continue to explore a similar effort to more effectively extend the reach of the program into hospitals, and possibly the arena of leased commercial spaces with high turnover rates. Other niche markets that may respond to a higher level of technical support will also be considered as they are identified.

In addition to working with individual building owners, SBD has interfaced aggressively with large retail chains to promote energy efficiency and sustainability.

When each chain proposes opening a series of stores across California, SBD will continue to work directly with their design teams helping them incorporate energy efficiency measures into their new prototype, utilizing a whole building approach. SBD models that prototype across all 16 climate zones in California, to clearly identify energy savings and potential incentives for these customers. With these chains now beginning to focus on green/sustainable stores with renewable energy as part of the design this activity will continue to grow during the 2013–2014 Transition Period.

SBD will extend the potential of targeted approaches to market segments or industries where alternative interventions may be more effective than the traditional design assistance/incentive approach. For example, simplified approaches to working with the segment of rapidly designed and constructed building types would consider such facilities as quick service restaurants. A customized targeted approach will focus on market segments such as hospitals and clean room facilities, and other market segments as identified.

Formatted: Fontcolor: Black, Not Superscript/ Subscript

d) Innovation

The Statewide New Construction Program features a number of new program elements that reflect innovative out-of-the-box thinking. These innovative features originated from the IOUs' desire to extend their resources in order to achieve the ambitious goals of the program by tapping into heretofore unexplored markets. Some examples include:

- Simplified SBD for smaller projects, which will offer web-based advice on common energy saving strategies.
- Performance Bonus adds for sustainability measures designed to move the market towards very high levels of energy efficiency.
- Program implementation that will emphasize fuel neutrality: a whole building, performance-based incentive approach that focuses on overall building efficiency rather than individual measures.
- On the basis of recommendations resulting from the EM&V review and other experience, SBD will initiate a number of innovations, including the following:

**The Zero Net Energy Campaign**

Many building owners and their design teams are interested in higher performance buildings, but the costs and risks of going beyond known design practice can be substantial. Learning how to design, build and operate the next generation of buildings will continue to challenge current thinking.

Already, approximately 50%—70%<sup>45</sup> of the square footage of new building stock participates in the SBD program (according to SDG&E data)—the program is reaching the customers. Now, using Zero Net Energy (ZNE) benchmarks, SBD will work closely with each IOU's internal sustainability and Zero Net Energy offerings to develop an overall strategy needed to move toward the goals established in the CLTEESP for commercial buildings in achieving the ZNE performance targets.

In addition to SBD, marketing for the ZNE program will be leveraged through other IOU programs, e.g. Sustainability PIP at SCE. The campaign will focus on subsectors and climate zones having the most potential in achieving ZNE targets in a cost-effective manner.

These innovative projects will require additional design time, innovative technologies, creative design solutions, and higher funding levels to achieve these results.

**Program Goals Pertaining to Zero Net Energy**

**Formatted:** No bullets or numbering, Tab stops: 1", List tab

**Formatted:** Indent: Left: 0.63", Bulleted + Level: 1 + A linedat: 1.25" + Tab after: 1.5" + Indentat: 1.5", Tab stops: 1", List tab + Notat 1.5"

**Formatted:** Indent: Left: 0.38"

<sup>45</sup> Data from San Diego Gas and Electric

—Creating a demand in the marketplace for super-efficient, green, LEED+ and/or solar ready, high performance buildings will be a priority. ZNE’s aggressive program goals include the following:

- Buildings will use a minimum of 40% less energy than Title 24 codes requirements
- A new kBtUs per sq. ft. by building type performance metric will be adopted (e.g. to encourage inclusiveness of strategies (e.g. buildings operations and occupant created loads)
- Up to 5% of SBD projects will comply with ZNE goals and outcomes.
- For ZNE pilot projects, the WBA incentives may range up to \$0.50 per kWh plus the standard kW incentive.

### Incentives

Reaching ZNE’s goal of energy efficiency 40% below Title 24 will require innovative incentives. ZNE building innovators may be eligible for utility funding such as:

- Advanced computational modeling
- Higher incentive targets
- Additional technical/design team assistance
- Financial assistance for natural ventilation strategies and on site renewable energy systems design— either utility or customer owned.

### Training

The SBD Program, through the WE&T Program will offer advanced design training for architects, lighting designers, to advance the opportunities in Zero Net Energy. The training, covering subjects including natural ventilation systems and daylight lighting, will take place in workshops and “lunch and learns.”

### Program Evaluation Through End Use Monitoring and Benchmarking

Influencing the decision makers as early as possible is crucial in addressing the need for sub-metering/advanced metering to track a building’s performance in key areas such as lighting and plug loads. Those devices then help create feedback loops for the owner and the utility.

Newly constructed buildings do not have one year’s worth of data to effectively utilize the Energy Star Portfolio Manager benchmarking tool. Consequently, SBD will funnel completed projects into benchmarking programs that exist at individual IOUs, where the buildings will be queued for benchmarking after one year’s data are available. Buildings that appear to have performance problems will receive additional review and/or services to improve performance, e.g. re-commissioning.

Following the completion of each project, a comprehensive process evaluation and/or internal program reviews will be conducted to determine:

- Successful incentive strategies
- Successful technical/design integrations

Formatted: Indent: Left: 0.38", Space After: 0 pt, No bullets or numbering

Formatted: Space After: 0 pt, Bulleted + Level: 1 + Aligned at: 0.63" + Indent at: 0.88"

Formatted: Bulleted + Level: 1 + Aligned at: 0.63" + Indent at: 0.88"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 2.54" + Tab after: 2.79" + Indent at: 2.79", Tab stops: 1", List tab

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 2.54" + Tab after: 2.79" + Indent at: 2.79", Tab stops: 1", List tab

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 2.54" + Tab after: 2.79" + Indent at: 2.79", Tab stops: 1", List tab

— Key marketing/business case messaging

Lessons learned from these evaluations will be applied to the net zero pathway that will improve SBD performance over time.

To analyze the success of this campaign, it is important to not only evaluate each project upon completion, but energy efficiency performance must be monitored for several years following completion. The building owners need to be apprised of the follow up results so they know how their building is performing. Elements of these follow up evaluations will include metering for:

- Plug load
- Lighting
- HVAC
- Other loads (process loads deemed important)

The SBD program may offer incentives towards the cost of installing metering to measure energy use in these areas or for sub-metering tenant spaces.

**Case Studies**

Case studies will be produced for ZNE projects to capture lessons learned and to highlight the elements, design, and performance of ZNE buildings. These case studies, to include information gathered in the follow up program evaluations, will broaden the market interest, knowledge, and skill sets to make ZNE buildings a reality.

**Market Transformation**

The ZNE program seeks to encourage high performance building and transform the market by:

- Identifying, demonstrating, building familiarity and lowering costs of energy savings strategies so that they are more likely to be codified
- Training design professionals on advanced energy savings strategies
- Providing business case related information (financial benefits, leadership benefits, non-energy benefits) to support owner interest in adopting corporate policies related to green and high performance buildings.

**Internal Program Coordination**

SBD ZNE activities will be coordinated very closely with Emerging Technologies (ET) Programs to profile their technologies. ET will help fund the monitoring, verification and provide studies related to ZNE projects and benefit from lessons learned from the process evaluations.

Coordination with Codes and Standards can help develop reach codes for Title 24.

**External Program Coordination**

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + A linedat: 2.54" + Tab after: 2.79" + Indentat: 2.79", Tabstops: 1", List tab

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + A linedat: 2.54" + Tab after: 2.79" + Indentat: 2.79", Tabstops: 1", List tab

Formatted: Indent: Left: 0.38"

This program would work with various external organizations that are interested in driving ZNE buildings. These organizations will help promote the “success stories” of early adopters.

### **Peak Reduction Incentives**

SBD will offer an incentive for peak demand reductions, consistent with the CPUC’s methodology for determining peak kW reductions. The rationales for directly incentivizing peak reductions are two fold:

- Adding a direct demand incentive will encourage measures that may have little or no energy savings, but significant demand reductions. California values energy savings and permanent demand reductions equally. Therefore, the indirect demand reduction incentive currently offered by the WBA, through tying the energy incentive rate to the Time Dependent Valuation (TDV) based compliance margin, does not offer sufficient visibility to the importance of achieving peak demand reduction.
- A flat incentive for peak demand reductions, in addition to the energy incentive, addresses two industry concerns. To achieve the same magnitude of energy savings as under the previous Title 24 code versions. There is also widespread recognition in the CLTEESP that achieving the state’s aggressive goals will require increased incentive levels to offset the effects of diminishing returns.

Formatted: Indent: Left: 0.63", Bulleted+ Level: 1 + Aligned at: 2.54" + Tab after: 2.79" + Indent at: 2.79", Tab stops: 1", List tab

### **Design Team Incentives**

SBD offers Design Team Incentives (DTI) for WBA projects to support the extra effort on the part of design teams for integrated energy design and to reward exceptional design accomplishments within the framework of the WBA. In addition, SBD will continue to develop a mechanism by which design firms are offered extensive technical support in building their in-house energy modeling capabilities. This assistance is intended to help design firms overcome the initial learning curve barriers that have kept many from undertaking energy modeling for energy efficiency measure alternatives analysis when programming buildings.

Formatted: Indent: Left: 0.38"

By forming alliances with design firms to ramp up their internal energy modeling resources, SBD will achieve increased market penetration for the WBA. SBD will support the long range vision of the CLTEESP by encouraging the design community to consider energy efficiency as an equally important component of every building’s programming.

For 2013-2014, the Design Team Incentives will equal one-third of the owner’s incentive. The threshold for design teams to begin earning a DTI is the same as that of the owner: 10 percent better than code. Additionally, 50 percent of the DTI will be paid to the design team upon acceptance of the Owner Agreement and all supporting analysis and documentation. The design team will be required to conduct energy modeling with comparison of alternatives. These analyses will be contained in a report prepared by the design team that is presented to the project owner and accepted by the utility. The DTI will be capped at \$50,000.

