Appendix B

CIRCULATION ELEMENT – COMMUNITY INPUT

This appendix summarizes input received from community outreach programs, most notably the Ventura Vision and the Comprehensive Plan Advisory Committee work. It is intended to acknowledge comments received from those work efforts and to document their role in formulating the Circulation Element recommendations.

VENTURA VISION

In 1999 and 2000 a comprehensive outreach program was carried out guided by a broad based Citizens Outreach Committee. That effort culminated in the “Ventura Vision, Seize the Future” document of March 2000. This vision document articulated a shared vision to guide the community in the future, including guiding principles, vision statements, and strategies for pursuing those visions. With respect to circulation, the following statement of high-priority strategies was noted:

***Our Accessible Community.** Develop a balanced transportation system by encouraging land use modifications and “transportation systems management” to reduce traffic congestion; upgrading road maintenance, improving and diversifying local transit systems; promoting a regional rail strategy; enhancing parking through better use of existing structures and new structures at strategic locations; facilitating bicycle and pedestrian access through an interconnected system of bike and walking paths; and exploring ways to improve the community’s access to air transportation.*

As embodied in this statement and as outlined in the section entitled “Our Accessible Community,” the vision identified its central goal as seeking an integrated multi-modal transportation system in which bus, rail, bicycle and pedestrian modes can reduce dependency on the automobile for transportation. The overall goal of the Circulation Element articulates this vision as do specific objectives such as listed in the transit, bicycle and pedestrian components of the Element. In addition, implementing strategies from the Vision document have been directly or indirectly incorporated into the Element in the form of specific programs.

COMPREHENSIVE PLAN ADVISORY COMMITTEE (CPAC)

A special Comprehensive Plan Advisory Committee (CPAC) met over a number of months in early 2002 to provide input to the Comprehensive Plan update process. This committee provided a forum to address Comprehensive Plan issues and to thereby supplement the results of the major community outreach program described above.

The meeting in which Circulation was the main topic was held on March 13, 2002, and numerous comments were received from CPAC members and from public attendees at that meeting. The comments were grouped into four topics, 1) arterial street, 2) public transit, 3) bikeways and 4) pedestrians. The first three of these are addressed here, and the fourth is discussed under separate cover. For each subject area, the comments are listed and the actions taken with respect to those comments noted. In some cases the comments pertain to a specific traffic issue that would not be within the purview of the General Plan, but is nevertheless an important concern with respect to circulation. These have been compiled so that the information can be forwarded to the appropriate department within the City. Most comments provided valuable input to the Circulation Element preparation process and were an important consideration in the development of the Circulation Element. The following sections discuss the three topic areas.

ARTERIAL STREETS

The CPAC and public comments on arterial streets are summarized in Table B-1. Discussion on specific subject areas follows.

Customized Street Classification (Comments S1.1, S1.4, S1.6, S1.12, S1.13, S1.15, S2.6, S2.7, S2.8)

The potential for customizing street classifications in the Circulation Element was presented at the March 13 meeting. The comments received indicate a general interest in adopting this approach and the arterial street component of Circulation Element has been prepared accordingly. The previous chapter of this report discussed design classifications and functional classifications, the latter addressing the customizing of the classification system for arterial streets.

Table B-1
 ARTERIAL STREETS
 CPAC and Public Comments – March 13, 2002

COMMENT	ACTION*
S1 – CPAC COMMENTS	
S1.1 Do not widen Ventura Avenue, custom approach needed	CE
S1.2 Connect Cameron	CE(D)
S1.3 Need traffic signals on the Avenue	N&F
S1.4 Custom approach needed to extend Olive north of Stanley to Sycamore Village	CE
S1.5 Solve the north/south traffic for future development	CE(D)
S1.6 Apply “custom approach” citywide	CE
S1.7 Hwy 101 / Harbor; Northbound Hwy 101 off-ramp / road to Channel Drive/ Borchard	CE
S1.8 Roundabout at Main and Mills	CE(D)
S1.9 Extend Mills south along Arundell Barranca to Harbor Blvd.	CE(D)
S1.10 State Route 126 westbound to Hwy 101 southbound	N&F
S1.11 Poli, from North Pacific to North Victoria, should be 1) reconstruct to 2 lanes 2) Remove side parking 3) slow to 30 mph 4) install bike / pedestrian side lanes 5) calm traffic 6) move traffic to Loma Vista	CE(D)
S1.12 Need custom approach along Main and Thompson	CE
S1.13 Needs to be pedestrian friendly along Main and Thompson and where Main and Thompson meet Telegraph	CE
S1.14 Extend Arundell to Schooner Drive	CE(D)
S1.15 Special treatment to Foothill Road	CE(D)
S1.16 Extend Johnson Drive north to Foothill Road	CE(D)
S1.17 Extend Kimball south across Santa Clara River to Oxnard	CE(D)
S1.18 Extend south Johnson Drive eastbound along Santa Clara River and then north to Bristol Road	CE(D)
S1.19 Provide roadway from Bristol across Santa Clara River into Oxnard	CE(D)
S1.20 Extend Loma Vista at Petit all the way to Amador	CE(D)
S1.21 Extend Balboa at Newport all the way to Wells	CE(D)
S1.22 Extend North Bank Drive northeast to Bristol Road	
S2 – PUBLIC COMMENTS	
S2.1 Stanley to 33 onramp needs to be improved – very dangerous	N&F
S2.2 Extend Olive north to connect with Ventura Avenue north of Stanley.	CE
S2.3 Need traffic calming on Olive esp. near the Boys & Girls Club.	CE
S2.4 Connect the 2 parts of Cameron.	CE(D)

Table B-1 (cont)
 ARTERIAL STREETS
 CPAC and Public Comments – March 13, 2002

COMMENT	ACTION*
S2 – PUBLIC COMMENTS (cont)	
S2.5 Need additional traffic signals on Ventura Avenue especially south of Stanley.	N&F
S2.6 Customize Main though Midtown – similar to Downtown – with wide sidewalks and pedestrian amenities	CE(D)
S2.7 Customize 5 points as Midtown entry	CE(D)
S2.8 As stated in plan, retain “county” character of Foothill Road. Retain 2 lanes, enhance with bike path, and lower speed limit. No additional traffic can be accommodated.	CE(D)
S2.9 Recognize that Foothill carries substantial traffic, which will increase – 4 lanes needed.	CE(D)
S2.10 Foothill Road cannot take additional traffic from Hall Canyon, Barlow Canyon, and Sexton Canyon as proposed by Lloyd Corp. and Mariano Rancho.	CE(D)
S2.11 Traffic calming speed bumps or more stop signs on through streets between Foothill and Loma Vista, esp. Sexton Hall, Dorothy, and Agnus.	CE
S2.12 Callens onto East Main – takes much time to get out driveway onto Main traffic.	N&F
S2.13 Poli Street and Foothill Road cannot be widened. It is an old route to Santa Paula – It can’t take much more traffic	CE
S2.14 Is there a road planned for access to the Lloyd Properties on the other side of the hills, north side, and running east to west?	N&F
S2.15 Anticipate potential future development of agricultural parcels north of Highway 126 – identify future extension of Johnson Drive across freeway north through agricultural parcels.	CE
S2.16 Anticipate potential future development of agricultural parcels in inner city greenbelt – easterly extension of Balboa Street and Loma Vista Road.	CE
S2.17 Anticipate potential future development of inner city greenbelt parcels by identifying future extension of roadways through agricultural properties such as Kimball, Ralston, and any other streets. Identify need for specific plan to establish possible road design standards, location of roads, etc. City needs to investigate economic feasibility of extending Kimball south to Oxnard – identify whether this will occur in general plan time frame.	CE
S2.18 Mills Road should be put through to Foothill	CE
S2.19 Safer intersections downtown	N&F
* Actions taken are as follows:	
N&F	Comment not directly applicable to the Circulation Element but has been noted and forwarded to the appropriate City Department
CE	Comment is being addressed in the Circulation Element Update
CE(D)	Comment is being addressed in the Circulation Element Update and is discussed here in the text

New Roadways (Comments S1.2, S1.9, S1.14, S1.16, S1.17, S1.18, S1.19, S1.20, S1.21, S1.22, S2.15, S2.16, S2.18)

There are a number of new roadways on the current Circulation Element and these are being evaluated as part of preparing the Circulation Element update. Those being indicated in the comments as potentially desirable are as follows:

Southward extension of Mills across US-101

Extension of Arundell to Schooner Drive

Extension of Johnson Drive north to Foothill Road

Extension of Johnson Drive eastward along the Santa Clara River to connect to Bristol

Extension of Loma Vista at Petit to Armador

Extension of Balboa at Newport to Wells

An additional comment (S2.4) suggested connecting the two parts of Cameron. At the present time, Cameron is not on the Circulation Element and hence unless it was to be added to the Element such an extension would be a local subdivision issue rather than a Comp Plan issue. While an extension could help provide north/south capacity parallel to Ventura Avenue, there are issues involved such as bisecting an existing park and residential neighborhood. Without an assessment of feasibility, it is not recommended at this time that Cameron be added to the Circulation Element.

Additional Crossing(s) of the Santa Clara River (Comments S1.19, S2.17)

The question of an additional crossing of the Santa Clara River east of US-101 is currently being addressed in a joint study by the County of Ventura, the City of Ventura and the City of Oxnard. Since the location and sizing of one or more bridges affects all three entities, that cooperative study will evaluate a number of alternatives and the potential impacts/benefits to the communities involved. It is anticipated that this Comprehensive Plan process will have the benefits of the results of that study and thereby be able to incorporate recommendations into the Circulation Element update.

Foothill Road (Comments S2.8, S2.9, S2.10, S2.13)

While one of the public comments (S2.9) appears to contradict the others by suggesting a four-lane road should be built, the general consensus is that Foothill Road has a special character and should

remain at two lanes (as articulated in the Vision Plan). One of the purposes of devising customized functional classifications is to address this special roadway and its needs and limitations. Special functional classifications are aimed at preserving or attaining a desirable character while providing adequate carrying capacity for the forecast traffic volumes. Discussions on this can be found in the traffic forecasting results (Chapter 3.0) and in the development of functional classifications (Chapter 4.0).

Roundabouts (Comment S1.8)

The comment suggests a roundabout at Main and Mills, presumably to address the high traffic volume at this location. Unfortunately, a roundabout to accommodate this volume would require considerable right-of-way and not necessarily be more effective than a signalized intersection. At the same time, the comment introduces the concept of roundabouts as a traffic control device for deployment in the City. Roundabouts have been used in various locations in the United States, including some locations with relatively high traffic volumes. The greater use, however, has been as traffic calming devices and as a means of creating a more local character to a street (compared to traffic signal control at an intersection). The suggestion here is that roundabout intersections be considered as part of the toolbox for the traffic calming measures and if found desirable, could be deployed accordingly.

PUBLIC TRANSIT

The CPAC and public comments on Transit are summarized in Table B-2. The following discussion addresses specific subject areas.

Train Depot/Transit Centers (Comments T1.3, T1.4, T1.5, T1.9, T2.6, T2.10)

These comments reflect an awareness of the role that transit stations/centers can have in promoting transit use. Policies and programs plus the associated discussion in the Circulation Element respond to these, and emphasize its importance. Since the City has a greater degree of control over providing such amenities (compared to train and bus routing and scheduling) it represents an appropriate directive to pursue such facilities through a variety of actions, both public and private.

Table B-2
PUBLIC TRANSIT
CPAC and Public Comments – March 13, 2002

COMMENT	ACTION*
T1 – CPAC COMMENTS	
T1.1 Public transit should focus on transit dependent areas	N&F
T1.2 Smaller buses could be used during off peak hours	N&F
T1.3 The depot should be in the Front Street area between Kalorama and Laurel.	CE(D)
T1.4 The depot should be located at Front Street at Figueroa	CE(D)
T1.5 Put a transit center at Pacific View mall on Telegraph	CE(D)
T1.6 Seniors need a way to get to the center of the mall.	CE(D)
T1.7 Pedestrian access to transit is problematic at Victoria and Telephone	N&F
T1.8 Improve public transit, bus stops, facilities in the Westside	CE
T1.9 Metrolink Station at Los Angeles Avenue and Azahar.	CE(D)
T1.10 Kneeling busses need to be routed to senior apartments and complexes and large senior housing areas	CE
T1.11 Priority should not be given to ADA over seniors.	--
T1.12 Subsidize seniors' taxicab CHITS	N&F
T2 – PUBLIC COMMENTS	
T2.1 Use smaller buses which use non-polluting fuel	N&F
T2.2 North-south connections to SCAT east-west routes	N&F
T2.3 More public transit in small buses that neighborhoods	N&F
T2.4 Slow traffic, narrow roads, use transit	--
T2.5 Mass transit with bike, surfboards, skateboard storage	N&F
T2.6 Bus stops need to be upgraded. Middle class people with transit options don't want to sit on dirty benches in the sun or rain. Bike racks on buses are very good. We need a multi-modal transit center downtown.	CE(D)
T2.7 Trolley transit route from downtown through midtown to mall to Harbor back by beach to downtown runs every 30 minutes.	--
T2.8 Publicly subsidized mass transit	--
T2.9 School only through 6 th	--
T2.10 Transportation (bus service) should be available to the train station	N&F
* Actions taken are as follows:

CE	Comment is being addressed in the Circulation Element Update
CE(D)	Comment is being addressed in the Circulation Element Update and is discussed here in the text

BIKEWAYS

The CPAC and public comments on bikeways are summarized in Table B`-3. Discussion on specific areas of interest or concern follows:

Additions or Modifications to Bikeway System (Comments B1.1, B1.2, B1.3, B1.6, B1.7, B1.8, B2.4, B2.5, B2.6, B2.7, B2.12)

The comments include a number of suggestions for modifying and/or expanding the General Bikeway Plan. Such suggestions need to be considered in the next update process for that plan and included if appropriate.

One of the key roles of the Circulation Element is to ensure compatibility between the bikeway plan and the Functional Classifications of the roadways used by the designated bike routes or trails. All functional classifications have the ability to provide a Class II bike lane provided the right-of-way is in accordance with the design classification. In some cases, the functional classification supports the potential inclusion of a Class I bike path in the standard cross-section (e.g., the Two-Lane Boulevard). The intent is to provide as much flexibility as possible in enhancing and expanding the Citywide bikeway system.

Table B-3
GENERAL BIKEWAY PLAN
CPAC and Public Comments – March 13, 2002

COMMENT	ACTION*
B1 – CPAC COMMENTS	
B1.1 Connection from Vista Del Mar to Thompson	CE(D)
B1.2 Close road (Brakey Road) to traffic and make it pedestrian and bike only	CE(D)
B1.3 Bike path along Olive (Westside)	CE(D)
B1.4 Improved bike and pedestrian path to get from Mills (the mall) to lower Main Street	CE
B1.5 Improved access to existing bike trail along Ventura River from residential areas along Olive and north of Stanley (i.e., Sycamore Village)	CE
B1.6 Bikeway extension from Cedar to Dakota.	CE(D)
B1.7 Harbor to Ondulondo/Clearpoint – pedestrian / bikeway barrancas	CE(D)
B1.8 Extend bike path from Barranca from Bristol to Park	CE(D)
B1.9 Extend bike path in traffic lane all the way through the curve (on Johnson)	N&F
B1.10 More segregated trails	CE
B1.11 Slow down traffic along Foothill so that cars and bikes may coexist.	CE
B1.12 More police funding. Do you want a bike path along your backyard? Just a thought. We need police on all new bike paths. Policing needed for increased crime	--
B1.13 Create and facilitate cross-city bike routes for specific transportation objectives as in Santa Barbara.	CE
B1.14 Make Foothill 2 lanes with bike path adjacent to road on south side (slow Foothill traffic to 30 mph)	CE
B1.15 Policy: All upgrades to arterials shall include a bikeway	CE
B1.16 Coordinate with county and other cities/communities to hire a bike consultant with input on all road projects (someone like Wilson Hubbell)	--
B1.17 Need through traffic bike lanes at intersections – this is a problem throughout the City of Ventura.	N&F
B1.18 Right turn and west from Harbor to Seaward needs improvement from danger of traffic turning on to freeway (similar problems in other areas in town).	N&F
B2 – PUBLIC COMMENTS	
B2.1 Class II bike trail along Ventura Avenue	CE
B2.2 Better access to bike path from the community located north of Stanley and east of Ventura Avenue (i.e. Sycamore Village)	CE
B2.3 Need safer and easier connection between Ventura River Trail and Omer Rains path	CE
B2.4 Seaward should eliminate parking and have bike lanes instead	CE(D)
B2.5 Bikeway extension off Cedar Street (north to Dakota?)	CE(D)
B2.6 Eliminate parking on Poli in favor of bike lanes	CE(D)

Table B-3 (cont)
 GENERAL BIKEWAY PLAN
 CPAC and Public Comments – March 13, 2002

COMMENT ACTION*

B2 – PUBLIC COMMENTS (cont)

B2.7	Need a bike and/or pedestrian link from Marina Park to the Harbor	CE(D)
B2.8	Connections	CE
B2.9	Policy suggestion – All arterials should provide for a bike path whenever a road is re-striped or re-paved.	CE
B2.10	Biketrails on Foothill Road	CE
B2.11	Real bike lanes on Victoria; slow traffic get rid of sidewalk bike lane	CE
B2.12	Bike trails or pedestrian trails along Barrancas	CE(D)
B2.13	More bikeways to get across town not just recreational trails – use bike as transportation mode.	CE
B2.14	We need education to change perception of bicycling – share the road concept – bicycling is viable transportation mode	CE
B2.15	Foothill Road should not be made 4 lanes. It should remain 2 lanes with bike and pedestrian paths and left hand turn bays.	CE
B2.16	Consider bikeways to connect communities where there are no streets – i.e. bikeways out of closed off developments	CE

Appendix F

2004 Biennial Water Supply Report

2004 Biennial Water Supply Report

I. Executive Summary

This report is submitted in compliance with the City Council adopted 1994 Comprehensive Water Resources Management Plan (CWRMP). The CWRMP consists of a compilation of water supply policy statements to provide guidance related to the City's future water supply and demand. The intent of the plan is to ensure the City's ability to provide its customers with adequate water that meets regulatory water quality standards.

A water supply monitoring requirement is included in the CWRMP. This requirement calls for an annual review of critical water supply conditions and a biennial report to the Council for certification in the Fall of even numbered years. The purpose of the Biennial Water Supply Report is to certify that the City's existing water supply and planned improvements are sufficient to satisfy our needs for at least the next ten years and provide advance warning if a supplemental water supply is needed. The ten-year planning horizon represents the time needed to develop a supplemental water supply.

This 2004 Biennial Water Supply Report finds that the City's future water supply and planned improvements are sufficient to satisfy the City's water needs beyond this 10-year planning horizon.

The report includes projections of the City's future water supply and demands. The current and projected water supplies used in the report include: (1) production from the Ventura River, (2) supply from Lake Casitas, (3) production from the Mound Groundwater Basin, (4) pumping allocations in the Oxnard Plain Groundwater Basin, (5) pumping allocations in the Santa Paula Groundwater Basin and (6) future Saticoy County Yard Well. The water demand figures used were determined from historical water consumption figures, anticipated water consumption trends and the estimated population growth for the water service area.

The report also summarizes the capital improvement projects planned for the next five years. These planned improvements increase the City's ability to utilize existing water resources. The planned projects will improve the quantity and quality of the City's existing supplies and provide the system flexibility necessary for the City to support demands during a drought period when the need arises.

In addition to a biennial water supply report, staff annually reviews the health of the City's water supplies. Potential impacts to the water supply, which include the condition of our facilities, agreements with other agencies and weather conditions, are tracked. By tracking these effects potential impacts can be identified before they occur. At this time the City's water supplies are healthy. It is concluded that with planned capital improvements there is sufficient water supply to satisfy the City's water demands for at least the next ten years. In two years when the next Biennial Water Supply Report is prepared, conditions will be reassessed and water supply and demand projections updated.

II. Current and Projected Water Supply

There are presently five water sources that provide water to the City water system:

1. Ventura River surface and subsurface water intakes and four shallow wells (Foster Park)
2. Casitas Municipal Water District (Casitas)
3. Mound Groundwater Basin
4. Oxnard Plain Groundwater Basin (Fox Canyon Aquifer)
5. Santa Paula Groundwater Basin

The City has acquired a sixth source, a well located on the Santa Clara River east of Highway 118 (Wells Road). This location is not within either the Santa Paula Groundwater Basin or the Fox Canyon Aquifer. The well is complete and has been tested for production capacity and water quality. Capacity tests indicate the production from this well will be at least 2,500 gallons per minute (gpm). Pumping and control systems will be complete by mid-year 2005 and connecting pipelines to the Saticoy Conditioning Facility will be complete near the beginning of 2006.

The City also holds a State Water Project (SWP) entitlement of 10,000 acre-feet per year (AFY). To date, the City has not received delivery of its allotment, and it is not certain if or when facilities will be constructed to transport SWP water to the City. In 1998 the City became a signatory to the SWP Monterey Amendment. The amendment would allow the City, with other contractors, to sell surplus water back to the state, however litigation has prevented the terms of the amendment from being fully acted upon.

The City manages its water resources conjunctively. Conjunctive use is the practice of first utilizing surface supplies (which are lost to the ocean if not used when they are available), before groundwater supplies (which can be stored for use when the surface supplies are not plentiful). Groundwater is used to provide for seasonal demands and as a source during drought periods. Therefore, the City will generally utilize its water supplies in the following order: Ventura River, Lake Casitas, and groundwater basins.

In addition, the City provides reclaimed water from the Ventura Wastewater Reclamation Facility to two municipal golf courses, the Ventura Marina area and private customers for landscape irrigation.

1. Ventura River

Surface water from the Ventura River is diverted through the City's Foster Park Facilities. The surface diversion, subsurface intake, and four shallow wells within the Ventura River collect water. Production from this source is a function of several factors including production capacity, local hydrology, environmental impacts, and the storage capacity of the Ventura River alluvium and upstream diversions. Currently, our surface diversion is unused due to the natural migration of the active river channel. Foster Park improvements, now in design, will replace production from our surface diversion with

additional wells. Even without production from the surface diversion, the City produced 6,722 AF from Foster Park in 2003, a year of below average rainfall.

The production from the Ventura River in 1992 was 9,874 AF, the highest annual water volume ever produced. The lowest production was 1,463 AF in the 1951 drought year. The Ventura River water source is highly variable and very dependent upon local hydrology. The CWRMP states the yearly yield is between 700 and 11,000 AF per year. For this report the average long-term water production of 6,700 AFY will be used, and is based on the Evaluation of Long Term Alternative Water Sources, James M. Montgomery, June 1993.

2. Casitas Municipal Water District (Casitas)

The western portion of the City is within the Casitas service area. Approximately 32 percent of the City's water accounts are located within the Casitas service area. Use of Casitas water is restricted to the volume of water used within its boundaries. The "safe yield" of Lake Casitas is defined to be the amount of water that can be removed from the lake each year without excessive risk that the lake will become dry. The safe yield of Lake Casitas is currently estimated to be 21,920 AFY, based on the critical historical dry period from 1944 to 1965. Studies by Casitas' engineering department have shown that this period represents the most critical dry spell for the Lake's watershed of all the years for which historical data is available.

To maintain future operation of Lake Casitas at safe yield, Casitas established an allocation program for its customers in 1992. The City's allocation can be as high as the in-district demand for Stage 1 (wet or average year), or reduced to 7,090 AFY for Stage 2 (dry conditions) and further incrementally reduced (Stages 3 and 4) to 4,960 AFY for Stage 5 (extremely dry conditions). Stage 2 is initiated when Lake Casitas storage drops below 95,000 AF and Stage 5 is initiated when levels drop below 65,000 AF. The lower allocation remains in effect until the storage is recovered to 90,000 AF. Total lake storage is approximately 254,000 AF. Lake Casitas storage as of August 2004 was 168,397 AF.

In July 1995 the City signed an agreement with Casitas, which established the City's minimum purchase at 6,000 AFY. The terms of the agreement are subject to the allocation program described above during drought periods. For this report the projected water supply available from Casitas is anticipated to average 8,000 AFY, the projected in-district demand.

3. Mound Basin

Two wells supply water from the Mound Groundwater Basin (Victoria Well No. 2 and Mound Well No. 1). Construction of Mound Well No. 1 was completed in 2003.

In March 1996 the City completed a project that included: 1) constructing Mound Basin

monitoring wells at Camino Real Park and Marina Park; 2) developing a database from historical records, and 3) identifying potential surpluses within the basin. This work was performed in conjunction with the United Water Conservation District. The report compiled as part of that project indicated that historical data supports a basin yield of at least 8,000 AFY during drought conditions as long as pumpage is reduced during wet years to allow water levels to recover. It is anticipated that the basin will be able to sustain a higher yield (at least 10,000 AF during drought periods), provided that future wells are located so as not to adversely impact the existing Mound Basin Wells. Future annual reports will further assess the operational yield of the basin.

For this report the future water supply from the Mound Basin is assumed to be 4,200 AFY based on 75 percent of the current pumping capacity of 5,600 AFY.

4. Oxnard Plain Groundwater Basin

Wells near the Buenaventura Golf Course have drawn from the Oxnard Plain Groundwater Basin since 1961. Additional wells have been constructed over the years with the most recent being completed in 1991. Currently, three wells produce potable water for the City's system. These wells pump from the Fox Canyon aquifer of the Oxnard Plain Groundwater Basin. Average annual yield from the Golf Course Wells over the past 15 years has been about 3,200 AFY.

The Fox Canyon Groundwater Management Agency (GMA) was created by state legislation in 1982 to manage local groundwater resources in a manner to reduce overdraft of the Oxnard Plain and stop seawater intrusion. A major goal of the GMA is to regulate and reduce future extractions of groundwater from the Oxnard aquifers, in order to operate the basin at a safe yield. In August 1990, the GMA passed Ordinance No. 5, which requires existing municipal groundwater users to reduce their extractions by five percent every five years until a 25 percent reduction is reached by the year 2010.

The City's baseline allocation was set by the GMA at 5,459 AFY, which was the average extraction from the Golf Course Wells for the period of 1985 to 1989. Beginning in 1992, baseline extractions set by the GMA were reduced by 5% to 5,186 AFY, in 1995 it was reduced to 4,913 AFY, and further in 2000 to its current allocation of 4,640. This allocation will further be reduced as follows:

<u>Years</u>	<u>Amount (AFY)</u>
2006	4,367
2010	4,094

Following wet weather conditions, water levels in the City's groundwater basins rise significantly. Conjunctive use strategies and customer water conservation have allowed the City to store 33,193 AF in the GMA bank as of the end of calendar year 2003. This storage bank makes it possible for the City to implement operational procedures that will allow the use of its groundwater supplies up to safe yield levels, and to use its

banked groundwater as an additional supply during future drought conditions. If the City were to use its banked water, it is estimated that the City could extract as much as 5,500 AFY based on 75% of the current pumping capacity of 7,300 AFY. However for this report, future supply is conservatively based on GMA restricted extraction limits listed in the preceding paragraph.

5. Santa Paula Groundwater Basin

The Saticoy Water System acquired by the City in 1968 included Saticoy Well No. 1, which draws water from the Santa Paula Basin. Due to casing failure, the well was destroyed and replaced in 1991 with a new well designated as Saticoy Well No. 2 in the same general location. Pumping capacity within the Santa Paula Basin is currently only 2,200 AFY based on 75% of the current pumping capacity of 2,900 AFY. With the addition of Saticoy Well 3 (completion anticipated 2006) to be located east of Highway 118 (Wells Road) we anticipate increasing pumping capacity in the basin to 6,400 AFY.

In March 1996, the City ended a five-year stalemate over the future use of the Santa Paula Basin. Under an agreement with the United Water Conservation District and the Santa Paula Pumpers Association (an association of ranchers and businesses), the City can pump on average 3,000 AFY from the Santa Paula Basin. The City is not limited to this allocation in any single year, but may produce seven times its average annual allocation (21,000 AF) over any running seven-year period. In addition, the City may pump an additional 3,000 AFY in case of an emergency resulting from a long-term drought situation. Therefore, for the purposes of this report, the future annual production from the Santa Paula Basin is estimated to be 3,000 AFY.

6. Saticoy Yard Well

The County of Ventura has relocated their maintenance yard to a site within the Saticoy Community contiguous to the City's water service area. In exchange for extraterritorial water service, the County has provided the City a well to offset their water demand. The well is expected to provide not only production capacity for serving the maintenance yard, but also significant additional system capacity. The Saticoy Yard Well is anticipated to begin production in 2006, with an estimated 75 percent of design production capacity of 2,262 AFY. The water demand for the maintenance yard is estimated to be 20 AFY.

III. Water Supply Summary

The following Table 1 summarizes the historical deliveries from each of the above sources, as well as projected deliveries to the year 2014. Projected figures are based on the water supply available from each source, and do not necessarily represent amounts currently produced.

Table 1: Historic and Projected Water Source Production and Supply Availability (acre-feet)

Year	Surface Water		Ground Water				Total Water Supply (7)
	Ventura River (1)	Lake Casitas (2)	Mound Basin (3)	Oxnard Plain Basin (4)	Santa Paula Basin (5)	Saticoy Yard Well (6)	
Historic Production							
1980	7,276	7,544	0	5,198	2,129		22,147
1985	5,493	9,099	2,360	6,172	46		23,170
1990	2,859	6,175	4,365	5,749	0		19,148
1995	9,042	1,622	2,169	2,603	2,594		18,030
1996	7,926	4,456	2,789	2,768	1,599		19,538
1997	7,052	7,089	213	3,452	2,025		19,831
1998	8,069	4,328	802	4,312	1,033		18,544
1999	6,419	7,061	3,955	1,621	1,669		20,725
2000	6,779	5,836	4,579	2,674	1,698		21,566
2001	5,727	6,292	4,030	905	2006		18,960
2002	5,951	7,127	3,720	1,978	1,157		19,933
2003	6,722	4,874	5,546	2,898	316		20,356
Projected Supply							
2004	6,700	8,000	4,200	4,600	3,000	0	26,500
2009	6,700	8,000	4,200	4,400	3,000	2,262	28,562
2014	6,700	8,000	4,200	4,100	3,000	2,262	28,262

Notes:

1. Ventura River future supply is the average long-term production based on analysis of the period from 1939 to 1982 per the Evaluation of Long Term Alternative Water Sources, James M. Montgomery, June 1993.
2. Includes the City's total past Casitas purchases in addition to raw water and oil recovery users; projected supply is the City's current in-district use.
3. Mound Basin future supplies are 75 percent of well pump rated output.
4. Oxnard Plain Basin future supply is based on GMA restricted extraction limits rounded to nearest 100 AF.
5. Santa Paula Basin future supply is the pumping allocation of the Stipulated Judgement.
6. Saticoy Yard Well future supply is 75 percent of design maximum pump output capacity.
7. Includes treated and raw water; excludes reclaimed water supply.

IV. Historic and Projected Water Demand

A. Historic Water Demand

Water consumption within the City (excluding raw water/oil company use) has decreased in recent years as shown by the per capita use figures in Table 2. The annual per capita usage from 1940 to 1970 averaged about 0.31 acre-feet per person (AF/capita). In the period 1976-1989 (pre-mandatory water conservation), the annual per capita use averaged about 0.22 AF/capita. In the period 1994-2003 (post mandatory water conservation), the per capita figure dropped to an average of 0.182 AF/capita. This decrease in per capita consumption is the result of structural improvements such as low flow fixtures and low water consuming appliances in some existing and all new housing and an active water conservation program adopted by the City in 1975 and further strengthened with mandatory regulations in 1990. Mandatory regulations were lifted in 1993, however water conservation efforts remain very effective.

Table 2: Historic Water Production and Population

Year	Total Prod. (AF) (1)	Raw Water Use (AF) (2)	Treated Water Use (AF) (3)	Est. Pop. Served by Water System (4)	Per Capita Use (AFY) (5)	Annual Rainfall (in.) (6)
1940	4,240	0	4,240	13,264	0.320	12.54
1950	5,307	0	5,307	16,534	0.321	13.34
1960	8,832	0	8,832	29,114	0.303	12.08
1970	21,524	4,473	17,051	57,964	0.294	13.92
1980	22,147	4,766	17,381	73,774	0.236	24.78
1990	19,148	2,317	16,831	94,856	0.177	5.53
1991	14,660	2,077	12,583	94,913	0.133	17.01
1992	16,469	1,625	14,846	95,626	0.155	20.91
1993	17,459	2,010	15,449	96,540	0.160	28.21
1994	18,980	2,000	16,980	97,154	0.175	11.47
1995	18,030	1,602	16,428	99,668	0.165	34.52
1996	19,538	1,500	18,038	100,482	0.180	13.81
1997	19,831	1,829	18,002	101,096	0.178	16.02
1998	18,544	1,769	16,775	101,610	0.165	43.25
1999	20,725	1,067	19,657	102,224	0.192	10.56
2000	21,566	1,129	20,481	103,238	0.198	17.04
2001	18,960	889	18,071	104,153	0.173	23.22
2002	19,933	968	18,965	105,267	0.180	7.24
2003	20,356	846	19,510	106,782	0.182	20.06
Average	1940-70				0.31	
Average	1976-89	Pre-Mandatory Water Conservation)			0.22	
Average	1994-2003	Post-Mandatory Water Conservation			0.179	

Notes for Table 2:

1. Total production includes all water produced by the City and purchased from the Casitas Municipal Water District, including raw water and oil recovery use.
2. Raw water use includes oil and raw water users.
3. Treated water use is total production less raw water use.
4. Population figures provided by City of Ventura Community Development Department and California Department of Finance. Estimated population served by water system for 1990-date includes areas outside of city limits served by the City.
5. Per capita use excludes raw water and oil use (treated water use ÷ population).
6. Annual rainfall is the average of measured precipitation for the water year (October 1st through September 30th) for four rain gauge stations throughout the City (Stations #66, #122, #167, and #222) as provided by the Ventura County Flood Control District.

B. Population Projections

Recent historical populations (see Table 2) are from adjusted Department of Finance figures for the City's Planning Area, including the County water service area. Projected populations used in this study (see Table 3) were provided by the City Community Development Department, and reflect the figures shown in the 1989 Comprehensive Plan for the City's Planning Area, adjusted to the 1990 and 2000 census. We have also included the portion of our water service area, which covers unincorporated areas adjacent to the City. These are slightly different than the population figures used in the City's 2002 Biennial Water Supply Report, due to recent adjustments by the Department of Finance.

It is important to note that the projected population figures used in this report are not intended to represent either support for or any commitment to this level of growth. Rather they are intended to provide a safe margin in planning for long-term water improvements that might be needed given the rate of growth that could be allowed under the 1989 Comprehensive Plan. Currently the City is going through the process of revising the Comprehensive Plan.

Table 3: Estimated Population Growth for Water Service Area

Year	Projected Planning Area Population
2004	108,651
2009	113,162
2014	118,295

Note: City population estimates are based on the U.S. 2000 Census and

a growth rate of 0.9%. Additional population for the unincorporated area served by Ventura's water system, is based on 2004 count of customers outside city limits and a growth rate of 0.6%.

C. Projected Water Demand

For planning purposes, in 1990 the City used 0.22 AF of water per capita per year based on the average pre-mandatory conservation per capita use data (see Table 2). Anticipated demand reductions, through long-term conservation programs, have lowered the per capita water usage factor. Estimated demand reductions due to conservation in 1990 were anticipated to be five percent in 1995 (0.209 per capita use), 10 percent in 2000 (0.198 per capita use), and 12 percent thereafter (0.194 per capita use). The figures in Table 2 show that the reductions assumed in 1990 have been exceeded and are now around 17 percent. Based on data from the past 10 years since mandatory conservation ended, the average per-capita usage is 0.179 AFY. For the purpose of this report 0.179 AFY per capita will be used to estimate future water demands.

In addition, raw water demand for oilfield injection has declined steadily since 1970. Average raw water usage for the past 5 years was 1,000 AFY. For the purpose of this report a future raw water demand of 1000 AFY will be used.

Applying this per capita demand factor to the projected populations provides an estimate of treated water demands for the next 10 years, as shown in Table 4. As stated, the numbers in Table 4 reflect the belief that there will be few substantive changes in the near future, with planned long-term improvements.

Table 4: Projected Water Demand (Acre Feet) - (Normal year, weatherwise)

Year	Est. Water Service Area Pop. (1)	Per Capita Usage AFY (2)	Treated Water Demand (2)	Raw Water Demand (3)	Total Water Demand
2004	108,651	0.179	19,449	1,000	20,449
2009	113,162	0.179	20,256	1,000	21,256
2014	118,295	0.179	21,175	1,000	22,175

Notes:

1. Estimated planning area populations are from Table 3.
2. Treated water demand is estimated population multiplied by 0.179 AF/capita based on the 1994-2003 average post-mandatory water conservation per capita use from Table 2.
3. Raw water demand projections include raw water and oil users.

V. Water Supply and Demand Summary

Table 5 summarizes the City's projected water demand and supply through the year 2014. Additional water supplies will not be needed until sometime after 2014 under average non-drought weather conditions.

Table 5: Summary of Projected Water Demand and Supply (Acre Feet) - (Non-Drought Conditions)

Year	Projected Planning Area Pop.(1)	Projected Water Demand(2)	Projected Water Supply(3)	Additional Water Supply Needed(4)
2004	108,651	20,449	26,500	No
2009	113,162	21,256	28,562	No
2014	118,295	22,175	28,262	No

Notes:

1. Projected planning area population is from Table 3.
2. Projected water demand is from Table 4, and includes oil and raw water use.
3. Projected water supply is from Table 1.
4. Additional water supply needed is the projected water supply less the projected water demand. Additional supply to meet water quality goals is not included.

Based on the above projection, the existing water supply and planned improvements are sufficient to satisfy the City's water needs for at least the next ten years.

VI. Planned Improvements

The City will continue to implement capital improvements and do resource planning for our water system. These improvements will increase production capacity and storage, improve our ability to move water from the diverse sources of supply to all points of use, improve water quality, reliability and safety. We anticipate an update of the Water System Master Plan during the 2004-05 fiscal year.

The availability of the facilities below are essential to meet future water production, storage and transport needs. For purposes of this report, we have assumed these projects will proceed as currently anticipated. Detailed system condition and hydraulic evaluations for both normal and drought condition operation are still to be completed. When completed these may change the projects on this list.

- Upgrade of Foster Park Production Facilities. This will include replacing the production capacity of the surface diversion with new wells. Upgrades of the facilities have been designed and are pending environmental approval. Construction should begin in 2006 and be completed by 2008.
- Saticoy Conditioning Facility Renovation. Upgrades to the facility, including the installation of an emergency generator, will provide capacity to treat production from two wells simultaneously.
- Construction of Saticoy Well No. 3. This new well is currently included with the upgrade of the Saticoy Conditioning Facility. Design is underway and completion is anticipated by 2006.
- Construction of Connecting Pipelines. Several system connections are still needed to enable efficient movement of water from sources to distant sections of the City.
- North Wells Road Reservoir. This 4 million gallons of additional storage will serve the eastern portion of the area to improve fire and domestic supply reliability.

Other projects currently included in the 5-year Capital Improvement Plan include both projects needed to maintain our existing water system infrastructure and projects planned to improve system efficiency and reliability. They include:

- Rehabilitate and upgrade mechanical/electrical system for Golf Course Well #3;
- Correction of distribution system dead-ends and complete system service loops;
- Replacement of aging cast iron mains;
- Continue modernization of and provide emergency backup power for the booster pump stations that deliver treated water to system storage; and
- Construct new pipeline improvements to include interties for the 210/330 and 210/430 zones and backup zone connections for the Pierpont-Harbor neighborhood.

Although additional water supplies are not needed at this time, the following system efficiency improvements will make the water system capable of supporting increased demands:

- Continue to work with participating agencies on the Ventura River Watershed and Habitat Conservation Plans for Steelhead Trout.
- Continue discussions with local agencies concerning our State Water Project Entitlement.

- Continue work towards development of Santa Paula Basin Operational/Management Plan with United Water Conservation District & Santa Paula Pumpers Association.
- Implement the recommendations in the West County Water Supply Reliability Study, which would provide an emergency connection between the Ventura and Oxnard water systems.
- Work with the Casitas Municipal Water District to formally define the City's water service in the North Ventura Avenue area.

VII. Certification

By adopting the 2004 Biennial Water Supply Report, the City Council certifies that based on the findings of this report, there is sufficient water supply available with existing local resources to satisfy the City's water needs for at least the next ten years. The next biennial certification review will take place in the Fall of 2006.

Responses to Comments on the Draft EIR

RESPONSES TO COMMENTS ON THE DRAFT EIR

The letters that follow are the public comment letters on the Draft Environmental Impact Report (EIR) for the proposed 2005 Ventura General Plan. The Draft EIR was circulated for a public review period that began on June 1, 2005 and concluded on July 18, 2005. This appendix includes responses to comments on the Draft EIR.

The City received 32 comment letters on the Draft EIR. Commenters and the pages on which each letter appears are listed below.

Commenter	Page
1. Terry Roberts, Director, State Clearinghouse, Governor's Office of Planning and Research	3
2. Richard A. Rojas, Superintendent, Channel Coast District, California Department of Parks and Recreation	7

Subject: City of Ventura 2005 General Plan Draft EIR
SCH#: 2004101014

Dear Kari Giaketsis:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on July 13, 2005, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Terry Roberts

SCH# 2004101014
Project Title City of Ventura 2005-General Plan Draft EIR
Lead Agency San Buenaventura, City of

Type EIR Draft EIR

Description The 2005 Ventura General Plan is an update to the 1989 Comprehensive Plan that currently serves as the blueprint for development in the City of Ventura. The 2005 General Plan updates each of the 1989 Comprehensive Plan elements, other than the Housing Element (an update of which was approved in 2004) with policies and action items that reflect the current needs and preferences of the community. The land use map will also be updated including a simplification of the number of land use categories from over 30 to 9 land use categories.

The 2005 General Plan DEIR includes analysis of six separate land use scenarios. These scenarios range from an intensification/reuse only option with minimal changes to the City's sphere of influence (SOI) to an option that includes three expansion areas totaling 1,449 acres currently in agricultural use for possible future development. The DEIR would also be used as a Master Environmental Assessment (MEA) for future environmental analysis in the planning area.

Attn: State Clearinghouse

RE: City of Ventura General Plan Draft EIR - SCH #2004101014

Dear Reader:

Thank you for the opportunity to review and comment of the Draft EIR (DEIR) for the City of Ventura's General Plan. Two state park units and a portion of the Ormer Rains Bike trail are within the jurisdiction of the City. We have had a long and successful working relationship with the City and look forward opportunities to work together.

Our comments on the DEIR focus on the biological resources. There are four specific points/considerations we believe should be brought to the City's attention. They are:

- 1. **Coastal strand/Beach:** Our field data records have recorded two Western snowy plover nests on the beach north of the Santa Clara River in Summer 2005. Western snowy plovers also use this coastal strand/beach as wintering foraging habitat. It is also an area known for nesting by the California Least Tern. A
- 2. **Special status communities/areas:** The beach area north of the Santa Clara River should be considered as a sensitive habitat area because it supports both Western Snowy Plover and California Least Tern habitat. B
- 3. **Summary comparison of impacts for EIR scenarios:** All development and intensification of use in the City has potential for increasing impacts on the Santa Clara River Estuary due to discharges from the City's wastewater treatment plant. Unless contemplated water recycling programs keep pace with increased growth there will be increased levels of discharge into the Santa Clara River Estuary. Other less easily quantified impacts will occur in riparian, wetlands, and open water habitats due to increased runoff tied to increased impermeable surface area within developments. These in turn could affect special status species such as tidewater goby, steelhead, and other aquatic spp. through the potential for increased erosion and associated sediment entering waterways, increased contaminants entering waterways, and other effects associated with increased impermeable surfaces C
- 4. **Action 1.8 should include the buffering all watercourses.** Action Items to protect riparian areas from the impacts of future development effective in protecting riparian areas should include the avoidance of building within the D

Letter 2

COMMENTER: Richard A. Rojas, Superintendent, Channel Coast District, California
Department of Parks and Recreation

DATE: July 13, 2005

RESPONSE:

Response 2A

The commenter notes that Department of Parks and Recreation records indicate that two Western snowy plover nests were identified on the beach north of the Santa Clara River in summer 2005 and notes that the same area is also known for nesting by California least tern. In response to this comment, the second paragraph under Coastal Strand/Beach on page 4.4-1 of Section 4.4, *Biological Resources*, will be revised to read as follows:

Cobble beach habitat is also found near the Ventura River mouth and in patches intermixed with sandy beach habitat. Littleneck and bean clams may be found buried next to cobbles used by gastropods such as the black turban snail. The cobble area also contains a few striped and yellow shore crabs. The listed Western snowy plover forages in the beach habitat in the City and has been identified on the beach north of the Santa Clara River. The listed least tern also nests in sandy beach/coastal strand habitat north of the Santa Clara River mouth.

This minor clarification does not affect the conclusions of the Draft EIR. Implementation of proposed General Plan policies and actions would reduce potential impacts to the Western snowy plover and California least tern to a less than significant level.

Response 2B

The commenter states that the beach area north of the Santa Clara River should be considered a "sensitive habitat" because it supports the Western snowy plover and California least tern. General Plan Action 1.17 identifies "shoreline areas" as sensitive habitats and requires surveys and appropriate buffers and other mitigation for any projects that may affect such areas. Implementation of this action would address possible future impacts to the Western snowy plover and California least tern.

Response 2C

The commenter states that the intensification of land use within the City has the potential to indirectly affect the Santa Clara River estuary and other open water habitats because of increased discharges from the wastewater treatment plant and increased surface runoff associated with the increase in impermeable surface area. Issues relating to wastewater treatment and surface water quality are addressed in Sections 4.13, *Utilities and Service Systems*, and 4.8, *Hydrology and Water Quality*. As discussed in Section 4.13, the City's wastewater treatment plant has adequate capacity to handle the projected increase in wastewater flow under any of the six EIR land use scenarios. As such, although an increase in overall wastewater generation would occur, wastewater

treatment would continue to meet Regional Water Quality Control Board discharge requirements and significant impacts would not occur. As discussed in Section 4.8, all future development in the City would be subject to the requirements of the Ventura County SQUIMP, which provide specific stormwater runoff treatment requirements and performance standards. The standards for new development and redevelopment exceed the standards of most existing development in the City and generally restrict post-project runoff levels to pre-project levels. Continued implementation of SQUIMP requirements on all new development and redevelopment within the City would be expected to generally improve the quality of stormwater runoff and reduce impacts to surface water quality to a less than significant level.

Response 2D

The commenter states an opinion that Action 1.8 should include the buffering of all watercourses and that building within the floodplain should be avoided. Proposed Action 1.8 provides for a minimum 50-foot buffer for waterways that retain natural soil slopes and thus have the potential for biological value. This action is not intended to apply to existing concrete-lined channels since such channels have little or no biological resource value. However, Action 1.10 calls for the removal of concrete channel structures as funding allows and where doing so will fit the context of the area and not create unacceptable flood or erosion potential. As discussed in Section 4.8, *Hydrology and Water Quality*, the six EIR land use scenarios include only a limited amount of developable land within the floodplain. Any future development proposals within 100-year flood zones would be required to comply with all Federal Emergency Management Agency requirements as well as the City's Flood Plain Ordinance.

PLANNING DIVISION

RE: 2005 Ventura General Plan EIR Comments

Dear Kari:

Thank you for providing the Ventura Local Agency Formation Commission (LAFCO) with the opportunity to comment on the Draft Program EIR for the Ventura General Plan. As a responsible agency for subsequent projects that may be implemented according to the General Plan, LAFCO must be able to make findings that the CEQA determinations made by the lead agency are appropriate for proposed project(s). Having the opportunity to comment on draft environmental documents helps to ensure that the CEQA issues as they pertain to the LAFCO process are addressed prior to application to LAFCO. Please understand that the specific comments about the DEIR detailed below are those of the LAFCO staff. The DEIR has not been reviewed or discussed by the Commission.

Section 2.0 – Project Description

- 1. Figures 2-4, 2-5, 2-6, 2-7 and 2-8 contain multiple, confusing references to areas within the North Ventura Avenue area ("North Avenue Potential Expansion Area", "Upper North Avenue District" and "North Avenue District"). These Figures and all related text references should be clarified so the reader can better distinguish between "Districts" and the "Potential Expansion Areas" in the North Ventura Avenue area. A
- 2. Due to the relatively large scale of the "Scenario" maps (Figures 2-3 through 2-8), it would be helpful if a list or table of Assessor parcel numbers is included as part of the Project Description Chapter to distinguish the specific boundaries of each of the potential expansion areas. B

Section 4.2 - Agriculture

- 1. Please find enclosed additional comments offered in 11 x 17-inch chart format in an effort to reduce the length of our narrative comments. This chart is intended to clarify and supplement the information provided in the agricultural impacts chart on Page 4.2-12 of the EIR. In particular, please note Footnote No. 3 on the chart. As currently described in the EIR, annexation of the North Avenue Potential Expansion C

Area is not possible based on the fact that geographic contiguity cannot be established unless the EIR is revised to include parcels to the south not already analyzed in the scope of the proposed General Plan land use scenarios.

Please also note the a portion of the 11-acre property north of the wastewater treatment plant included in Scenario 1 is subject to City SOAR according to County GIS maps.

2. Although the City of Ventura may use the State Important Farmland Maps as a threshold for significance for their initial study checklist, LAFCO must comply with the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 definition of prime agriculture to determine agricultural impacts. The definition is as follows:

(Government Code (G.C.) Section 56064)

"...an area of land whether a single parcel or contiguous parcels, that has not been developed for a use other than an agricultural use and that meets any of the following qualifications:

- (a) Land that qualifies, if irrigated, for rating as class I or II in the USDA Natural Resource Conservation Service land use capability classification, whether or not land is actually irrigated, provided that irrigation is feasible.*
- (b) Land that qualifies for rating 80 and 100 Storie Index Rating.*
- (c) Land that supports livestock used for the production of food and fiber and that has an annual carrying capacity equivalent to at least one animal unit per acre...*
- (d) Land planted with fruit or nut-bearing trees, vines, bushes, or crops that have a nonbearing period of less than five years and that will return during commercial bearing period on an annual basis...of not less than \$400 per acre.*
- (e) Land that has returned from the production of unprocessed agricultural plant products an annual gross value of not less than \$400 per acre for three of the previous five years."*

For LAFCO purposes, the USDA rating and storie class of the site should be addressed in the EIR or at the time of application for a specific boundary change.

3. Not all parcels under Land Conservation Act (LCA) contract within the Olivas Potential Expansion Area are shown on Figure 4.2-3. Based on our review of County GIS maps, it appears that approximately 170 acres of land are under LCA contract in the Olivas area rather than 24 acres as indicated in the EIR (Assessor Parcels: 080-0-020-200 and 138-0-060-495). The map and accompanying text references to total acreage under LCA contract should be revised accordingly.

4. For those Expansion Areas containing parcels subject to LCA contracts, the EIR should describe the consistency review process according to Government Code Section 56856.5 and acknowledge that this generally precludes the ability of LAFCO to approve the annexation of such lands to a city. G
5. The first paragraph on Page 4.2-11 indicates that any change to greenbelt agreement boundaries between cities requires approval from LAFCO. This is incorrect. Greenbelt agreements are statements of local policy adopted by one or more cities and the County of Ventura. However, although LAFCO is not a party to greenbelt agreements, it has “endorsed” all such agreements as statements of local policy. As such, LAFCO has adopted a policy providing that a proposal from a city that is in conflict with any greenbelt agreement will not be approved unless exceptional circumstances exist. A greenbelt amendment must be amended by all parties involved prior to any proposal which may be in conflict with the agreement being considered by LAFCO (see enclosed Section 2.5.3 of the LAFCO Commissioner’s Handbook). H
6. The EIR references proposed General Plan Policy 3D (“Continue to preserve agricultural lands within the City’s Planning Area”) and cites proposed General Plan Action 3.12 as being one means to this end. General Plan Action 3.12 directs the City to renew and “modify” greenbelt agreements as necessary to direct development to already urbanized areas.” I

Page 4.2-16 of the EIR contains the following statement:

“ Implementation of the above policies/actions would minimize the *premature* conversion of agricultural lands under any of the land use scenarios. Outside of re-designating important farmlands for continued agricultural use, additional mitigation is not available.” (emphasis added)

Given the above statement acknowledging that agricultural land would not be permanently preserved within the timeframe and context of the development contemplated under the proposed General Plan, and based on the EIR conclusion that all six land use scenarios would result in the conversion of agricultural land within the sphere, and that two of the scenarios (Scenario 2 and 3) would actually require a reduction in the area covered by the Oxnard-Ventura Greenbelt, it is unclear how any of the proposed scenarios could be found to be *consistent* with General Plan Action 3.12, let alone how these policies could be found to serve as “mitigation measures” (see next comment).

7. Two of the mitigation measures proposed by the EIR to address impacts associated with the conversion of agricultural land (Pages 4.2-15 – 4.2-16) refer to implementation of General Plan Actions 3.12 and 3.15 which, respectively, directs J

the City to renew and modify greenbelt agreements as necessary to direct development to already urbanized areas, and to adopt use permit standards for non-farm activities in agricultural areas that protect and support farm operations (including requiring non-farm uses to provide buffers). However, the EIR acknowledges that these policies merely serve to minimize the “premature” conversion of agricultural land and, and that “outside of re-designating important farmlands for continued agricultural use (which the EIR does not propose to do), additional mitigation is not available.” As such, reliance on these policies which serve as only *temporary* means to preserve agricultural land as “mitigation” does not seem to reflect the true intent of mitigation under CEQA. Moreover, given that the impacts regarding agricultural land conversion would remain unavoidably significant, even with this “mitigation”, we believe that the references to the proposed General Plan actions as “mitigation” should be deleted altogether.

8. Please note that LAFCO is planning to prepare a Municipal Service Review (MSR) for the City of Ventura, which is required before LAFCO can undertake an update of the City’s sphere of influence. As part of this process, LAFCO policy 4.1.2.3 (enclosed) provides that city spheres of influence should coincide, with or cover lesser area than, voter approved growth boundaries. LAFCO will base the update of the City’s sphere of influence on the above-noted policy, unless there is sufficient justification for change. This project EIR and subsequent decisions by the City about its SOAR boundary will be used as part of the basis for the City’s sphere of influence update by LAFCO. Thus, once LAFCO completes the MSR, the probable result will be that all territory located within the current sphere of influence but subject to the City’s SOAR ordinance will be removed from the sphere (including all or portions of land use Scenarios 2-6, and possibly even Scenario 1, with respect to the 11-acre area that is outside of the current sphere and a portion of which is subject to the City SOAR). If LAFCO’s sphere of influence update is completed prior to the passage of a SOAR vote to redesignate any of the Expansion Areas, any of the Expansion Areas that are subject to the City SOAR ordinance could also be outside the City’s sphere of influence. As such, the EIR should discuss the fact that an application for a sphere amendment may need to be approved by LAFCO prior to considering these lands for annexation. K
9. The first paragraph of page 4.2-18 incorrectly references the Olivas area as being part of Scenario 4. L
10. The discussion on page 4.2-18 under Scenario 5 indicates that a portion of the Western Cañada Larga area could only be converted to another use upon cancellation of existing LCA contracts and approval of a sphere of influence amendment by LAFCO. Scenarios 2 and 3 would also require cancellation of existing LCA contracts. The applicable sections of the EIR should be revised to acknowledge this fact. Also, based on the City’s current sphere of influence M

boundary. Scenarios 1, 2, 3 and 4 would require sphere of influence amendments. Scenario 6 may potentially require a sphere amendment following the pending sphere update to be performed by LAFCO as part of the Municipal Service Review process.

11. Under Scenario 1 on page 4.2-20, the EIR states, "several agricultural properties within the proposed SOI that are currently designated for non-agricultural uses could be developed under this scenario." The EIR proceeds to reference properties in the Saticoy area that may present potential agricultural/urban compatibility conflicts, however, there is no information about any specific property in the Saticoy area and no mapped reference. For the record, we would like it noted that the subject EIR does not contain sufficient information to assess impacts associated with any annexations associated with these properties. Any future actions requiring LAFCO approval will require additional environmental review. N

Section 4.14 - Land Use and Planning

12. Section 4.14 (Land Use and Planning) of the EIR contains erroneous interpretations of the Cortese-Knox-Hertzberg Act of 2000 (California Government Code Section 56000 et seq.), LAFCO policies and the Ventura County Guidelines for Orderly Development. Please refer to the "Frequently Asked Questions" link on our website at www.ventura.lafco.ca.gov for additional information. For the sake of ease and clarity, we recommend that the EIR simply reference the applicable Code Sections or local policy documents in sufficient detail for interested readers to locate on their own accord rather than include inaccurate restatements of statutes and policies. As such, we recommend that all the applicable interpretations found on pages 4.14.6 and 4.14.7 be deleted. O

13. In addition to the factors contained in Government Code Section 56000 et seq., the Ventura LAFCO has adopted local polices that will also be considered as a part of any LAFCO review of the project. A discussion about consistency with these Ventura LAFCO policies and any resulting environmental impacts should be included in the EIR. All of these polices are contained in the Ventura LAFCO Commissioner's Handbook. A complete copy of the Commissioner's Handbook is available from the Ventura LAFCO and on-line at the Ventura LAFCO web site. Specific applicable LAFCO policies are enclosed and include: P
- a. Conformance with local plans and policies (policy 2.5.1), especially in relation to any changes that may be necessary to the City's SOAR ordinance.
 - b. Agriculture and open space conversion (policy 3.1.5 in its entirety). Note that policy 3.1.5 requires a detailed alternative site analysis of non-prime agricultural or vacant lands as well as an analysis of the impacts on

adjoining prime agricultural or open space lands. Also note that this policy refers to phasing annexation for very large developments that may involve time horizons over 5 years.

- c. School capacity (policy 3.1.6)
- d. Annexation of unincorporated island (policy 3.2.3)

Given that the subject EIR does not include an analysis of several of the above noted policies, LAFCO does not consider this EIR adequate for the purposes of any future sphere amendments or annexations unless supplemental analysis is provided.

Paragraph b, above is emphasized in response to statements in the EIR indicating that the 2005 General Plan would not change the land use designation for any of the areas under Scenarios 2 through 6 (pages 4.2-17 through 4.2-18). At the point when the City begins to implement any land use scenario that requires an amendment to the sphere of influence, please note that LAFCO discourages such unless annexation of the territory involved is anticipated within five years. Note further, however, that once territory is within the City's sphere of influence there is no requirement that it be annexed within five years or any other specific timeframe.

- 14.** In acting on any governmental boundary reorganization proposal LAFCO must consider the factors identified in Government Code Section 56668. Each of these factors should be fully discussed in the appropriate sections of the EIR. Note that these factors include a reference to Government Code Section 56377 concerning open space conversion and that LAFCO uses the definition of open space contained in Section 65560 of the Public Resources Code.

Again, thank you for the opportunity to comment. If there are any questions regarding our comments, please feel free to contact me at 805-654-2866.

Sincerely,

Kim Uhlich
Senior Analyst

DIVISION 2 – OPERATIONAL POLICIES

CHAPTER 5 – LOCAL PLANS AND POLICIES

SECTION 2.5.1 CONFORMANCE WITH LOCAL PLANS AND POLICIES

2.5.1.1 Consistency with General and Specific Plans: Unless exceptional circumstances are shown, LAFCO will not approve a proposal unless it is consistent with the applicable general plan and any applicable specific plan. For purposes of this policy, the applicable general plan is as follows:

- i. For proposals by a city, the general plan of the city.
- ii. For proposals by a district, where the affected territory lies within an adopted sphere of influence of a city, the general plan of the city.
- iii. For proposals by a district, where the affected territory lies outside an adopted city sphere of influence, the Ventura County General Plan.

2.5.1.2 Consistency with ordinances requiring voter approval: For cities that have enacted ordinances that require voter approval for the extension of services or for changing general plan designations, LAFCO will not approve a proposal unless it is consistent with such ordinances and voter approval has first been granted, or unless exceptional circumstances are shown to exist.

SECTION 2.5.2 GUIDELINES FOR ORDERLY DEVELOPMENT

LAFCO encourages proposals that involve urban development or that result in urban development to include annexation to a city wherever possible. In support of this policy LAFCO has adopted Guidelines for Orderly Development, the policies of which are incorporated by reference.

SECTION 2.5.3 GREENBELTS

The County of Ventura and various cities in the County have adopted Greenbelt Agreements for the purposes of preserving agriculture and/or open space, providing separation between cities, and/or limiting the extension of urban services. The Ventura LAFCO is not a direct party to these Greenbelt Agreements, but has endorsed them as statements of local policy. As such, LAFCO will not approve a proposal from a city that is in conflict with any Greenbelt Agreement unless exceptional circumstances are shown to exist. A Greenbelt Agreement shall be amended by all parties involved prior to any proposal which may be in conflict with the Agreement is considered by LAFCO.

SECTION 3.1.5 AGRICULTURE AND OPEN SPACE PRESERVATION

3.1.5.1 Findings and criteria for prime agricultural and open space land conversion: LAFCO will approve a proposal for a change of organization or reorganization which is likely to result in the conversion of prime agricultural or open space land use to other uses only if the Commission finds that the proposal will lead to planned, orderly, and efficient development. For the purposes of this policy, a proposal for a change of organization or reorganization leads to planned, orderly, and efficient development only if all of the following criteria are met:

- i. The territory involved is contiguous to either lands developed with an urban use or lands which have received all discretionary approvals for urban development.
- ii. The territory is likely to be developed within 5 years and has been pre-zoned for non-agricultural or open space use. In the case of very large developments, annexation should be phased wherever possible.
- iii. Insufficient non-prime agricultural or vacant land exists within the existing boundaries of the agency that is planned and developable for the same general type of use.
- iv. The territory involved is not subject to voter approval for the extension of services or for changing general plan land use designations. Where such voter approval is required by local ordinance, such voter approval must be obtained prior to LAFCO action on any proposal unless exceptional circumstances are shown to exist.
- v. The proposal will have no significant adverse effects on the physical and economic integrity of other prime agricultural or open space lands.

3.1.5.2 Findings that insufficient non-prime agricultural or vacant land exists: The Commission will not make affirmative findings that insufficient non-prime agricultural or vacant land exists within the boundaries of the agency unless the applicable jurisdiction has prepared a detailed alternative site analysis which at a minimum includes:

- i. An evaluation of all vacant, non-prime agricultural lands within the boundaries of the jurisdiction that could be developed for the same or similar uses.
- ii. An evaluation of the re-use and redevelopment potential of developed areas within the boundaries of the jurisdiction for the same or similar uses.
- iii. Determinations as to why vacant, non-prime agricultural lands and potential re-use and redevelopment sites are unavailable or undesirable for the same or similar uses, and why conversion of prime agricultural or open space lands are necessary for the planned, orderly, and efficient development of the jurisdiction.

3.1.5.3 Impacts on adjoining prime agricultural or open space lands: In making the determination whether conversion will adversely impact adjoining prime agricultural or open space lands, the Commission will consider the following factors:

- i. The prime agricultural and open space significance of the territory and adjacent areas relative to other agricultural and open space lands in the region.
- ii. The economic viability of the prime agricultural lands to be converted.
- iii. The health and well being of any urban residents adjacent to the prime agricultural lands to be converted.
- iv. The use of the territory and the adjacent areas.
- v. Whether public facilities related to the proposal would be sized or situated so as to facilitate the conversion of prime agricultural or open space land outside of the agency's sphere of influence, or will be extended through prime agricultural or open space lands outside the agency's sphere of influence.
- vi. Whether natural or man-made barriers serve to buffer prime agricultural or open space lands outside of the agency's sphere of influence from the effects of the proposal.
- vii. Applicable provisions of local general plans, applicable ordinances that require voter approval prior to the extension of urban services or changes to general plan designations, Greenbelt Agreements, applicable growth-management policies, and statutory provisions designed to protect agriculture or open space.
- viii. Comments and recommendations by the Ventura County Agricultural Commissioner.

SECTION 3.1.6 SCHOOL CAPACITY

In addition to the factors and determinations required by state law, LAFCO will consider whether or not the territory involved in a proposal for a change of organization or reorganization can be served by affected school districts. LAFCO will not favor any change of organization or reorganization proposal where any affected school district certifies that there is not sufficient existing school capacity, or will not be sufficient school capacity at the time of development, to serve the territory involved.

**SECTION 3.2.3 ANNEXATION OF UNINCORPORATED ISLAND AREAS BY
CITIES**

(Added 4/16/03)

Any approval of a proposal for a change of organization or reorganization will be conditioned to provide that proceedings will not be completed until and unless a subsequent proposal is filed with LAFCO initiating proceedings for the change of organization or reorganization of all unincorporated island areas that meet the provisions of Government Code Section 56375.3, provided all of the following criteria are applicable:

- i. The approved proposal was initiated by resolution of a city that surrounds or substantially surrounds one or more unincorporated island areas that meet the requirements of Section 56375.3.
- ii. The territory in the approved proposal consists of one or more areas that are each 40 acres or more in area.
- iii. The territory in the approved proposal will not be used exclusively for agriculture or open space purposes after the completion of proceedings.
- iv. The territory in the approved proposal is not owned by a public agency or used for public purposes.

DIVISION 4 – SPHERES OF INFLUENCE

CHAPTER 1 – GENERAL POLICIES

SECTION 4.1.1 APPLICABILITY AND WAIVER

4.1.1.1 Applicability:

(a) These policies and standards do not preempt state law. In the event of a conflict between these policies and the provisions of state law, the provisions of state law shall prevail.

(b) In the event of a conflict between these policies relating to spheres of influence and the rules and regulations, or the operational policies, adopted by the Ventura LAFCO, the provisions of the rules and regulations and the operational policies shall prevail.

4.1.1.2 Waiver: These policies and standards relating to spheres of influence shall be given great weight as a part of the Ventura LAFCO's consideration of proposals. They are general guidelines for the Commission to follow, however, they are not mandatory or binding. The Commission can and will consider each proposal upon its merits within the parameters set forth in state law. Should the Commission elect not to follow a policy, it shall, as a part of any resolution on the matter and as part of the written record, set forth the specific waiver, and the reason for it.

SECTION 4.1.2 BOUNDARIES

4.1.2.1 Compliance with state law: All boundaries shall comply with the provisions of state law.

4.1.2.2 Conformance with lines of ownership and assessment: Sphere of influence boundaries should coincide with lines of assessment or ownership. If sphere of influence boundaries do not coincide with lines of assessment or ownership they shall be described by metes and bounds legal descriptions sufficient for definitive mapping purposes using geographic information system software.

4.1.2.3 Consistent with voter approved growth boundaries: For cities that have enacted ordinances that require voter approval for the extension of services or for changing general plan designations, sphere of influence boundaries should coincide with, or cover lesser area than, voter approved growth boundaries.