If a design team elects not to perform energy modeling for the DTI approach on a WBA project, SBD will provide comprehensive energy modeling services to the customer and their design team. These Design Assistance (DA) services have proven successful over the past years in providing energy calculations, design facilitation, and energy recommendations that provide the guidance and information building owners need to make well-informed design and construction decisions for their facilities. In many cases building owners find that design assistance is the main influence in their including energy-efficient options in their building—even more influential than a direct incentive. In all such cases, SBD will track and report such results toward its program goals. If design assistance services are provided, Design Teams become ineligible for incentives or their own.

### **Simplified Approach for Small Projects**

Continuing into 2013-2014, SBD will further develop and if ready offer a mass-market simplified approach for small projects to participate in the program. SBD has historically achieved very high penetration rates with mid-sized and especially large new construction projects. However, numerous barriers exist to deeply penetrating the small project market. Such barriers are typically centered on the extensive level of design assistance provided to SBD projects. From the customer's perspective, small projects often do not warrant the high level of involvement and documentation that participating in the standard systems approach or WBA requires. For the SBD program, these small projects are not cost-effective to deliver the extensive suite of design assistance services typically provided to all SBD projects.

To overcome these barriers, the simplified approach will offer web-based advice on common energy efficiency strategies applicable to customers' project types through an internet portal. The customer's Title 24 compliance documentation will be accepted as documentation for implementing these strategies. A project size threshold will be set to prevent overlap between the simplified approach and the systems approach. Incentives will be designed to overcome the capital cost barriers typically present on projects in this size range.

Initially, small offices, religious facilities, elementary schools, and strip malls have been identified as customer segments that will directly benefit from a simplified SBD approach. The simplified approach will target these projects first, adding in other segments as they are identified as having high potential to benefit.

Elementary school projects that apply too late in the design process to participate in SBD will be directed to Third Party New Construction programs as applicable.

### **Sustainability Incentives**

SBD offers additional financial incentives beyond direct energy and demand reduction incentives to systems approach and WBA projects that perform building commissioning (Cx) during design and construction, and/or install end-use monitoring equipment to trend building performance in the lighting, plug load and HVAC areas.

An incentive for building commissioning directly supports the realization of the energy savings that were modeled in the package of energy efficiency recommendations presented by SBD and chosen by the customer for the project. An incentive for Cx ensures that the facility is operated in a manner consistent with achieving the maximum benefit from the installed energy efficiency measures. This helps to ensure that the state will receive the full benefit of the installed measures.

The Sustainability incentives will take the form of a multiplier, i.e. Commissioning incentive is 1.1 and End Use Monitoring incentive is 1.2, to be applied to the owner's base incentives. Whole Building Approach and Systems Approach projects are eligible for these incentives. Projects participating in the Simplified Approach method are not eligible for Sustainability incentives.

Financing of energy efficiency upgrades continues to be a barrier in achieving full savings potential. To help overcome the barrier of financing higher efficient equipment in Savings By Design projects, the program will explore leveraging the Statewide EE Financing program as directed by the CPUC in 2013-2014.

#### e) Integrated/coordinated Demand Side Management

At a minimum, all marketing materials developed to support energy efficient design process will cross promote demand response to educate customers on the availability of IOU DR programs. Additional work will take place during the three year program cycle to evaluate closer linkages between EE and DR.

##### Integrated Design

The integrated design process encourages facilities to be designed with energy efficiency included as an objective from the start. When done correctly, it is likely that the overall cost of construction for the energy efficient building will not exceed the cost of the building at minimum code compliance. The focus of this offering is to provide an incentive to design teams at the earliest stages of the design process.

Formatted: Indent: Left: 0.38"

#### f) Integration across resource types

The Savings By Design Program is designed to be implemented with fuel neutrality. Wherever possible, program management staff will highlight potential water savings and work with the local water utilities to incorporate water savings into the program. SCE and SCG have signed a joint agreement to exchange terms and electricity savings derived from projects they have been able to secure, so lost opportunities are minimized.

##### Industry Integration

SBD field delivery staff will develop a full spectrum of energy use and sustainability program offerings by collaboratively working with applicable electric, gas, water and other industry groups. Issues such as energy savings associated with water use efficiency and

embodied energies in building materials and transportation will be explored and analyzed to identify potential new sources of energy savings.

SBD will interact with the California Lighting Technology Center to encourage aggressive lighting recommendations which revolve around LED task lighting, LED down lights, effective day lighting and various outdoor lighting applications such as parking garages, exterior lights, walkway and parking lot lighting.

#### **Program Integration**

SBD field delivery staff will collaborate with demand response and self generation programs, as appropriate, to combine program offerings into a customer friendly and easy-to-use program. Technologies, such as building integrated photovoltaic systems and energy management systems that are flexible enough to respond to new demand response strategies, are obvious strategies that can be integrated into a whole building approach to educate designers in the benefits of their adoption in new construction.

SBD will continue its integrated partnership with the Emerging Technology group in bringing new and innovative technologies and designs into the mainstream commercial new construction market. One of the highlights of this partnership is the *Office of the Future*, a program designed to address new ideas for energy efficiency in the commercial buildings market.

*Office Of The Future* is geared primarily to impact the tenant improvement process for existing office space but is also viable for new construction projects and new tenant improvement projects occurring in Class A office building shells. In addition to high quality, energy efficient lighting, *Office of the Future* also addresses plug loads, HVAC performance, advanced metering technologies for performance verification, and demand response thermostats.

The program is being re-designed to be user friendly so it will be welcomed by the leasing/tenant improvement market and perceived as a business benefit, both from an environmental standpoint and from the potential incentives perspective.

#### g) Pilots

Not Applicable

#### h) EM&V

The utilities will work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program

implementation has begun, since the plans need to be based identified program design and implementation issues. The utilities plan to work together and with the Energy Division to develop a complete plan for 2013-2014 studies and budgets after the program plans are finalized and filed. EM&V efforts will be an important component as the IOUs move forward with the demonstrations of deeper energy efficiency, whole building demonstration projects. In an effort to explore the appropriateness of various measures of whole building savings — many using interval meter data — the IOUs will consider parallel EM&V with such demonstration projects; a key component to successful evaluation of these new approaches.

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics;
- Work with ED to resolve market baseline and transformation issues;
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

## 8.) Program Logic Model

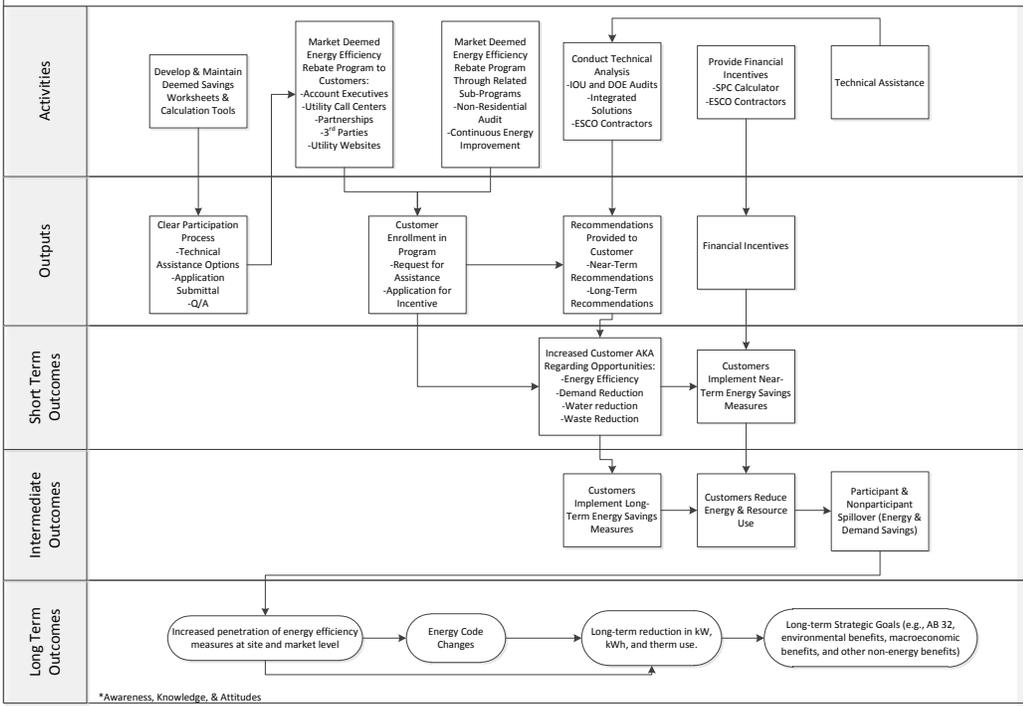

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. As there were no revisions to the original logic model for the Commercial Calculated Incentives Program, this logic model is left unchanged.

Formatted: Heading1, Indent: Left: 0", A djust space between Latin and A siantext, A djust space between A siantext and numbers

Formatted: Heading1, Left

PY2013-2014 Commercial Calculated Incentive Program – Logic Model

1. ~~1.2d~~ Program Name: Commercial Deemed Incentives, Core Sub-program

Program ID: SCG - 3711

Program Type: Statewide Core Program

2. Projected Program Budget Table

Table 1 – reference the overarching program for budget details

3. Projected Program Gross Impacts Table – by calendar year

Table 2 – reference the overarching program for savings gross impact details

4.) **Program Description**

a) **Describe program**

The statewide ~~commercial~~ Commercial Deemed Incentives sub-program provides rebates for the installation of new energy efficient equipment. Deemed retrofit measures have prescribed energy savings and incentive amounts and are generally intended for projects that have well defined energy and demand savings estimates (i.e., T12 to T8 replacements). The Commercial Deemed Incentive mechanism is designed to help influence the installation of energy efficient equipment and systems in both retrofit and added load applications by reducing the initial purchase costs of such equipment and reducing the “hassle” of participating in utility rebate programs by offering a simple application process.