Q

2005 Ventura General Plan EIR: Comparison of Scenarios 1 -6 Integrating LAFCo Law/Policies and Minor Data Corrections

CRITERIA	Scenario 1 (4)	Scenario 2	Scenario 3	Scenario 4	Scenario 5	Scenario 6
Prime Farmland Conversion?	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage
Conflicts with SOAR? (1)	Portion of the 11 acres north of water filtration plant subject to City SOAR	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage
Conflicts with LAFCo Law/Policy? (2)	11 acres north of water filtration plant would require SOI amendment prior to annexation. However, annexation of noncontiguous territory is prohibited by Sec. 56741 of C-K-H	North Avenue area is not contiguous to City boundary, annexation is prohibited by Sec. 56741 of C-K-H	North Avenue area is not contiguous to City boundary, annexation is prohibited by Sec. 56741 of C-K-H	North Avenue area is not contiguous to City boundary, annexation is prohibited by Sec. 56741 of C-K-H	North Avenue and Western Canada Larga areas are not contiguous to City boundary, annexation is prohibited by Sec. 56741 of C-K-H	North Avenue area is not contiguous to City boundary, annexation is prohibited by Sec. 56741 of C-K-H
Conflicts with Guidelines for Orderly Development (3)?	Yes; land to be developed for urban purposes should first be annexed to City. North Avenue area cannot be annexed per LAFCo policy	Yes; land to be developed for urban purposes should first be annexed to City. North Avenue area cannot be annexed per LAFCo policy	Yes; land to be developed for urban purposes should first be annexed to City. North Avenue area cannot be annexed per LAFCo policy	Yes; land to be developed for urban purposes should first be annexed to City. North Avenue area cannot be annexed per LAFCo policy	Yes; land to be developed for urban purposes should first be annexed to City. North Avenue and Western Canada Larga areas cannot be annexed per LAFCo policy	Yes; land to be developed for urban purposes should first be annexed to City. North Avenue area cannot be annexed per LAFCo policy
Conflicts with greenbelt agreement?	No, according to criteria for Scenario 1 eligibility as stated in EIR (5)	Yes; refer to EIR for acreage	Yes; refer to EIR for acreage	No	No	No
Conflicts with LCA contract(s)?	No, according to criteria for Scenario 1 eligibility as stated in EIR (5)	Yes; 170 acres in Olivias area under LCA contract (EIR indicates 24 total acres)	Yes; 170 acres in Olivias area under LCA contract (EIR indicates 24 total acres)	No	Yes; refer to EIR for acreage	No

NOTES:
 (1) The EIR should indicate that LAFCo will not accept an application for a sphere amendment or an annexation for any territory subject to the City SOAR ordinance until and unless voter concurrence is reached.
 (2) Through a pending State-mandated review and update of the City's sphere of influence to be performed by LAFCo within the next year, and based on Ventura LAFCo policies, all land currently subject to the City SOAR ordinance will potentially be removed from the SOI. As such, several areas identified as being within the SOI will potentially be removed from the SOI. This information should be included and made part of the EIR analysis.
 (3) The location of the "North Avenue Potential Expansion Area" as described in the EIR does not include territory that would make annexation of this PEA possible under State law. It is possible to annex the parcels within the North Area PEA but in order to do so under this EIR it would be necessary to revise the project description and the boundaries of one or more of the land use scenarios to include properties south of the PEA that provide a means of geographical contiguity with properties already within the City boundaries located considerably south of the currently described North Avenue PEA. Some of these properties may be subject to the City SOAR ordinance and thus their inclusion in the General Plan area would need to be analyzed along with any other additional potential impacts.
 (4) This analysis for Scenario 1 includes analysis of "incorporation" (sic) of approximately 11 acres north of water filtration plant in the North Avenue area as referred to in EIR. Specific properties included in under this Scenario are not all identified in the EIR. Those areas that are identified, such as the McGrath property, Thille area property, and several Saitcoy sites, should be included in the impact analysis if they are known to be part of Scenario 1.
 (5) Page 4.2-16 refers to criteria that properties eligible to be part of Scenario 1 must meet, such as properties not subject to City SOAR, can include agricultural land but must be designated for urban use, not subject to an LCA contract, not within a greenbelt and within the current SOI. However, Page S-1 of the EIR describes Scenario 1 as one that limits development "almost exclusively" to areas within the current SOI. Other EIR references to Scenario 1 indicate that no land outside the SOI will be included. Thus, the parameters of Scenario 1 are inconsistent and unclear.
 (6) According to the County GIS maps, approximately 29 acres within the W. Canada Larga PEA and approximately 66 acres in the North Ventura Avenue PEA, for a total of approximately 95 acres, are subject to the City SOAR.

Letter 3

COMMENTER: Kim Uhlich, Senior Analyst, Ventura Local Agency Formation Commission

DATE: July 11, 2005

RESPONSE:

Response 3A

The commenter notes that there are multiple confusing references to the North Avenue District, Upper North Avenue District, and North Avenue Expansion Area on Figures 2-4 through 2-8. The Upper North Avenue district is shaded gray and numbered "1." The North Avenue district is shaded gray and numbered "2." The North Avenue expansion area is shown with a hatch pattern and labeled as such. All three areas are within the current Sphere of Influence. However, the North Avenue expansion area is considered such because it is designated Agriculture in the current Comprehensive Plan land use map and therefore would need voter approval for re-designation and subsequent development.

Response 3B

The commenter requests a listing of parcel numbers for each of the potential expansion areas. This list was provided to the LAFCO staff upon their request and is attached.

Response 3C

The commenter notes that annexation of the North Avenue potential expansion area is not possible because it is not contiguous with the current City boundary. It is presumed that annexation and development of the North Avenue area would not occur (if at all) until such time as areas to the south and/or west are annexed to the City. The Draft EIR Project Description is unclear on this point. Therefore, the discussion of the City's corporate limits in Section 2.0, *Project Description*, will be revised as follows in the Final EIR (new text is underlined):

a. Corporate Limits. The corporate limits of the City currently encompass approximately 13,700 acres, or 21 square miles. The City stretches from the Pacific Ocean eastward to the community of Saticoy and northward up the Ventura River valley. The City is not currently seeking annexation of any lands outside the current City limits. However, the City may seek annexation of unincorporated islands as well as urbanized areas adjacent to the current City limits (such as in Saticoy and the North Ventura Avenue area) over the life of the 2005 General Plan. Any annexations would be sought only at such time as the area to be annexed is contiguous with the current (at that time) City limit.

In addition, the first full paragraph on page 2-5 will be replaced with the following in the Final EIR to clarify whether and how the City may seek adjustments to the Sphere of Influence:

The City is not seeking any adjustments to the SOI at this time. However, the 2005 General Plan includes a land use designation ("Industrial") for a small area outside the current SOI. This area encompasses approximately 10-11 acres located north of the City's water filtration plant. The City may seek inclusion of that area within the SOI over the life of the 2005 General Plan; however, any application for an adjustment to the SOI and annexation would occur (if ever) only at such time as the City's corporate boundary has been extended to be contiguous with the boundary of the area. Similarly, should any potential expansion areas be selected for inclusion in the General Plan land use map in the future, the SOI may be proposed for adjustment at that time to encompass the expansion areas. Applications for any necessary SOI adjustments would be sought at such time as development of these areas is proposed. The SOI adjustments that would be needed for each expansion area are discussed in detail in subsection 2.5. Finally, the City is interested in having the SOI moved to be coterminous with the City's corporate boundary for the hillside areas above the City pursuant to Action 1.13 of the Draft General Plan. It is the City's understanding that the Ventura LAFCO is planning to prepare a Municipal Service Review (MSR) for the City that will likely result in the removal this area (and possibly other areas, including all of the potential expansion areas) from the SOI; therefore, the City will not seek an SOI adjustment at this time. However, if the LAFCO does not take action to remove the hillside areas from the SOI, the City may apply for such an adjustment in the future.

Subsection 2.5.3.c of the EIR Project Description will be revised to read as follows in the Final EIR (new text is underlined):

c. Possible Future Changes to Sphere of Influence Boundaries. As noted in subsection 2.2, although the City is not seeking adjustment to the Sphere of Influence (SOI) at this time, implementation of the 2005 General Plan may require several adjustments to the Sphere of Influence (SOI) that would subsequently be processed and subject to approval by LAFCO. About 2,300 acres in the hillsides above the City are proposed to be removed from the SOI. This would remove these areas from consideration for future City extension of services and focus future development on non-hillside areas. In addition, approximately 10-11 acres north of the City's water filtration plant along the west of SR 33 may need to be included in the SOI at some point in the future. This area is partly in agricultural use, but it is designated for industrial development in the Ventura County General Plan and in the 1989 Comprehensive Plan.

The SOI would not need to be adjusted at this time to include any of the expansion areas considered in this EIR. However, certain expansion areas would require expansion of the SOI if they are to be considered for future development. Such SOI expansions would be sought, if ever, at such time as development of the areas is proposed. Possible future expansions of the SOI include the following:

- Western Cañada Larga – This 110-acre area, located at the northern end of the Planning Area along the State Route (SR) 33 corridor, would need to be included in the SOI if selected for possible future development. Inclusion within the SOI could occur only at such time as the City's corporate boundary has been extended to be contiguous with the boundary of the expansion area.*
- Olivas – About 55 acres of the 930-acre Olivas area (the portion of this area north of U.S. 101) are within the current SOI. However, the remaining 875 acres, which*

consist of agricultural land located primarily between U.S. 101 and Harbor Boulevard, would need to be included in the SOI if this area is selected for possible future development.

- *Serra – About 160 acres of the 438-acre Serra area are currently outside the SOI. This area, which is located south of Bristol Road and along the north bank of the Santa Clara River, would need to be included in the SOI if the Serra area is selected for possible future development.*

Because the Ventura LAFCO may remove all areas subject to voter approval from the SOI as a result of its Municipal Service Review, any of the expansion areas may have been removed from the SOI by the time they are considered for development. Therefore, an SOI adjustment may need to be sought for any of the expansion areas.

The second, third, and fourth paragraph under subsection 2.6 (those related to LAFCO approvals) will be replaced with the following:

The City is not seeking annexation of lands or adjustments to the SOI at this time. However, implementation of the 2005 General Plan may require future approval of adjustments to the City's SOI, as described above. Annexations and SOI adjustments would be sought as appropriate at such time as developments are proposed for the areas in question. Any adjustments to the SOI will require approval from the Ventura LAFCO.

Other references to future SOI adjustments throughout the Draft EIR will be adjusted to reflect the above. In addition, Figures 2-3 through 2-8 will be revised to eliminate the future SOI boundaries that are depicted.

Response 3D

The commenter states that the 11-acre property north of the water treatment plant is subject to SOAR according to County records. In actuality, two small pieces of the property in question are designated Agriculture in the current Comprehensive Plan and therefore subject to SOAR. However, the bulk of the property (and the entire area included within the Upper North Avenue District depicted on Figures 2-3 through 2-8) is designated Industrial and not subject to SOAR.

Response 3E

The commenter notes that the Ventura County LAFCO uses the USDA rating and storic class of the site to determine the significance of agricultural resource impacts. Any project EIR for future annexation or SOI adjustment proposals will address these factors, in accordance with LAFCO requirements.

Response 3F

The commenter notes that the Olivas area includes an additional Land Conservation Act (LCA) contract not noted in the Draft EIR. In response to this comment, Figure 4.2-3 will be amended to reflect this additional LCA contract. In addition, Table 4.2-3 and accompanying text will be

amended to reflect the fact that EIR Scenarios 2 and 3 would potentially affect 170 acres if land under LCA contract. This change in acreage does not affect the findings or conclusions of the Draft EIR as conflicts with agricultural designations were already identified as unavoidably significant for Scenarios 2 and 3.

Response 3G

The commenter suggests that the EIR should describe the LAFCO review process required by the California Government Code and that the presence of LCA contracts within an area generally precludes LAFCO from approving annexation. In response to this comment, the following will be added to the first paragraph under "Scenario 2 - Intensification/Reuse + North Avenue + Olivas + Serra" on page 4.2-17 (under Impact AG-2):

The California Government Code (Section 56856.5) generally precludes the LAFCO from approving annexation of lands under LCA contract unless a notice of non-renewal has been filed and the annexing agency (the City) agrees that no services will actually be provided during the remaining life of the contract for land uses or activities not allowed under the contract.

This same sentence will also be added under the discussion of Scenarios 3, 4, and 5.

Response 3H

The commenter notes that the Draft EIR incorrectly states that the LAFCO needs to approve amendments to greenbelt agreements. In response to this comment, the last sentence of the first paragraph under "Greenbelt Agreements" on page 4.2-11 will be replaced with the following:

A greenbelt agreement must be amended by all parties involved before the LAFCO will consider any proposal that may be in conflict with the agreement.

Response 3I

The commenter questions how the conversion of land within the Oxnard-Ventura Greenbelt Agreement could be found to be consistent with proposed General Plan Action 3.12 relating to the preservation of farmland and greenbelt agreements and how the proposed General Plan action could serve as a "mitigation measure." The action to which the commenter refers is not a "mitigation measure." Rather, it is an action proposed in the draft General Plan and thus is part of the "proposed project." In CEQA terms, mitigation measures are additional actions above and beyond those included in the proposed project. With respect to consistency with Action 3.12, it is the City's stated intent, throughout the 2005 General Plan, to focus first on intensification and reuse of lands within the SOI prior considering expansion of the SOI boundaries. It is expected that the focus on intensification and reuse will relieve pressure for the development of farmland at the City's periphery. Nevertheless, the City acknowledges that some planning objectives may not be met through intensification/reuse alone and, under Scenarios 2-6, would retain the flexibility to consider annexation of various expansion areas at some point in the future. Though the City's general approach to planning is expected to minimize pressure for the future conversion of farmland, the Draft EIR acknowledges that such conversion would be an unavoidably significant impact. Finally, it should be noted that City

staff are recommending adoption of a variation on Scenario 1 (the "Intensification/Reuse Only" scenario), which includes none of the expansion areas and thus would not affect any areas within existing greenbelt agreements.

Response 3J

The commenter states an opinion that General Plan Actions 3.12 and 3.15 should not be referred to as "mitigation measure." As noted in Response 3I, the actions to which the commenter refers are not "mitigation measures," but rather are proposed General Plan policies that are part of the "proposed project." The discussion in the Draft EIR is merely intended to direct the reader to proposed General Plan actions that address the issue of farmland conversion. The Draft EIR acknowledges that, despite the inclusion of these actions in the draft General Plan, buildout of any of the EIR land use scenarios would result in unavoidably significant impacts relating to the conversion of important farmlands.

Response 3K

The commenter notes that the LAFCO is currently planning to prepare a Municipal Service Review that may result in the removal of all areas subject to voter approval from the SOI and states that the EIR should acknowledge this fact. Such a discussion will be added to the Final EIR. Please see Response 3C.

Response 3L

The commenter notes that the discussion of Alternative 4 incorrectly references the Olivas area. In response to this comment, the last sentence of the first paragraph on page 4.2-18 will be removed in the Final EIR.

Response 3M

The commenter notes that the statement regarding LCA contract cancellation under Scenario 5 also applies to Scenarios 2 and 3. The commenter also notes that any of the scenarios could ultimately require an expansion of the SOI. In response to this comment, the following sentence will be added to the discussion of Scenarios 2 and 3 on page 4.2-18 (under Impact AG-2):

Lands under LCA contract could only be converted upon cancellation of the contracts.

The SOI issue is discussed in previous responses. A statement regarding the need to expand the SOI for Scenarios 2, 3, and 4 will be added to the applicable discussions under Impact AG-2 and a statement of the possible need for an SOI adjustment will be added to the discussion of Scenario 6. Such a statement is not necessary for Scenario 1 since, although development under that scenario may require a future SOI adjustment, such an adjustment would not involve agriculturally-designated land (please see Response 3D).

Response 3N

The commenter notes that the LAFCO will require additional environmental review for the future conversion of agricultural parcels within the SOI prior to any actions requiring LAFCO approval. Agricultural lands within the Planning Area are shown on Figure 4.2-1. The EIR is a program level document that analyzes the overall impact of growth under the 2005 General Plan. Project-specific environmental review will be conducted for individual development projects at such time as projects are proposed.

Response 3O

The commenter suggests that the text describing LAFCO policies and the Cortese-Knox – Hertzberg Act of 2000 be replaced with simple references to these policies in order to avoid inaccurate representations of policy intent. The commenter suggests that the EIR should include discussion of several additional policies relevant to LAFCO’s review of the 2005 General Plan that are not included in the Draft EIR. In response to this comment, the discussion under Impact LU-1 will be replaced with the following in the Final EIR:

Impact LU-1 No boundary adjustments are being sought at this time and all of the General Plan scenarios emphasize intensification and reuse over expansion of the City. Annexations and Sphere of Influence adjustments could be sought at some point in the future under any of the scenarios and certain possible annexations/Sphere of Influence adjustments could potentially conflict with relevant State and LAFCO policies. However, because any conflicts would need to be resolved prior to LAFCO approval of any boundary adjustment, impacts can be reduced to a Class III, less than significant level, for all six scenarios.

The State of California possesses the exclusive power to regulate boundary changes, which means that no local government has the right to change its own boundary without State approval. The Legislature has prescribed a “uniform process” for boundary changes for both cities and special districts that is now embodied in the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (California Government Code Section 56000 et seq.). This Act delegates the Legislature’s boundary powers to local agency formation commissions (LAFCOs).

The Ventura LAFCO is responsible for reviewing and approving proposed jurisdictional boundary changes in Ventura County, including the annexation and detachment of territory to and/or from cities and most special districts, incorporations of new cities, formations of new special districts, and consolidations, mergers, and dissolutions of existing districts. In addition, LAFCOs must review and approve contractual service agreements, conduct service reviews, and determine spheres of influence for each city and district.

In addition to the Cortese-Knox-Hertzberg Act, the Ventura LAFCO has adopted local policies that it considers in its review of projects. The LAFCO also enforces the County’s Guidelines for Orderly Development. A complete listing of policies that

LAFCO considers in its review of proposed boundary changes can be found in the LAFCO website (www.ventura.lafco.ca.gov).

No adjustments to the City's corporate boundaries or Sphere of Influence (SOI) are proposed at this time. However, all of the 2005 General Plan scenarios could accommodate the development of lands that are outside the current City boundaries and SOI. Specific analysis of individual proposals would be needed at the time such possible future boundary adjustments are proposed, but boundary adjustment policies are discussed below as they relate to the 2005 General Plan.

Conformance with Local Plans and Policies

Unless exceptional circumstances are shown, LAFCO will not approve a proposal unless it is consistent with the applicable general plan and any applicable specific plan. No boundary adjustments are being sought at this time. Although boundary adjustments may be sought in the future under any of the EIR scenarios, it is anticipated that such adjustments would be consistent with the 2005 General Plan, regardless of which of the EIR scenarios is adopted.

LAFCO will not approve a proposal unless it is consistent with ordinances requiring voter approval. Scenarios 2-6 all includes potential expansion areas that are subject to voter approval. No land use designated or boundary adjustment is being sought at this time for any of the expansion areas. If such adjustments are sought at some point in the future, they will be sought only after voter approval of a land use designation change for the property in question.

Guidelines for Orderly Development

LAFCO encourages proposals that involve urban development or that result in urban development to include annexation to a city wherever possible. All of the EIR scenarios emphasize intensification/reuse over expansion of the City's boundaries and no boundary adjustments are being sought at this time. Nevertheless, all of the scenarios would accommodate development in lands that are outside the current corporate boundaries and the SOI. Development of such areas could be found to be in conflict with the Guidelines for Orderly Development, particularly with respect to the North Avenue and Western Cañada Larga expansion areas, which are not contiguous with the existing City corporate boundary. However, no development would occur until such time as the property in question is annexed and, if necessary, included in the SOI. Such adjustments could be made only with LAFCO approval and, in the case of the expansion areas, voter approval under SOAR. Given that future boundary adjustments would only be made at such time as they are deemed consistent with the Guidelines for Orderly Development, any of the scenarios could be found to be consistent with the Guidelines.

Greenbelts

LAFCO will not approve a proposal for a city that is in conflict with any Greenbelt Agreement unless exceptional circumstances are shown to exist. Scenarios 1, 4, 5, and 6 do not include any lands that are subject to existing Greenbelt Agreements. However, the Olivas expansion area that is included in Scenarios 2 and 3 is within the Oxnard-

Ventura Greenbelt. As such, the Olivas area could be brought into the SOI and annexed to the City only if it is removed from the Greenbelt. Such an amendment to the Greenbelt Agreement could be made only with the consent of the City of Oxnard. Moreover, approval of a land use designation change could only be made with voter approval under the SOAR Ordinance.

Agricultural and Open Space Preservation

LAFCO will approve a proposal for a change of organization that is likely to result in the conversion of Prime agricultural land or open space land only if it finds that the proposal will lead to planned, orderly, and efficient development. For a development to be deemed planned, orderly, and efficient, all of the following criteria must be met: (1) the territory involved is contiguous with lands developed with an urban use or that have received approvals for urban development; (2) the territory is likely to be developed within 5 years and has been pre-zoned for non-agricultural use; (3) insufficient non-Prime agricultural land or vacant land exists within the existing boundaries of the agency that is planned and developable for the same general type of use; (4) the territory is not subject to voter approval for the extension of services or changing of land use designations; and (5) the proposal will have no significant adverse effects on the integrity of other Prime agricultural or open space lands.

All of the EIR scenarios emphasize intensification and reuse of existing urban lands prior to the development of agricultural lands. Nevertheless, as discussed in Section 4.2, Agricultural Resources, any of the six scenarios would potentially accommodate the conversion of some Prime agricultural lands if the City's planning objectives cannot be met through intensification and reuse. All of the areas that could potentially be converted are contiguous with existing urban uses and, in many instances, are surrounded by urban uses. Although the North Avenue, Olivas, Serra, and Poinsettia expansion areas are subject to voter approval under the SOAR Ordinance, voter approval would have to be received prior to any LAFCO action. In addition, it is anticipated that inclusion within the SOI and/or annexation would not be sought unless development were planned within five years. In the case of large developments that could potentially be accommodated under Scenarios 2, 3, 4, and 6, development and annexation may need to be phased. Any of the agricultural lands that could be converted under Scenarios 1-6 could be found to be consistent with LAFCO's agricultural and open space preservation policies, though LAFCO's determination would need to be at the time of individual proposals based upon current (at that time) circumstances and the nature of the proposals.

School Capacity

LAFCO will not favor a change of organization where any affected school district certifies that there is no sufficient existing school capacity to serve the territory involved. As discussed in Section 4.11, Public Services, many VUSD schools are at or near capacity and would be over capacity in 2025 with the growth projected under any of the EIR scenarios. Scenario 1 would only accommodate a minor SOI adjustment that would not bring any residential development, though the annexation of individual properties that may be sought in the future under Scenario 1 could generate new VUSD students. The expansion areas included in Scenarios 2, 3, 4, and 6 include sufficient acreage to

accommodate new schools that would be needed to serve the areas. However, the expansion areas included in Scenario 5 may lack sufficient land to accommodate the development of new schools. The impacts of individual developments on schools will need to be addressed on a case-by-case basis as such impacts depend upon the nature of the project and the circumstances for the VUSD at the time of the individual application.

Annexation of Unincorporated Island Areas

Any approval of a proposal for a change of organization for an area of 40 acres or more will be conditioned to provide that the proceedings will not be completed until and unless a subsequent proposal is filed with LAFCO initiating proceedings for the change of organization of all unincorporated island areas that meet the provisions of Government Code Section 56375.3. This policy means that LAFCO will not approve annexations of 40 acres or more unless the City has filed an application to annex all of the island areas in the City, which include eight separate islands in the Montalvo area totaling about 55 acres. Therefore, no additional annexations will be completed until an application for annexation of these island areas has been filed.

Mitigation Measures. *No mitigation is required. Individual boundary adjustment proposals will need to be addressed by the City and the Ventura LAFCO on a case-by-case basis.*

Significance After Mitigation. *As the City is not seeking any boundary adjustments at this time, no inconsistencies would occur with respect to any of the six scenarios. Certain areas that may be considered for future annexation and/or inclusion within the SOI would not be eligible under current conditions; however, it is assumed that boundary adjustments would not be sought until such time as such adjustments could be found to be consistent with state and local requirements.*

The summary matrix and EIR summary table will also be revised to reflect this revised discussion.

Response 3P

The commenter notes that LAFCO must consider factors identified in Government Code Section 56668 in acting on any governmental boundary reorganization and suggested that these factors should be discussed in the EIR. Please see Response 3O. As noted in previous responses, although development that could be accommodated under any of the EIR scenarios may involve the consideration of future adjustments to the City's corporate boundary and/or sphere of influence, the City is not seeking any boundary adjustments at this time. As specific boundary adjustments are proposed in the future, the City will conduct analysis of applicable Government Code provisions as required by LAFCO.

Response 3Q

The commenter has attached a matrix with LAFCO's analysis of each of the EIR scenarios. Most of the items contained in the matrix are addressed in Responses 3A through 3Q. However, several additional items are addressed below.

The commenter states that County records indicate that 95 acres included in EIR Scenario 5 are subject to the SOAR Ordinance rather than the 84 acres indicated in the Draft EIR. The commenter may have included in the 11 acres north of the City's water treatment plant in the estimate of SOAR acreage. As discussed in Response 3D, only a very small piece of the 11-acre property north of the City's water treatment plant is subject to SOAR.

With respect to the North Avenue expansion area, it is correct that this area could not currently be annexed. However, no annexation would be sought at this time even if that expansion area were included in the selected General Plan land use map. Rather, annexation may be sought in the future, but not until and unless contiguous properties to the south and/or west were incorporated either before or as a part of the same request. If annexation is sought at some point in the future to accommodate a specific development proposal, a separate environmental review of the specific proposal will be conducted.

Footnote 4 of the LAFCO's suggested corrections table suggests that the EIR should include specific analysis of several sites within the current SOI that could be considered for future annexation under EIR Scenario 1. The Draft EIR acknowledges that a number of properties outside the corporate limits may be considered for annexation and development in the future and addresses the overall citywide impacts associated with the possible future development of these areas. However, project-specific analysis is not the purpose of the General Plan EIR, nor is such analysis possible given that no specific developments have been proposed at any of the sites in question. If and when specific development applications are submitted to the City, project-specific analysis, including analysis of applicable LAFCO policies, will be conducted at that time.

Re: Casden Properties LLC site at Johnson and North Bank Drives, Ventura, CA

Dear Ms. Porras:

You will soon be considering the Public Review Draft of the Ventura General Plan ("Draft General Plan") for adoption and the supporting Draft Environmental Report ("DEIR"). In the attached letter to Ms. Daluddung, Community Development Director, we have outlined our comments for your consideration in this matter.

We own an 8-acre site located at the northeast corner of Johnson and North Bank Drives. After initial meetings with City staff in early 2003, we were told that staff anticipated that the new planning designation of our site would support a dense, mixed-use development. We revised our proposal accordingly and shared this new plan with staff and with the CPAC at a hearing. Upon the City's recommendation, we withheld submission of a formal application and participated in the General Plan amendment process, waiting to submit our project once the General Plan is amended. We were quite surprised that our proposed project was not reflected in the Draft General Plan or the DEIR and that, in fact, the development potential for the entire Johnson Drive Corridor was lower than that proposed for just our project.

Please review the attached letter on the Draft General Plan and our proposed project and consider our recommendations. We are committed to supporting the goals of the City and would be happy to discuss our proposed project with you at your convenience. Thank you for your consideration.

Sincerely,

Carol Schwartz, Assistant Vice President
Community Development
Casden Properties LLC

Ms. Susan J. Daluddung
Community Development Director
City of San Buenaventura
City Hall – Room 133
501 Poli Street
Ventura, CA 93002

Ref.: Casden Properties LLC site at Johnson and North Bank Drives
Ventura, CA

Dear Ms. Daluddung:

We have reviewed the Public Review Draft of the Ventura General Plan (“Draft General Plan”) and respectfully submit these comments for your review and consideration. We believe that the Development Potential identified for the Johnson Drive Corridor should be increased, especially with respect to the residential component.

Our Property

As you are aware, in January 2003, Casden Properties LLC, through an affiliate, acquired an 8.03 acre site in Ventura located at the northeast corner of Johnson and North Bank Drives. In Spring 2003, we met with City staff for a pre-application meeting for development of this site. At the meeting, we were informed that the City had embarked on the update of the General Plan based on Smart Growth principles and were anticipating that the new designation of our site would support a dense, mixed-use development. We therefore revised our development scheme to a mixed-use project including 300 rental housing units and 22,500 square feet of commercial space, which we shared with staff. Because of the review process, we postponed the submission of a formal application for this project until the General Plan was amended.

In the intervening period, we have participated in the General Plan Update process, attending the various scoping and community meetings and shared the proposed project at a CPAC hearing. The Draft General Plan designated our site in the Johnson Drive Corridor for Commercial use. The Commercial designation “encourages a wide range of building types of anywhere from two to six stories that house a mix of functions, including commercial, entertainment, office, and housing” which supports the mixed-use concept we have proposed.

A LIMITED LIABILITY COMPANY

However, we are concerned that the Development Potential that was identified in the Draft General Plan for the Johnson Drive Corridor appears to understate the potential for this area. While we recognize that the City has stated that the guidelines are not limits of development, we believe that a greater level of development should be encouraged in this Corridor to better support the City's growth goals.

The Draft Environmental Impact Report that was prepared to support the Draft General Plan states that the growth was distributed among the various corridors and districts in the City "[B]ased on the development potential of each growth district and corridor and direction from the community, CPAC, Planning Commission and City Council on where growth in the community should be encouraged". We believe that the Johnson Drive Corridor, and in particular, our site, is an excellent location for rental housing as a component of a mixed-use project. In this letter, we will present our rationale for increasing the residential potential of the corridor. We hope that the planners and members of the CPAC can review the allocation for housing and revise it, taking into account our 300 units before the General Plan is finalized and adopted this summer.

Johnson Drive Corridor

The Johnson Drive Corridor appears to have two large sites remaining for development—our site and the site bounded by Johnson Drive, North Bank and the Ventura Freeway. The remainder of the corridor is developed with entertainment/retail use, commercial buildings and self storage.

While some of the existing projects might ultimately be redeveloped, we would anticipate that the Development Potential for the Corridor is much greater than the proposed 150 residential units, 50,000 square feet of retail space and 20,000 square feet of office space, and would be easily realized on these two undeveloped sites. Given its location, fronting the freeway, the other site would not be a prime location for residential development. However, our site is an excellent location for rental housing. We contend that a build-out of 300 units at this location would provide the appropriate scale of development to support the City's goals for Smart Growth.

The City of Ventura is committed to the principles of Smart Growth and has identified a number of Smart Growth concepts as part of the Draft General Plan. Increasing the intensity of residential development in the Johnson Drive Corridor serves to further support Smart Growth precepts. We will demonstrate how intensification of residential development in the Johnson Drive Corridor will support Smart Growth objectives and how a larger critical mass of residential development is needed at our site to support these Smart Growth goals and desirable development forms.

Johnson Drive Corridor as Location for Housing

Mix land uses. Smart Growth encourages a mix of land uses both vertically and horizontally. By introducing a significant component of residential units to this commercial corridor, residents can benefit from proximity to services and existing

businesses can benefit from this additional customer base. For example, the commercial center adjacent to the project site includes a TutorTime childcare facility which tends to attract new families with young children. This facility would benefit from an adjacent residential property that could provide additional client families.

Create a range of housing opportunities and choices. Because of the commercial nature of the corridor, a significant amount of rental housing would be an appropriate infill use. Rental product in this area will provide a much needed alternative to the for-sale product available further north on Johnson Drive.

Create walkable communities. By developing a substantial number of residential units at this site, we increase the opportunity for neighboring businesses and for the on-site retail and live/work units to be supported by walk-in customers. Residents will be able to walk to the movies or the video store located across the street or to the shops and services on the property. Our scheme also incorporates pedestrian access to the Linear Park which runs along the perimeter of the site.

Preserve open space, farmland, natural beauty and critical environmental areas. Our site is an infill location within the Johnson Drive Corridor. It is adjacent to the farmland of the Serra Expansion Area, being considered in the Draft EIR for future development and expansion of the City. By intensifying the development in this existing corridor, it forestalls the development of this agricultural area.

Provide a variety of transportation choices. Intensifying the residential development in the Corridor allows an increased number of residents to benefit from proximity to the South Coast Area Transit (SCAT) bus route along Johnson Drive, Ventura Intercity Service Transit Authority (VISTA) bus stops and easy access to the Freeway. By locating more potential commuters adjacent to the Freeway, we reduce the impact of these new households on local traffic patterns.

Foster distinctive, attractive communities with a strong sense of place. The Johnson Drive Corridor lacks a cohesive focus or image. The addition of a substantial, high-quality housing component will support a more diversified base of commercial establishments to better serve the corridor and the neighboring communities.

Casden Properties LLC Development Concept

Mix land uses. We have proposed the development of 22,500 square feet of retail space and 300 residential units, a number of which will be live/work product. We have designed the site with retail at the western portion of the site, along North Bank Drive, with live/work space transitioning to the residential eastern portion of the site. Our site is a preferable location for residential units in the City as the mix of uses at our site and the proximity to surrounding commercial development allows for pedestrian access, reducing the traffic impact that might accompany a similar level of residential development elsewhere.

Take advantage of compact building design. The residential component of the Casden proposal is comprised of 3-story buildings set on slightly elevated podiums. The required parking is primarily accommodated under the podium in a semi-subterranean structure. This creates a compact building form above ground, surrounding landscaped courtyards. The sprawl that comes from vehicular circulation and parking in projects with grade level automobile accommodation is avoided in this design scheme. It is important to note that podium products are very expensive to construct. We need to be able to develop a critical mass of units (approximately 300) before the substantial investment needed for this product is supported.

Create a range of housing opportunities and choices. Our project concept includes a range of housing product and target markets. Our current proposal includes both traditional rental units as well as live-work units fronting the commercial edge of our site. We also plan to provide both market rate and a significant component of affordable housing units in our project.

Foster distinctive, attractive communities with a strong sense of place. Casden Properties LLC is committed to developing beautiful projects with a high level of amenity. This proposed project will be distinctive by virtue of the podium product separating the vehicular from the pedestrian circulation and allowing for significant landscaping. By developing this site with 300 units, we are able to provide a high level of community amenities, including a large recreation center and pool area, which are anticipated to become a focal point for the residents. With lower development potential, the level of community amenities must be scaled back significantly.

Strengthen and direct development toward existing communities. As an infill site within an existing community, development should be intensified at this location. By increasing the amount of housing at the site, a critical mass of units can be developed to strengthen the sense of community here. The currently contemplated 150 units are simply too few to achieve a true sense of community in this location, which does not abut other residential areas.

Achieving critical mass on our site is necessary to develop and maintain a project that is consistent with City goals.

- Quality Product: The podium product we plan to develop creates very desirable, walkable communities, with large amounts of landscaped areas free from vehicular traffic.
- Project Amenities: Our proposed project includes a large recreation center, pool, spa, and large landscaped areas as project amenities. This level of amenity requires a critical mass of units to support their inclusion and maintenance.
- On-going, Committed Management: In order to operate and maintain this project at the appropriate level of service and security, dedicated property management is required, which can only be supported at a project of significant size.

Casden Properties LLC respectfully submits this request to increase the residential allocation in Johnson Drive Corridor to at least 300 units. We are very committed to supporting the goals of the City while developing this project and are eager to discuss our proposal further at your convenience. Attached for your perusal are a copy of the proposed site plan and a description of the project.

Sincerely,

Carol Schwartz

Project Description
Site Plan

Project Site: Johnson and North Bank Drives
Northeast Corner of intersection
The site is accessible off Highway 101 North at the Johnson Drive exit.

Site Description:

Lot Area: 8.03 acres
Density: 300 dwelling units / 52 du/acre Residential
22,500 SF Commercial
Parking: 510 stalls –Residential [includes direct and tandem]
90 stalls -Commercial

Project Description:

This project is designed to include 300 dwelling units including an affordable component in a community where people can live and work.

The development is arranged to respond to the constraints and opportunities presented by its surroundings. The main entrance is off Johnson Drive. This provides great visibility from the Highway 101. The site will be lushly landscaped, feature decorative paving and planting to entice the motorist.

The proposed project is bounded by commercial sites to the north, and west. To the east is agricultural developed land; however this site borders the east end of San Buenaventura. The adjacent site to the east is outside of San Buenaventura. The south edge of the site borders Highway 101.

The buildings are designed with three stories over semi-subterranean parking. A main drive runs through the site past a 3,500 square foot clubhouse with attendant. The residential buildings front on this main drive or perimeter view opportunities as appropriate.

The typical building has eighteen dwelling units. These apartments include one bedroom, and two bedroom configurations.

LOT AREA

Notes:

- Overall residential growth is based on 0.88% annual growth through 2025. Overall non-residential growth is based on estimates provided by Stanley R. Hoffman Associates, Inc. All unit and square footage numbers are estimates of how future growth may be distributed based on available land, local land use practices, and recent Council and community direction and preferences. All figures are for analytical purposes only. The actual distribution of future growth in the City may vary based on market forces and other factors. Both the districts/corridors and expansion areas could accommodate more development and/or a different mix of development.
- The distribution of growth in the districts and corridors is based on the following general assumptions: (a) The Downtown area and, to a lesser extent, the Ventura Avenue corridor will be the focus of future residential and commercial growth; (b) the Arundell, North Avenue, and Upper North Avenue areas will be the focus of future industrial growth; (c) other districts and corridors will not be the focus of growth, but will accommodate a certain amount of growth over time. When possible, knowledge of possible future plans or land availability has been used to estimate future growth. For example, the estimates of growth in the Downtown and Harbor Districts are based on the Downtown Specific Plan and Master Plan and staff knowledge of likely projects. Growth estimates for the Arundell community consider the likely development of the 75-acre McGeeth property with a mix of uses and development of other vacant lands. Growth estimates for the Auto Center area consider the possibility of a "big box" retailer in that area.
- Estimates of growth in the SO/Other Infill sites are based on the following general assumptions: (a) 101/126 Orchard site will develop similarly to a project recently proposed for that site; (b) Wells/Salicoy sites will develop in accordance with ongoing planning efforts for those areas; (c) the Pierpont area will develop generally in accordance with a conceptual project recently considered by the City; (d) Second Units will be added at a rate of 15/year; (e) roughly half of underutilized lands identified in the Housing Element will be re-developed over the next 20 years; (f) all vacant lands outside the districts and corridors will be developed in accordance with the proposed land use designations.
- Planned and Pending Developments based upon the City's 2004 Planning and Pending Developments list. Building areas do not include self storage facilities.
- Expansion area totals are conceptual estimates that encompass a mix of uses and residential densities.
- The following potential projects not included in the 2004 Planned and Pending Developments list have been included in the future development totals: (1) 150,000 square feet of industrial development in the Auto Center area; (2) 165,000 square feet of retail development along Wells Road in the Salicoy area; (3) 50,000 square feet of office development on a 3.5-acre site along Ralston Drive. The Auto Center industrial project is included in the Auto Center district; the other two projects are included in the "vacant" category. The square footage associated with these projects has been added to the projections of future growth to provide a "worst-case" analysis of possible future impacts.

Letter 4

COMMENTERS: Carol Schwartz and Demetrius Zeigler, Casden Properties, LLC

DATE: June 14, 2005

RESPONSE:

The commenters state concerns that their project near the northeast corner of the Johnson Drive/North Bank Drive intersection was not reflected in the Draft EIR and note that the development potential for the Johnson Drive corridor identified in the Draft EIR is lower than for their project. The commenters also attach a letter describing their proposal and how it relates to various City development goals and requesting an amendment to the development "allocation" for the Johnson Drive corridor.

It is not the intent of the Draft EIR to identify or analyze the impacts of specific development proposals. As discussed in Section 1.0, *Introduction*, the Draft EIR is intended to meet the requirements of a Program EIR, which is prepared on a series of actions (such as a General Plan) that may be characterized as one large project. By design, a Program EIR is more conceptual in nature than a Project EIR and contains a more comprehensive discussion of impacts, alternatives, and mitigation measures. Once a Program EIR has been prepared, subsequent activities within the program (such as individual development proposals) must be evaluated to determine whether an additional CEQA document needs to be prepared.

The development totals used in the Draft EIR, as reflected in Appendix C of the Draft EIR, should not be interpreted as "allocations" of growth for individual districts, corridors, or neighborhood centers. Rather, they are estimates of the distribution of future growth within the Ventura Planning Area based on direction from the City Council, ongoing development trends in the City, and other factors. The estimates for individual districts, corridors, and neighborhood centers are not intended to serve as growth caps for those areas, but rather, were developed for analytical purposes only in order to estimate the overall effects of projected citywide growth through 2025. In no case do the estimates of projected growth for an individual district, corridor, or neighborhood center reflect the maximum growth potential for that district, corridor, or neighborhood center. Actual growth within each district, corridor, and neighborhood center may be higher or lower than projected in the Draft EIR. Individual developments will need to undergo separate environmental review on a case-by-case basis to determine their specific impacts.

In response to several comments on the Draft 2005 General Plan and Draft EIR, a table will be added to the General Plan that will show the carrying capacity of the total land area for the Plan. This table is intended to show what the total development potential is versus the realistic estimates provided in the original table (May Draft Overview, Table 2, pages 14 & 15).

Re: Correction to Assessor's Parcel Number referenced in 2005 General Plan EIR – Page 6-17, paragraph 6.6.1., lines 5 & 6.

I have noticed a typographical error in the 2005 EIR of the Assessor's Parcel Number for my property located at 1456 Alelia Street in Saticoy.

My parcel is incorrectly identified as 90-043-13. The correct APN is 90-143-13.

Two additional APN's should also be referenced. The Southerly extension of Alelia Street has been abandoned by the County of Ventura and the acreage deeded back to myself and the property owner to the West - APNs 90-142-14 & 90-143-17. Please see the enclosed platt map.

Therefor, all four APN's should be referenced in paragraph 6.6.1 as follows: APNs 90-142-11, 90-142-14, 90-143-13 and 90-143-17.

Thank you for your assistance in this matter.

Respectfully,

Charles W. Rogers
Owner APNs 90-143-13 & 90-143-17

Enclosures:
Platt map
2005 EIR page 6-17

Like 2005 General Plan Scenarios 2-6, this alternative would generally be consistent with most regional land use plans and policies. This alternative would pose the same potential conflict with the Guidelines for Orderly Development associated with Scenario 5, but would not pose the potential conflict with Coastal Act policies pertaining to the preservation of Prime farmland that would occur under Scenarios 2 and 3.

Population and Housing

Population and housing growth would be similar to that of General Plan Scenarios 2-6. The 2025 population is projected to exceed SCAG and Ventura County AQMP forecasts. As with the 2005 General Plan scenarios, implementation of this alternative would be expected to maintain a balance of jobs and housing in the City.

6.6 INTENSIFICATION/REUSE + MINOR MAP CLEAN-UP

6.6.1 Description

This alternative is a variation of 2005 General Plan Scenario 15, the Intensification/Reuse Only scenario. The purpose of this alternative is to address three minor map clean-up issues identified following receipt of City Council direction on the recommended 2005 General Plan land use map. The first of these involves the re-designation of approximately five acres along the south side of Rosal Lane in the unincorporated area of Saticoy (APNs 90-142-11 and 90-043-13) that are designated "Industrial" on the draft General Plan land use map, but are designated "Residential Two Family" in the County of Ventura's Saticoy Area Plan. To achieve consistency with the Saticoy Area Plan, these lots would be redesignated "Residential Medium Density" under this alternative. The second change involves properties located on the Westside between Ramona (north), Simpson Street (south) and straddling Sheridan Way. This map change would include changing the proposed land use designation from low to high density residential to be consistent with the neighborhood and existing uses on the properties. A third change involves properties located in the Simpson Historic District located to the south of Simpson Street in generally the same area. The land use map would be changed from high to medium density, which is consistent with existing development in the Simpson Historic District and would generally allow 2 units per parcel.

90-143-13

Other than the three changes described above, this alternative is identical to 2005 General Plan Scenario 1. An estimated 8,300 residential units are projected to be added through 2025.

6.6.2 Impact Analysis

Other than issues pertaining to land use compatibility (aesthetics, noise, hazards), this alternative's impacts would be identical to those of Scenario 1. Re-designation of the five-acre area in Saticoy may incrementally increase the potential for compatibility conflicts with existing and future industrial uses in the area as properties to the south are designated "Industrial." However, potential conflicts relating to lighting, noise, and hazards can be addressed through appropriate design, including, if necessary, the construction of solid block walls between residential and industrial uses. In addition, it should be noted that the properties along the north side of Rosal Lane, immediately across the street, are designated "Residential Medium Density." As such, developing the site along the south side of Rosal Lane with residential uses

Letter 5

COMMENTER: Charles W. Rogers, Owner APNs 90-143-13 and 90-143-17

DATE: June 20, 2005

RESPONSE:

The commenter notes that the assessor's parcel numbers for the site along the south side of Rosal Lane in Saticoy that would be re-designated "Residential Medium Density" under the "Intensification/Reuse + Minor Map Cleanup" alternative discussed in Section 6.0, Alternatives, are incorrectly identified. In response to this comment, the first paragraph under the "Description" of that alternative on page 6-17 will be amended to read as follows (changes are underlined):

This alternative is a variation of 2005 General Plan Scenario 5, the Intensification/Reuse Only scenario. The purpose of this alternative is to address three minor map clean-up issues identified following receipt of City Council direction on the recommended 2005 General Plan land use map. The first of these involves the re-designation of approximately five acres along the south side of Rosal Lane in the unincorporated area of Saticoy (APNs 90-142-11, 90-142-14, 90-143-13, and 90-143-17) that are designated "Industrial" on the draft General Plan land use map, but are designated "Residential Two Family" in the County of Ventura's Saticoy Area Plan. To achieve consistency with the Saticoy Area Plan, these lots would be redesignated "Residential Medium Density" under this alternative. The second change involves properties located on the Westside between Ramona (north), Simpson Street (south) and straddling Sheridan Way. This map change would include changing the proposed land use designation from low to high density residential to be consistent with the neighborhood and existing uses on the properties. A third change involves properties located in the Simpson Historic District located to the south of Simpson Street in generally the same area. The land use map would be changed from high to medium density, which is consistent with existing development in the Simpson Historic District and would generally allow 2 units per parcel.

This minor text correction does not change the EIR conclusions or result in any significant impacts not identified in the Draft EIR. The change in land use would not create any significant land use conflicts that could not be addressed through site design.

Subj: 2005 General Plan Draft Environmental Impact Report Review Comments

1. A review of the General Plan Draft Environmental Impact Report June 2005, Section 4.13, UTILITIES & SERVICE SYSTEMS, was conducted and resulted in development of the following comments.

A. Page 4.13-1, of the General Plan Draft Environmental Impact Report¹ states "An operational evaluation prepared as part of the 1993 City Water Master Plan provides a detailed analysis of the water system and future needs.", however, the Water System Operational Evaluation & Improvement Program Report² findings are not discussed and has not been updated to reflect current conditions of the water system, sources of water supply or the population being served by the water system.

A

B. The General Plan Draft Environmental Impact Report does not address: historic or future water consumption by category; the impact of drought conditions on the yield of existing water sources; or the potential future water source requirements. Page 4.13-9 of the General Plan Draft Environmental Impact Report³ identifies the City of Ventura Historic and Projected Water Production⁴ and is based on the 2004Biennial Water Supply Report⁵. The water system analysis contained in the 2004Biennial Water Supply Report⁶ does not address: 1) historic or future water consumption by category⁷; 2) the impact of drought conditions on the yield of existing water sources⁸; or 3) the potential future water source requirements⁹. A graph of the annual rainfall data for Ventura Station 66 obtained from the Ventura County Watershed Protection District for the period 1892-2001 is attached for information as Figure 1. The graph shows a trend for above average rainfall began in 1991.

B

² Water System Operational Evaluation & Improvement Program, June 1993

³ General Plan Draft Environmental Impact Report June 2005

⁴ General Plan Draft Environmental Impact Report, Historic and Projected Water Production, Table 4.13-8

⁵ 2004Biennial Water Supply Report, September 2004

⁶ 2004Biennial Water Supply Report, September 2004

⁷ Water System Operational Evaluation & Improvement Program Historic Water Consumption Summary, Table ES-2

⁸ Water System Operational Evaluation & Improvement Program Potential Yield of Existing Water Sources, Table ES-8

⁹ Water System Operational Evaluation & Improvement Program Potential Future Water Source Requirements, Table ES-10

Figure 1 – Total Annual Rainfall and Cumulative Deviation from Annual Average Rainfall for Ventura Station 66 for the Period of 1892-2001.

C. Page 4.13-9 of the General Plan Draft Environmental Impact Report¹⁰ identifies the City of Ventura Historic and Projected Water Production¹¹. The projected future treated water production requirements are computed from a constant per capita water usage of 0.179 and the expected population being served. There appears to be a discontinuity in the Years 1989-1991 between the per capita water usage data contained in the Water System Operational Evaluation & Improvement Program Historic Water Demand Trends, Table ES-1¹² and General Plan Draft Environmental Impact Report, Historic and Projected Water Production, Table 4.13-8¹³. Chart of the annual per capita water usage contained in 1993 Water Report and 2005 DEIR are contained in Figures 2 and 3. It is recommended this discontinuity in the per capita water usage between the 1993 and 2004 Water Reports be explained in the DEIR.

¹⁰ General Plan Draft Environmental Impact Report June 2005

¹¹ General Plan Draft Environmental Impact Report, Historic and Projected Water Production, Table 4.13-8

¹² Water System Operational Evaluation & Improvement Program Historic Water Demand Trends, Table ES-1

¹³ General Plan Draft Environmental Impact Report, Historic and Projected Water Production, Table 4.13-8

Figure 2 – Comparison of Per Capita Water Usage Data contained in the Water System Operational Evaluation & Improvement Program Historic Water Demand, Table ES-1¹⁴ and General Plan Draft Environmental Impact Report, Historic and Projected Water Production, Table 4.13-8¹⁵.

Figure 3 – Trend Lines for Annual Per Capita Water Usage Data contained in 1993 Water Report and 2005 DEIR.

D. Furthermore, a detailed trend analysis of the per capita water usage between the years 1991 and 2004 reveals a increase in 0.0028 A-F per capita per year which is not factored into future treated water requirements and is shown in Figure 4. The General Plan Draft Environmental Impact Report, Projected Water Demand, Intensification/Reuse Only, Table 4.13-15¹⁶ appears to use 0.504 A-F per year water use per unit which equates to a 0.196 A-F per capita per year based on an occupancy of 2.57 persons per dwelling unit. A need for an additional source of water can be expected to meet treated water needs between the years 2020 and 2025 and is shown in Table 1 if the projected annual increase in per capita water usage is used to compute future requirements. The potential requirement for future water sources depends on several factors including the anticipated long-term yield of existing water sources under

Potential Future Water Sources Requirements

The quantity of water needed by the City from new sources depends on several factors, including the anticipated long-term yield of existing water sources under varying weather conditions, potential future water demands in the system, which potential future water sources are implemented, and water quality goals. Even without improving the quality of water provided to the customers, additional water is needed now and in the future just to meet quantity deficits in dry years. Table ES-10 summarizes the water quantity needs for future demand conditions based on potential yields from existing sources only. As shown in the table, water quantity deficits are anticipated in all future dry years, and in average years by 2040. Dry year deficits would be approximately 4,500 acre-feet in 1995 and approximately 7,000 acre-feet per year by 2010. Additional water quantities beyond those indicated would be needed to improve water quality.

Figure 4 - Water System Operational Evaluation & Improvement Program
Potential Future Water Sources Requirements, Page ES-16

E. Page 4.13-9 of the General Plan Draft Environmental Impact Report¹⁸ identifies the City of Ventura Historic and Projected Water Production¹⁹. The projected future treated water production requirements are computed from a constant per capita water usage of 0.179 and the expected population being served. There appears to be a discontinuity in the Years 1989-1991 between the treated water used data contained in the Water System Operational Evaluation & Improvement Program Historic Water Demand Trends, Table ES-1²⁰ and General Plan Draft Environmental Impact Report, Historic and Projected Water Production, Table 4.13-8²¹. Chart of the treated water used contained in 1993 Water Report and 2005 DEIR are contained in Figure 5. It is recommended this discontinuity in the treated water requirements between the 1993 and 2004 Water Reports be explained in the DEIR.

Figure 5 – Chart of Treated Water Used.

11/22/09

1/ Total production is all water produced or delivered from City sources; AF = acre feet.
 2/ Untreated water use is oil company and agricultural water use in the North Ventura Avenue area (CMWD direct + Kingston effluent).
 3/ Treated water use is total production less untreated water use.
 4/ Maximum day demand is based on treated water production (Doll Course Wells + Sycroy Well + Victoria Well + CMWD #2 + A's MWD + Power effluent + Valley Vista BPS); MGD = million gallons per day.
 5/ Peaking factor for maximum day demand is related to average day demand.
 6/ Estimated water population is the approximate population served by the water system; this is slightly higher than the population within the City limits (see Table 5).
 7/ N/A = data not available.
 8/ Per capita use factor is treated water use divided by population.
 City-wide annual rainfall averaged from four rainfall stations: Downtown, Avenue 10, Hill Canyon, and the County Government Center.

^{1/} Data is from City water consumption billing records (AF = acre feet).
^{2/} Consumption categories are from City billing data base.
^{3/} Water loss is the difference between total production and total consumption; the 1987 figure of 188 AF is an anomaly due to meter read cycles.

Water System Operational Evaluation & Improvement Program Historic Water Consumption Summary, Table ES-2

TABLE ES-8

POTENTIAL YIELD OF EXISTING WATER SOURCES

Existing Source	Potential Long-Term Yield (acre-feet) ^{1/}			Projected Water Quality (mg/l TDS) ^{2/}
	Wet Year	Avg Year	Dry Year	
Ventura River	11,000	6,700	700	660
Lake Casitas ^{3/}	7,090	7,090	4,960	450
Oxnard Plain Basin ^{4/}	4,090	4,090	4,090	1,100
Santa Paula Basin	3,000	3,000	3,000	1,000
Mound Basin	<u>6,000</u>	<u>6,000</u>	<u>6,000</u>	2,100
Total	31,180	26,880	18,750	

- 1/ Potential long-term (year 2010) yield of existing sources per the Long-Term Sources Evaluation study. Some of the existing sources require additional production facilities to provide the potential yields shown. Assumes groundwater safe yields extracted in wet, average, and dry years.
- 2/ Projected water quality is the average TDS for the past five years, except for the Mound Basin where quality is expected to continue to deteriorate from current levels.
- 3/ Lake Casitas yield is the City's Stage 2 annual allocation for wet and average years, and Stage 5 allocation (70% of Stage 2 allocation) for dry years.
- 4/ Oxnard Plain Basin long-term yield (year 2010 and beyond) is 75% of GMA baseline allocation (yield decreases in 5% steps from baseline beginning in 1992).

Water System Operational Evaluation & Improvement Program Potential Yield of Existing Water Sources, Table ES-8

TABLE ES-10

**POTENTIAL FUTURE WATER SOURCE REQUIREMENTS
(For Annual Water Quantity Needs Only -
Quality Needs Are Not Included)**

Study Year	Total Demand ^{1/}	Potential Yield from Existing Sources ^{2/}			Net Supply (Deficit) ^{3/}		
		Wet Yr	Avg Yr	Dry Yr	Wet Yr	Avg Yr	Dry Yr
1995	24,027	31,990	27,690	19,560	7,963	3,663	(4,467)
2000	24,280	31,720	27,420	19,290	7,440	3,140	(4,990)
2010	25,732	31,180	26,880	18,750	5,448	1,148	(6,982)
2040	30,959	31,180	26,880	18,750	221	(4,079)	(12,209)

1/ From Table ES-4 (all values in table are in acre-feet).

2/ From Table ES-8 and including GMA stepped reductions of Oxnard Plain Basin sources (5% reduction increments in 1995, 2000, 2005, and 2010). Some of the existing sources require additional production facilities to provide the potential yields shown.

3/ Total existing source capacity less total demand.

Conjunctive Use of Sources

One of the recommendations of the Long-Term Sources Evaluation study is to increase the overall yield of existing water sources by implementing a conjunctive use operating procedure. This procedure would involve utilizing surface waters (Ventura River, Lake Casitas, and SWP) during wet years to the fullest extent possible while letting groundwater sources rest. During dry years when the surface water source yields are reduced, the groundwater sources can be pumped to meet remaining demands. Production facilities for the additional dry year extractions would be required. This approach can also be implemented if desalinated seawater is chosen by conjunctively using groundwater and Ventura River and Lake Casitas water.

Conjunctive use of the City's existing groundwater sources is limited by the requirement to maintain long-term production from the groundwater basins within their safe yields. The total safe yield of existing groundwater sources is estimated to be approximately 13,000 acre-feet per year in the year 2010. The Oxnard Plain and Mound Basins are recommended to be conjunctively used, because both basins have large storage and transmissivity capacities. The Oxnard Plain Basin also has an accounting system in place per the GMA ordinances.

In order for conjunctive use of existing groundwater sources to be feasible, a long-term balance between wet, average, and dry year conditions must occur. Beginning a conjunctive use program after an extended dry period is not recommended, because groundwater levels have been reduced and require several wet years to bring levels back to normal conditions.

W:\0171\CAN7.qxd

Potential Future Water Sources Requirements

The quantity of water needed by the City from new sources depends on several factors, including the anticipated long-term yield of existing water sources under varying weather conditions, potential future water demands in the system, which potential future water sources are implemented, and water quality goals. Even without improving the quality of water provided to the customers, additional water is needed now and in the future just to meet quantity deficits in dry years. Table ES-10 summarizes the water quantity needs for future demand conditions based on potential yields from existing sources only. As shown in the table, water quantity deficits are anticipated in all future dry years, and in average years by 2040. Dry year deficits would be approximately 4,500 acre-feet in 1995 and approximately 7,000 acre-feet per year by 2010. Additional water quantities beyond those indicated would be needed to improve water quality.

Water System Operational Evaluation & Improvement Program Potential Future Water Sources Requirements, Page ES-16

**Table 2-3
Population and Housing Projections**

	2004 Levels ^a	2025 Estimates		Change from 2004-2025	
		0.88% Annual Growth	1.14% Annual Growth	0.88% Annual Growth	1.14% Annual Growth
Population	104,952	126,153	133,160	21,201	28,208
Housing Units ^b	40,880	49,138	51,867	8,258	10,987

^a Source: California Department of Finance, City/County Population and Housing Estimates, 1/1/2004. Note that 2004 data are used as the baseline because 2005 data were not available when the EIR was initiated in Fall 2004; 2005 population and housing estimates are provided in Table 3-1 in Section 3.0, Environmental Setting.

^b Housing unit estimates assume that the current ratio of 2.57 persons per household remains constant through 2025. In reality, the number of persons per unit could go up or down, depending upon housing costs, the types of housing built in the City, population growth, and other factors.

2003	6,722	4,874	5,546	2,898	316		20,356
Projected Supply							
2004	6,700	8,000	4,200	4,600	3,000	0	26,500
2009	6,700	8,000	4,200	4,400	3,000	2,262	28,562
2014	6,700	8,000	4,200	4,100	3,000	2,262	28,262

Notes:

1. Ventura River future supply is the average long-term production based on analysis of the period from 1939 to 1982 per the Evaluation of Long Term Alternative Water Sources, James M. Montgomery, June 1993.
2. Includes the City's total past Casitas purchases in addition to raw water and oil recovery users; projected supply is the City's current in-district use.
3. Mound Basin future supplies are 75 percent of well pump rated output.
4. Oxnard Plain Basin future supply is based on GMA restricted extraction limits rounded to nearest 100 AF.
5. Santa Paula Basin future supply is the pumping allocation of the Stipulated Judgement.
6. Saticoy Yard Well future supply is 75 percent of design maximum pump output capacity.
7. Includes treated and raw water; excludes reclaimed water supply.

Letter 6

COMMENTER: Daniel Cormode

DATE: June 19, 2005

RESPONSE:

Response 6A

The commenter states that the Draft EIR does not provide updated information on the water system from the 1993 Water Master Plan. The current water system is described on pages 14.13-1 through 4.13-7 based on updated information provided by City Public Works Department staff. The 1993 Water Master Plan is incorporated by reference in the Final EIR.

Response 6B

The commenter states that the Draft EIR does not address historic or future water source by category, the impact of drought conditions on the yield of existing water sources, or potential future water source requirements. Detailed historic water consumption by land use category is not available. Detailed future consumption by area and by land use category is provided in Tables 4.13-15 through 4.13-20 for Scenarios 1 through 6, respectively. Potential sources of supply are shown in Table 4.13-7 and the entire discussion under Impact U-1 compares projected future water demand to available supply. The Biennial Water Supply Report included in Appendix F includes discussion of various City programs that augment City supplies under drought conditions. A detailed analysis of available water supply during various drought conditions will be undertaken as part of the City's Urban Water Management Plan, which must be updated in years ending in zero and five. Demand projections from the various scenarios were, however, compared to those of the 2000 UWMP and all were below those projections.

Response 6C

The commenter suggests that the Draft EIR estimates future water demand based on a constant per capita rate and notes that per capita water consumption has risen since 1991. The projections of future water demand contained in Section 4.13 of the Draft EIR are not based upon a per capita rate, but rather are based upon water demand factors for the various uses anticipated under the 2005 General Plan. Therefore, the fact that per capita consumption may have increased slightly does not affect the water demand projections or conclusions regarding the availability of water supply.

Future water demand was not projected based on a per capita rate, but rather was projected based on typical rates for the uses anticipated to be developed through 2025. Therefore, the current per capita rate from the Biennial Report (which includes all water demand associated with all uses) cannot be compared only to the demand associated with future residential development. Instead, it should be compared to the entire projected demand associated with all uses. For comparison purposes, the increase in annual water demand for Scenario 6 is estimated at 7,611 acre-feet, while the projected population increase for that scenario is 28,208

(as shown in Table 2-3 in Section 2.0, *Project Description*). This equates to a per capita rate of 0.269 acre-feet per person (7,611/28,208). Other scenarios would yield similar per capita consumption.

The projected per capita rate of 0.269 acre-feet per year is about 50% higher than the current citywide per capita rate of 0.179 acre-feet per year. Therefore, water demand associated with future development has been projected based upon a conservative estimate of per capita water consumption. The estimates of overall citywide water demand in 2025 are conservative not only because of the high per capita rate assumed, but also because the baseline citywide water demand assumed for all scenarios is the highest water use from the past five years (21,500 acre-feet per year).

Subj: 2005 General Plan Draft Environmental Impact Report Review Comments

Ref: (a) Daniel Cormode ltr re: 2005 General Plan Draft Environmental Impact Report Review
Comments dated 19 June 2005

1. A review of the General Plan Draft Environmental Impact Report June 2005, Section 4.13, UTILITIES & SERVICE SYSTEMS, was conducted and comments were contained in reference (a)/
2. Additional comments are forwarded relative to review of the subject document.
3. The subject document does not adequately address the impact of a prolonged drought and the adequacy of water resources to supply the required water under those conditions.
4. During the April 1986 through January 1991, the volume of water stored in Lake Casitas decreased by 48% from 254,800 A-F to 129,173 A-F and is shown in Figure 1.

Data Source:

California Department of Water Resources, Division of Flood Management, June 2005 Lake Casitas
Figure 1 – Lake Casitas Water Storage (A-F)

5. It is highly probable that additional droughts can be identified from the examination of rainfall data for the years 1891-2001 for Ventura Station 66 shown in Figure 2. Droughts of 8 years probably occurred during the years 1893-1905, 1918-1925 and 1944-1951 and a 5 year drought occurred during 1986-1990.

Data Source: Ventura County Watershed Protection District, 2003, Ventura Station 66
Figure 2 - Annual and Cumulative Deviation from Average Rainfall for Ventura Station 66

6. Drought conditions also impact the ability of the City to pump water from the Ventura River basin. And increase the load on the Oxnard and Mound aquifers and i9s shown in Figure 3. The DEIR does not discuss the ability of the aquifers to supply water during prolonged drought conditions.

Data Source: Developed from City fo San Buenaventura, Public WorksDepartment, Utilities Division, June 2005 Source Data

SOURCE PRODUCTION - DATA IN ACRE FEET

COMMENTER: Daniel Cormode

DATE: June 23, 2005

RESPONSE:

The commenter states an opinion that the Draft EIR does not adequately address the impact of a prolonged drought and the adequacy of water resources to supply the required water under those conditions. As stated in responses to Letter 6 (the commenter's June 19, 2005 letter), the Biennial Water Supply Report included in Appendix F discusses various City programs that augment City supplies under drought conditions. The impact of drought on the ability of the water supply system, including the management of surface and groundwater storage, is addressed in the City's Urban Water Management Plan, which is updated in years ending in zero and five. It should also be noted that any future development of more than 500 dwelling units would also be subject to the requirements of Senate Bills 221 and 610, which require a Water Supply Assessment and Verification Report that must address drought conditions.

Subj: 2005 General Plan Draft Environmental Impact Report (DEIR) Review Comments

Ref: (a) Daniel Cormode e-mail of 20 May 2001

1. The subject DEIR identifies impacts to fire services, police services, traffic; circulation, storm drain systems and schools which will required additional funding. Some of those mitigation measures will require public finding as they will benefit the general population and other mitigation measures having direct impact as a result of the development require funding by developer. These magnitude of these economic impacts do not appear to be discussed in either the proposed 2005 General Plan nor the subject DEIR.

2. It is recommended discussion of the following relevant economic/fiscal elements identified in the State of California General Plan Guideline be adequately addressed in the subject DEIR and discussion should be contained therein. Those elements include discussing:

a. Fiscal Stability, including existing and potential revenue resources, costs of services and facilities and economic forecasts.

b. Budgetary Structure, including: existing outlays to departments, services and comparable revenue recoupment mechanisms and levels; and comparison of facility and services versus efficiency of providing the programs.

3. For additional information, please contact me by telephone at 805-647-4063 or by e-mail at dcormode@sbcglobal.net.

Subj: Economic Development Issue Paper
Date: 5/20/01
To: merrymanwcc@aol.com
CC: sandmand@pacbell.net
BCC: ttanda@pacbell.net

Margaret,

At the 16 May 01 CPAC Meeting, an Economic Development Issue Paper for the City of San Buenaventura Comprehensive Plan was presented to members of the Comprehensive Plan Advisory Committee (CPAC).

The presentation stated that Economic Development Goals and policies can assist the City in achieving its overall Vision by:

- Guiding economic revitalization in key areas of the community;
- Presenting new economic options for development at key entry points to the City;
- Promoting the City's economic potential to achieve regional prominence, strengthen the economic base of the City, and stimulate other economic investments in the community;
- Seeking to minimize sales tax "leakage" to surrounding areas and increase fiscal benefits;
- Providing a healthy climate to encourage economic investments in the community;
- Emphasizing training and job opportunities for local workers;
- Providing a choice of housing opportunities commensurate with job growth;
- Maintaining a high level of public services and infrastructure for residents and businesses; and
- Actively pursue opportunities for a more balanced economic base in all focus areas.

What is missing from both the above presentation and the Vision, are identification, and potential cost if applicable, of:

- Key areas of the City requiring revitalization;
- The type of revitalization required for each key area;
- Specific economic options;
- Key entry points to the City;
- The economic potential of the City through an economic model or other measurable statistical analysis tool;
- The ability for the City to sustain itself economically, both currently and in the future, based on City infrastructure maintenance and support requirements;
- The climate needed to encourage economic investment in the City;
- Training and job opportunities for local workers;
- Types of housing opportunities available;
- Areas of current/expected job growth;
- Current/Future public services and infrastructure requirements by both residents and business; and
- opportunities for a more balanced base.

Furthermore, I feel the data contained in the presentation did not clearly relate to the following relevant economic/fiscal elements identified in the State of California General Plan Guidelines:

- Business retention and development by sector;
 - Identification of the needs, limitations and alternatives to existing businesses;
 - Identification of potential improvements and strategies which would encourage business retention;
- Employee Development

- Areas of employment growth, shortages and needs;
- Business Recruitment:
 - Relevant issues concerning the types, number, and success of existing and potential recruitment strategies.
 - Identification of those businesses which would be compatible with the objectives of the general plan and consistent with the carrying capacity of the land and infrastructure.
- Fiscal Stability
 - Includes existing and potential revenue resources, costs of services and facilities and economic forecasts.
- Budgetary Structure
 - Existing outlays to departments, services and comparable revenue recoupment mechanisms and levels.
 - Comparison of facility and services versus efficiency of providing the programs.