The Commercial Deemed Incentives sub-program directly addresses key market factors that lead to higher energy costs for California businesses. Providing a menu of prescribed common measures simplifies the process of reviewing project proposals and provides a “per-wadget” rebate that reduces the cost of retrofitting outdated and inefficient equipment. This sub-program makes it attractive for customers to spend money in the short-run in order to achieve lower energy costs in the long-run.

b) **List of Measures**

The following measure categories are eligible for Commercial Deemed Incentives:

- Lighting
- Air conditioning equipment
- Food service equipment
- Refrigeration
- High efficiency water heating
- Plug load

Formatted: Tab stops: 0.38", Left

Formatted: Font: Bold

Formatted: Indent: Left: 0.13"

Formatted: Indent: Left: 0.38"

Audits are an important tool for marketing and increasing the uptake of EE measures. Nonetheless, an audit is not a prerequisite for deemed incentives. In fact, deemed incentives are specifically designed for ease of use—and the goal is to decrease, rather than increase, any administrative burden on customers opting for deemed incentives. Utilities are exploring higher deemed incentives for customers completing an audit as part of their application.

Formatted: Indent: Left: 0.44"

Deemed ~~Energy~~ ~~energy~~ ~~Efficiency~~ ~~efficiency~~ ~~Rebates~~ ~~rebates~~ for ~~Businesses~~ ~~businesses~~ will be part of the integrated strategy to promote energy efficiency with non-residential customers. The Statewide Commercial Deemed Team will hold regular conference calls and in-person meetings to share successes challenges, and best practices in delivering energy efficiency via deemed incentives. When appropriate, the Commercial, Industrial, and Agricultural segments will meet as a statewide entity to share successes challenges, and best practices in delivering energy efficiency to each market sector and associated sub-segments.

~~Deemed Energy Efficiency Rebates~~ Commercial Deemed Incentives will work with the other sub-programs to design customer facing marketing materials that integrate EE offerings into a complete energy savings package that is focused on individual market segments. ~~In the high efficiency water heating category, PG&E has a higher per MBtu rebate than does Sempra due to the differences in the markets.~~

**c) ~~List of Non-incentive Commercial Customer Services~~ Energy Advisor Services**

Formatted: Font: Bold  
Formatted: Font: Bold  
Formatted: Font: Bold  
Formatted: Font: Bold  
Formatted: Indent: Left: 0.25", Hanging: 0.13", Tabstops: 0.38", List tab + Notat 0.5"

The Commercial Deemed Incentives sub-program is primarily an incentive program designed to achieve energy savings through measure implementation; however it does provide such non-incentive measures as technical consultation and application preparation assistance to help customers navigate through the application process. This assistance ensures that the sub-program captures lost opportunities by not allowing projects to fall behind schedule simply because the customer does not have the resources to shepherd through the process.

**5) Program Rationale and Expected Outcome**

**a) Quantitative Baseline and Market Transformation Indicators (MTIs)**

Formatted: Indent: Left: 0.38"

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

Formatted: Indent: Left: 0.25", Hanging: 0.13"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.5"

See Attachment A - Table 3 – refer to the overarching program for quantitative baseline metrics

Formatted: Indent: Left: 0.5"

~~Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been~~

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

~~given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long-term, consistent, and expensive data collection has not been done in California.~~

~~The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed-upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude "draft" metrics at this time and instead suggest a means of developing meaningful indicators.~~

~~The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.~~

~~We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.~~

**b) Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

See Attachment A - Table 4 – refer to the overarching program for quantitative baseline metrics

See Section 1a.5.a.

**c) Program Design to Overcome Barriers**

The Statewide Commercial Deemed Incentives sub-program offers customers rebates to implement energy efficiency measures that have been identified primarily through standard utility energy efficiency audits, in-depth facility/process assessments or retro-

Formatted: Tab stops: 0.5", Left

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

commissioning studies. The sub-program is designed to help commercial customers overcome barriers to adopting energy efficiency program measures by reducing financial costs to the customers for the implementation of energy efficient measures that address major end-uses (e.g., lighting, HVAC, plug loads). Additionally, the easy-to-use online and paper application process reduces that hassle and transaction costs generally associated with ~~commercial deemed incentives~~incentives, where engineering calculations and pre- and post-monitoring may be required.

Formatted: Indent: Left: 0.5"

Furthermore, to ensure equity to all business customer segments, this program will continue to offer statewide-consistent, cost-offsetting itemized rebates to help customers with the cost of installing new energy efficient equipment.

Formatted: Indent: Left: 0.5"

Incentives and savings payouts will be based upon deemed measures in the DEER database or through work papers.

Formatted: Indent: Left: 0.5"

The Commercial Deemed Incentives sub-program delivers a consistent message statewide to commercial customers about the benefits, energy savings and GHG reductions that efficient technologies and “best operating practices” offer. This eliminates the barrier often run into by commercial customers of getting incorrect or out-of-date information from local networks.

The Commercial Deemed Incentives sub-program not only brings IOU incentive information to customers, but in many instances also provides additional information about other opportunities for project assistance, such as State or Federal funds available for energy efficiency projects, Tax incentives or other local sources of project funding.

In several instances, high efficiency Emerging Technologies are viable, but are unknown to facility owners and system designers and thus, are slow to penetrate the market, causing energy efficiency opportunities to be “lost.” The Commercial Deemed Incentives sub-program helps speed market penetration and associated energy savings for Emerging Technologies by offering “premium” incentives for emerging technologies that are “proven” but not widely employed in the markets for which they are intended (e.g., solid state lighting, advanced lighting controls).

Formatted: Indent: Left: 0.38"

**d) Quantitative Program Targets**

The targets provide herein are best estimates, but nonetheless are forecasts.

**Table 5**

<u>Program Name</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>Projects</u>	<u>TBD</u>	<u>TBD</u>

**e) Advancing Strategic Plan goals and objectives**

iii. The unifying objective of the Strategic Plan is to employ market transforming strategies to encourage marketplace adoption of energy efficient measures to a point that public investment in energy efficiency is no longer necessary (Section 1, page 4). The Deemed Incentives sub-program will support this effort by employing two of the five market transformation policies identified in the Strategic Plan. Specifically, the Program will offer “carrots” in the form of financial incentives to help pull the marketplace towards energy efficiency. The Deemed Incentives sub-program will also provide education and informational resources through marketing and program outreach efforts. Therefore, these program elements will work in concert to transform the market towards sustained, long-term energy savings.

The program will help to achieve the following near-term strategic goals as identified in Chapter 3 of the Strategic Plan:

- 2-3: Ensure compliance with minimum Title 24 codes – The Commercial Deemed Incentives sub-program only provides incentives for projects that exceed current Title 24 minimum baselines. Incentive rates will be created to encourage the implementation of advanced technologies (e.g., solid state lighting) to ensure deeper levels of energy reductions including implementation of the Office of the Future Consortium’s Phase 2 recommendations, “The 25% Solution”, which seek to reduce energy usage 25 percent below Title 24-2005 baselines.
- 2-5: Develop tools and strategies to reduce energy consumption in commercial buildings – The Commercial Deemed Incentives sub-program directly supports this effort by collecting data and conducting energy use and efficiency studies that, when collected over multiple IOU service territories, will be very helpful in supporting statewide efforts to establish a robust and useful knowledge base for the commercial sector.
- 2-7: Develop business models that deliver integrated energy management solutions – The Commercial Deemed Incentives sub-program will implement incentive mechanisms that will “reward comprehensive energy management retrofits” such as incentives for reaching certain stretch goals that produce significant energy savings

Formatted: Indent: Left: 0.5", No bullets or numbering, Tab stops: Not at 1.75"

Formatted: Indent: Left: 0.5"

Formatted: Indent: Left: 0.5", Tab stops: 0.75", List tab + Not at 1"

beyond an established baseline. Additionally the iBonus concept (see Section 6.e) will further encourage integrated solutions.

- 2-8: Improve utilization of plug load technologies – The existing incentive structure pays for energy reductions through plug load measures. Additional incentives that encourage greater penetration of plug load technologies may be required and will be developed to support technologies recommended by [PIERCEC](#), the Office of the Future Consortium.

## 6) Program Implementation

### a) **Statewide IOU Coordination**

The Statewide IOU Coordination process, described in detail in the Statewide Commercial Energy Efficiency Program, will ensure continuous improvement and consistent implementation of all of the sub-programs. The discussion below will focus on how the IOUs will coordinate the [Commercial](#) Deemed Incentives sub-program specifically.

The Statewide IOU Coordination process for the [Commercial](#) Deemed Incentives sub-program will be as follows:

- Hold Regular Program Manager Meetings – The Deemed sub-program managers from each of the IOUs will meet on a regular basis. The sub-program managers will unify, to the extent possible, the implementation of program aspects such as Program name, Program delivery mechanisms, Incentive levels, marketing and outreach plans, and IOU program interactions. The sub-program managers will also discuss new innovations and develop solutions to overcoming implementation challenges. Therefore, the regular meetings will focus on issues specific to the Deemed sub-program only.
- Designate an IOU Program “Lead” – One of the sub-program managers that participates in the regular meetings will be the designated Deemed Program IOU “Lead”. The IOU lead will represent the sub-program at the regular Statewide Steering Committee meetings.
- Participate in Regular Steering Committee Meetings – The IOU lead will be responsible for attending the regular Steering Committee Meetings and sharing [Commercial](#) Deemed Incentives sub-program innovations, experiences and challenges that have the potential to impact multiple sub-programs or the core Commercial Energy Efficiency Program as a whole.
- Adopt Program Enhancements - Once the Steering Committee agrees that a specific innovation or implementation policy has merit on a statewide level; the IOU lead will distribute the information to the Deemed sub-program managers by email or at the next regular meeting for adoption and integration. Therefore, the IOU lead will act as a conduit feeding Deemed sub-program-specific information up to the statewide Steering Committee and distributing measures for adoption back to the Deemed sub-program managers.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.13"

**Formatted:** Indent: Left: 0.44"

**Formatted:** Indent: Left: 0.38"

**Formatted:** Indent: Left: 0.38", Hanging: 0.13", Tabstops: 0.5", List tab + 0.56", Left + 1", Left

- Evaluate Program Enhancements – To complete the adaptive management loop, the Deemed sub-program managers will track the success of the adopted statewide enhancement or implementation policy and report any challenges or concerns at the regular Commercial Deemed Incentives sub-program meeting. The IOU lead will report any challenges that transcend the Commercial Deemed Incentives sub-program to the Steering Committee, who will determine whether further course corrections are needed.

By following the process stated above, the Commercial Deemed Incentives sub-program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the three year implementation cycle. Sub-program innovations and challenges will also feed productively into the higher-level Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.

The coordination and unity of all program aspects, such as Program name, Program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions, will be handled through this statewide coordination framework. However, these aspects will start off at a high level of statewide consistency. In rare cases, there will be IOU-specific deviations. Such instances where one IOU will favor a different approach than the other IOUs will be called out in italicized text throughout the Deemed Incentives sub-program.

i. Program name: Deemed Incentives

ii. Program delivery mechanisms

Deemed Incentives will be primarily delivered via paper or online application. Measures and incentive levels will be the same across IOUs, unless markets in the individual IOUs require adjustments based on research, communication with industry, and/or changes in the economic landscape.

iii. Incentive Levels

Incentive levels vary by measure type, but will be offered consistently across IOU service territory except where local market conditions necessitate different amounts. Higher incentive levels will be provided for Emerging Technologies to spur traction in the market as feasible. The level of increased incentive for emerging technologies will be evaluated on a measure by measure basis dependent on kW, kWh, therms, equipment cost, other market factors and cost effectiveness.

iv. iv. Marketing and outreach plans

The Deemed Incentives sub-program will be marketed through IOU account executives, as well as through third-party programs, trade allies, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and

Formatted: Indent: Left: 0.38"

Formatted: Indent: Hanging: 0.25", Tab stops: -2.88", Left + 0.81", Left

program participation. In addition, direct customer contact by account executives, Demand Response Program outreach, phone and e-mail support will be provided.

In 2013-2014, the IOUs will implement segmentation research and messaging.

Marketing campaigns will provide a wide range of action-oriented solutions targeted to “personas” identified through segmentation research. In addition, marketing efforts will be “bundled.” That is, a menu of demand response, energy efficiency and conservation programs will provide customers a full array of EE and DR options. By providing packaged energy management solutions for each industry segment, the IOUs will be better able to communicate with and serve customers.

Marketing efforts will incorporate a variety of marketing tactics and activities to promote the solutions in the Deemed Incentives sub-program. Education, awareness and outreach efforts will rely on a combination of mass media and targeted communication channels to ensure that messages reach the intended audiences with enough frequency to motivate attitude and behavior changes. The marketing strategies may include, but are not limited to, a mix of print, direct mail, e-mail, personal contact, trade shows, trade association meetings, customer workshops and seminars, energy-related and other community events and partnerships with business and industry organizations, specialized collateral, case studies, website links and information with regular updates, bill inserts, press releases, and newspapers.

Additionally, IOUs may investigate piloting alternative channel marketing and outreach options that utilize community-based organizations and/or third parties to recruit small businesses and influence them to take actions that result in energy efficiency improvements. Local government partnerships, regional and community entities tend to interface with small businesses with some regularity; therefore, partnering with these organizations could prove to be a viable delivery option. A marketing and outreach campaign with Business Improvement Districts through our Local Government Partnerships, will serve to educate and increase engagement in a segment that is hard to reach.

#### **v. IOU program interactions**

The Deemed Incentives sub-program managers will partner with the programs as appropriate offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to co-brand program information and marketing collateral with this sector’s customers, to the extent possible. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, comprehensive information that discusses all resource efficiency issues will benefit the customer to the mutual advantage of the single resource programs.

With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, and co-release

**Formatted:** Font: Bold

**Formatted:** Indent: Hanging: 0.25", Tab stops: 0.5", Left + 0.88", Left

brochures, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Deemed sub-program incentives for energy efficient equipment that may also reduce air and GHG emissions.

**vi. — Similar IOU and POU programs**

The IOUs will be delivering many third-party programs that utilize the Deemed Incentives sub-program infrastructure. This will help ensure a consistent delivery of measure incentives and protect programs from undermining each other and detracting from achieving cost-effective energy savings.

**b) Program delivery and coordination**

**i. Emerging Technologies program**

To meet California’s future energy efficiency goals, both in terms of overall usage and peak demand usage, new technologies and new applications of technology are needed. The Commercial Deemed Incentives sub-program will seek support from ETP’s incubation and development of new technologies to meet the needs of the marketplace. ETP provides the pipeline of new technologies that the Commercial Deemed Incentives sub-program looks to incorporate to maintain a robust selection of energy savings equipment. The program will look to ETP to provide customers with technology information, validating effectiveness as an unbiased and neutral expert.

Deemed ~~Incentives~~ incentives will be primarily delivered via paper or online application. Measures will be the same across IOUs and incentive levels will also be aligned, unless markets in the individual IOUs require adjustments based on research, communication with industry, and/or changes in the economic landscape.

**ii. Codes and Standards program**

The Commercial Deemed Incentives sub-program relies on Codes and Standards to help maintain an updated and relevant list of measures that support savings. As ~~Codes codes~~ and ~~Standards standards~~ impact measures, the Commercial Deemed sub-program will act to align itself with appropriate offerings. It is important to manage the measure life cycle to take full advantage of providing incentives before moving them into codes and standards. Programs will include new offerings that will allow flexibility in adapting to changes in codes and standards, market trends, and technologies. Planned enhancements to Title 24 will be reflected in incentive levels and eligible measures and services. As the market moves toward “low energy” or “zero net energy” buildings, specific changes to each element of the bundling will be made to ensure the latest cost effective technologies/services (e.g., LEDs) are made available as these technologies transition from research and development to the mainstream.

**iii. WE&T**

WE&T is a portfolio of training and information programs that showcase energy efficient equipment found on the list of measures offered in the [Commercial Deemed Incentives](#) sub-program. Dissemination of information takes place through energy centers, technology test centers, and information and training program offerings. During classes, time is dedicated to energy efficiency programs and how to participate. In ~~2010-2012~~[2013-2014](#), a program representative will be available to deliver the EE message and answer questions.

**Formatted:** Indent:Left: 0.69"

**iv. Program-specific marketing and outreach plans**

The Deemed Incentives sub-program will be marketed through IOU Account Executives, as well as through third-party programs, educational, outreach and other marketing activities. Marketing activities will target business customers, ESCOs, trade associations, local business groups and government entities to generate interest and program participation. In addition, direct customer contact by Account Executives, Demand Response Program outreach, phone and e-mail support will be provided.

**Formatted:** Font:Bold  
**Formatted:** Indent:Left: 0.62",Hanging: 0.13",Numbered+ Lev el:1 + Numbering Style:i, ii, iii, ... + Startat: 1 + A lignment: Right + A lignedat: 0.25" + Tabafter: 0.38" + Indentat: 0.38",Tabstops: 0.75",List tab + Notat 0.38"  
**Formatted:** Indent:Left: 0.75"

The IOUs will continue to build on and refine marketing plans and strategies used in past portfolios in the ~~2009-2004~~[2013-2014](#) cycle. This will involve developing marketing plans to deliver targeted messages to specific customers that resonate with their values and needs with the goal of increasing the market uptake of deemed incentives. These plans will coordinate and create timelines for activities, present strategic campaigns, establish targets and metrics, and include a performance monitoring strategy.

The following will be used as marketing and outreach channels:

- [Non-contracted equipment vendors](#) are a key delivery channel of the [Commercial Deemed Incentives](#) sub-program. Emphasis will be placed on building awareness with more vendors in the territory and training vendors on how to participate effectively in the program.
- [Community-based organizations \(CBOs\)](#), [faith-based organizations \(FBOs\)](#), [non-profit organizations](#), and [non-government organizations \(NGOs\)](#) with unique access and following are expected to be emphasized as delivery channels.
- [Trade associations and industry networks](#)
- [Enabling partners](#) (financial institutions, trade associations, service providers, law firms, environmental organizations)
- [Unique channels that offer complementary value propositions from the customers' perspective](#) (e.g., energy, water, materials management, recyclables, corporate citizenry).

**Formatted:** Bulleted+ Lev el:1 + A lignedat: 0.75" + Tabafter: 1" + Indentat: 1"

**Formatted:** Indent:Left: 0.81",Tab stops: 0.81",Left

The ideal marketing mix will be assessed for maximum awareness and participation. Marketing and outreach coordination will be coordinated among the IOUs utilizing the statewide coordination process described above.