Recommend the above concerns be either placed on the CPAC meeting agendas for discussion or forwarded on to City Staff for action as appropriate.\

R/

Daniel Cormode

Excerpts fro Draft EIR

- **Storm Drain System** - potential impacts due to system deficiencies in older parts of the City, including Ventura Avenue corridor and Downtown district (all scenarios); this impact can be mitigated through development of funding mechanisms to address system deficiencies

- **Fire Protection Service** - potentially significant impacts to fire protection service in the North Ventura Avenue area (Scenarios 2-6); this impact can be mitigated through development of a new fire station in the North Ventura Avenue area

- **Police Protection Service** - potentially significant impacts relating to the need for new facilities (all scenarios); this impact can be mitigated through expansion of facilities as necessary

- **Traffic Performance Standards** - potentially significant impacts to roadway intersections (Scenarios 1, 3, 4, 5, and 6); impacts can be mitigated through policies and actions directing implementation of feasible system improvements as needed

<p>Impact HWQ-2 Development accommodated through the year 2025 under any of the land use scenarios under consideration for the 2005 General Plan would increase the amount of impervious surfaces within the Planning Area, potentially increasing surface runoff in areas where existing storm drain systems are deficient. This is considered a Class II, significant but mitigable, impact for all scenarios.</p>	<p>HWQ-2 Additional Drainage Actions. The following actions shall be added to the 2005 General Plan to address existing storm drain system deficiencies:</p> <ul style="list-style-type: none"> • Develop a financing program for the replacement of failing corrugated metal storm drain pipes in the City. • Adopt assessment districts or other financing mechanisms to address storm drain system deficiencies in areas where new development is anticipated and deficiencies exist (e.g., Downtown district, Ventura Avenue corridor, and Harbor district). 	<p>Less than significant for all scenarios.</p>
---	---	---

<p>Impact PS-1 Development under any of the 2005 General Plan land use scenarios would increase the City's population and density of development, and introduce new development into high fire hazard areas. This would increase demand for fire protection services and potentially create the need for new fire protection facilities. With proposed General Plan policies, impacts for Scenario 1 are Class III, less than significant. Impacts for Scenarios 2-6 are considered Class II, significant but mitigable.</p>	<p>PS-1(a) North Avenue and Western Cañada Large Expansion Areas. The following action shall be added to the 2005 General Plan if any land use scenario that includes possible future development of the North Avenue expansion area or the Western Cañada Large expansion area is adopted:</p> <ul style="list-style-type: none"> • Add a fire station in the North Avenue area as determined necessary by the Ventura Fire Department. Consider an assessment district for the North Avenue area to fund a new station. <p>PS-1(b) Poinsettia Expansion Area. The following action shall be added to the 2005 General Plan if any land use scenario that includes possible future development of the Poinsettia expansion area is adopted:</p> <ul style="list-style-type: none"> • Include a fire station site in any future specific plan for the Poinsettia expansion area if determined necessary by the Ventura Fire Department. 	<p>Less than significant for all scenarios.</p>
---	---	---

<p>Impact PS-2 Possible future development under Scenarios 1-6 would increase the City's population and density of development, thereby resulting in the need to construct new facilities in order to provide effective police protection service. Impacts would be Class II, significant but mitigable, for any of the six land use scenarios.</p>	<p>PS-2 Police Protection Service. The following actions shall be added to the 2005 General Plan:</p> <ul style="list-style-type: none"> • Establish a new Downtown storefront to meet the needs of the growing Downtown population • Expand the Police Department headquarters as necessary to accommodate staff growth. 	<p>Less than significant for all scenarios.</p>
--	--	---

<p>Impact PS-3 Projected enrollment growth under the 2025 General Plan would exceed the capacity of existing schools within the Ventura Unified</p>	<p>None required, but the following are recommended:</p> <p>PS-3(a) School Coordination. The</p>	<p>Less than significant for all scenarios.</p>
<p>School District, thereby creating the need to construct additional facilities. However, payment of State-mandated school impact fees is presumed to provide funding for needed new school facilities. Therefore, although available land for new schools may be limited (particularly for Scenarios 1 and 5), impacts to schools would be reduced to a Class III, less than significant, level for any of the six land use scenarios.</p>	<p>following action should be added to the 2005 General Plan:</p> <ul style="list-style-type: none"> • Coordinate with the Ventura Unified School District to ensure that school facilities can be provided to serve new development. <p>PS-3(b) Expansion Area Schools. The following action should be added to the 2005 General Plan if any land use scenario that includes an expansion area is adopted:</p> <ul style="list-style-type: none"> • Require expansion area specific plans to be prepared in coordination with the Ventura Unified School District and set aside land needed for new school facilities. 	

<p>Impact TC-1 Growth accommodated under any of the General Plan land use scenarios could result in deficiencies to the local circulation system based on recommended level of service standards. The number of locations that could have deficiencies based on the projected growth scenarios ranges from one (for Scenario 1) to four (for Scenarios 2 and 4). Feasible improvements are available to address all projected deficiencies for Scenarios 1, 3, 4, 5, and 6; therefore, impacts associated with those scenarios are considered Class II, significant but mitigable. For Scenario 2, implementation of feasible improvements would not achieve performance standards at the Johnson Drive/North Bank Drive intersection. The impact at that location is considered Class I, unavoidably significant, for Scenario 2.</p>	<p>To ensure that impacts are addressed and that the improvements identified in this EIR (or other feasible improvements that achieve the same objectives) are identified, the following measure is required:</p> <p>TC-1 Additional Circulation Action. The following action shall be added to the 2005 General Plan to ensure that traffic impacts of future developments are addressed and mitigated:</p> <ul style="list-style-type: none"> • Require project proponents to analyze traffic impacts and implement mitigation as appropriate prior to development. Depending upon the nature of the impacts and improvements needed, mitigation may either consist of implementing needed physical improvements, contributing "fair share" fee toward implementation of needed improvements, or some combination thereof. 	<p>Less than significant for Scenarios 1, 3, 4, 5, and 6. Unavoidably significant at Johnson Drive/North Bank Drive intersection for Scenario 2.</p>

Letter 8

COMMENTER: Daniel Cormode

DATE: June 20, 2005

RESPONSE:

The commenter states an opinion that the Draft EIR should include economic and fiscal analysis relating to increased demand for police and fire service, and transportation and storm drain infrastructure. It is not the EIR's purpose to discuss environmental or fiscal effects. The purpose of the EIR is to identify and, when possible, mitigate potentially significant environmental effects, which generally relate to physical changes to the environment. Section 15131 of the *CEQA Guidelines* states that "economic or social effects of a project shall not be treated as significant effects on the environment."

Hello Charles:

I understand that granny flats is the vernacular way of describing a guest house and even is used to describe second units. My understanding is that you are asking about second units.... under the law it has this new name.. People often the two. Two Second units are exempt from CEQA under State statute. the second point is that both second units and "granny flats " do not have an impact separate and apart from any other population-- so the answer is yes, the City has taken them into account with our population projections. I will forward you to our consultant if you are asking for more detailed information.

Have a great day.

Subject: EIR

Has the EIR made any provision for the impact of the Granny Flats that have been included in the general plan? Since the implementation of the program will be impacted by the city's understanding of the resources required to build the flats, has a sensitivity analysis been done concerning alternate ways to implement the plan. Granny flats can create a lot of problems in neighborhoods with limited parking. Since residents are often using their garage for storage rather than their cars, just because a house has a garage does not mean that there is adequate parking. Since this issue can create a lot of legal issues between neighbors, how ill disputes be resolved without burdening the courts?

Charles Spraggins
Ventura, CA

Letter 9

COMMENTER: Charles Spraggins

DATE: June 26, 2005

RESPONSE:

The commenter asks whether the EIR has made any provision for “granny flats” and how disputes about parking associated with these units will be resolved. The EIR analysis assumes that up to about 300 second units will be built in the City through 2025, or about 15 units per year for 20 years. Therefore, the overall citywide impact of adding second units has been accounted for in the EIR. Any analysis of the impacts of individual second units would be speculative as the nature and magnitude of impacts would depend upon where such units are built. In any event, it should be noted that State law allows for the construction of second units in certain instances regardless of whether or not the proposed 2005 General Plan is adopted.

SUBJECT: COMMENTS TO THE DRAFT EIR

Dear Ms. Gialketsis:

We have reviewed the Public Review Draft Environmental Impact Report ("DEIR") and respectfully submit the following comments regarding the development potential identified for the Johnson Drive Corridor for City decision makers' consideration. We are concerned that the Development Potential identified in the DEIR of 150 residential units, 50,000 square feet of retail space and 20,000 square feet of office space appears to considerably understate the potential for this area.

We feel that a greater level of development should be encouraged in the Johnson Drive Corridor to better support the City's smart growth goals, and other sustainable development policies, especially with respect to the residential component. We believe that future intensification and redevelopment in the Johnson Drive Corridor, combined with future new development on available infill sites, makes the stated Development Potential in the Corridor insufficient. It is quite likely that the projected thresholds for residential and non-residential development described in the DEIR would be quickly realized on the two remaining undeveloped sites in the Corridor (both located at the intersection of Johnson and North Bank Drives). We contend that significantly increasing the intensity of residential development in the Johnson Drive Corridor would support the City's Smart Growth goals and encourage desirable development forms in this very important "gateway" corridor. Intensifying the residential development potential in the Johnson Drive Corridor would:

- 4. *Preserve open space, farmland, natural beauty and critical environmental areas.*
The Johnson Drive Corridor is adjacent to the farmland of the Serra Expansion Area being considered in the Draft EIR for future development and expansion of the City. By intensifying the development in this existing Corridor, it forestalls the development of nearby agricultural areas.

- ⊥ *Foster distinctive, attractive communities with a strong sense of place.* The Johnson Drive Corridor lacks a cohesive focus or image. The addition of a substantial, high-quality housing component would support a more diversified base of commercial establishments to better serve the corridor and the neighboring communities.
- ⊥ *Mix land uses.* Smart Growth encourages a mix of land uses both vertically and horizontally. By introducing a significant component of residential units to this commercial corridor, existing businesses can benefit from the stabilizing effect of this sizeable, adjacent customer base, while residents benefit from proximity to services and stores.
- ⊥ *Create walkable communities.* By encouraging the development of a substantial number of residential units in this corridor, we increase the opportunity for local businesses to be supported by walk-in customers. Residents will be able to walk to the movies or the nearby shops and make use of the Linear Park which runs along the perimeter of the Corridor.
- ⊥ *Create a range of housing opportunities and choices.* Because of the generally commercial nature of the corridor, a significant amount of housing would be an appropriate infill use. For example, rental product in this area would provide a much needed alternative to the for-sale product available further north on Johnson Drive.
- ⊥ *Provide a variety of transportation choices.* Intensifying the residential development in the Corridor allows an increased number of residents to benefit from proximity to the South Coast Area Transit (SCAT) bus route along Johnson Drive, Ventura Intercity Service Transit Authority (VISTA) bus stops, and easy access to the Freeway. By locating more potential commuters adjacent to the 101 Freeway, the impact of these new households on local traffic patterns would be reduced.

We understand that the City intends for the projections included with the DEIR to be assumptions for analytical purposes only, and that the Districts, Corridors and Expansion Areas could accommodate more development based on market forces and other factors. We acknowledge City staff's assertion that the Development Potential described in the DEIR is not intended as a future "cap" on development; however, we are concerned that the described Development Potential would later be perceived by members of the public (or even the City Council) as a limit to growth and, thus, constrain new residential development in this corridor otherwise ripe for infill/intensification. We fear this is a real possibility since the DEIR indicates that projected City growth was distributed among the various corridors and districts in the City "based on the development potential of each growth district and corridor and direction from the community, CPAC, Planning Commission and City Council on where growth in the community should be encouraged." Even clear language qualifying the empirical assumptions, as provided in

the footnotes to "Appendix C" of the DEIR, may do little to change the perception that the Development Potential projections are not targets or limits.

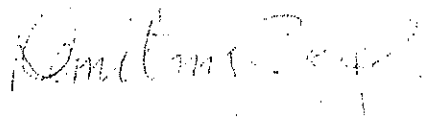

Equally concerning to us is the anticipated relationship among the DEIR, Draft General Plan and forthcoming Development Code, such that the same assumptions and projections used solely for analytical purposes in the DEIR (such as residential development potential) could become policy through the creation of the formal Development Code. In other words, those projections used solely for analysis in the Draft General Plan and DEIR could seriously limit future development opportunities if adopted into ordinance with the Development Code if the zoning density designations are derived from these figures. This could have the unintended consequence of turning the otherwise "analytical projections" into local law.

As a result of the above considerations, we respectfully recommend that the residential development potential in the Johnson Drive Corridor be revised substantially upward to accommodate the appropriate scale and quality of future housing in this key infill Corridor.

Sincerely,

Carol Schwartz

Letter 10

COMMENTERS: Carol Schwartz and Demetrius Zeigler, Casden Properties, LLC

DATE: July 7, 2005

RESPONSE:

The commenters re-state concerns about the amount of development assumed in the Draft EIR for the Johnson Drive corridor and request that the amount of development assumed for the Johnson Drive corridor be revised upward. These concerns are addressed in the response to Comment Letter 4. As the commenters acknowledge, the growth estimates included in the Draft EIR for all districts, corridors, and neighborhood centers are assumptions to be used for analytical purposes. These do not represent growth caps or restrictions and do not limit the ability of the City to approve individual projects that include more units or square footage than have been assumed in the EIR analysis. As such, there is no reason to adjust the growth estimates shown in the Draft EIR. The specific impacts of individual development projects will need to be addressed on a case-by-case basis.

In response to several comments on the Draft 2005 General Plan and Draft EIR, a table will be added to the General Plan that will show the carrying capacity of the total land area for the Plan. This table is intended to show what the total development potential is versus the realistic estimates provided in the original table (May Draft Overview, Table 2, pages 14 &15).

Subject: **Response to the Draft Environmental Impact Report for the 2005 Ventura General Plan**

On behalf of the partners of the Howard and Howard Ranch, and also, of all the farmers in the Serra area, I would like to take this opportunity to commend both Staff and the Consultants for a remarkable achievement in producing this EIR on the 2005 Draft Ventura General Plan. Having been an active citizen participant over the course of the past 5 years of this process, I am particularly gratified that so much attention was given to the issues of agriculture in the Ventura urban environment, and to the Serra area in particular. **A**

We understand that Scenario 1 – Intensification/Reuse is the first priority of the General Plan and that further discussion of the potential expansion areas, identified as Scenarios 2-6, will be postponed until after the adoption and ratification of both the General Plan and the EIR has occurred on August 8th. As owners of commercial agricultural land within the Serra area, we support this approach. However, we also agree with the statement in the General Plan (page 3-10) that “even the most successful effort to achieve community planning goals through infill may need to be supplemented at some point by expanding into areas outside the city limits.”

The Draft EIR has included the Serra area in two of the potential growth expansion scenarios, Scenario 2 (Intensification/Reuse + North Avenue + Olivas + Serra) and Scenario 4 (Intensification/Reuse + North Avenue + Serra). We are also aware that Staff has recommended “the North Avenue and Serra expansion areas as the top priority for development if future growth to the year 2025 cannot be met through infill development alone.” (Attachment D – Long-Term Potential Expansion Strategy to the General Plan). We strongly support their recommendation.

This response to the Draft EIR addresses several major concerns, contradictions, and what we believe to be errors in the content of the document, particularly as they affect the discussion of the Serra area. These points are as follows:

LACK OF CONSISTENCY IN THE MAPS (FIGURES) INCLUDED IN THE DRAFT EIR SHOWING THE SERRA AREA

The First Assembly of God Church site at the corner of Montgomery Avenue and Bristol Road

B

In November, 1999, this 25.59-acre parcel was removed from SOAR restrictions and pre-zoned to an R-1 Single Family zone with a subzone of R-1-1AC with the passage of Measure C the "First Assembly of God Land Initiative." (See Appendix F, Draft General Plan). In early 2004, the church submitted plans for the development of the site to the Community Development Department. Those plans, proposed to be built in several phases, include at least seven sports fields, a large church sanctuary, multiple other church buildings, two maintenance buildings, two concession buildings, an amphitheater, picnic areas, parking areas, and a jogging track. Although no further action has been taken by the church to proceed with this development, the plans are included in the City's Pending Project list.

Section 2.5.5 b. (pg. 2-31) of the Draft EIR states, "Currently planned and pending projects were taken from the City's Pending Projects list. These were assumed to occur".

Despite this stated assumption, only seven maps out of a total of 36 maps showing the Serra Expansion Area correctly show the First Assembly of God Church site removed from the Serra Expansion Area. One map includes the parcel as outside the City Limit boundaries (Figure 2-9) and is correct. Two other maps show this site as continuing in agriculture, so are possibly correct, despite the plans to urbanize this land in the near future. The remaining 26 maps erroneously include this parcel in the Serra Expansion Area and contradict the Draft's stated working assumptions and methodology of assuming pending projects to occur. Figure 4.2-3 (Greenbelts, Land Conservation Act Contracts, SOAR Designated Lands, and Hillside Voter Participation Areas) is particularly inaccurate, given that the church property has not been under SOAR since 1999. (Specific details of these maps are given below.)

On several occasions since 2000, I have requested the Community Development Department to change their maps to accurately reflect this change in the Serra area. I was assured that the General Plan would reflect this change: most maps presented in both the Draft General Plan and the Draft EIR do not. We believe that no accurate future growth planning of this area can be accomplished without an accurate report of the extent to which urban uses have and are encroaching upon commercial farmland under SOAR restrictions in Serra. We respectfully request that all maps in both the Draft General Plan and the Draft EIR be corrected to accurately depict the First Assembly of God Church site.

Maps CORRECTLY showing Serra WITHOUT the First Assembly of God Church site
(These maps are correct)

- Figure 2-3 (page 2-17) Scenario 1 – Intensification/Reuse Only
- Figure 2.4 (page 2-19) Scenario 2 – Intensification/Reuse + No. Avenue + Olivas + Serra

**Maps Showing 1st Assembly of God site in agriculture despite “Assumed” Development
(These maps may be correct)**

Figure 4.2-1 Lands in Agricultural Use
Figure 4.2-2 Important Farmlands

**All Other Maps in the Draft EIR Showing the Serra Area *INCORRECTLY INCLUDE* the First
Assembly of God Church site**

VUSD Property (South of Ralston where it meets the Serra Area Agricultural Land)

C

This ten-acre parcel is owned by the VUSD and is therefore under no SOAR restrictions. It can be developed at any time. Curiously, it appears on only one map in either the Draft General Plan or the Draft EIR as separate from the rest of the agricultural lands in the Serra Potential Expansion Area.

Figure 4.12-5 – Pedestrian System includes this parcel as a school-owned property, nestled in a corner of the Serra Potential Expansion Area (see the lilac colored square under the letters EX.)

More curious still, this area does not even appear as a school site on the following map
Figure 4.11-3 –Public Schools and Libraries.

Figure 4.2-3 – Greenbelts, Land Conservation Act Contracts, SOAR Designated Lands, and Hillside Voter Participation Areas, inaccurately shows this area to be part of SOAR Designated Lands. It is not and has never been under SOAR restrictions.

Our concerns regarding this property are similar to those we have with the presentation of the 1st Assembly of God site as being part of the Serra Potential Expansion Area. Again, we believe that accurate reporting of the land designations and uses in this area are vital to responsible future growth planning. We respectfully request that all maps in both the Draft General Plan and the Draft EIR be corrected to accurately depict the VUSD property in the Serra Area.

TRANSPORTATION AND CIRCULATION – SECTION 4.12

D

This section of the Draft EIR includes a number of errors and omissions, as well as some proposed “roadway improvements” that directly contradict a primary goal of the 2005 General Plan “to protect our hillsides, farmlands and open spaces”. Below is a discussion of those areas of particular concern, including the widening of Montgomery and Ramelli Avenues, the extension of Kimball Road and Ralston Street, and proposed Class II bikeways, any and all of which will remove farmland from the Serra Potential Expansion Area.

Widening of Ramelli and Montgomery Avenues

Ramelli Avenue borders existing SOAR farmland on the northwest section of the Serra Potential Expansion area and Montgomery Avenue borders existing SOAR farmland on the northeast section of Serra.

Common sense might dictate that both of these roads be widened as a consequence of increased urban development in the area, specifically that of the Community Park and the First Assembly of God Church site. However, if these roads are widened it will necessitate removing farmland currently under SOAR restrictions for the purpose of building the road improvements. These two roads will take land from three of the five remaining farmers in the Serra area. Hence, any discussion of changes to Ramelli and/or Montgomery is of great concern to those of us who own farmland in Serra.

Both the Draft General Plan (Figure 4-3 Roadway Classification Plan) and a number of maps in Appendix E graphically show the City's intention to widen both of these roads, under each and every scenario presented in the EIR. Yet, the EIR does not mention these roadway improvements anywhere else in the document, either in the text or in any table in the EIR or Appendix E to the EIR.

It should be noted that unless the Serra Potential Expansion Area is selected for growth expansion, the widening of Ramelli and/or Montgomery Avenues would be in direct conflict of the stated goal to "protect and preserve farmland". In the case of these two roadway improvements, farmland would be removed from production not only for the road itself, but also for any buffer that might be required by the County Agricultural Commissioner and the City. In addition to actual farmland lost from production, the additional encroachment of urban traffic in this area will only serve to exacerbate already serious ag/urban conflict issues.

It is impossible to know whether these the maps, showing the widening of these roads, have been printed in error, or whether there have been multiple omissions in not including these roadway improvements in the various tables in the Draft EIR and Appendix E to the Draft EIR. Regardless, this needs to be clarified and corrected before the final approval and ratification of this document. We respectfully request that this be done.

Howard and Howard Response to the Draft EIR
 July 14, 2005
 Page Five

Extensions of Kimball Rd. and Ralston St. in Scenario 5 (Intensification/Reuse + No. Avenue + Western Canada Larga)

The discussions of Scenario 2 (Intensification/Reuse + North Avenue + Olivas + Serra) and of Scenario 4 (Intensification/Reuse + North Avenue + Serra) include a Kimball Road extension from Telephone Road to North Bank Drive and a Ralston Street extension from Ramelli Avenue to Montgomery Avenue. Certainly, if either of these two scenarios is selected for future growth expansion, these two road extensions will be crucial to a well-planned development of the Serra area. E

Discussion for Scenario 5 (Intensification/Reuse + North Avenue + Western Canada Larga), however also anticipates that new roadway links would include a “Kimball Road extension from Johnson Drive to Bristol Road” and a “Ralston Street extension from Ramelli Avenue to Montgomery Avenue” (Section 4.12 Scenario 5, page 4.12-63). We believe this to be an error for the following reasons:

1. A Kimball Road extension from Johnson Drive to Bristol Road would transect farmland in Serra that is supposed to remain in farmland under Scenario 5 until at least 2025.
2. The Transportation and Circulation Element of every General Plan since the early 1970’s has included an extension of Kimball Road to Bristol Road, but never one from Johnson Drive to Bristol Road, so it begs the question whether this is really the intended extension.
3. A Ralston Street extension from Ramelli Avenue to Montgomery Avenue makes absolutely no sense in that it would horizontally bisect the northern portion of the Serra farmland when this area is supposed to remain in farmland under Scenario 5. It makes even less sense to extend Ralston Street, without also including the extension of Kimball Road from Telephone Road to Bristol Road.
4. **These road extensions are INCLUDED in the following discussion of Scenario 5:**
 Draft EIR Transportation and Circulation Scenario 5 text (page 4.12-63)
 Draft EIR Table 4.12-12 Roadway Improvements – Scenario 5 (page 4.12-67)
 Appendix E Table 3-14 Roadway Improvements – Scenario 5 (page 3-52)
 Appendix E Table 3-15 2025 ICU Summary-Scenario 5. (page 3-56)
5. **These road extensions are NOT INCLUDED in the following discussion of Scenario 5:**
 Appendix E Scenario 5 Text related to roadway improvements (pgs. 3-45, 3-50)
 Appendix E Figure 3-14 2025 ADT Volumes – Scenario 5 (page 3-48)
 Appendix E Figure 3-15 2025 ICU – Scenario 5 (page 3-49)
 Appendix E Figure 4-14 Roadway Classifications – Scenario 5 (page 4-22)
 Appendix E Figure 4-15 ADT Volumes – Scenario 5 (page 4-23)

Given the conflicting information presented in the Draft EIR and the Appendix to the Draft EIR it is difficult to know if these two road extensions are planned under Scenario 5 or not. I recently spoke with a member of

Staff, who assured me that yes, indeed, these road extensions had been planned through Serra under Scenario 5, despite the fact that Serra is not included as a Potential Expansion Area under this scenario.

Howard and Howard Response to the Draft EIR
July 14, 2005
Page Six

Therefore, in response to this EIR, we must strenuously object to the extension of these two roads in particular, in any configuration, and also to the development of any roads that will transect and/or remove farmland that potentially will remain under SOAR restrictions and/or are designated Agriculture Only until at least 2025 in this General Plan.

For five years I have argued in both oral presentations and written submissions to the CPAC, the Planning Commission, and the City Council that any road extensions or expansions through farmland that is expected to remain under SOAR restrictions should be removed or abolished from any growth development plan for Ventura. This is particularly true in the case of "roadway improvements", such as the Kimball and Ralston Road extensions discussed here and the widening of Ramelli and Montgomery discussed above.

To intentionally design urban incursion by road extensions that will subdivide what is left of already small islands of farms segregated in the Ventura urban area, while requiring those farms to remain as farms is to violate every goal, policy and action plan that calls for the protection and preservation of agricultural land. As stated above, in addition to actual farmland lost from production for these road extensions, the additional encroachment of urban traffic in this area will only serve to exacerbate already serious ag/urban conflict issues.

Either the citizens of Ventura want to preserve farmland, already completely encircled by urban development, or they don't. If they do, they must accommodate the farms they say they want to protect. If they want to realistically protect these "inner city" farms, they will have to deal with traffic congestion that might otherwise be accommodated by driving roads through what is now farmland. They will also have to learn to accept other inconveniences associated with having farms in the midst of the urban environment. If the citizens of Ventura do not wish to do these things, they must allow this farmland to be developed.

Therefore, we respectfully demand that the extensions of both Kimball Road and Ralston Street as described in Scenario 5 be deleted from the Traffic and Circulation section of the Draft EIR and also from Appendix E of the Draft EIR.

Class II Bike Lane as shown in the Serra Area

A Class II Bike Lane is defined in Section 4.2 Transportation and Circulation 4.12.1 Setting d. Bicycle/Pedestrian Travel (page 4.12-15) as a "lane on a road that is reserved for bicycles. The lane is painted with pavement lines and markings and is signed. The lane markings decrease the potential for conflicts between

F

motorists and bicyclists. Bike lanes are one-way, with a lane on each side of the roadway between the travel lane and the edge or paving or, if parking is permitted, between the travel lane and the parking lane. The lanes are at least four feet wide, five feet if parking is permitted.”

Howard and Howard Response to the Draft EIR
July 14, 2005
Page Seven

Both Figure 4-1 (Bicycle Facilities) of the General Plan and also Figure 4-12-4 of Section 4.12 Transportation and Circulation Figure show Class II Bike Lanes where there would be potential extensions of Kimball Road and Ralston Street.

Given that Class II Bicycle Lanes can only exist where there are developed roads, it would seem reasonable to suggest that these potential bikeways should only appear in those areas, and under those circumstances, in which those roads would be extended.

Therefore, while we encourage the use of alternative transportation, especially that of bicycles, we must object to the presentation in both the Draft General Plan and the Draft EIR of these Class II Bicycle lanes along presupposed extensions of Kimball Road (from Telephone Road to Bristol Road) and/or the extension of Ralston Street from Ramelli to Montgomery. Until and unless the Serra Area is selected as a Growth Expansion Area, it is inappropriate to identify bike lanes going through the area, without the confirmation of the development of the associated roads.

Consequences of the First Assembly of God Church Site Development

G

As owners of one of the two SOAR-restricted agricultural properties that are adjacent to the First Assembly of God Church site in the Serra Area, we are incredibly concerned about the impact that the development of this site will have on our land, and also the other remaining farmlands in the Serra area. A Staff member assured me that the Church property had been evaluated and had been included in the EIR analysis as a “pending project”.

Considering the contradictions and confusions in the Draft EIR Transportation and Circulation section, as presented above, we believe that there is some reason to be skeptical.

We are not traffic engineers, but it is difficult for us to believe that there will be no adverse or even increased traffic impact in the area considering the stated intentions of Church officials that this very intensely developed parcel will be in operation from 7 AM to 10 PM seven days a week. Despite assurances, we cannot but believe that at least Montgomery Road will need to be widened (as has been shown in many maps, although not detailed in any text or tables – See Above). We also believe that Ralston Street will need to be analyzed for expansion, even though the EIR traffic studies would indicate otherwise.

AGRICULTURE

The Draft EIR does an exemplary job of describing the impacts of development accommodated under the 2025 General Plan on existing agriculture in the Ventura Area.

Description of Serra in Section 4.2.1 Agriculture Setting (page 4.2-7)

H

The description of Serra in the Draft EIR is incorrect in several respects, including crops currently in production, the proximity of residential development to existing farmland, and the absence of discussion of the First Assembly of God Church site and the UVSD parcel (discussed above) that abut farmland.

Howard and Howard Response to the Draft EIR
July 14, 2005
Page Eight

We suggest the following rewrite (*Italics used for new language*):

This 464-acre area is currently used *for lemon and avocado orchards and for row crops. Adjacent to the farmland on the north is residential development and Telephone Road. Across Telephone Road on the north are more single-family homes and the new 100-acre community park that is expected to open during the summer of 2005. To the east is low-density residential development, and to the west both low and medium density residential development. At the corner of Montgomery Avenue and Bristol Road is a 26-acre parcel that is no longer under SOAR restrictions and which is planned for development.* Commercial uses are to the southwest along Johnson Drive. The Santa Clara River is located along the southern boundary of this area. The Department of Conservation has classified the entire Serra Area as a mix of "Prime", "Statewide Importance", and "Unique".

Buffers

For a number of years, the commercial farmers operating within the SOI of Ventura have asked the City to adopt a buffer policy that would help, in some measure, protect our land from the effects of urban encroachment. We are delighted that the 2005 General Plan includes two Actions that provide buffer policy.

Action 7.24 in the General Plan states: "Require non-agricultural development to provide buffers of 50 feet or more from agricultural operations to minimize the potential for pesticide drift." This action is also included in the Draft EIR in Section 4.7 Hazards and Hazardous Materials (page 4.7-13).

Action 3.15 in the General Plan states "Adopt use permit standards for non-farm activities in agricultural areas that protect and support farm operations, including requiring non-farm uses to provide all necessary buffers as determined by the Agricultural Commissioner's Office." This action is not specifically included in the Draft EIR. We believe that it would be appropriate to include this Action in Section 4.2 Agriculture in the Draft EIR. We respectfully request that Action 3.15 be included.

I

Portions of Land Not Developed in Scenarios 2-6 Allowed to Remain in Agriculture

J

Throughout the Draft EIR, discussions of Scenarios 2-6 submit the possibility that in such cases where there is more land than necessary to accommodate growth, that "any development could include wide areas of open space that could either allow portions of the areas to remain in agriculture or allow for large areas of civic spaces (parks) ..." (Section 4.1 Aesthetic and Community Design, page 4.1-15).

It is important to stress that any urban development that is built adjacent to commercial agricultural lands is potentially threatening to the protection and preservation of those agricultural lands. Even with buffers

required as part of the design of the new urban development, natural conflicts will arise between the urban interests and the agricultural interests. A list of such conflicts is presented in Section 4.2 Agriculture (pages 4.2-7 and 4.2-8). While it is gratifying that this EIR recognizes such conflicts, it is also somewhat troubling that it is potentially proposing that if too much land exists in a selected scenario, that the City will build what it needs, while leaving the remaining agriculture to deal with the consequences of adjacent development.

We suggest that any Long-term Potential Expansion Strategy that is selected give careful consideration to attempting to avoid creating new and potentially destructive ag/urban conflicts.

Howard and Howard Response to the Draft EIR
July 14, 2005
Page Nine

Right-to-Farm Ordinances

K

Section 4.2.1 c of the Draft EIR discusses the Right-to-Farm Ordinance approved by the City in 1997. However the description of this Ordinance presented here does not include the disclaimer built into the Ordinance that it does not apply "if the agricultural activity, operation, or facility obstructs the free passage or use, in the customary manner of ... any public park, square, street, or highway." (Right-to-Farm Ordinance, Section 4162) (underlining for emphasis.)

Given today's litigious-happy society, we believe it is important for the City to consider these exceptions to the Right-to-Farm Ordinance before adopting any growth plan or policy that will require roads or parks to encroach on existing agricultural land.

CONCLUSION

We congratulate everyone involved in the preparation of this Draft Environmental Impact Report to the 2005 Ventura General Plan. It is an outstanding effort and accomplishment. The scope and detail required in the production of this document is truly impressive.

We hope that you will accept the comments and suggestions included in this response to the Draft EIR knowing that we offer them with the sole purpose of making an already remarkable document even better.

Subject: **Response to the Draft Environmental Impact Report for the 2005 Ventura General Plan** L

The following are additional corrections that should be made to the Draft EIR. I suspect that by now, most of these have probably been cleaned up for the Final version, but just in case, I offer them here.

- Page iii Under List of Figures, after Figure 2-8, add "Scenario 6" before Intensification/Reuse + North Avenue + Olivas
- Page 4.2-18 At the end of the first paragraph under "Scenario 4 – Intensification/Reuse + North Avenue + Serra, the final sentence "In addition, about 24 acres within the Olivas area are under LCA contract" should be deleted. Olivas is not an expansion area studied under this scenario.
- Figure 4.11-2 This map is labeled "Parks and Recreational Facilities". It should be renumbered to read Figure 4.11-4. Figure 4.11-2 appears earlier in the section as a map labeled "Wildfire Risk Areas"
- Page 4.12-76 The heading at the top of the page reads "Scenario 6 – Intensification/Reuse + North Avenue + Olivas + Serra". This should be changed to read "Scenario 6 – Intensification/Reuse + North Avenue + Poinsettia".
- Page 4.12-89 A graphic box should be added around the section TC-1.