**v. Non-energy activities of program**

Integrated Energy Audits (described in the nonresidential Audit sub-program) is the primary vehicle to promote project solutions that look across the various IOU DSM program offerings, as well as complementary options available through other entities (e.g., water agencies). The results of the ongoing Water Efficiency Pilot Program will identify potential opportunities to reduce water use and the potential for associated Energy Efficiency savings. Since some customers within the program sectors are major water users, this sector is well positioned to realize linked water/electricity benefits through the Water Efficiency Pilot Programs.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.69", Hanging: 0.19", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.25" + Tab after: 0.38" + Indentat: 0.38", Tab stops: 0.81", List tab + Notat 0.38"

**Formatted:** Indent: Left: 0.88"

**vi. Non-IOU program interactions**

The Commercial Deemed Incentives sub-program managers will partner with the programs offered by CEC, ARB, Air Quality Management Districts, and other government agencies to capitalize on opportunities to co-brand program information and marketing collateral with this sector's customers. Conventionally, each government agency and utility has operated natural resource and energy programs independently, missing opportunities to serve customers who must manage more than one resource type. For customers who are regulated by or interested in more than one resource issue, comprehensive information that discusses all resource efficiency issues will benefit the customer to the mutual advantage of the single resource programs.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.75", Hanging: 0.13", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.25" + Tab after: 0.38" + Indentat: 0.38", Tab stops: 0.88", List tab + Notat 0.38"

**Formatted:** Indent: Left: 0.88"

With respect to water conservation, utility program managers will partner with the local water districts to co-brand marketing collateral, attend trade shows, co-release notices, for programs with interactive water and energy effects. Similarly, with ARB and Air Quality Management Districts, IOUs will offer customers Commercial Deemed Incentives sub-program incentives for energy efficient equipment that may also reduce air and GHG emissions.

**vii. CEC work on PIER with EPIC**

As of June 2012, PIER no longer exists. However, The-the Program will interact with the Emerging Technologies Program to leverage new technologies to increase the list of measures available for energy efficiency projects. The portfolio staff actively works to incorporate promising emerging technologies and PIER project in coordination with the applied research of EPICCEC.s. The program will work with PIER on researching new technologies for evaluation and testing for application in mainstream projects.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.75", Hanging: 0.13", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.25" + Tab after: 0.38" + Indentat: 0.38", Tab stops: 0.88", List tab + Notat 0.38"

**Formatted:** Indent: Left: 0.88"

**viii. CEC work on codes and standards**

Planned enhancements to Title 20 and 24 will be reflected in incentive levels and in eligible measures and services. See Section 6.b.ii.

**Formatted:** Font: Bold

**Formatted:** Indent: Left: 0.75", Hanging: 0.13", Numbered+ Level: 1 + Numbering Style: i, ii, iii, ... + Startat: 1 + Alignment: Right + Alignedat: 0.25" + Tab after: 0.38" + Indentat: 0.38", Tab stops: 0.88", List tab + Notat 0.38"

**Formatted:** Indent: Left: 0.88"

**ix. Non-utility market initiatives**

The sub-program will support, educate customers, and ~~or enforce~~ facilitate such initiatives as AB32, renewables, ANSI certification, facility benchmarking, Continuous Energy Improvement, California Green Building Initiative, and other initiatives as directed. The IOUs will remain engaged in these efforts and work to influence the development of increasingly higher standards.

Formatted: Indent: Left: 0.88"

**c) Best Practices**

To maximize program effectiveness, best practices in Program Design and Implementation will be employed and shared amongst IOUs. Areas of best practices for the Commercial Deemed Incentive sub-program approach include:

Formatted: Font: Bold

- Best practices in Program Design:
  - Regular communication amongst IOUs is critical to effective program design.
  - Identify qualifying products simply and effectively (Examples; ENERGY STAR®, CEE, PIER).
  - Seek input from industry in the development of new programs. The IOU programs are trying to change how an industry operates from manufacturer design to the customers purchasing and maintenance practices.
  - Industry participation increases program volume and speeds market transformation.
- Best practices in Program Implementation:
  - Strive to simplify messaging and participation for the customer. (Look for the ENERGY STAR label, purchase from a qualifying products list)
  - Understand the key motivators that drive an industry and use that information to market your program. Make certain outreach efforts make your program visible to your customers and the market that is catering to your customers.
  - Always communicate program marketing and advertising plans in advance to appropriate industry channels. Advanced notice allows industry partners an opportunity to leverage off of utility marketing efforts and reinforce the messaging we are trying to get across.
  - Statewide coordination is important as it makes it easier for national chains and manufacturers to understand and support IOU rebate programs. Statewide coordination also includes regular meetings to share industry contacts, marketing strategies and lessons learned. Coordinated statewide participation at relevant industry events has reduced administrative expenses through cost sharing arrangements.

Formatted: Indent: Left: 0.5", Tab stops: 0.75", List tab + Not at 1"

Formatted: Bulleted + Level: 1 + A Ligned at: 0.75" + Tab after: 1" + Indent at: 1"

Formatted: Indent: Left: 0.5", Tab stops: 0.75", List tab + Not at 1"

Formatted: Indent: Left: 0.75", Tab stops: 1", Left + 1.75", List tab + Not at 1.5"

**d) Innovation**

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

Innovative aspects of the program for ~~2010-2012~~2013-2014 include persistent integration of new and emerging technologies into the program processes. This will manifest itself in an increased emphasis on plug load technologies (in support of the Strategic Plan) and by aligning rebates with the recommendations of the Office of the Future Consortium to help make their “25% Solution” a reality.

Additionally, incentive mechanisms that emphasize peak demand reduction, addresses current economic downturn and better motivate customers to participate in energy efficiency incentive programs will be pursued. During ~~2010-2012~~2013-2014 program cycle new incentive structures will be periodically evaluated and necessary changes may be made in order to enhance program benefits and performance, including measure bundling incentives. The IOUs will explore offering an audit to customers considering three or more measures in an effort to determine if the audit itself leads to implementation of deeper energy savings.

Formatted: Not Superscript/Subscript

Formatted: Not Superscript/Subscript

Where possible, IOUs will use integrated approach to addressing DSM opportunities. Innovative aspects such as merging energy efficiency and demand response analysis and converting recommendations to projects under Retro-commissioning and/or nonresidential Audits, processing and reviewing energy efficiency and demand response measures in a single application, providing analytical information about applicable distributed generation solutions will maximize customer adoption rates for most cost-effective energy management opportunities.

**e) Integrated/coordinated Demand Side Management**

Formatted: Font: Bold

Over the last few years, traditional DSM programs have learned that successful customer participation in one program leads to a likelihood of repeat participation in the same program. Additionally, this successful participation makes these customers likely candidates for other similarly related types of programs. While a successful program experience leads to repeat participation, there has been difficulty in cross pollinating similarly related types of programs with these candidates due to program-specific silos. To overcome the historic siloing of DSM, the Deemed Incentives sub-program will leverage lessons learned from SDG&E’s DSM efforts by offering comprehensive, coordinated marketing and program delivery.

A primary issue when integrating energy efficiency and demand response programs is that the two programs are at financial odds with one another, as both programs often reduce the potential for each other’s financial incentives. For example, energy efficiency may reduce the overall baseline by which the demand response program’s incentives are based upon. Since benefits from long term energy savings derived from technological measures outweigh the temporary demand reduction benefits derived from behavioral actions, the program will offer additional incentives for energy efficiency measures that enable demand response when customers enroll, or are already enrolled, in demand response programs. In so doing, the program seeks to maximize the potential for both types of programs.

A secondary issue when integrating energy efficiency and demand response programs is that communications of both types of DSM program are often non-coordinated, since energy efficiency is typically technology based and demand response is often focused on behavior. Also, demand response efforts often happen prior to the summer “event season” and wane throughout the remainder of the year. To overcome these differences, the program will offer Integrated and coordinated year-round marketing through ~~consolidates~~ consolidated applications, collateral, web sites, and events, where applicable. Through bundling program elements and offering one program application, customers will have the opportunity to enroll in demand response programs in addition to energy efficiency programs.

The integration of energy efficiency and demand response programs presents several issues and, as stated previously, the sub-program seeks to overcome these issues by focusing on several tactics:

- Promotion and incentivizing of demand response enabling energy efficiency measures to ensure that energy efficiency is completed first to maximize potentials;
- Integrated and coordinated year-round marketing (e.g., applications, collateral, web sites, and events);
- Linking of program eligibility requirements (e.g., customer size);
- Provide unified technical assistance through enhanced EE/DR Audits through the TA/TI Program to allow for cross-harvesting opportunities;
- Integrated presence on utility websites; and
- Regular coordination meetings between energy efficiency and demand response program management.

~~During the 2010-2012 program cycle, funding for energy efficiency and demand response cannot be commingled; therefore payments will be split between the two programs as appropriate.~~

~~A new incentive mechanism called an Integration Bonus (iBonus) will be put in place to promote greater integration of DSM resources. The iBonus is available for customers who purchase, install, and are eligible to receive a rebate for an addressable energy saving device and who sign up for, or are already signed up for, a voluntary or rate-based Demand Response Program.~~

~~Technologies eligible for an iBonus will initially include the following addressable deemed measures, with additional measures added throughout the program as appropriate and identified:~~

- ~~Addressable Lighting Measures~~
- ~~Addressable HVAC Measures~~
- ~~Addressable Computer Network Power Management Software~~

Formatted: Indent: Hanging: 0.13", Tab stops: 0.5", Left

Formatted: Indent: Left: 0.38", Hanging: 0.13", Tab stops: 0.5", Left + Notat 0.75"

Formatted: Indent: Left: 0.38"

Formatted: Indent: Left: 0.63", Bulleted+ Level: 2 + Alignedat: 1" + Tab after: 1.25" + Indentat: 1.25", Tab stops: Notat 1.25"

- ~~○—Addressable Refrigeration Measures~~
- ~~○—Addressable Anti-Sweat Heaters~~

~~The technologies listed above will be clearly demarked on the deemed application as being eligible for the iBonus and specific terms and conditions concerning the respective measure will be included in the application.~~

**Formatted:** Indent: Left: 0.38"

**f) Integration Across Resource Types**

**Formatted:** Font: Bold

Integration across resource types (e.g., energy, water, and air quality) will be explored. Examples include working with Water Agencies to co-promote Food Service appliances that save water and energy and working with Air Quality Management Districts to co-promote Boilers and Water Heating measures that save energy and improve air quality.