Again, many kudos for a job well done.

Respectfully submitted,

Jean Howard Mann

Letter 11

COMMENTERS: Jean Howard Mann, Owner and Managing Partner, Howard and Howard Ranch

DATE: July 14, 2005

RESPONSE:

Response 11A

The commenter states support for the City's emphasis of intensification and reuse as the top priority for future growth as well as staff's recommendation that the North Avenue and Serra areas be the top priority for development if future growth through 2025 cannot be met through infill development alone. This support is noted.

Response 11B

The commenter states that there are inconsistencies on several maps, suggesting that some maps show the First Assembly of God Church site as within the Serra expansion area and that others of show the church as outside the Serra expansion area. All of the Draft EIR maps that depict the Serra expansion area include the First Assembly of God Church site within the expansion area. However, the commenter correctly notes that re-designation of the site has received voter approval and the site is no longer subject to the SOAR Ordinance. Therefore, although the First Assembly of God Church site is outside the current City boundary, it will be removed from the Serra expansion area. The maps throughout the Draft EIR will be revised to reflect this change, which will reduce the size of the Serra expansion area to an estimated 438 acres. This change will not substantively affect any of the Draft EIR conclusions, though the total acreage of agricultural land conversion for the Intensification/Reuse Only scenario will increase by about 26 acres and the amount of land subject to SOAR under Scenarios 2 and 4 will decrease by a similar amount. These changes will be made in the Final EIR.

Response 11C

The commenter notes that a 10-acre parcel south of Ralston Street is owned by the Ventura Unified School District (VUSD) and states an opinion that EIR figures should depict the site as a school and not subject to the SOAR Ordinance.

Figure 4.11-3 to which the commenter refers is intended to show existing school facilities, not merely VUSD-owned properties. Though owned by the VUSD, the site in question is currently used for agricultural production, not a school; therefore, no correction to Figure 4.11-3 is needed.

With respect to Figure 4.2-3, whether or not school district-owned properties are subject to local policies such as the SOAR Ordinance has been the subject of some debate. While it may be true that a public school could be developed without a SOAR vote, any other development on the property would be subject to a SOAR vote. For example, if the VUSD were to sell the property to a private developer (as has occurred with several other VUSD properties), development of

the site could occur only with voter approval. Because the 10-acre site in question could be subject to SOAR under certain circumstances, no correction to Figure 4.2-3 is needed.

Response 11D

The commenter states that there are inconsistencies between figures and tables in the EIR traffic study. Specifically, the comment states that several figures suggest that Ramelli Avenue and Montgomery Avenue are to be widened, but that accompanying tables omit the widening of those same roadways. Neither Ramelli Avenue nor Montgomery Avenue would be widened to add lanes or increase the road capacity. The widening that could potentially occur would be to add on-street park and/or sidewalks. However, such widening would only be expected to occur in conjunction with the possible future development of the Serra area.

Response 11E

The commenter states that there are inconsistencies in the Draft EIR with respect to whether or not the extensions of Kimball Road and Ralston Street would be implemented in conjunction with buildout of Scenario 5, which does not include the Serra expansion area. It is not anticipated that either Kimball Road or Ralston Street would be extended through the Serra expansion area under Scenario 5. The traffic modeling for that scenario did not assume the extension of either roadway. Any references to the extension of those two roadways for Scenario 5 contained in the Draft EIR will be corrected in the Final EIR.

Response 11F

The commenter states an opinion that figures showing the future extension of the bikeways through the Serra expansion area should be amended to exclude those extensions until and unless the Serra area is planned for development. In response to this comment, Figure 4-1 in the traffic study in Appendix E and Figure 4.12-4 in Section 4.12, *Transportation and Circulation*, will be amended to include a note indicating that bikeways through agricultural or open lands would be constructed only in conjunction with development of the area.

Response 11G

The commenter states concerns about the impact of the First Assembly of God Church site development on remaining agricultural lands and re-states concerns about the possible future expansion of Montgomery Road and Ralston Street. Agricultural/urban conflicts are discussed generally in Section 4.2, *Agricultural Resources*, and it is acknowledged that conflicts between the agricultural growers in the Serra area and adjacent urban uses may persist if the Serra area remains in agricultural use. The specific impacts of the First Assembly of God Church site on adjacent agricultural lands would need to be addressed as part of a site-specific environmental review of the church's development plans. See Response 11D for a response to concerns about the possible future widening of Montgomery Avenue. No widening of Ralston Street is planned.

Response 11H

The commenter suggests several clarifications with respect to the discussion of the Serra expansion area in Section 4.2, *Agricultural Resources*. In response to this comment, the paragraph describing the Serra area on page 4.2-7 is revised as follows (text revisions are underlined):

Serra. This 438-acre area is currently used for lemon and avocado orchards and for row crops. Adjacent to the farmland on the north are residential development and Telephone Road. Across Telephone Road to the north are more single family homes and the new 100-acre community park that is currently under construction. To the east is low density residential development, and to the west are both low and medium density residential development. At the corner of Montgomery Avenue and Bristol Road is a 26-acre parcel that is no longer subject to the SOAR Ordinance and that is planned for development. Commercial uses are to the southwest along Johnson Drive. The Santa Clara River is located along the southern boundary of this area. The Department of Conservation has classified this area as a mix of "Prime," "Statewide Importance," and "Unique" farmland.

Response 11I

The commenter requests that General Plan Action 3.15 pertaining to requiring non-farm uses to provide necessary buffers between agricultural and urban uses be included in the Final EIR. Action 3.15 is discussed in two separate places in the Draft EIR, on pages 4.2-16 and 4.2-22.

Response 11J

The commenter states concerns about what she perceives as a proposal in the Draft EIR to develop only as much of the expansion areas as needed, while leaving remaining agriculture to deal with the consequences of adjacent development. The Draft EIR is not proposing that portions of the expansion areas should be left in agricultural use, but rather merely acknowledges that, depending upon the level of development that is proposed in the expansion areas in the future (if any), all of the expansion area land may not be needed to accommodate planned development. In such an instance, remaining land not used for development could potentially remain in agriculture, but could also be used for other purposes (such as schools, parks, or other civic spaces). It is true that if only a portion of the Serra area, for example, were used for urban development, the remaining growers within the Serra area would be further isolated and would likely experience greater levels of conflict with urban uses.

Response 11K

The commenter notes that the City's Right-to-Farm Ordinance provides exceptions when agricultural activity obstructs the use of a public park, square, street, or highway. This exception is noted. As discussed under Responses 11E and 11F, no extensions of roadways or bikeways through the Serra expansion area would be expected to occur until and unless that area is planned for development.

Response 11L

The commenter notes five minor typographical errors in the Draft EIR. These will be corrected in the Final EIR.

501 Poli Street
Ventura, CA

12

DELIVERED VIA E-MAIL & FAXCIMILE

RE: San Buenaventura City General Plan EIR

Dear Ms. Gialketsis:

On behalf of the approximately 500 companies and their representative employees who make up the Greater LA/Ventura Chapter of the Building Industry Association of Southern California, thank you for the opportunity to comment on the City of Ventura's proposed 2005 General Plan and its accompanying Environmental Impact Report.

While the General Plan document is quite benign, we believe the "devil is in the details" of the almost 1000 page EIR. It is this document that will serve as the true guideline when questions or concerns arise. While we respect Ventura's efforts to seek the highest environmental standards that arise due to construction; we have concerns with some aspects of the proposed EIR. These concerns include the air quality standards, population growth, standards on public services, transportation and road construction, and utilities and services.

I. AIR QUALITY

The EIR uses numbers based on SCAG projections. The SCAG projections are lower than the city's; thus, every project becomes an unavoidable significant impact. The Air Quality thresholds (and population thresholds) should be consistent with the city's chosen alternative. The EIR should be revised once the city chooses its population limit so that development within that limit is not determined to create an unavoidable significant impact.

A

II. POPULATION AND HOUSING

The preferred environmental alternative, infill and intensification of reuse only without expansion areas, sets a limit of 8258 units of residential housing up until the year 2025. It is our thought that this number might be too low, not taking into account the maximum use of underdeveloped properties throughout the city.

B

III. PUBLIC SERVICES

It is in this section that we have the most concerns. The city has been using very high standards for parkland per 1000 residents, as well as for police and fire. The question should be asked "are these standards realistic?" Has the city ever met these standards during the previous general plan? If these arbitrary standards are carried over, then they should be evaluated against reality, and lowered where appropriate. This will avoid having every project in conformance with the plan have an unavoidable significant impact. These unattainable ratios will be the basis for new fees on development. The EIR must be made clear that new development does not pay for existing deficiencies, just the impacts of the new residents only. Parks take a significant role in this chapter.

C

The standard for a neighborhood park of 5 acres is arbitrary and outdated, again the same as in earlier General Plans. The BIA requests that the 5-acre standard be removed.

Fire services are another area in which the BIA has concern. All new residential construction requires fire sprinklers. This standard should be sufficient to help mitigate the need for additional fire personnel at least that of which is to be paid for by new development.

We are also concerned with the standards put forward on public schools. Is there a demographic analysis that takes into account the aging population?

IV. TRANSPORTATION AND CIRCULATION

We would like to request an addition to the EIR that states, "All future roadway, bikeway, and pedestrian path alignments are shown for illustrative purposes only. Exact alignments will be determined during project review." Some of these alignments are carried over from the 1975 plan, and may not reflect the most current topography or development which has since taken place. The city must maintain design flexibility, and avoid the duplicative process of a general plan amendment for road location on projects which conform to land use and other elements.

D

V. UTILITIES AND SERVICES

In this section there is a breakdown of new residential units and other construction by neighborhood. This breakdown is used for water and wastewater analysis only. The BIA feels the breakdown should be for illustrative purposes only; otherwise, a permanent breakdown will be adopted as part of the EIR, and will pre-ordain the RGMP process, and leave little discretion for decision makers.

E

While the General Plan update process has been quite lengthy, the BIA thanks the City of San Buenaventura for allowing us to be part of the discussion to date. As the City of Ventura focuses on streamlining their development processes, we welcome the opportunity to continue to be a part of the collective and collaborative processes which will someday result in an easier development process for our members to navigate.

Thank you once again for the opportunity to provide comments. Please feel free to contact me at 661-257-5042 or tdonlon@bialaventura.org if you have any questions or comments. Please note that in the last few weeks we have moved offices, we are now located at 28460 Avenue Stanford, Suite 110, Santa Clarita, CA 91355.

Sincerely,

Terra Donlon
Director of Government Affairs

Cc: Mr. Brian Brennan, Mayor
San Buenaventura City Council Members
Mr. Rick Cole, City Manager
Susan Daluddung, Community Development Director

Letter 12

COMMENTER: Terra Donlon, Director of Government Affairs, Building Industry Association

DATE: July 15, 2005

RESPONSE:

Response 12A

The commenter notes that the EIR uses numbers based on SCAG projections and suggests that the EIR should be revised once the City chooses a population limit so that future developments would not create unavoidably significant impacts. The population growth estimates included in the Draft EIR were directed by the City Council and are not purported to be a "limit". Because the projected citywide growth through 2025 based on the Council-directed growth rates exceeds the SCAG/Ventura County AQMP growth forecast for the City, any of the EIR scenarios could be found to be inconsistent with the AQMP. However, as noted in the Draft EIR and in the comment letter from the Ventura County Air Pollution Control District (Letter 27), the 2007 AQMP will include revised growth forecasts that will take into account the City's growth projections under the 2005 General Plan. As such, future developments that are consistent with the 2005 General Plan will likely be found to be consistent with the new AQMP.

Response 12B

The commenter states an opinion that the 8,258 residential units assumed to be added to the City through 2025 under Scenario 1 may be too low. This opinion is noted. The 0.88% average annual growth rate assumed for Scenario 1 represents the average annual rate of growth that has occurred in the City over the past 10 years (1994-2004) and as stated in 12A above, were directed by City Council to use as estimates.

Response 12C

The commenter disagrees with the standards for parks, fire service, and schools that are discussed in Section 4.11, *Public Services*. The park acreage standards presented in the Draft EIR are the currently adopted City standards, while the fire service standards are those provided by the Ventura Fire Department. Similarly, the projected number of new students associated with growth through 2025 is based on students per housing unit generation rates provided by the Ventura Unified School District. The Draft EIR differentiates between existing deficiencies based upon currently adopted standards and the demands for increased service associated with new development. New developments will be subject to existing park and school impact fees, which are intended to offset the demands associated with new developments rather than to alleviate existing deficiencies. Any new fire impact fees that the City may develop in the future would similarly be designed to have new developments offset the cost of providing facilities to serve the new development rather than to address existing deficiencies. It should be noted that existing impact fees for schools and parks, as well as any possible future impacts fees for other services (such as fire protection), can be used only for facilities and equipment, not for personnel.

Response 12D

The commenter requests that maps showing future roadway, bikeway, and pedestrian path alignments be amended to include a note indicating that the alignments shown are for illustrative purposes only and that final alignments will be determined during project review. These maps will be amended to include such a note in the Final EIR and General Plan.

Response 12E

The commenter requests that the breakdown of uses by location within the City in several tables in Section 4.13, *Utilities and Service Systems*, should include a note stating that the breakdown is for illustrative purposes only and that the actual amount of development within individual areas of the City may vary. The tables in Section 4.13 will be amended to include such a note in the Final EIR.

City of Ventura 2005 General Plan Update Draft E.I.R.
City Council & Planning Commission Joint Workshop#2
Review of the Draft E.I.R.

Re: **General Plan Scenario 5: Intensification/Reuse +
North Avenue + Western Canada Larga**

Dear Council Members & Commissioners:

Thank you for today's opportunity to address you with my comments
Concerning the City's 2005 General Plan Update Draft Environmental Impact Report.
Unfortunately, speaker time does not permit me to fully comment on all of the issues raised in
the analyses of General Plan Scenario 5. I will submit all of my written comments by the
conclusion of the 45-day review period July 18, 2005.

Today, I submit for your consideration a letter and maps concerning watershed flood
plain issues not addressed in the document's "Upper North Avenue District Housing"
Alternative. This Alternative is a variation of General Plan Scenario 5 relating to the Brooks
Campus expansion and the Petrochem Refinery residential reuse. The attached County G.I.S.
maps illustrate those sites to be substantially within the 100 year flood plain of Canada Larga
Creek.

I will limit my oral comments to 3 issues raised in the Environmental Impact Report
analyses of General Plan Scenario 5, which includes the Westernmost 120 acres portion of the
original 800 acre P.E.A. #1 Canada Larga. Those issues are Density, Guidelines for Orderly
Development and Farmland Conversion.

Thank you,

Shull Bonsall, Jr.
Rancho Canada Larga

Ventura, CA 93001

Subject: SUMMARY OF CANADA LARGA CREEK FIELD TRIP ON JUNE 2, 2005

Dear Mr. Bonsall:

The Canada Larga watershed is located about 5 miles north of the City of Ventura and has a catchment area of about 12,311 acres (19.24 square miles). Current land usage of the watershed are mostly natural woodlands and grass lands with cattle grazing. Canada Larga Creek is one of the two largest tributaries of Ventura River. A preliminary hydrologic study indicates that the 100-year peak flood flow discharge at the confluence with Ventura River is about 13,386 cubic feet per second (cfs).

In January and February of 2005, two major storms struck Southern California and resulted in over-bank flooding of Canada Larga Creek (approximately 40-year return period), causing damages to properties, agriculture and infrastructures; especially at the lower reach of Canada Larga Watershed.

To better understand the issue in Canada Larga Watershed, the District engineers, Sergio Vargas, Denny Tuan and Yunsheng Su, visited the site with you on June 2, 2005. This letter summarizes the findings of that field trip:

1. Lower reach of the Canada Larga Watershed is subject to frequent flooding. It is caused not only by undersized channels and road crossings, but also by the excessive amount of debris and sediment.
2. The District has identified the needs to address the issues, and a project is proposed in our Integrated Watershed Protection Plan (20-year plan). However, the present benefit-cost ratio does not rank a higher priority than other urgently needed District facilities improvements.

Mr. Shull Bonsall
June 23, 2005
Page 2 of 2

3. You mentioned that the Brooks Institute Camp Expansion project is under planning downstream of HWY 33, and that a land development project might be planned upstream of HWY 33 in the future. Should there be funding opportunities due to future land developments, the District can provide information, mapping, and engineering expertise in a watershed-wise evaluation for solutions of flood control, water quality and habitat restoration.
4. You explained your concept for a potential detention/debris basin. However, before any conclusion is reached, watershed-wise hydrology, hydraulics, and sediment transport studies have to be conducted to evaluate the baseline (existing) and the proposed conditions.

We appreciate the opportunities to work with you. Please feel free to give me a call at 805-650-4077 if you have any questions.

Sincerely,

Sergio Vargas, P.E.
Deputy Director

Letter 13

COMMENTER: Shull Bonsall, Jr., Rancho Cañada Larga

DATE: June 25, 2005

RESPONSE:

The commenter attaches a letter from the Ventura County Watershed Protection District, which addresses flooding issues in the Upper North Avenue district and notes that portions of the Brooks Institute campus and Petrochem refinery are within the 100-year flood zone. The commenter is correct that portions of the Upper North Avenue area is within the 100-year flood zone. This is discussed in Section 4.8, *Hydrology and Water Quality*. Any development within the 100-year flood zone would be subject to FEMA requirements as well as the requirements of the City's Floodplain Ordinance. In order to clarify the flooding potential as it relates to the Upper North Avenue District Housing alternative, the discussion under "Hydrology and Water Quality" for that alternative on page 6-15 will be amended to read as follows (new text is underlined):

Residential development within the Upper North Avenue District would be within the 100-year flood zone and would therefore be subject to the requirements of FEMA and the City's Floodplain Ordinance. Placing residential development within the Upper North Avenue district adjacent to the Ventura River would incrementally increase the potential for water quality impacts within the river. However, possible impacts could be addressed on a case-by-case basis through compliance with standard engineering practices and runoff control requirements. Overall, hydrology and water quality impacts would be somewhat greater than those associated with 2005 General Plan Scenario 5, but could be reduced to a less than significant level.

COMMUNITY DEVELOPMENT

Ms. Kari Gialketsis
City of San Buenaventura
Community Development Department
501 Poli St.
Ventura, CA 93001

Dear Ms. Gialketsis,

Thank you for the opportunity to comment on the Public Review Draft of the Ventura General Plan, May 24, 2005 and the associated Draft EIR. The Ventura Audubon Society has the following concerns.

The General Plan asserts that there is an intention to preserve the essential nature of our community. Specifically in Policy 1B it states that the City wishes to increase the area of open space protected from development impacts. The proposed expansion areas for development will significantly decrease the area of open space and we are opposed to this action. A

Agricultural open space does have some wildlife value. In the case of row crops; e.g. most of the proposed Olivas expansion, the wildlife value is very low, but in the other proposed expansion areas that contain orchards there is a medium level of wildlife value. Orchards provide cover and food, from associated insects, for many bird species. Virtually all of the proposed expansions are either in SOAR designated areas or are in designated Land Conservation Act Contracts and we feel that they should remain as open space.

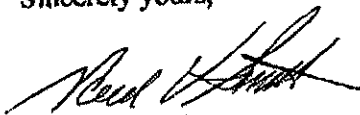

Action 1.8 states: "Buffer barrancas and creeks that retain natural soil slopes from development with a minimum of 50 feet of natural existing or restored vegetation." We feel that this may encourage removal of existing riparian forests (consisting of Cottonwood, Willow, White Alder and Sycamore trees) that are wider than 50 feet adjacent to watercourses. The loss of Riparian Forest is the cause of the significant decline of many bird species, e.g. Yellow-billed Cuckoo and Southwestern Willow Flycatcher that are dependent of this habitat. This action should be amended to require preservation of wider existing areas of Riparian Vegetation. B

Action 1.11 states: "Require that sensitive wetland and coastal areas be preserved as undeveloped open space wherever feasible." We feel this should be amended to require a level of "no net loss" of either sensitive wetlands or 'natural' coastal areas. C

Policy 1C states: "Improve protection for plants and animals." Within this policy, Action 1.18 states: "Prohibit dredging during fish spawning and bird migration cycles." This action is sufficiently vague to render it not useful. Does it apply to inland or coastal dredging? Western Snowy Plovers and California Least Terns nest on local beaches outside of normal bird migration times of the year and would be adversely impacted by dredging operations during that time. Which fish species are to be protected? The Ventura Port District often discharges dredge material into the ocean at the mouth of the Santa Clara River during the winter. This would not affect Tidewater Gobys but may impact Steelhead Trout wishing to migrate up the river. D

We are thankful that the City of Ventura has an attitude of environmental concern that is translated into day to day concerns by City staff. We look forward to working with the City in the future to preserve and protect the existing wildlife habitats that make Ventura a desirable place to live and work. We look forward to receiving your written responses to our comments. Please feel free to contact me at (805) 644-9344 if you have questions about our comments.

Sincerely yours,

Reed V. Smith
Board Member, Science Chair
Ventura Audubon Society

Letter 14

COMMENTER: Reed V. Smith, Board Member, Science Chair, Ventura Audobon Society

DATE: July 17, 2005

RESPONSE:

Response 14A

The commenter states opposition to the inclusion of any of the expansion areas in the 2005 General Plan, noting that agricultural open space has some wildlife value. This opposition is noted. City staff are currently recommending adoption of the "Intensification/Reuse Only" scenario, which includes none of the expansion areas.

Response 14B

The commenter suggests that buffers around riparian areas should be larger than the 50 feet identified in General Plan Action 1.8. This opinion is noted. The 50-foot buffer is a minimum requirement for new development adjacent to riparian areas. City staff believe that this is an appropriate minimum buffer area given the urban/suburban nature of the Planning Area. The 50-foot buffer is consistent with that adopted by many cities throughout California. If a larger buffer is needed in specific locations in order to address potentially significant impacts to a riparian corridor, then such a buffer can be required on a case-by-case basis.

Response 14C

The commenter suggests amending General Plan Action 1.11 to require no net loss of wetland and coastal areas. In response to this comment, Action 1.11 will be amended to read as follows (new text is underlined):

Require that sensitive wetland and coastal areas be preserved as undeveloped open space wherever feasible and that future developments result in no net loss of wetlands or "natural" coastal areas.

Response 14D

The commenter suggests that Action 1.18 regarding the timing of dredging should be modified to be more specific as to what type of dredging is being addressed and when dredging may occur. In response to this comment, Action 1.18 will be replaced with the following:

Action 1.18: Conduct coastal dredging in accordance with the U.S. Army Corps of Engineers and California Department of Fish and Game requirements in order to avoid impacts to sensitive fish and bird species.

RE: SCAG Comments on the Draft Environmental Impact Report (DEIR) for the 2005 Ventura General Plan
SCAG No. I 20050363

Dear Ms. Gialketsis:

Thank you for submitting the Draft Environmental Impact Report for the 2005 Ventura General Plan to the Southern California Association of Governments (SCAG) for review and comment. SCAG's responsibility as the region's clearinghouse per Executive Order 12372 includes the implementation of California Environmental Quality Act (CEQA) §15125 [d]. This legislation requires the review of local plans, projects and programs for consistency with regional plans.

SCAG staff has evaluated your submission for consistency with the Regional Comprehensive Plan and Guide (RCPG), Regional Transportation Plan (RTP), and the Compass Growth Vision. The Draft EIR addresses SCAG's policies and forecasts appropriately and has provided sufficient explanation of how the project helps meet and support regional goals. Based on the information provided in the DEIR, we have no further comments. We would appreciate notification of the Final EIR, especially should a change in project scope occur.

A description of the proposed Project was published in the June 1-15, 2005 Intergovernmental Review Clearinghouse Report for public review and comment.

If you have any questions, please contact me at (213) 236-1851. Thank you.

Sincerely,

Brian Wallace

RE: Draft Environmental Impact Report #SCH2004101014
City of Ventura General Plan Amendment Update 2005

Dear Ms Gialketsis:

As an interested property owner, we have reviewed the Draft Environmental Impact Report (DEIR) and General Plan Update. Overall, we are quite impressed with the new direction the City is taking.

In reviewing the Land Use Section of both the DEIR and General Plan Update, we agree with the City's proposed land use designation for high density residential on our property.

We would like to make the following comment regarding the DEIR:

- Transportation and Circulation Element – Many of the Exhibits show specific alignments for proposed bikeways and streets. We believe that it would be appropriate to note within the DEIR that these alignments are for illustrative purposes only. We feel that the City should retain the flexibility to adjust these alignments and locations as projects are developed.

We hope that the City incorporates our comment in the Final Environmental Impact Report.

Sincerely,

William M. Borgers
Vice President

Cc Rick Cole – City Manager
Susan Daluddung – Community Development Director
Lisa Porras – City Planner
Rincon Environmental

Letter 16

COMMENTER: William M. Borgers, Vice President, Ventura Citrus Properties, Inc.

DATE: Not dated

RESPONSE:

The commenter suggests that maps depicting road and bikeway alignments be amended to clarify that the locations shown are for illustrative purposes and that final alignments will be determined during project review. These maps will be amended to include such a note in the Final EIR.

June 27, 2005

SUSAN DALUDDUNG

17

Memo of Buz Bonsall's 3-minute public comments at the June 25, 2005 City Council/Planning Commission Workshop #2

Re: City of Ventura 2005 General Plan Update Draft E.I.R.

• Achieving the Vision

A

Cañada Larga was the only one of what ultimately became 12 P.E.A.s to be specifically called out for in the March 2000 Vision document. Had the original 800 acre P.E.A. #1, Cañada Larga, been studied in this Draft E.I.R., there would be plenty of excess acreage for Open Space, Parkland and School land use which were found lacking in Scenario 5: Intensification/Reuse - North Avenue + Western Cañada Larga. All or part of that acreage is still available for those purposes.

• Density

B

Assigning 1700 housing units to the roughly 80 usable acres of the 120 Acre Western Cañada Larga Expansion Area is a totally unrealistic density for this semi-rural area, making for unrealistic impacts. I would not want 1700 units on the entire original 800 Acre P.E.A. much less on the reduced acreage. A 3-digit number would be more appropriate for the land in either case.

• Guidelines for Orderly Development

C

In the potential Class 1, Unavoidably Significant Impacts of "Guidelines for Orderly Development Inconsistency," my conversations with Everett Mallais and Kim Uhlich of L.A.F.CO. lead me to believe this is an error. They say Scenario 2 and 3 would have the same impacts if looked at the same way as Scenario 5 or there would be no inconsistency with all three Scenarios 2, 3 & 5. They will make their comments.

• Farmland Conversion

D

I refer you to Table 4.2-1 on Page 4.2-2. The 120 Acre Western Cañada Expansion Area has no Prime Farmland, Statewide Importance Farmland or Unique Farmland - 0 acres total. This is also true for the original 800 acre P.E.A. All but 15 unusable riverbed and flood plain acres of the Cañada Larga Expansion Area, 120 acres or 800 acres, does not require a City S.O.A.R. vote to be utilized. I would direct you to the Ventura County Office of Agricultural Commissioner's letter in the Appendix A commenting on the Revised Notice of Preparation quote: "In reviewing the alternative P.E.A.s under consideration we have the following observations: ... Alternative #3 appears to be most in keeping with all the stated policies and goals of both the City and the County of Ventura. This Scenario requires minimum expansion of Sphere of Influence. Limited removal of Prime Agricultural soils and Lands protected under S.O.A.R. and provides direction for growth to 2025."

In the revised NOP, the referenced Alternative #3 is now Scenario 5: Intensification/Reuse + North Avenue + Western Cañada Larga in this E.I.R. document. Cañada Larga has no Farmland Conversion by itself.

Thank you.

Buz

Letter 17

COMMENTER: Buz Bonsall, Rancho Cañada Larga

DATE: June 27, 2005

RESPONSE:

Response 17A

The commenter notes that the 800-acre Cañada Larga area includes sufficient acreage to accommodate open space, parks, and schools. It is correct that the 800 acres included in the original Cañada Larga area considered by the CPAC, Planning Commission, and City Council would likely include sufficient acreage to meet school and park demands associated with development of the area.

Response 17B

The commenter states an opinion that the 1,700 residential units assumed for the Western Cañada Larga expansion area included in EIR Scenario 5 is unrealistic. The density assumed in the Draft EIR was directed by the City Council. City staff agree that the density assumed is not realistic; therefore, an alternative that reduces the density for the Western Cañada Larga and North Avenue expansion areas as compared to Scenario 5 was included in Section 6.0, *Alternatives*. That alternative, known as the "Upper North Avenue District Housing" alternative would replace some of the development assumed for the Western Cañada Larga expansion area with additional development in the Upper North Avenue district.

Response 17C

The commenter suggests that the conclusion regarding an inconsistency of the Western Cañada Larga area with respect to the Guidelines for Orderly development is an error. In its comment letter on the Draft EIR (Letter 3), the Ventura LAFCO suggested that inclusion of the Western Cañada Larga within the City's sphere of influence at this time would be inconsistent with the Guidelines for Orderly Development since that area is not contiguous with the current City limit. The LAFCO also suggests that development of the North Avenue expansion area may be inconsistent with the Guidelines for Orderly Development since it is not contiguous with the City boundary and, therefore, may not be annexed at this time. The LAFCO notes that annexation of the Olivas area (which is included in Scenarios 2 and 3) would not conflict with the Guidelines for Orderly Development. It should also be noted that, in response to the LAFCO letter, portions of the EIR Project Description and Section 4.14 were re-written to clarify how and when boundary adjustments may occur in the future and how the General Plan relates to future boundary adjustments. Because no boundary adjustments are being sought by the City at this time and it is presumed that future boundary adjustments would be sought only at such time as they could be found to be consistent with applicable State and LAFCO policies, the impact with respect to consistency with LAFCO policy has been changed to Class III, less than significant, for all scenarios.

Response 17D

The commenter notes that the Western Cañada Larga expansion area does not include any important farmlands and that the Agricultural Commissioner's Office has stated an opinion that Scenario 5 appears to be most in keeping with the policies of the City and County (note that the current Scenario 5 was called Scenario 3 in the Notice of Preparation). As discussed in Section 4.2, *Agricultural Resources*, it is correct that the Western Cañada Larga expansion area does not include any farmland designated as Prime, Statewide Importance, or Unique.

Subject: City of Ventura
2005 General Plan Draft Environmental Report

Dear Ms. Gilaketsis:

We appreciate the opportunity to provide you with our comments on the City's Draft Environmental Impact Report (DEIR) for the City's proposed 2005 General Plan. The DEIR is well written and comprehensive. A

We have focused our comments on the DEIR's analysis of the future development potential of the Upper North Avenue District (UNAD). The comments are offered in the spirit of ensuring that there is adequate flexibility in the General Plan's land use designation of "Industry" to allow a mixed-use project to be considered for the expansion of the Brooks Campus and adjacent area and to be found consistent with the City's 2005 General Plan. We are seeking to protect the potential that we believe exists for the City to realize numerous land use and economic objectives in the UNAD should it be annexed in the near future.

A conceptual plan, known as the *Village at Crooked Palm*, has been under development and would result in expansion of the Brooks Institute, the creation of an urban village, and the remediation and reuse of the former USA Petrochem site. With respect to this potential project in the UNAD, the City's Economic Development Strategy document (adopted on April 25, 2005) describes its potential to "...transform the upper North Avenue area from an industrial ghost town to a dynamic economic engine...." and proceeds to state that:

Setting the groundwork for project entitlement will be the City's primary focus for the next few years. Critical to the effort is site remediation, resolving outstanding land use issues that allow consistency with the General Plan update, and future annexation to the City (page 5).

To this end, the following comments reflect a desire to ensure that the groundwork is clearly established within the 2005 General Plan. We want to ensure that the opportunity is not lost to facilitate the City's future ability to consider an urban village concept within the UNAD and find it consistent with its newly adopted General Plan and the City's Economic Development Strategy.

Ms. Kari Gialketsis, Principal Planner
July 18, 2005
Page 2-

"Industry" Land-Use Designation

The proposed General Plan designates the land use for the UNAD as "Industry." With respect to the land use designations within the proposed General Plan, page 2-13 of the DEIR states that: *"For industrial parcels, industrial only projects would be allowed, but it is assumed that residential uses would be limited to work/live or live/work residences"*. This stated assumption is limiting and too restrictive to facilitate a future finding of General Plan consistency with the Economic Development Strategy for the Brooks campus and urban village land use concept currently under development. Residential use would not be limited to work/live units as there is also the extraordinary opportunity to create neighborhoods that would provide a variety of housing types to support Brooks' campus and the associated office, retail, cultural, and recreational uses.

Given these opportunities and land area available within the UNAD, a housing density consistent with the General Plan's "Neighborhood-Medium" providing for 9-20 dwelling units per acre, would be appropriate and should be considered for the UNAD.

The DEIR's assumptions regarding the limits of an *Industry* land use designation also runs counter to important planning objectives stated in the proposed 2005 General Plan and to the adopted goals of the Economic Development Strategy. For example, the proposed 2005 General Plan states:

Industrial sites that are fast converting to light industry, high tech manufacturing and assembly could become factory villages with green space, multiple types of housing, small scale retail to serve workers and spin-off businesses. (page 3-5)

The proposed General Plan also states in its description of corridors and districts:

One of the primary objectives for infill in Ventura is to produce mixed-use development that places everyday requirements in close proximity to dwellings. (page 3-7)

We therefore specifically request that the DEIR either broaden its assumptions of what land uses would be allowed in lands designated as *Industry* or that the land use designation for the UNAD be revised to Commerce or Residential (or a combination of all three) such that a mixed-use, urban village project could be processed and found to be consistent with the 2005 General Plan.