**g) Pilots**

**Formatted:** Font: Bold

Not applicable

**Formatted:** Indent: Left: 0.13"

**Formatted:** Font: Bold

**h) EM&V**

~~The utilities are proposing to work with the Energy Division to develop and submit a comprehensive EM&V plan for 2013-2014 cycle, after the program implementation plans are filed. This plan will include process evaluations and other program-specific studies within the context of broader utility and Energy Division studies. More details plans for process evaluation and other program-specific evaluation efforts will be developed collaboratively by the utilities and Energy Division. Development of these plans will occur after the final program design is approved by the CPUC, and in many case, after the program implementation has begun, since the plans need to be based identified program design and implementation issues. The utilities plan to work together and with the Energy Division to develop a complete plan for 2010-2012 studies and budgets after the program plans are finalized and filed. This plan will be submitted to the CPUC in time for approval along with the Program Implementation Plans.~~

Detailed plans for process evaluations and other evaluation efforts specific to this program will be developed after the final program design is approved by the CPUC and program implementation has begun, since final plans will be based on identified program design and implementation issues and questions. However, a brief description of the current, preliminary plans is provided below:

- Conduct evaluation to track the all proposed key metrics,
- Conduct specific process evaluation to improve program design, implementation and market effectiveness.

## 8.2 — Program Logic Model

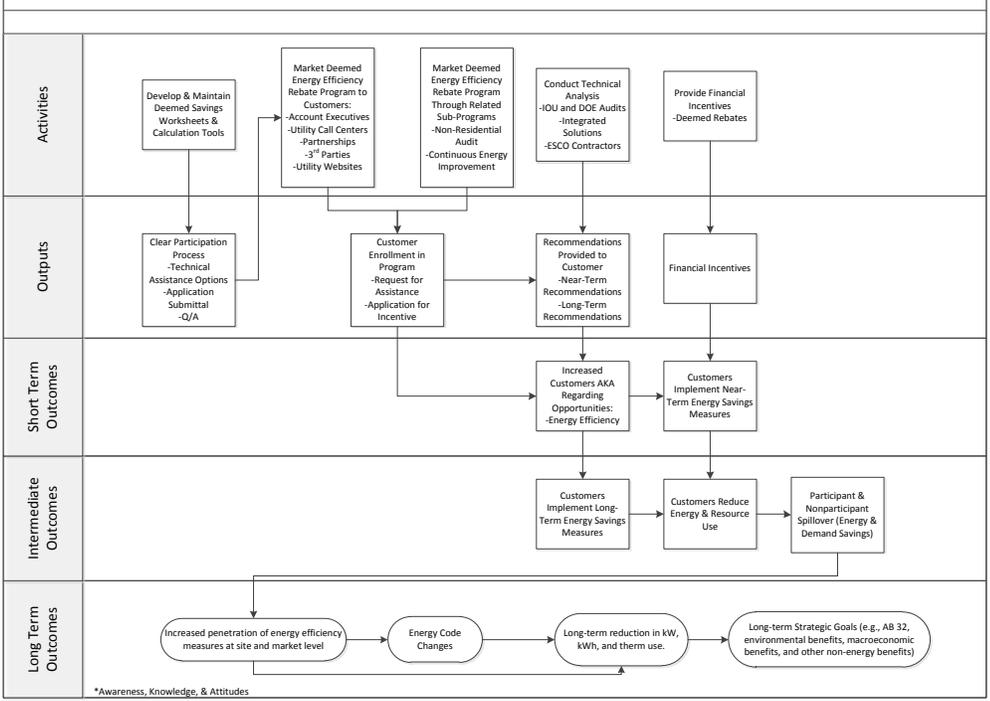

On December 2, 2010, the Commission issued Resolution E-4385, approving Program Performance Metrics (PPMs) for Pacific Gas and Electric Company, Southern California Edison Company, Southern California Gas Company and San Diego Gas and Electric Company for 2010-2012 statewide energy efficiency programs and subprograms. In addition, this Resolution approved updated logic models for the statewide programs. As there were no revisions to the original logic model for the [Commercial](#) Deemed Incentives Program, this logic model is left unchanged.

Formatted: Indent: Left: 0"

PY2013-2014 Commercial Deemed Incentives Program – Logic Model

Formatted: Left

Formatted: Indent: Left: 0"

4.) Program Description

a) Describe Program

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

The Commercial Continuous Energy Improvement (CEI) is a consultative service aimed at helping commercial customers engage in long-term, strategic energy planning. Corporate energy management is not currently part of normal business operations for the majority of utility customers. With current economic pressures forcing customers to reduce costs and focus more on their core business, it is likely to be further marginalized. CEI proposes to reintroduce the importance of energy management by transforming the market (and reducing energy intensity) through a comprehensive approach that addresses both technical and management opportunities and creates sustainable practices through a high-level energy commitment from executive and board-level management. CEI applies the principles of well-known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management. These principles are: (1) Commitment; (2) Assessment; (3) Planning; (4) Implementation; (5) Evaluation; and (6) Modification. At each stage of customer engagement, a variety of complementary utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost-effectiveness of the delivered energy management solution.

In 2013-14, CEI will be expanded to include select group of mid-sized non-residential customers. Available options to help target these customers may include an individualized, a small group, or a mass-market, remote deployment approach.

Formatted: Indent: Left: 0.38"

CEI will coordinate its services with the ~~Commercial Customer Services~~ Energy Advisor sub-program offerings. CEI offers customers what can be considered the pinnacle of audit offerings guiding senior management to instill energy considerations in all management/business operational decisions and in long term energy planning. Continuous Energy Improvement (CEI) describes a statewide package of products and services aimed at helping customers engage in long-term, strategic energy planning. It proposes to transform the market and reduce energy intensity through a comprehensive approach that

includes addressing both technical and management opportunities. A CEI approach applies the principals of well known business continuous improvement programs, such as Six Sigma and International Standards Organization (ISO) standards, to facility and plant energy management and includes these key steps: Commit, Assess, Plan, Implement, Evaluate, and Modify.

At each stage of customer engagement, a variety of utility and non-utility products and services can be customized to fit different customer profiles and optimize the cost effectiveness of each utility's portfolios.

Formatted: Indent: Left: 0.38"

In implementation, utilities will screen customers for certain CEI services based on factors such as customer energy use, complexity, number of facilities, energy decision making structure, environmental commitment or demonstrated motivation to take action. Screening criteria and specific product offerings will be utility appropriate.

Customer screening will allow the IOUs to target customers effectively. Implementing a CEI program requires significant time and resources for both the utility and the customer. Therefore, IOUs will consider the following and other factors when selecting customers:

- a. The customer's current and past commitment to energy management and green policies: Certain customers, such as WalMart, have already demonstrated a significant commitment to energy management as part of an overall green policy. IOUs will work closely with their strategic customer relationship managers to target such customers.

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + Aligned at: 0.25" + Tab after: 0.5" + Indent at: 0.5", Tab stops: 1", List tab + Not at 0.5"

The ability to deliver cost effective energy savings: CEI programs focus on helping customers transform their energy management processes, with the expectation that the transformation will lead to energy savings. IOUs will target customers with the potential to transform relatively quickly and cost effectively, so that delivery of energy savings begins within the 2010-2012 cycle. Such customers will be identified in close collaboration with the strategic customer relationship managers. Customer characteristics, such as energy use, complexity, number of facilities, and energy decision making structure will also be considered for their impact on cost effectiveness.

## Commitment

CEI begins with a high-level management commitment to improving energy performance, which increasingly can be combined with other environmental and regulatory commitments that ~~large~~ energy users are developing in response to market and political pressures. A corporate commitment sends the top-down message to employees, partners, shareholders and vendors that energy is a priority issue requiring attention – like safety – and also paves the way for establishing the required company resources required to implement the steps of CEI. These resources can include capital, personnel like energy champions or teams, or technical systems and software required for energy management.

Gaining true customer commitment can take time, but is critical. In implementation, utilities will formalize the Commitment phase with ~~larger or~~ more intensive customers through a CEI participation agreement, which outlines the utility CEI services being offered as well as minimum customer expectations.

## Assessment

Following Commitment, a comprehensive assessment is critical to identifying not only technical opportunities, but also systemic energy management practices and cultural shifts that can improve overall facility management practices and sustain continuous improvements towards long-term company targets. A component to the assessment will also include tools to help identify Energy Efficiency (EE) and Distributed Generation (DG), and Demand Response (DR) opportunities.

Based on screening criteria, utilities will offer comprehensive energy assessment services using vetted sources like (but not limited to) those described below, to develop a customer specific strategic energy plan.

~~Many tools and resources – utility and non-utility, free and licensed – are available to support comprehensive customer energy assessment. They include:~~

- ENERGY STAR’s Guidelines for Energy Management, housed on the ENERGY STAR website, provide step-by-step guidelines to support CEI in general, and also guide customers to ENERGY STAR’s numerous assessment tools. This option is a low-cost resource for smaller and medium customers interested in CEI. ([http://www.energystar.gov/index.cfm?c=guidelines.guidelines\\_index](http://www.energystar.gov/index.cfm?c=guidelines.guidelines_index))
- Customer Energy management Management assessment Assessment Tools such as Envinta’s One-To-Five, Achiever, or Challenger software products offer professionally facilitated energy management assessment with company decision makers and explores management practices and company priorities to develop a CEI roadmap for energy goals and actions.
- Integrated Energy Audits provide an inventory of technical facility end-uses and energy efficiency, demand response and self-generation investment opportunities. For a full description, see the ~~Commercial Customer Services Energy Advisor sub-program plan.~~

**Formatted:** Indent: Left: 0.63", Bulleted + Level: 1 + A linedat: 0.25" + Tabafter: 0.5" + Indentat: 0.5", Tabstops: 1", List tab + Notat 0.5"

**Formatted:** Underline

Benchmarking can measure the energy performance of a company, building, process, or piece of equipment against industry standards or comparable groupings. Benchmarking is a natural first step for the CEI process. Customers with multiple facilities find benchmarking useful to prioritize efficiency projects, track progress toward energy or GHG improvement goals or drive competition among similar benchmarked facilities. Units of measurement vary widely; for commercial buildings, the unit is energy used/square foot for a unit of time. Benchmarking can also be applied to other resources and environmental issues such as water use, CO<sub>2</sub>, and emissions.