The document should also clarify how the existing Brooks Campus is a use consistent with the proposed land use designation of *Industry* or if the proposed plan will result in an existing use being inconsistent with the newly adopted General Plan.

Ms. Kari Gialketsis, Principal Planner
July 18, 2005
Page 3 -

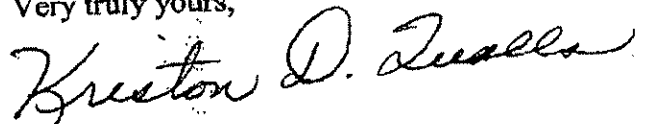

Alternatives Analysis

We note that a project concept similar to what is described above is included within the Alternatives Analysis (section 6.5 Upper North Avenue District Housing) as an alternative to Scenario 5 which is noted as having insufficient acreage to accommodate a mix of housing types or to accommodate parks, schools, or other public facilities. The DEIR analysis considers a mix of office, retail, student/rental housing and 750 other residences being developed on within the UNAD. The analysis also assumes that this level of development would reduce, commensurately, that which would otherwise be developed within the Western Cañada Larga and North Avenue sites. Beyond merely offsetting the intensity of development that might occur in these expansion areas, the DEIR description and analysis (beginning on page 6-13) should also clearly identify the other advantages resulting from developing the UNAD:

- Expanding Brooks' campus and creating jobs and new related growth opportunities in a mix-use urban environment consistent with the city's Economic Development Strategy.
- A brownfield site would be eliminated and reused.
- Development of the UNAD would meet the City's goal of utilizing existing urban infill sites before developing expansion areas.
- The development of the UNAD would be consistent with the County's Guidelines for Orderly Development by developing a site that is currently within the City's Sphere of Influence and contiguous with the City's boundary.

Thank you for your consideration of the foregoing comments. The UNAD is currently within the City's Sphere of Influence and will likely be considered for annexation in the near future. Given that the 2005 General Plan is intended to guide the City's land use decisions until 2025, it should provide the City's future decision-makers with the flexibility to consider exemplary projects and land uses on underutilized parcels that could potentially satisfy many of the City's economic, job creation, housing and community planning objectives.

Very truly yours,

Kriston D. Qualls
General Counsel

cc: Susan Daluddung, Community Development Director
Rob Rossi, Hollywood West LLC

Letter 18

COMMENTER: Kriston D. Qualls, General Counsel, USA Petroleum Corporation

DATE: July 18, 2005

RESPONSE:

Response 18A

The commenter notes that the 2005 General Plan includes various statements suggesting that mixed use development is encouraged within light industrial areas, but that the Draft EIR suggests that residential uses within Industrial-designated areas would be limited to work/live or live/work residences. It is true that various types of residences could be found to be compatible with light industrial development and that one of the 2005 General Plan objectives is to produce mixed use development where everyday requirements are in close proximity to residences. In response to this comment, the last sentence of the first paragraph of EIR page 2-13 will be amended to read as follows (new text is underlined):

For Industrial-designated parcels, industrial only projects would be allowed. Residential uses could include work/live or live/work residences, or traditional housing as part of mixed use development so long as residences are not subject to significant compatibility conflicts relating to such issues as aesthetics, noise, or health and safety that cannot be addressed through site planning.

Response 18B

The commenter suggests that the analysis of the "Upper North Avenue District Housing" alternative should be amended to acknowledge various environmental benefits of that alternative, including implementation of the City's economic development strategy, elimination of a brownfield site, emphasizing intensification/reuse, and consistency with the Guidelines for Orderly Development. The Draft EIR already implicitly acknowledges that development of the Upper North Avenue district would be consistent with City goals and objectives as well as the Guidelines for Orderly Development. In response to this comment, the discussion under "Hazards and Hazardous Materials" for the Upper North Avenue District Housing alternative will be amended to read as follows (new text is underlined):

Hazard impacts would be similar to those of 2005 General Plan Scenario 5. This alternative could potentially increase safety conflicts relating to the placement of residential development in proximity to oil production in the Upper North Avenue area. On the other hand, redevelopment of the Petrochem refinery site would eliminate an existing brownfield. Compliance with 2005 General Plan policies and standard safety requirements on new development would reduce impacts relating to hazardous materials to a less than significant level.

RE: 2005 Ventura General Plan EIR Comments

Dear Kari:

CITY OF VENTURA DRAFT ENVIROMENTAL IMPACT REPORT JUNE 2005

Comments and Corrections by Buz Bonsall, owner of the 120 acre Western Cañada Larga Potential Expansion Area.

Pg. S-1 2nd ¶ "...Three Five "Expansion Areas" "

A

Fig. 2-1a & Fig. 2-1b "Planning Area" Boundaries inconsistent on maps at City Water Facility in Cañada Larga area.

B

Pg. 4.1-18 Photo 13 caption "... Portions of the hillside area fronting the freeway could potentially be graded has already been removed and graded for SR33 Freeway and could be regraded and developed if this expansion area is selected."

C
Regraded

Pg. 4.1-18 Photo 14: This photo depicts M2- Industrial zoned industrial land on the Westside of SR33 and does not represent the grazing land on the Eastside of SR33.

West D

Pg. 4.2-1 Legend "Row Crops" incorrectly depicted on Western most portion (West of bike path) of Western Cañada Larga Expansion Area

E

Pg. 4.4-24 Photo 3: Depicts a Caltrans SR33 Freeway 15+ acres hillside removal and grading project (Late 1969) with natural plant recovery.

F

Pg. 4.4-25 Scenario 5 paragraph, final sentence "the Western Cañada Larga area is the least most disturbed of the expansion areas (15+ acres of hillside removal and massive grading for the SR33 freeway in 1969)...."

G

Pg. 4.4-26 First paragraph reference to Photo 3: There is no native bunch grass or oak woodland present in photo 3. Line 5 "Santa Clara River" should be Ventura River.

H

RANCHO CAÑADA LARGA

Pg. 4.5-17 "Scenario 5" paragraph...." A portion of the mission aqueduct is located ~~within~~ outside to the south of Western Cañada Larga expansion area."

I

Pg. 4.11-51 Top of page final sentence ".....with that scenario." It should be noted that the owners of the Western Cañada Larga Expansion Area have over 6000 acres adjacent to the Arca for potential parkland. There is no shortfall of acres.

J

Pg. 6-20 Public Services: It should be noted there is a Ventura County Fire Department Station building on North Ventura Avenue next to the City's Water Treatment facility.

K

General Comment: As noted by the D.E.I.R. authors at Pg. 4.1-19 Scenario 5, 1700 housing units assigned to the reduced acreage (120 acres) of the original 800 acre Potential Expansion Area of Cañada Larga is "unrealistic", hence the unrealistic impacts in D.E.I.R. data (such as sewer plant capacity etc.) throughout the report.

L

Thank you for the opportunity to comment. If there are any questions regarding my comments, please feel free to contact me at 805-565-0629.

Sincerely,

Buz Bonsall
Rancho Cañada Larga

Letter 19

COMMENTER: Buz Bonsall, Rancho Cañada Larga

DATE: July 18, 2005

RESPONSE:

Response 19A

The commenter notes a typographical error in the Summary. This will be corrected in the Final EIR.

Response 19B

The commenter notes an inconsistency in the depiction of the Planning Area shown in Figures 2-1a and 2-1b. The Planning Area boundary shown in Figure 2-1a will be corrected in the Final EIR.

Response 19C

The commenter suggests a clarification of the caption accompanying Photo 13 in Section 4.1 of the EIR to note that the area shown was previously graded as part of the SR 33 construction. The caption will be amended as suggested by the commenter in the Final EIR.

Response 19D

The commenter correctly notes that the area shown on Photo 14 in Section 4.1 is designated Industrial. The caption accompanying that photo will be revised in the Final EIR to read as follows:

Agricultural land adjacent to the Western Cañada Larga expansion area looking south from SR 33. This area is within the Upper North Avenue District and is currently designated Industrial.

Response 19E

The commenter notes that the area west of the bike path within the Western Cañada Larga expansion area is not in row crop production, as shown on Figure 4.2-1. Figure 4.2-1 will be corrected in the Final EIR to show that area as "Grazing/Livestock" land.

Response 19F

The commenter notes that the area shown in Photo 3 in Section 4.4, *Biological Resources*, was previously graded as part of the SR 33 construction. This comment is noted, though no change to the photo caption is necessary.

Response 19G

The commenter states an opinion that the Western Cañada Larga area is the most disturbed among the expansion areas. Even though much of the area in question has been disturbed historically by past grading activity, the open lands of the Western Cañada Larga area maintains higher biological resource value than the irrigated agricultural lands associated with the other expansion areas. Therefore, from a biological resource perspective, it would be considered the least disturbed.

Response 19H

The commenter notes that Photo 3 on Figure 4.4-4 does not depict native bunch grass or oak woodland. The commenter also notes that the reference to the Santa Clara River on the fifth line of page 4.4-26 should be to the Ventura River. The reference to the Santa Clara River will be corrected in the Final EIR. Although Photo 3 does not depict the habitats mentioned by the commenter, the statement to which the commenter refers merely notes that the Western Cañada Larga has the potential for such habitats. Site specific surveys of the area would be needed to determine whether such habitats actually are present. Such surveys would appropriately be conducted in conjunction with the environmental review of any specific development project for the area.

Response 19I

The commenter requests a clarification of the location of the Mission Aqueduct, as discussed on page 4.5-17. The Mission Aqueduct is known to be in the North Avenue area, but actual location of the Mission Aqueduct is not known with certainty. In response to this comment, the sentence noted by the commenter will be revised to read as follows (new text is underlined):

A portion of the Mission Aqueduct is located in the vicinity of the Western Cañada Larga expansion area.

Response 19J

The commenter notes that acreage is available for parks within Rancho Cañada Larga. This comment is noted, though the areas mentioned by the commenter are not within the Western Cañada Larga expansion area discussed in the Draft EIR.

Response 19K

The commenter notes that there is a County Fire Department station next to the City's water treatment facility. This comment is noted, though the City would need to provide fire protection service in the event that properties within the North Avenue area are annexed and developed.

Response 19L

The commenter states an opinion that the development total assumed for the Western Cañada Larga expansion area are unrealistic. Please see Response 17B.

VENTURA UNIFIED SCHOOL DISTRICT

THE POINSETTIA CITY BY THE SEA

July 18, 2005

Lisa Y. Porras, Senior Planner
 Community Development Department
 City of San Buenaventura
 P.O. Box 99
 Ventura, CA 93002

RECEIVED

JUL 16 2005

PLANNING DIV.

Dear Ms. Porras:

Thank you for the opportunity to review and provide input to the Draft Environmental Impact Report for Ventura's General Plan. The following are our comments pertaining to the K-12 Educational School Facilities.

- 1) Attached is a sample copy of the District's letter to the City dated September 18, 2003 concerning the Draft Comprehensive Plan Update and Draft Issue and Alternative Report. It seems these comments were not addressed on the Draft EIR Report. Also attached is a letter to the Planning Commission concerning public school classroom capacity and proposed residential development dated October 10, 2003. A
- 2) Figure 4.11-3 shows the locations of school facilities and administration facilities within the planning areas operated by Ventura Unified School District (VUSD). There have been some changes. The District no longer owns the Arcade District office site. It was sold last year. The Santa Clara District office site is currently in escrow and the Transportation Department only occupies this site. The administration staff that once occupied the Arcade and Santa Clara office sites has been relocated to the newly remodeled Education Service Center, (formerly Kinko's Corporate Office). Education Service Center is located at 255 West Stanley Avenue. Please make these changes to Figure 4.11-3. B
- 3) The Draft Environmental Impact Report did not take into consideration the relationship between commercial and industrial development projects and school facility needs. Economic opportunities as a result of the development of commercial and industrial space attract new households to the community. C

Commercial and industrial development along with residential development has an impact on school enrollment. New jobs require a larger labor force while in turn, causes new housing to be built to increase the housing supply. The families in these new houses will have their children enrolled in the local school district. This enrollment growth, a joint result of the commercial, industrial and residential development impacts the facility capacities of our District. In conclusion, this type of new development will cause a need for school facilities in Ventura Unified School District. Please note besides residential development, new commercial and industrial development projects are also subject to school impact fees.

City of San Buenaventura
July 18, 2005
Page 2 of 4

- 4) On page 4.11-37, it states, "One alternative to developing new schools would be to expand existing schools". Existing District facilities will be pressed beyond capacity solely with the projected student enrollment from new residential development. Our facilities have minimal space remaining to accommodate projected enrollments from new development. D

Both classrooms and support space are needed to house additional students. As classrooms are added to schools, overcrowding becomes greater in the multi-purpose facility, library, administration office and other support areas. Without additional core space, the current standards of support space will suffer. As result of the implementation of class size reduction in grades Kindergarten through third grades several years ago, it maximized the space at several elementary school sites. Also, parking facilities at our sites will be impacted. Schools such as Balboa Middle, Loma Vista Elementary, Mound Elementary and E.P. Foster Elementary already have inadequate parking facilities that, in turn, impact adjacent neighborhoods.

Ventura Unified School District considers a school overcrowded when it operates at 90 percent of capacity. Using this standard, 18 of the District's schools are overcrowded. Students are being transferred to less crowded schools and are unable to attend a school in their neighborhood. The enrollment projection indicated in the Draft EIR will continue to grow and exceed available school space. One of the goals in the Districts master plan is to construct a new middle school in the east end of the City in the Wells Road area. This will help accommodate students generated from the housing development that has occurred in the east end in the last 6 years.

The remaining student capacity at this district's elementary, middle and high school is of the greatest short-term concern, while the new schools will be required to meet long-term student population progression. In addition many of the existing schools are in older neighborhoods. In these areas, minimal vacant land is available for expansion.

- 5) In relation to Impact PS-3, page 5.17, we disagree with the statement "less than significant for all scenarios." We consider the impact to school facilities as unavoidably significant for all scenarios. The implementation of the project will result in a potentially significant impact. We request that a School Facility Availability Ordinance a Memorandum of Understanding be adopted by the City Council as a proposed residential development should be approved only in confirmation with this ordinance. This involves the City encouraging the school district and developer to engage in early discussions about the nature and scope of the proposed projects, possible fiscal impact and mitigation measures. It is my understanding a similar measure was adopted by the City Council and spearheaded by the past Councilman, Mr. Steve Bennett that was Resolution NO. 97-98 E
- 6) In addition to SB 50 as mitigation measure and the above noted resolution. We recommend that the following objectives and policies be included to address education issues and impacts to public schools within the project scenarios. F

City of San Buenaventura
 July 18, 2005
 Page 3 of 4

Objective: Accommodate the growth of all educational facilities.

- Policy: Provide an adequate level of infrastructure and services to accommodate campus growth at all educational levels.
- Policy: Work with the school district to locate school sites where infrastructure already exists to minimize costs to the school district in new school construction.
- Policy: Include school district staff in the review and input of annexation proposals to guide campus site selection and desirable design elements.
- Policy: Streamline the permitting process for educational facilities as practicable

Objective: Emphasize smart growth principles through all steps of the land development process.

- Policy: Ensure well-planned infill development Citywide, allow for increased density in selected areas along established transportation corridors.

The policies listed above will significantly lessen impacts directly related to the Project. We request that individual development proposals will comply with proposed City standards and practices regarding review of the adequacy of educational facilities. These proposed standards and practices include:

- Use the CEQA review process to evaluate impacts of future development on local schools.
- Ensure the payment of SB 50 school impact fees by project proponents as necessary.

We do concur to some degree with the mitigation measures listed on page S-17 and S-18 but need additional enforcement by the City to implement the above noted recommended objectives and policies.

- 7) The Draft EIR indicates the overall acreage needed to accommodate new school facilities has ranges for each potential expansion scenario. This range does not match the Assumed Expansion Area Acres by Use on Table 2-8, page 2-35. For example, Scenario 2, page 4.11-38 indicates a range from about 38 to 103 acres, but when you compare this to Table 2-8, it shows 110 acres for a school scenario. Please make the necessary corrections G
- 8) No land use designation is indicated on the expansion area maps to accommodate future school sites. H

City of San Buenaventura
July 18, 2005
Page 4 of 4

- 9) On page 4.11.40 Significance after Mitigation states: "Continue collection of State-mandated school impact fees would fund the construction of new school facilities that would be required to accommodate projected increases in school enrollment and would reduce school impacts to a less than significant level for any of the six scenarios." However, the cost of school facility needed by the district to accommodate students related to new development projects is greater than the fees which may be levied against respective type of new development projects. This statement is supported by Development Impact Fee Justification Study dated July 3.2003. As you are aware, construction cost to built public outlay projects continue to increase dramacily in the state of California. I
- 10) We request that the consultant provide a detail methodology how they determined the projected 2025 student enrollment and school acres needed listed on Tables 4.11-14 and 4.11-15. Please confirm that the California Department of Education's usage standard was used to determine the square footage needed per student generated from development. J

In conclusion, the City should consider suitable school capacity when they approve development. It is the overall benefits to the City that adequate and school facilities are established with helps contribute to the quality of education in the community.

We would like to meet with the consultants and City Staff to discuss our comments. Please call me to schedule this meeting at 289-7981, extension 1010. Thank you.

Sincerely,

Jorge B. Gutierrez
Director of Facilities Services

City of San Buenaventura
Planning Commission
P.O. Box 99
501 Poli Street
Ventura, CA 93002

Dear Commissioners:

This letter is concerning the K-12 Educational School Facility issues related to the Draft Comprehensive Plan Update and Draft Issues & Alternatives Report. For your information, I have been a member of the Comprehensive Plan Advisory Committee for the past two years. During my tenure, I have tried to provide vital input into the development of the plan as well as its impact on public school facilities.

I would like you to consider the comments I addressed to the City of Ventura Planning Department concerning the Draft Plan (see attached).

Further, I have attached a copy of Resolution No. 97-98: "A Resolution of the City Council Amending the Land Use Land Plan Element of the Comprehensive Plan Regarding Public School Classroom Capacity and Proposed Residential Development". I recommend that this resolution be incorporated into the Comprehensive Plan.

If you have any questions, please do not hesitate to call me at 289-7981, extension 1010. I appreciate your time and consideration in this matter.

Sincerely,

Jorge Gutierrez
Director of Facilities, Maintenance and Operations

VENTURA UNIFIED SCHOOL DISTRICT

September 18, 2003

City of San Buenaventura
City Planning Department
Attn: Lisa Porras, Associate Planner
P.O. Box 99
Ventura, CA 93002

Dear Ms. Porras:

Thank you for the opportunity to review and provide input on the draft Comprehensive Plan Update and Draft Issues and Alternatives Report. Below are our comments pertaining to the K-12 Educational School Facilities.

PUBLIC SERVICES

On page 11, under Public Services, a statement was made that; "... public schools overcrowding has been alleviated with the recent opening of Foothill Technology High School ..." This statement is incorrect. The Foothill Technology High School helped relieve the student overcrowding at the high school level, but did not alleviate the total problem.

It was indicated that District middle schools have sufficient space. Again, this is not an accurate statement. Based on the Districts' 2002-03 Classroom Usage Report, Anacapa Middle School is at 99% student capacity; and Balboa Middle School, located in the east end of the city, is at 91% student capacity.

Last year, Balboa middle school's enrollment was 1454. The District prefers student enrollment at the middle school level to be around 1200. This school contains the largest student population among the four middle schools in the District. Also, of the 55 classrooms on site, 12 are portable, which means 22% of the class space is relocateable. The student population continues to grow every year as a result of housing developments that have occurred in the past 10 years in the east end of the city. Although portables have been placed at Anacapa and Balboa middle schools, the core facilities, such as cafeterias, have not been expanded.

The elementary schools in the west side of the city, which include E.P. Foster and Sheridan Way, are at 100% capacity. There are 22 classrooms at E.P. Foster Elementary School of which 13 are portable classrooms. This means 59% of the classroom space at E.P. Foster is relocateable; Sheridan Way Elementary School's relocateables make up 38% of classroom space.

The Public Services section relating to public schools do not portray a true picture of overcrowding conditions facing Ventura Unified School District. We recommend the data previously provided to the consultant working on the Comprehensive Plan should be expanded to include the above-noted information at the elementary, middle and high schools level.

City of San Buenaventura

September 17, 2003

Page 2 of 3

PUBLIC SERVICES ISSUES

We request that the Public Services Issues on Page 12 concerning schools be expanded to add the following pertinent issues:

1. Crowding problem will still arise as more relocateables are added to existing school sites;
2. Need to replace and upgrade aging portable classrooms;
3. Need to expand support spaces such as libraries, restrooms, cafeterias and multi-purpose rooms in same proportion to classrooms to alleviate school overcrowding;
4. Constraints - Opportunity to expand existing campuses is limited by the physical size of the school sites and by the capacities of existing permanent facilities; and
5. Explore the feasibility of the City adopting a School Facility Availability Ordinance.

In respect to the School Facility Availability Ordinance, this type of ordinance may have been adopted by the City Council, several years ago, which was spearheaded by past Councilmen, Steve Bennett. As a proposal, residential development should be approved only in confirmation with the School Facility Availability Ordinance. This involves the City encouraging the school district and developers to engage in early discussions about the nature and scope of proposed projects and possible fiscal impact and mitigation measures.

HOUSING DEMAND – Section 3.1.1

The Population and Housing section does not reflect the school age population (5-17 years) in the City of Ventura. We request a figure be prepared which show the school age population from 1970 to 2025. This figure requested will show the magnitude of growth at different periods of time during the duration of the General Plan. Also, will rising birth rates result in increased enrollment from older homes?

SCHOOLS – Section 3.1.2

We would like to meet with the consultants to determine their methodology in determining land needed for new schools. Our projections used by the State Department of Education are different than what is proposed for land needed at each school grade level. The projected school needs should comply with the State Services Land Standards for the number of students per classroom and laboratory, recommended size of parcel for a given number of students, and the number of pupils per acre. Services level standards measure the physical attributes of educational facilities and their ability to provide a given level of educational benefit.

COMMERCIAL AND INDUSTRIAL SITES – Section 3.2.4

We would like to know if the consultant took into consideration the relationship between commercial and industrial development and schools impact. For example, in a case of a business moving to a new facility from an existing building in the city, it is assumed that on average, the older facility will be occupied by a new business enterprise with the same number of employees as the business that moved out. It is the growing capacity of the community to accommodate employment that result in residential growth and increased school demand.

City of San Buenaventura

September 17, 2003

Page 3 of 3

SCHOOLS – Section 5.7

We disagree with the statement "the acreage estimate could be reduced in various ways, including more intensive use of existing schools, reducing the acreage requirement of new schools". The schools in our district are at or near capacity. With the District's implementation of class size reduction at K-3 grade level, additional relocateable classrooms were placed at elementary school sites, and at the same time, support space such as libraries and cafeterias were not expanded. With the additional classroom space added in the past ten years, there exists a lack of available open space to address future growth without impacting playground and support space.

The recommendation to reduce the acreage requirements of new schools will impact the District's ability to meet the Department of Education State Services Standards. By not meeting these standards, the District will not provide a quality level of educational environmental benefits to support curriculum and the learning process. Also, it will perpetuate overcrowding conditions for students and staff at impacted school sites.

At the top of page 93, it states "... no land within the existing City/SOI is specifically designed for new schools" ... except for the 10-acre elementary school PEA #2 (North Avenue). We feel there is sufficient property within PEA #2, #7, #8 and #9 to designate as new school sites. We recommend that the 100-acres required for new schools be address in the General Plan. Also, this plan fails to address the financial measures to pay for the new schools as a result of population growth.

We would like to meet with the consultants and City staff to discuss the possible 20-acre site Pacific View Mall (North Site) and the 35-acre area south of DeAnza Middle School.

Should you have any questions, please do not hesitate to call me at 289-7981, extension 1010.

Sincerely,

Jorge B. Gutierrez
Director of Facilities, Maintenance and Operations

Letter 20

COMMENTER: Jorge B. Gutierrez, Director of Facilities, Maintenance and Operations,
Ventura Unified School District

DATE: July 18, 2005

RESPONSE:

Response 20A

The commenter references letters submitted to the City in 2003 and suggests that the Draft EIR does not address comments included in those letters. The Draft EIR incorporates relevant information contained in the referenced letters. In addition, consultant staff contacted the VUSD several times during the preparation of the Draft EIR in the first half of 2005 and received current enrollment and other data from the VUSD during that time period as well.

Response 20B

The commenter notes two changes to the locations of VUSD facilities that should be reflected on EIR Figure 4.11-3. Figure 4.11-3 will be amended in the Final EIR to reflect the new location of the VUSD Education Service Center on Stanley Avenue.

Response 20C

The commenter states an opinion that the Draft EIR does not take into account the relationship between commercial/industrial development and school enrollment. As suggested by the commenter, the generation of new jobs in the community is expected to contribute to population growth. However, the population and housing growth estimates discussed in the Draft EIR include all new housing and population growth anticipated for the Ventura Planning Area, including people who relocate to the area to fill new jobs. As discussed under Impact PH-4 in Section 4.15, *Population and Housing*, the City is projected to maintain a balance of jobs and housing through 2025 under any of the six land use scenarios studied in the Draft EIR. Therefore, the effect of job growth on school enrollment has been accounted for in the Draft EIR. As the commenter notes, non-residential developments would continue to be required to pay State-mandated school impact fees.

Response 20D

The commenter notes that a number of VUSD schools are already at or near capacity, that existing facilities have minimal space to accommodate projected enrollment increases, and that minimal vacant land is available in many existing neighborhoods. The commenter also notes that the VUSD is planning to construct a new middle school in the Wells Road area.

The comments with respect to school enrollment and capacity, and available land for new schools are consistent with the discussion under Impact PS-4 in Section 4.11, Public Services. Table 4.11-4 shows that projected 2025 enrollment exceeds the capacity of VUSD schools at the elementary, middle, and high school levels, while the discussion under "Scenario 1 -

Intensification/Reuse Only” acknowledges that there is “limited land that could be used for the development of new school facilities.” In response to this comment, the following sentence will be added at to the last paragraph on page 4.11-11:

One of the goals in the VUSD master plan is the construction of a new middle school in the Wells Road area.

Response 20E

The commenter states disagreement with the conclusion that impacts to schools would not be significant under CEQA and requests that the City adopt a “school availability ordinance” or memorandum of understanding in which residential development would only be approved following developer discussions with the VUSD and development of appropriate mitigation measures. The opinion with respect to the significance of school impacts is noted. As acknowledged in the Draft EIR, projected school enrollment exceeds the capacity of VUSD schools and, under some EIR scenarios, limited land is available for the development of new schools. However, as noted in the Draft EIR, pursuant to Section 65995(h) of the California Government Code (Senate Bill 50, chaptered August 27, 1998), the payment of statutory fees “...is deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization.” As the State legislature has made this determination, the City has no authority to make a determination that payment of State-mandated fees would not mitigate impacts.

The Draft EIR includes two recommended actions that would at least in part address the request for coordination between developers, the City, and the VUSD. These are listed below.

PS-3(a) School Coordination. The following action should be added to the 2005 General Plan:

- Work with the Ventura Unified School District to ensure that school facilities can be provided to serve new development.

PS-3(b) Expansion Area Schools. The following action should be added to the 2005 General Plan if any land use scenario that includes an expansion area is adopted:

- Require expansion area specific plans or community plans to be prepared in coordination with the Ventura Unified School District and set aside land needed for new school facilities.

Response 20F

The commenter suggests several additional policies/ actions for inclusion in the 2005 General Plan. The actions listed in Section 4.11 of the DEIR and under Response 20E partially address these suggestions. The City will continue to cooperate with the VUSD to identify new school sites in areas where residential growth is anticipated to occur. Chapter 3 of the 2005 General Plan addresses “smart growth,” which is one of the

primary emphases of the General Plan. The City will be required by law to continue to use the CEQA process to evaluate the impacts of local development on schools and collect State-mandated school impact fees on behalf of the VUSD.

Response 20G

The commenter notes that the acreage assumed for schools within expansion areas does not match the acreage needed to meet the demands of individual EIR land use scenarios. These acreages are not intended to match. The commenter notes that the school acreage assumed for the expansion areas under Scenario 2, for example, is 110 acres, while the projected overall demand for acreage ranges from about 38-103 acres. This suggests that the expansion areas included in Scenario 2 provide more than enough acreage to meet overall demand associated with buildout of that scenario. Thus, inclusion of the expansion areas could help accommodate students generated by intensification and reuse development.

Response 20H

The commenter notes that the expansion areas do not include land use designations to accommodate schools. As noted in Section 2.0, *Project Description*, the City is not proposing to re-designate any of the expansion areas at this time. The Draft EIR considers these areas as possible future expansion areas. It is anticipated that any future development proposal for any of the expansion areas would involve a Specific Plan that would include provisions for schools.

Response 20I

The commenter notes that the costs of school construction are greater than that provided by State-mandated fees. As discussed in Section 4.11 and in Response 20E, State law dictates that payment of the State-mandated fees constitutes full and complete mitigation under CEQA.

Response 20J

The commenter requests an explanation of the methodology used to project school enrollment and school acreage requirements. This methodology is described in Section 4.11, *Public Services*. To estimate growth in student enrollment, the projected number of new housing units was multiplied by the students-per-household rates provided by the VUSD. To estimate the acreage of new schools needed, the following methodology was used:

- The current school capacity totals were subtracted from the projected number of new students (these totals are shown in the second column of Table 4.11-15)
- These totals were divided by the projected number of students per school (shown in the third column of Table 4.11-15) to determine the number of new schools needed (shown in the fourth column of Table 4.11-15)
- The number of schools needed were multiplied by the number of acres per school, from the California Department of Education recommended school size, to determine the amount of school acreage needed (shown in column 5 of Table 4.11-5)

Re: *Comments on City of Ventura 2005
General Plan Draft Environmental Impact Report*

Dear Ms. Gialketsis:

I am submitting these comments regarding the Draft Environmental Impact Report ("DEIR") for the City of Ventura 2005 General Plan ("General Plan") on behalf of my client, Mariano Rancho, LLC. Mariano Rancho owns approximately 215 acres of vacant property within the City of Ventura ("City"), located north of Poli Street/Foothill Road and zoned R-1-7. As a longstanding member of the Ventura community, Mariano Rancho shares the City's interest in supporting responsible and sustainable planning for the future of the community.

To that end, we have reviewed the General Plan, the DEIR for the General Plan and the City of San Buenaventura 2000-2006 Housing Element ("Housing Element") to ensure that the documents are accurate and consistent. Our comments touch on apparent inconsistencies between the Housing Element and the General Plan, difficulties in tracking housing unit allocations and corresponding traffic impacts for particular areas across the three documents, characterization of the habitat conditions on the Mariano Rancho property and the Ventura hillside areas generally, and the need to clarify the status of linear parks delineated in the General Plan.

Page 2

I. Apparent Inconsistency Between the General Plan Projected Housing Growth Distribution and the Housing Element**A**

A general plan must be integrated and internally consistent among and within each element. Government Code § 65300.5. The housing element is one of seven mandated elements in the general plan. Gov. Code § 65302. Although it must be updated every five years, rather than the longer time frame permitted for updating general plans, the housing element must still be consistent with the overall general plan. Gov. Code § 65888

In Ventura's case, the City adopted the most recent Housing Element in April 2004, while the multi-year General Plan updating process was underway. The Housing Element contains certain assumptions about development potential which should be carried through to the General Plan. In particular, in its analysis of availability of sites for housing, the Housing Element states that 2,050 housing units can be developed on vacant lots in Ventura, of which 486 units may be developed on vacant sites zoned R-1-7.¹ Appendix D of the Housing Element provides a complete inventory of vacant sites, including parcel number, zoning and acreage. Mariano Rancho's property (740010015 R-1-7) is listed as 215.40 acres with "constraint" acreage of 71.97. Assuming this very conservative constraint estimate is accurate (which cannot be confirmed without the benefit of a project-specific analysis for the site), by applying the maximum density of 6 units per acre and the 70% of lot maximum density assumption used in the Housing Element, the unit potential derived for the Mariano Rancho property in the Housing Element is:

$$71.97 \text{ acres} \times 6 \text{ DU/acre} \times 70\% = 302 \text{ dwelling units.}$$

Turning to the General Plan DEIR, Table 2-5 summarizes Projected Housing Growth Distribution for the 20-year planning period of the General Plan under all scenarios by growth area. The General Plan proposes to focus most of the new growth into the specified Growth Districts/Corridors; these areas account for 3,950 units in all scenarios. The Mariano Rancho property is not located within one of these nine Growth Districts/Corridors. The DEIR projects another 2,650 units to be built within the proposed smaller Sphere of Influence and existing areas designated for urban uses, of which 700 units are projected to be built on vacant and underutilized parcels outside the Growth Districts/Corridors. (DEIR p. 2-32.) Appendix C to the DEIR breaks these 700 infill units down further into 250 units projected to be developed on underutilized sites and 450 units projected to be built on vacant property. Note 3 to the tables in Appendix C explains that these tables assume that "all vacant land outside the districts and corridors will be developed in accordance with the proposed land use designations."

Taken together, it is difficult to reconcile the assumptions in the Housing Element with those in the General Plan. Specifically, how do the 486 units assumed for just the R-1-7 zoned areas in the Housing Element compare to the 450 units projected for all non-Growth District/Corridor vacant property in the General Plan EIR? Using the Housing Element methodology and assuming the property is developed in accordance with its zoning, the Mariano Rancho's 302 units alone would account for 67% of all the units projected to be built

¹ Adopted City of San Buenaventura 2000-2006 Housing Element, April 2004, pp. 4-1, Chart 4-1 on p. 4-2.

GIBSON, DUNN & CRUTCHER LLP

Kari Gialketsis
July 15, 2005
Page 3

on vacant properties designated for urban uses outside the Growth Districts/Corridors and within the city limits. Additional clarification of how the Housing Element assumptions relate to the General Plan's Projected Housing Growth is necessary to confirm that the General Plan is internally consistent as required by state law.