• software products like those developed by Envinta. *Envinta One To Five, Achiever, Challenger*, for example, let company decision makers explore management practices and company priorities to develop a CEI roadmap for energy goals and actions.

• Benchmarking tools, measure the energy performance of a company, building, process, or piece of equipment against industry standards or comparable groupings. Benchmarking is a particularly useful tool to support a CEI process. Customers with multiple facilities can prioritize efficiency projects, track progress toward energy improvement goals or drive competition among similar benchmarked facilities. Benchmarking can also be applied to other resources and environmental issues such as water use, CO<sub>2</sub>, and emissions.

Existing benchmarking tools include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding. These include tools for commercial facilities, cement, auto assembly, and an LBNL winery benchmarking tool. Under development are ENERGY STAR benchmarking tools for food processing, glass manufacturing, and pharmaceutical manufacturing, as well as an LBNL tool for dairy processing. Benchmarking and establishing baselines are an important component of the Management Standard for Energy SME 2000-2008, the DOE sponsored ISO Plant Certification, and Superior Energy Performance criteria.

• Simple or integrated energy audits provide an inventory of technical facility end uses and energy efficiency, demand response and self-generation investment opportunities. For a full description, see the Statewide Integrated Audits sub-program description.

Based on screening criteria, utilities will offer comprehensive energy assessment services utilizing, but not limited to, vetted sources like those described above, to develop a customer specific strategic energy plan. In implementation, the statewide Agricultural program will continue to partner with energy industry peers, industry associations and DOE/CPUC sponsored labs and consultants to enhance the use of existing tools and develop new tools to improve key California agricultural sectors.

## **CEI Planning**

**Formatted:** Indent: Left: 0.08", Hanging: 0.3", SpaceBefore: 0 pt, Bulleted+ Level: 1 + Alignedat: 0.5" + Tab after: 0.75" + Indent at: 0.75", Tab stops: 1", List tab + Not at 0.75"

**Formatted:** Indent: Left: 0.38"

**Formatted:** Indent: Left: 0.38", No bullets or numbering, Tab stops: Not at 1"

**Formatted:** Indent: Left: 0.38"

Strategic energy planning involves setting energy goals and action plans around energy efficiency, demand response, and generation as appropriate. ~~Implementation of the planning stage of CEI can be undertaken independently by the customer, or with utility support.~~ Planning for ~~larger complex~~ customers will typically involve Account Representatives and/or consultants. As is discussed in the Strategic Plan and in the Statewide Integration PIP, strategic planning can also include complementary non-energy considerations as well, such as GHG reduction, water efficiency, and waste-stream minimization, all which have embedded energy components.

Data and findings from a comprehensive customer assessment are critical in developing any comprehensive energy plan, including the results from technical audits or assessments, facility benchmarks, energy management assessments, and assessments of company priorities. This information is analyzed and used to develop realistic and achievable company goals and prioritized shorter-term tactics needed to achieve them. Energy plans should be living documents revisited and revised regularly.

Energy goals can vary widely and include elements such as resource utilization (“Company X will reduce ~~it’s~~ overall energy intensity by 3% over the next 3 years”), carbon reduction goals (“Company X will be carbon neutral by ~~2012~~2014”), or management oriented goals (“Company X will implement energy teams by ~~2010~~2013”). Goals can be stated in internal documents or can be made public through press releases as part of larger sustainability plans, which is increasingly important for large and public companies.

CEI will assist customers in developing and implementing action plans to execute the prioritized near-term activities in support of their company’s energy goals, as well as the resources, staff and schedule for tracking. Action plans typically includes activities such as:

- ~~prioritizing~~ Prioritizing process systems or facilities based on benchmarking or company drivers,
- ~~identifying~~ Identifying internal resources required to implement plans, and
- ~~develop~~ Developing project justification and incentive application documentation lists and detailed schedules.

### CEI Implementation

In the implementation stage, utilities partner with customers to identify technical support and utility and non-utility resources available to support implementation of projects, such as rebates, incentives, third party and government partnership programs, and state and national resources, including:

- Statewide Commercial Deemed ~~rebates~~ Incentives
- Statewide Commercial Calculated incentives for new construction/tenant improvement, retrofit and retro-commissioning and/or repair

Formatted: Indent: Left: 0.38", Tab stops: 0.69", Left + Notat 0.75"

Formatted: Indent: Left: 0.38", Tab stops: 0.69", Left + Notat 0.75"

- Third-Party and Government Partnership programs (described in the statewide and local third-party filings)
- Utility IOU and non-utility IOU financing options
- Non-utility financing options and owners External and Internal engineer support

Formatted: Indent: Left: 0.5", Tab stops: 0.81", List tab + Not at 0.5" + 1"

Formatted: Indent: Left: 0.38"

### CEI Evaluation and Modification

Like in any continuous improvement program, evaluation is an ongoing process of assessing comparing actual performance against company goals, targets and action plans. It may include:

Formatted: Indent: Left: 0.5"

- repeating Repeating the benchmarking and system or facility baseline process annually,
- assessing Assessing advancements in organizational and management practices that facilitate energy management improvements, or
- evaluating Evaluating cost savings per unit of product. Regular evaluation will inform changes to goals and action plans moving forward.

Regular evaluation will inform changes to goals and action plans moving forward.

Formatted: No bullets or numbering

Formatted: Normal, Indent: Left: 0.31", First line: 0.13"

#### b) List of Measures

CEI does not provide incentives to customers, but ultimately facilitates the customer's implementation of energy efficiency projects through statewide-incentive programs. However, depending on the outcome of the 2012 process evaluation, customer incentives may be offered.

Formatted: Underline

Formatted: Indent: Left: 0.13"

Formatted: Font: Bold

Formatted: Indent: Left: 0.13"

#### c) List Non-incentive Commercial Customer Services Energy Advisor Services

CEI is a non-resource program that provides comprehensive strategic energy planning and consulting services for commercial customers. These services include: energy management assessments, energy planning, baselining and benchmarking, project implementation support, customer recognition (e.g., "corporate sustainability awards"), and web-based energy resources.

Formatted: Font: Bold

## 5.) Program Rationale and Expected Outcome

#### a) Quantitative Baseline and Market Transformation Information

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Formatted: Font: Bold

Formatted: Indent: Left: 0.13"

See Attachment A for Table 3 – Refer to the overarching program for metrics

Market Transformation has not been a major focus of the California energy efficiency programs since the energy crisis. Consequently, relatively little attention has been given in recent years to identifying and gathering data on indicators of change towards market transformation. For some programs or sub-programs that promote a single end use or measure, there may be some data available for this purpose, probably from industry sources, that we have not yet identified. For many of the programs, however, this kind of long term, consistent, and expensive data collection has not been done in California.

The utility program planners have worked closely with their respective EM&V staffs and with each other to identify available information and propose potential metrics. Each utility and each program has some data available, but attempts to distill the limited available information into a common set of agreed upon metrics have proved far more difficult to accomplish. Offering metrics in which there is not confidence would not be productive. Therefore, the utilities respectfully exclude “draft” metrics at this time and instead suggest a means of developing meaningful indicators.

The utilities will develop meaningful baseline and market transformation concepts and metrics for programs that do not currently have them, and then propose to design and administer studies to gather and track consistent, reliable and valid baseline and market effects data. We would propose to use the program logic models and The California Evaluation Framework (2004) as guides, and to begin this work after approval of the Application, using funding provided for Evaluation, Measurement & Verification.

We expect that the baseline studies should (1) adequately describe the operation of markets that are targeted by a program, (2) confirm our tentative identification of measurable parameters that would indicate changes towards greater efficiency in the market(s) and that are likely to be affected by the program, and (3) gather the current values of those parameters, to serve as baselines against which future market movement can be tracked.

**b) Market Transformation Indicators (MTIs)**

By its nature, market transformation occurs as a result of numerous factors and programs, not single sub-programs. Therefore, all metrics and goals are proposed at the program level. Please refer to the quantitative baseline and market transformation discussion, presented in the overall program PIP.

Table 4 – Refer to the overarching program for market transformation metrics  
See Section 1a.5.a.

**c) Program Design to Overcome Barriers**

CEI is intended to address several market barriers that prevent wider adoption of energy efficiency practices. These barriers and the strategies to overcome them include:

Formatted: Indent: Left: 0.13", Hanging: 0.25"  
Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

Formatted: Font: Bold

- Lack of information – The CEI evaluation and modification process provides data that customers can use to reevaluate their commitment and/or modify their energy goals.
- Performance uncertainties – Through CEI’s comprehensive baselining and benchmarking assistance, customers will have access to real-time data that demonstrates how their facility is performing relative to their established goals.
- Organizational customs – The high-level customer commitment that is at the core of CEI increases the likelihood that corporate cultures that prevent successful implementation of comprehensive energy policies ~~will be changed.~~

**d) Quantitative Program Targets**

**Formatted:** Indent: Left: 0.38"

**Formatted:** Font: Bold

The targets provided herein are best estimates, but nonetheless are forecasts.

**Formatted:** Indent: Left: 0.13"

**Table 5**

<u>Program Name</u>	<u>Program Target by 2013</u>	<u>Program Target by 2014</u>
<u>Number of Engagements</u>	<u>TBD**</u>	<u>XTBD**</u>

**Formatted:** Indent: Left: 0.13"

**Formatted:** Font: Bold

**e) Advancing Strategic Plan goals and objectives**

**Formatted:** Indent: Left: 0.13"

The program will help to achieve the following near-term strategic goals as identified in the Commercial chapter of the Strategic Plan:

- 2-1: State/Local Governments and Major Corporations Commit to Achieve EE Targets

**Formatted:** Indent: Left: 0.31", Bulleted+ Level: 1 + Alignedat: 0.63" + Indentat: 0.88"

CEI seeks to (1) gain corporate level commitment to energy efficiency as a core business operation; (2) develop corporate energy policies that establish measurable goals; (3) develop a actionable plan to achieve these goals; (4) guide customers to IOU programs that can help implement cost-effective EE projects; and (5) provide a feedback loop to measure performance. This codified process is designed to support the significantly greater energy efficiency performance desired by the Strategic Plan.

- 2-2-2: Develop Tools to Reduce Energy in Commercial Buildings

**Formatted:** Indent: Left: 0.38"

As part of the implementation of CEI, the utilities will partner with energy industry peers, industry associations and Department Of Energy/CPUC sponsored labs and consultants, to enhance the use of existing tools, and develop new tools to assist commercial customers ~~reduce~~ initially ~~reduce~~ energy usage at their facilities, ~~and~~ then continue to operate their facilities in an efficient ~~and persistent~~ manner. Current tools used for benchmarking tools and resources include those developed by the EPA for ENERGY STAR and by Lawrence Berkeley National Lab (LBNL) with CEC funding:

**Formatted:** Indent: Left: 0.38", Tab stops: 0.69", Left

- o ENERGY STAR Portfolio Manager Commercial Benchmarking: Benchmarks customer facility against a national database of similar NAICS codes for an ENERGY STAR score (0-100), kBtu/sq ft-yr, lbs CO<sub>2</sub>/yr.

Formatted: Indent: Left: 0.5", Bulleted + Level: 1 + Aligned at: 1" + Tab after: 1.25" + Indent at: 1.25", Tab stops: 0.25", Left + 0.69", Left + Not at 1.25"

- o Management Standard for Energy SME2000-2008

- o LBNL Superior Energy Performance
- o DOE Superior Energy Performance
- o ISO-50001

- o 2-72-3: Develop Business Models to Deliver Energy Management Solutions—

CEI's fundamental purpose is to achieve corporate level commitments from commercial customers to change their existing business models to consider energy usage and sustainability as a core part of their daily operations. This level of commitment will help achieve greater penetration of energy efficiency in the commercial market sector.

## 6.) Program Implementation

### a) Statewide IOU Coordination

The Statewide IOU Coordination process will ensure continuous improvement and consistent implementation of all sub-programs. The discussion below will focus on how the IOUs will coordinate the CEI sub-program specifically. The Statewide IOU Coordination process for the CEI sub-program will be as follows:

- o Hold Regular Sub-program Manager Meetings – The CEI sub-program managers from each of the IOUs will meet on a regular basis. The sub-program managers will unify, to the extent possible, the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The sub-program managers will also discuss new innovations and develop solutions to overcoming implementation challenges.
- o Input to Program Sector Lead Meetings – The CEI sub-program managers will communicate to their Program Sector Leads the CEI sub-program innovations, experiences, and challenges that have the potential to impact multiple sub-programs or the Program as a whole. When a specific innovation or implementation policy has merit on a Statewide-level, the Sector Lead will distribute the information to the CEI sub-program managers by e-mail for adoption and integration.
- o Evaluate Program Enhancements – To complete the adaptive management loop, the CEI sub-program managers will track the success of the adopted Statewide enhancement or implementation policy and report any challenges or concerns at the monthly CEI sub-program meeting.

Formatted: Indent: Left: 0.25", Tab stops: 0.5", List tab + Not at 0.75"

By following the process stated above, the CEI sub-program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the 2013-2014 program cycle. Sub-program innovations and challenges will also feed productively

into the higher-level Program Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.

The coordination and unity of all program aspects will be handled through this statewide coordination framework. However, these aspects will start off at a high-level of statewide consistency. In some cases, there will be local IOU-specific deviations. Instances where certain IOUs favor a different approach than the other IOUs will be called out in italicized text.

**i. Program name:** Commercial Continuous Energy Improvement Program

**ii. Program delivery mechanisms**

As with other information and education sub-programs, CEI will be primarily delivered by IOU customer energy efficiency staff and contractors, service and sales representatives, website and marketing and outreach efforts. Other delivery channels may also be developed.

Where applicable, the Utility’s account representatives will support this activity within the statewide industrial sector, as well as third parties, government partnerships, and Utility local programs.

**iii. Incentive levels - N/A.** (CEI is a non-resource program).

**iv. Marketing and outreach plans, e.g. research, target audience, collateral, delivery mechanisms**

CEI will be available to all commercial customers meeting certain eligibility criteria to justify the cost of the offering. Criteria will include, but not be limited to, customer energy use, complexity, number of facilities, energy decision-making structure, and environmental commitment or demonstrated motivation. Collateral materials such as fact sheets, how-to documents, Power Point slides, case studies, etc., will be produced and distributed during sales calls, public events, association meetings, and/or trade shows. In addition, sponsoring and/or holding recognition events that present customers with awards for achieving specific levels of efficiency, sustainability and/or integration will be explored as a means to promote greater levels of participation.

**v. IOU program interactions with CEC, ARB, Air Quality Management Districts, local government programs, other government programs as applicable**

CEI will include the CEC’s Green Building Initiative program, DOE’s “ISO plant certification” programs, EPA EnergyStar Portfolio Manager benchmarking, EPA Building Performance with Energy Star and other programs, USGBC LEED certification, and local and other government incentive programs as applicable.

**vi. Similar IOU and POU programs**

Formatted: Indent: Left: 0.25", No bullets or numbering, Tab stops: 2", List tab

Formatted: Indent: Left: 0.38", Tab stops: 0.5", List tab + Not at 0.75"

Formatted: Indent: Left: 0.38", Tab stops: 0.5", List tab + Not at 0.75"

Formatted: Indent: Left: 0.44", Tab stops: 0.5", List tab + Not at 0.75"

Formatted: Indent: Left: 0.56", Tab stops: 0.94", List tab + Not at 0.75"

Formatted: Indent: Left: 0.44", Tab stops: 0.56", Left + 0.88", List tab + Not at 0.75"

Formatted: Indent: Left: 0.63"

Formatted: Indent: Left: 0.5", Tab stops: 0.63", List tab + Not at 0.75"

Over the next two years, the IOUs will seek to increase their interactions with the POUs as applicable to promote the CEI concept throughout the state. This may involve the creation of periodic California energy efficiency program summits that seek to increase awareness of the Strategic Plan and how programs could/should be designed to help meet its aggressive targets.

Formatted: Indent: Left: 0.63"

~~The Statewide IOU Coordination process will ensure continuous improvement and consistent implementation of all sub programs. The discussion below will focus on how the IOUs will coordinate the CEI sub program s pecifically. The Statewide IOU Coordination process for the CEI sub program will be as follows:~~

Formatted: Indent: Left: 0.38"

Formatted: Font: Bold

- ~~○ Hold Regular sub Program Manager Meetings—The CEI sub program managers from each of the IOUs will meet on a regular basis. The sub program managers will unify, to the extent possible, the implementation of program aspects such as program name, program delivery mechanisms, incentive levels, marketing and outreach plans, and IOU program interactions. The sub program managers will also discuss new innovations and develop solutions to overcoming implementation challenges.~~
- ~~○ Input to Program Sector Lead Meetings—The CEI sub program managers will communicate to their Program Sector Leads the CEI sub program innovations, experiences, and challenges that have the potential to impact multiple sub programs or the Program as a whole. A specific innovation or implementation policy has merit on a statewide level, the Sector Lead will distribute the information to the CEI sub program managers by email for adoption and integration.~~
- ~~○ Evaluate Program Enhancements—To complete the adaptive management loop, the CEI sub program managers will track the success of the adopted statewide enhancement or implementation policy and report any challenges or concerns at the monthly CEI sub program meeting.~~

Formatted: Indent: Left: 0.63", Bulleted + Level: 1 + A linedat: 0.5" + Tab after: 0.75" + Indentat: 0.75", Tab stops: 1", List tab + Notat 0.75"

Formatted: Indent: Left: 0.88", Bulleted + Level: 2 + A linedat: 1" + Tab after: 1.25" + Indentat: 1.25"

Formatted: Indent: Left: 0.38"

~~By following the process stated above, the CEI sub program managers will play a critical role in ensuring unified implementation on a statewide level over the course of the three year implementation cycle. Sub program innovations and challenges will also feed productively into the higher level Program Steering Committee process, where the IOU lead will act as participant and conduit between both statewide coordination systems.~~

~~The coordination and unity of all program aspects, such as program name, program delivery mechanisms, marketing and outreach plans, and IOU program interactions, will be handled through this statewide coordination framework. However, these aspects will start off at a high level of statewide consistency. In some cases, there will be local IOU specific deviations. Such instances where certain IOUs favor a different approach than the other IOUs will be called out in italicized text.~~

b) **Program delivery and coordination**

CEI includes the following coordination efforts:

i. **Emerging Technologies (ET) program**

CEI implementation will include identification and project development at specific customer sites with potential for Emerging Technologies program participation and demonstrations. CEI implementation shall include identification and project development at specific customer sites with potential for Emerging Technologies program participation, demonstrations and incentives.

ii. **Codes and Standards program**

CEI implementation ~~shall~~will include information about pending new Codes and Standards program that may affect planning or prioritization of retrofit or new construction projects.

iii. **WE&T efforts**

CEI implementation will integrate with WE&T efforts by providing CEI process, lessons learned, and case study input to energy engineering curriculum designers for community colleges and universities. This activity will be coordinated through the Statewide WE&T program team and will ultimately be integrated into the web portal that team is now developing. IOUs will assess and support specialized WE&T training to help target working energy management professionals, industry professionals, and those pursuing education in universities and colleges.