II. The Circulation Element Update Traffic Study Does Not Track the Housing Element Assumptions**B**

The need for clarification extends to the issue of how Appendix E to the DEIR, the Comprehensive Plan Circulation Element Update Traffic Study ("Traffic Study"), accounts for the trips that would be generated by the growth assumed in both the Housing Element and the land use element of the General Plan. Attached to this comment letter is a communication from Paul W. Wilkinson, of the traffic engineering firm Linscott Law & Greenspan, noting the difficulties he had confirming that the permitted development assumed in the Housing Element was carried over to the development potential tabulation input to the General Plan and the Traffic Study. Mr. Wilkinson's analysis is hereby incorporated into this comment letter by reference.

In particular, we request that the General Plan and Traffic Study be amended to include a Traffic Analysis Zone ("TAZ") Exhibit and a trip table (development summary and trip forecast) that presents a development and trip making forecast for every TAZ that is consistent with all elements of the General Plan. Such TAZ and trip table exhibits would enable planners, property owners and community members to more clearly assess the traffic impacts of the growth assumptions and provide a basis for comparing site specific analyses to the General Plan's overall growth and circulation goals, policies and actions.

III. Characterization of the Habitat on the Mariano Rancho Property and Hillside Areas Overstate Potential Impacts**C**

Figure 4.4-1 on page 4.4-3 of the DEIR maps the habitat types found within the planning area of the General Plan. The map depicts a substantial portion of the Mariano Rancho property and nearly all of the hillside property as containing coastal sage scrub habitat. A note on Figure 4.4-1 states that the vegetation cover types were derived from Landsat Thematic Mapper satellite imagery. We understand that at the analytical level of a General Plan detailed site characterizations are impractical and inappropriate. However, more detailed studies of the area indicate that Figure 4.4-1 vastly overstates the extent of coastal sage scrub in the Mariano Rancho and hillside areas. As a result, we would expect that as part of a site-specific analysis, some of the potential impacts identified, such as BIO-2 potential adverse affects on sensitive habitats, BIO-3 potential affects on special-status plants and animals and BIO-4 potential affects on ecological connectivity through wildlife corridors, would not be found or would be avoided.

GIBSON, DUNN & CRUTCHER LLP

Kari Gialketsis
July 15, 2005
Page 4

IV. Status of Designated Linear Parks Should be Clarified

Figure 4.11-4² Parks and Recreational Facilities on page 4.11-15 of the DEIR, depicts a linear park network that includes a linear park running through the Mariano Rancho property and portions of the hillside areas. The Final EIR should clarify that these linear parks do not currently exist, have not been offered for dedication to the City and that the City has not presently offered to purchase the land for these parks.

In addition, the text at page 4.11-20 acknowledges that the "[r]esources available for constructing the linear park and trail system are acquired through conditions placed on developers who plan to build in areas within the linear park network." This approach to building the linear park therefore appears to presume the development of the hillside property in order to obtain the exactions necessary to dedicate and construct the linear park through the hillside portion of the City. This appears to be at odds with the General Plan's overall goal of focusing future development on non-hillside areas.³ Therefore, the DEIR and the General Plan should be revised to either remove the linear park network designations from the hillside areas or include a statement that the linear parkland in this area may be acquired through purchase of the property or the permitting of limited development in the area to obtain the parkland through dedications.

Finally, the linear park system proposed for the hillside area in Figure 4.11-4 does not appear to have been delineated with consideration of the natural topography of the area. We suggest that text be added to the General Plan and DEIR stating that the final alignment of the Mariano Rancho and hillside linear parks may be revised to account for topography, habitat and other considerations.

We appreciate the opportunity to comment on the General Plan DEIR and look forward to reviewing the final document in the coming weeks.

Very truly yours,

Cecilia V. Estolano

Subject: **Review of General Plan and Related City Documents
Mariano Rancho Property
Ventura, California**

Dear Ms. Estolano:

At your request, we've reviewed several documents prepared by the City of Ventura as part of its General Plan update process. Those documents include the following:

- City of San Buenaventura, *Ventura General Plan, Public Review Draft*, May 24, 2005;
- City of Ventura, *2005 General Plan: Draft Environmental Impact Report*, SCH #2004101014, June 2005;
- City of San Buenaventura, *Comprehensive Plan Circulation Element Update Traffic Study*, May 2005, Appendix E;
- *Adopted, City of San Buenaventura, 2000-2006 Housing Element*, April 2004.

These documents were reviewed with the intent of tracking the "placeholder" within each for the Mariano Rancho property, which lies generally northeast of Downtown, north of Poli Street and Foothill Road, and south of the "Hillsides" open space area illustrated in the Draft General Plan Diagram (follows page 16 of the *Public Review Draft of the General Plan*). The intent of that tracking was to confirm that the permitted development on the property as outlined in the City's *Adopted 2000-2006 Housing Element* was carried over to the development potential tabulation input to the *General Plan Public Review Draft*, which in turn was specifically input to the *Circulation Element Update Traffic Study*.

Such a process would normally ensure that a future housing development proposal on a specific site, when consistent with the *Housing Element* assumptions for that site, would also be consistent with the City's circulation planning for the site area. This consistency would be most conveniently indicated when the trip table for the Traffic Analysis Zone (TAZ) of the *Circulation Element Update* traffic studies indicates a unit count, attributable to that specific site, which exactly (or very nearly equals) the

unit count permitted by the *Housing Element* (and by extension the *General Plan* Land Use component, since the *Housing Element* and *General Plan* are supposed to be consistent).

Unfortunately, as the following discussion will reveal, we are not able to make that finding of internal consistency between the *Housing Element* "placeholder" for the site, and the traffic analyses that support the *Circulation Element Update*. It may be possible that they are, but we doubt it. Having been unable to reconstruct that consistency from document to document, we recommend that the question be posed to the City as part of the public review process, ensuring that that which is called for on the Mariano Rancho property within the *Housing Element* is indeed represented in the circulation planning and impact studies conducted by the City.

Adopted City of San Buenaventura 2000-2006 Housing Element (April 2004)

Chart 4-1 of this report (page 4-2, which is also Page 124 in the electronic version) identifies the residential development potential on vacant sites in the City. The Mariano Rancho falls within the R-1-7 zoning designation, where the maximum density is 6 units per acre. The chart indicates that there are 56 parcels within this category, with vacant acreage totaling 111.7 acres, and with a development potential (at 70% of maximum density) of 486 dwelling units. (As an aside, the math here may be in error: $111.7 \times 6 \times 70\% = 469$ dwelling units).

Looking to Appendix D of this report, all of the assessor's parcel numbers that resulted in the Chart 4-1 summary are indicated, sorted to either underutilized or vacant sites (the later includes the Mariano Rancho). Looking to the "vacant sites" summary, the zoning designation, parcel acreage, and "constraint" acreage (presumably useable acreage) are indicated. As we understand it, the Mariano Rancho is APN 740010015 R-1-7, for which the total site acreage is 215.40, and the "constraint" acreage is 71.97. Taking the later, and the methodology underlying Chart 4-1, the unit potential of the Mariano Rancho would be as follows:

$$71.97 \text{ AC} \times 6 \text{ DU/AC} \times 70\% = 302 \text{ dwelling units.}$$

Using our terminology, this constitutes the future development "placeholder" we would expect to be carried to the other documents discussed below.

City of San Buenaventura, Ventura General Plan, Public Review Draft, May 24, 2005

Continuing our focus on the Mariano Rancho as a future residential development site, with as many as 302 dwelling units per the adopted *Housing Element*, Table 2 (pages 14 and 15) of the *General Plan Public Review Draft* presents the development potential for both residential and non-residential categories throughout the City. The *Draft* indicates, "Table 2 provides estimates of the amount of development that could reasonably be expected to occur in the city, sphere of influence, and potential expansion areas based on the densities and intensities allowed under each planning designation". These estimates

N:\2600\3-052685-1\Mariano Rancho Property.doc

Ms. Cecilia V. Estolano
July 15, 2005
Page 3

are sorted to "districts" and "corridors" (both of which are identified in the Draft General Plan Diagram following page 16 of the *Draft*), as well as "sphere of influence (SOI) / other infill" and "planned and pending developments" which, in our reading are not located on any figure of the *Draft*. In reviewing Table 2, it appears that Mariano Rancho is not represented among any of the described sub areas or projects. Thus while a development total of 302 units is the inferred unit potential of the site in the *Adopted Housing Element*, those units appear not to be included in any of the land use scenarios considered in the *Draft*, or its companion EIR *Draft*.

It is worth noting that among all four categories and their sub areas, Table 2 indicates an added development potential of 8,318 DU in the City, and this total appears to presume no development on the Mariano Rancho.

City of San Buenaventura, Comprehensive Plan Circulation Element Update Traffic Study, May 2005, Appendix E

From this document, it is evident that the Mariano Rancho is located within Sub Area 17 of the traffic analysis (Figure 3-1, Page 3-5). It will be noted that the report presents six figures using this base, one for each of six land use scenarios studied by the consultant. While the ADT pie chart varies among those six figures, Sub Area 17 includes the Mariano Rancho and the much larger surrounding area that includes the "Hillsides" area plus those intervening undeveloped sites between the "Hillsides" on the north and Poli Street and Foothill Road on the south.

Table 3-1 (page 3-4) of this report identifies the growth by land use type for the 17 sub areas of the study. A total of 435 dwelling units are identified for Sub Area 17 in Table 3-1. While this table refers specifically to Scenario 1 (of six) analyzed in the study, the 435 added unit ("total growth") total in Sub Area 17 is the same for all six scenarios. While 435 is clearly greater than the 302 unit development potential for Mariano Rancho inferred from the *Adopted Housing Element*, there is no way to tell from the studies we have if Mariano Rancho is included at any specific DU count.

Further, it is worth noting from Table 3-1 that the total growth potential for housing units among all 17 sub-areas of the traffic study is 8,539 dwelling units. For other scenarios, this total amount varies between 11,241 and 11,255 units, but the added unit count in Sub Area 17 remains constant at 435 units. Referring back to the discussion on Table 2 of the *General Plan Public Review Draft*, the development potential throughout the study area was estimated at 8,318 units. All six scenarios of the traffic study presume a greater unit total (meaning the traffic forecasts and findings are conservative...a good thing), but again we cannot isolate the specific development "placeholder" for Mariano Rancho.

JUL 18 2005 3:30PM GDC LA 7

Ms. Cecilia V. Estolano
July 15, 2005
Page 4

Conclusion

Given all of the above, we conclude that:

1. The *Adopted Housing Element* intended a total development of 302 residential units on Rancho Mariano.
2. The *General Plan Public Review Draft* identified a development potential of 8,318 residential units throughout the General Plan study area. Mariano Rancho does not appear to be part of that summary at any total, including the 302 units inferred by the *Adopted Housing Element*.
3. Mariano Rancho is included within Sub Area 17 of *The Comprehensive Plan Circulation Element Update Traffic Study*. That sub area is much larger than the footprint of Mariano Rancho. The projected housing growth in Sub Area 17 is 435 units regardless of the scenario evaluated. While 435 exceeds the 302 unit development total per the *Housing Element*, it still is not clear if the traffic study recognized / established a 302 unit "placeholder" for Mariano Rancho in circulation planning for the City.
4. In our experience, the ability to track, or "map", the development totals of a specific development proposal against prior land planning and circulation studies prepared at the city-wide level is an indispensable tool in reviewing and processing those eventual development applications. The documents we have do no allow us to conclude a consistency between the *Adopted Housing Element*, the *General Plan Public Review Draft*, and *The Comprehensive Plan Circulation Element Update Traffic Study* for the Mariano Rancho property.
5. While we've come to this conclusion as we tried to create this "map" for Mariano Rancho, we are concerned that virtually any future development proposal in the City could have the same difficulty, creating unnecessary trauma for the decision maker, staff, community and applicant. We recommend that such a mapping correlation process be framed now, as part of this General Plan review process, to avoid those unnecessary difficulties in the future. Such a framework may require refinement to these studies, or from a circulation perspective, might be relatively easily solved through a straight forward reconciliation process that presents a specific Traffic Analysis Zone (TAZ) exhibit and identifies a trip table (development summary and trip forecast), that for every TAZ, presents a development and trip making forecast that is deemed consistent with the selected Scenario of the General Plan adoption.

COMMENTER: Cecilia V. Estolano, Gibson, Dunn & Crutcher, LLP, on behalf of Mariano Ranch, LLC

DATE: July 15, 2005

RESPONSE:

Response 21A

The commenter states concerns about what are perceived as inconsistencies between the housing growth projections contained in the Housing Element and the 2005 General Plan EIR. The Housing Element and the 2005 General Plan EIR use different methodologies to project possible growth because they have different purposes. The purpose of the analysis in the Housing Element was to demonstrate the ability to meet the City's housing needs; therefore, the numbers provided in the Housing Element illustrate the maximum development potential based upon the current zoning. The Draft EIR, on the other hand, is attempting to provide a "realistic" estimate of how much growth will actually occur through 2025 rather than illustrate the maximum amount of development that could occur theoretically. The growth factors upon which the Draft EIR analysis is based represent historic growth rates over the past 10 years (0.88% annually) and the past 20 years (1.14% annually). Theoretically, any of the land use scenarios considered in the Draft EIR could accommodate substantially more growth if all of the designations shown on the land use map(s) were built out to their maximum. However, it is unlikely that such growth would actually occur within the 20-year timeframe of the 2005 General Plan.

It is important to note that the EIR is an informational document, not a policy document, and that the growth numbers presented in the Draft EIR are assumptions developed for analytical purposes only. City and consultant staff attempted to distribute the future growth through the City in a manner consistent with the General Plan land use designations, Council direction, and current growth patterns in the City. However, the actual amount of growth that may occur in any given area may be higher or lower than that presented in the Draft EIR and a deviation from the number of projected units for any specific area would not represent an inconsistency with the General Plan.

Finally, it is also important to note that the proposed land use designation for the Mariano Ranch property about which the commenter is concerned (Low Density Residential) affords the same development potential as the current 1989 Comprehensive Plan designation (a maximum of 8 units per acre). Therefore, the development potential of the property has not changed.

Response 21B

The commenter attaches an analysis from a traffic engineering firm and requests that the traffic study include a traffic forecast for every traffic analysis zone that is consistent with all elements of the General Plan. A table such as that described by the commenter would not be useful and would more likely be the source of substantial confusion. As discussed under Response 21A, the maximum development potential estimates shown in the Housing Element and the

projections of growth over the next 20 years contained in the Draft EIR are not the same, nor are they intended to be as the two documents are intended to serve different purposes. It should again be noted that the development potential of the Mariano Ranch property about which the commenter is concerned would not change under the 2005 General Plan.

Response 21C

The commenter states an opinion that the biological resource analysis in the Draft EIR overstates the extent of coastal sage scrub in the Mariano Ranch area and individuates that biological resource impacts can likely be avoided if that area were to develop. The Draft EIR is intended to provide a conservative estimate of possible future impacts. It is correct that site-specific analysis of individual properties may reveal that biological resource impacts may be lower than suggested in this program level document. In any event, the City concurs with the opinion that biological resource impacts can be avoided or mitigated, as evidenced by the fact that the Draft EIR concludes that proposed General Plan policies would reduce biological resource impacts to a less than significant level.

Response 21D

The commenter notes that the Final EIR should clarify that linear parks shown in the hillside areas do not currently exist and, if they are to be developed, would need to be acquired through property acquisition or permitting of limited development to obtain parkland through dedications. The commenter also suggests that text be added to the figure depicting linear parks be amended to include text indicating that the alignments shown are conceptual and subject to change based upon site-specific conditions. The commenter is correct that linear parks in these areas would need to be acquired or obtained through dedications. A note will be added to the EIR and General Plan maps indicating that the linear park locations are conceptual.

RECEIVED
JUL 18 2005
PLANNING DIV.

Ms. Lisa Y. Porras
City of San Buenaventura
Community Development Department
501 Poli Street
P.O. Box 99
Ventura, CA. 93002-099

Subject: General Plan Update

"Dear Ms. Porras,

My firm's review of the City draft EIR evaluating the effects on the environment of the new City General Plan is summarized as follows:

1. It does not appear to evaluate current and future potential redevelopment within the City and its ultimate effect on traffic, air quality, noise, etc
2. It selects an already underutilized use of City lands, both within the City limits and Sphere of Influence boundaries, leading to Scenario No.1, but doesn't take into account natural population increases less deaths in addition to minor proposed housing increases. Use of antiquated SCAG guidelines fails to account for natural increases nor for redevelopment of such areas as the Harbor, Mid-Town and Ventura Avenue North to Canada Larga.
3. The most appropriate population scenario should assume a rate of housing at 1.14% rather than 0.88%.
4. It would be a burden on staff and costly to choose a population level that will be regularly exceeded, thus causing need for General Plan amendments, most of which would require complex and convoluted election campaigns. Using the SCAG population numbers is not being current and automatically causes almost every project to exceed City population and require a General Plan Amendment.
5. General Plan Amendments in Ventura are expensive and problematic.
6. As to one of our projects, Westwood Communities' Parklands, we assume that its location is considered infill in the new General Plan despite the need to annex it to the City.

A

B

C

D

E

F

7. At S-11, Biological Resources, Impact BIO-1: A specific standard of 50 feet of setback from barrancas appears inconsistent with a Form Based Code approach in the New General Plan. Buffers from barrancas should be adaptable depending on (1) whether the barranca edge is where scenic retail or housing may be located, (2) the layout of contiguous parallel pedestrian and bike paths, etc. As an example, the buffer for Parklands is planned at 40 feet on each side of Brown Barranca. Where a barranca runs through a project area and not along one side, the amount of the buffer becomes doubled, impacting not only the adaptation of the barranca into the plan but keeping quite a bit of land out of use. G

8. At S-18, Public Services, Impact PS-3: We bring to your attention that a new school is not planned for the Parklands. H

9. At 4.11-18, City Park Facilities: Please recognize that the amount of acreage and size of public parks needs greater flexibility upon adoption of a Form Based Code approach to residential development. Our understanding of New Urbanism Parks calls for multiple parks of smaller acreage, dispersed through a proposed residential project. An example of this is our Parklands project, which has a proliferation of smaller than 5 acre parks, including tot lots, informal pitch and hit parks, etc. I

10. In the sections on Circulation and connecting streets, we strongly urge that not all connecting streets be required to be straight alignments between existing termini and entry into secondary and primary public streets. As an example, because of the strong desires of the residents west of Parklands, the east-west connector to Wells Road is designed to connect, but not in a straight run. This alignment was urged by the neighbors to the project as a means of keeping future trips from running through their home streets. Thus, we are urging that you provide street standards which allow for a convoluted, but nevertheless actual connection without having to leave an existing or proposed residential neighborhood. J

Respectfully submitted,

David J. Rose
DTR Engineering

Chuck Cohen
Weston Benshoof Rochefort Rubalcava & MacCuish

Letter 22

COMMENTER: David J. Rose, DTR Engineering

DATE: July 18, 2005

RESPONSE:

Response 22A

The commenter states an opinion that the Draft EIR does not appear to evaluate the effects of current and future redevelopment. The Draft EIR evaluates the impacts of potential citywide growth through 2025, including intensification/reuse (including redevelopment of properties) and, in some instances, expansion of the City. As noted in Section 2.0, *Project Description*, approximately 8,300 housing units are assumed to be added to the City through intensification and reuse over the next 20 years and each of the analysis subsections in Section 4.0, *Environmental Impact Analysis*, evaluates the impacts associated with such intensification/reuse development. Traffic, air quality, and noise issues are discussed in detail in Sections 4.12, 4.3, and 4.10, respectively. Traffic impacts are further discussed in the full traffic study included in Appendix E.

Response 22B

The commenter states an opinion that the use of SCAG guidelines fails to account for natural population increases or the redevelopment of various areas. It is not clear to which SCAG guidelines the commenter is referring. The Draft EIR analysis discusses SCAG policies in Sections 4.14 and 4.15. However, as discussed in the Draft EIR, the population projections used in the Draft EIR exceed SCAG forecasts for the City; therefore, the City is not relying on SCAG's guidelines with respect to projected population growth through 2025. With respect to redevelopment, each of the Draft EIR land use scenarios anticipates the development of approximately 8,300 housing units in the City through intensification and reuse, including a substantial number of units in the Harbor, Midtown, and Ventura Avenue areas. Finally, both of the growth rates used in the Draft EIR (0.88% annually and 1.14% annually) are higher than the natural growth rate for the area, which is generally estimated at about 0.6% annually.

Response 22C

The commenter states an opinion that the 1.14% annual average growth rate is more appropriate than the 0.88% growth rate. These numbers were directed by City Council to be used as reasonable growth estimates over the next 20 years.

Response 22D

The commenter states an opinion that using SCAG population projections that are not current causes almost every project to exceed the City's population projections and therefore require a General Plan amendment.

The Draft EIR does not rely on SCAG forecasts. It merely acknowledges that the population projections used in the Draft EIR exceed SCAG growth forecasts for the City. Individual projects would not require a General Plan amendment merely because the City's population projections exceeds SCAG's forecast. The more likely scenario is that SCAG will update its forecasts to reflect the City's current growth projections following adoption of the 2005 General Plan. Similarly, it is anticipated that the Ventura County APCD will update its growth forecasts for Ventura in the 2007 AQMP that is currently in preparation.

Response 22E

The commenter notes that General Plan amendments are expensive and problematic. This comment is noted; however, as discussed above, exceedance of SCAG population forecasts would not necessitate a General Plan amendment for individual projects.

Response 22F

The commenter assumes that the Westwood Communities Parklands' project is considered infill even though the site requires annexation. The site is within the current Sphere of Influence and designated for urban use; therefore, its development would be included in the Intensification/Reuse Only scenario.

Response 22G

The commenter notes that the 50-foot buffer from riparian areas can affect large amounts of land and suggests that requiring such a buffer is inconsistent with a Form Based Code approach. This concern is noted. It is not clear why such a requirement would be inconsistent with a Form Based Code approach. Buffers can be adaptable depending upon circumstances, but the 50-foot buffer has been determined to provide the minimum distance needed to effectively protect riparian habitat and associated wildlife movement corridors. This minimum distance is consistent with that adopted by a number of communities in the southern California region.

Response 22H

The commenter notes that the Parklands project does not include a new school. This comment is noted. The developer will be required to pay State-mandated school impact fees.

Response 22I

The commenter notes that the size and acreage of parks needs greater flexibility under a Form Based Code approach. City staff agree with this statement generally and will continue to seek various means of meeting park and recreational demands associated with new development on a case-by-case basis. In addition, language has been added to the General Plan under Policy 6A as follows:

Update standards for citywide public parks and open space to include an expanded menu of shared park types, and identify locations and potential funding sources for acquiring new facilities in existing neighborhoods.

Response 22]

The commenter suggests that not all connecting streets should be required to provide straight alignments between existing termini and entries into public streets. Specific alignments of new road extensions will continue to be reviewed on a case-by-case basis. The alignments shown in the Draft EIR and traffic study are conceptual only and will need to be adjusted to reflect on the ground conditions as part of individual project review.

Re: City of Ventura Draft Environmental Impact Report, SCH # 2004101014

To Whom It May Concern:

I am responding to the extraordinary above captioned Draft EIR. I am certain that you have already been told that it works better than weights in the gym. While totally impressed, it doesn't mean that I don't have some concerns and comments.

Initially, I offer a concern about Scenario 1 and the population limited therein and related to an outdated SCAG maximum number for the City. During the course of the CPAC update, at least three population alternatives were announced, including a recommendation of the Planning Commission to peg the new number based on a ratio of 1.14% per year rather than 0.88%. Scenario 1 is very restrictive, and one could assume that the annual birth rate produces a greater number of new Ventura residents, at least by a factor of 1+%, than the number which die or leave the community for other reasons. It essentially omits or doesn't provide for at least some new residents attracted to this beautiful, now vibrant city.

I was unable to find a population allowance for redevelopment, particularly along major streets in mid-town, The Avenue and the Harbor.

While the General Plan is silent on population, the EIR is likely to be relied on by persons generally opposed to new projects, and it will be used as a supportable statistical basis to declare a new project as not being consistent with the General Plan as it relates to population, and its concomitant effects on traffic, air quality, etc., regardless of the absence of a formal cap in its text.

Community Development Department
 City of Ventura
 July 18, 2005
 Page 2

The foregoing analysis of the population base leads me to the more important, costly and time consuming concern that, while there is an implicit flexibility of dealing with added population, the current text could require worthwhile and well located applications to go through an amendment to the General Plan due to its reliance on the known unrealistic SCAG projection, which is already less than actual.

It is my understanding that the new General Plan is a precursor to the City adopting a Form Base Code approach to all new development. The initial application is taking shape in Downtown and was recently informally applied to the School District's Hails property under contract to The Olsen Company. Should my premise be correct, the EIR should be similarly oriented, and not include hard edge archaic current zoning standards. In that regard, it should be a prospectively designed General Plan.

To illustrate the foregoing, please consider:

Public Services:

Park Area: Ventura is a mature City with existing park and recreation areas, which have been added to over the years as needed. One outstanding feature of the City is its beaches, which provide a recreation amenity non-coastal cities would die for. Yet, it appears that the EIR is calling for the same green park acreage as is required in non-coastal cities. A review of Tables 4.11-8, 4.11-9 and 4.11-10 find sufficient park acreage aggregating from the three categories examined in those Tables. On the larger scale, Ventura is addressing active sports parks. In a Form Base Code setting, minimum 5 acre parks are arbitrary and likely questionable or unnecessary. More apropos would be an EIR statement to the effect that new projects require new ideas, dimensions and types of common recreation, specially in light of more attached housing, smaller lots and less private on-site recreation area. Thus, in my opinion, rigid park requirements are out of touch with the new planning paradigm. B

Fire Facilities: The standards discussed in the EIR relate to a different, earlier time when fire fighters were primarily engaged in fire protection and fire fighting rather than as now, with a change of emphasis to serving as paramedics. There will always be a necessary role for fire personnel to keep our C

 WESTON BENHOFF
 ROCHEFORT RUBALCAVA MACCUISH LL
 ATTORNEYS AT LAW

Community Development Department
 City of Ventura
 July 18, 2005
 Page 3

cities safe and to do prevention. But old standards do not take into full consideration the requirements of the State Uniform Building Code, improved construction materials, e.g. roofing, and methods, e.g. interior sprinklers, wall construction treatment, etc. Thus, the issue is whether the EIR should comment generally rather than specifically on such facilities and crew numbers.

Biological Resources at page S-11: The specificity of the buffer area in Action 1.8 related to rivers, creeks and barrancas is too binding. Each of such natural settings need be protected, and protection provided from potential overflows to nearby development. But to specify an arbitrary set back of 50 feet is to, in my opinion, miss the point of the Form Base Code, which enables a recognition of greater integration, not based on arbitrary dimensions or distances, of such natural features with new projects to enhance the aesthetic, recreation and socialization character of such new projects. Thus, non intrusive bike and walking paths—not subject to effects of spillover—as well as detention/retention areas used for passive recreation could be forced away from the top of banks where the full experience of being close to water courses is best enjoyed. Similarly, the matter of proximity of restaurants or even residences to such water courses should be left to topographic and site design and safe and thoughtful construction methods, all of which would go through rigorous review to reach a more spontaneous, natural and random product. Such creativity should be rewarded and not preempted by language in the FEIR or the General Plan.

Public Schools: PS-3 is a positive example of dealing with a generic matter of placement of new schools as need arises.

Noise:

Impact N-1: By specifying a sound wall in the EIR pursuant to Action 7.28, other values such as views of the Santa Clara River could be unintendedly obscured and subordinated. Such a sound issue could be addressed on a specific project look and not clutter the EIR and General Plan.

Utilities and Service Systems:

Impact U-2(b): It is observed that the reference to sanitation capacity in this subsection specifies Ojai Valley Sanitary District capacity. It is found that the language in this subsection hands jurisdiction or development veto

Community Development Department
City of Ventura
July 18, 2005
Page 4

power to that special district to the detriment of the City maintaining final authority and options. If it is necessary to specify the subject District, you might consider adding language, to wit: "only when the Ojai Valley Sanitary District has adequate capacity for projected wastewater flows or there is other mitigation approved by the City Engineer."

Population and Housing:

Impact PH-2: The finding of Significance after Mitigation in the third column of Table S-1 would not be required but for the tie-in of all Scenarios 1-6 to the SCAG population projection.

H

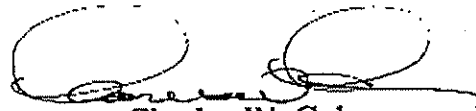

Transportation and Circulation:

Policy 3E and Action 3.17 are other positive examples of, in this case, dealing with road alignments and dimensions in a Form Based Code mode, wherein there is flexibility to provide for connectivity of existing to new roadways in a manner which enhances walkability and direct access without overburdening existing neighbors, e.g. design for Parklands' street system, particularly connecting the existing neighborhood street on the west boundary to Wells Road, but not necessarily in a straight alignment.

I

Congratulations on a heroic effort and documented study.

Very truly yours,

Charles W. Cohen

Letter 23

COMMENTER: Charles W. Cohen, Weston, Benshoof, Rochefort, Rubalcava & MacCuish, LLP

DATE: July 18, 2005

RESPONSE:

Response 23A

The commenter states an opinion that the 0.88% population growth rate considered in the Draft EIR is overly restrictive. The commenter also states concerns about reliance on SCAG population projections and what he believes is the lack of a "population allowance" for the Midtown, Ventura Avenue, and Harbor areas. Finally, the commenter states an opinion that the EIR should not include "hard edge archaic zoning standards."

The opinion with respect to the appropriate population growth rate for the City is noted. As noted in the Draft EIR, the 0.88% average annual growth rate assumed for Scenario 1 represents the average over the past 10 years, while 1.14% growth rate assumed for Scenarios 2-6 represents the average over the past 20 years. It is important to note that the growth rates assumed in the Draft EIR are not intended to be growth caps. Rather, they are estimates used for analytical purposes that are intended to provide a realistic picture of likely conditions in 2025.

As part of the overall anticipated growth, the Draft EIR relies on certain assumptions about where future growth might occur and assigns growth to areas throughout the City, including the Midtown, Ventura Avenue, and Harbor areas. However, as with the overall population growth assumptions in the Draft EIR, the assumed amount of growth for individual areas within the City are not meant to be growth caps for those areas. Any of the districts, corridors, or neighborhood centers could theoretically accommodate substantially more growth than assumed in the Draft EIR based on the land use designations. However, it is not realistic to assume that all areas of the City would build out to the maximum theoretical degree over the next 20 years.

In response to several comments on the Draft 2005 General Plan and Draft EIR, the table in the 2005 General Plan will be revised to eliminate the detailed estimates of future growth by geographic location. The Final 2005 General Plan will include a table that summarizes growth projections by general category (districts/ corridors, neighborhood centers, other) in order to eliminate confusion about whether the growth projections for individual areas used for the EIR analysis constitute growth caps for those areas.

The Draft EIR does not rely on SCAG forecasts. It merely acknowledges that the population projections used in the Draft EIR exceed SCAG growth forecasts for the City. Individual projects would not require a General Plan amendment merely because the City's population projections exceeds SCAG's forecast. The more likely scenario is that SCAG will update its forecasts to reflect the City's current growth projections following adoption of the 2005 General

Plan. Similarly, it is anticipated that the Ventura County APCD will update its growth forecasts for Ventura in the 2007 AQMP that is currently in preparation.

It is correct that the City intends to adopt a Form Based Code subsequent to approval of the 2005 General Plan. However, it is not clear which zoning standards to which the commenter is referring. The Draft EIR analysis does not rely on current zoning standards.

Response 23B

The commenter states concerns about the use of current City park standards in the Draft EIR and suggests that the EIR is "calling for the same green park acreage as is required in non-coastal cities." The commenter also states an opinion that the use of rigid park requirements is not appropriate. The opinion regarding park standards is noted. The Draft EIR uses current City park acreage standards to estimate future demand for parks. However, it is true that acreage is only one component of park demand. In addition, as noted in the Draft EIR, the estimate of existing park acreage does not include beaches, schools, or regional park and open space facilities located outside the Planning Area. All of these facilities offset the "shortfall" of parks identified in the Draft EIR and will continue to do so in the future. The City will continue to seek creative ways of meeting the park and recreational needs of the community, which likely will involve some variation from the adopted standards in some instances. In addition, language has been added to the General Plan under Policy 6A as follows:

Update standards for citywide public parks and open space to include an expanded menu of shared park types, and identify locations and potential funding sources for acquiring new facilities in existing neighborhoods.

As noted in the Draft EIR, the continued collection of park fees and use of these funds to develop new parks and recreational facilities would reduce park-related impacts to a less than significant level.

Response 23C

The commenter states an opinion that the standards for fire protection service discussed in the Draft EIR are inappropriate given the current emphasis on paramedics. The commenter also suggests that the EIR should comment on fire service more generally, rather than providing information about specific personnel and facility needs. These opinions are noted. The information regarding current fire service needs was obtained directly from the Ventura Fire Department as part of the Draft EIR preparation. Therefore, it is presumed that the needs identified in the Draft EIR reflect the current Department needs.

Response 23D

The commenter states an opinion that the 50-foot riparian area setback specified in the Draft EIR is unnecessarily binding, noting that in certain circumstances a less restrictive setback may be adequate. This opinion is noted. The City will retain flexibility in how the setback requirement is to be applied. However, the recommended 50-foot buffer provides the minimum determined to be needed to maintain the biological integrity of "natural" riparian areas.

Response 23E

The commenter states agreement with the manner in which school impacts is addressed in the Draft EIR. No response is necessary.

Response 23F

The commenter states an opinion that the need for sound walls would be more appropriately addressed as part of a specific project than as part of the General Plan. This opinion is noted. The action mentioned by the commenter is intended to address existing noise issues for current residences located adjacent to area freeways. Project-specific analysis of future development proposals would not address this existing condition.

Response 23G

The commenter suggests a revision to Mitigation Measure U-2(b) to provide additional flexibility for the City. In response to this comment, Measure U-2(b) is revised to read as follows (new text is underlined):

U-2(b) *Ojai Valley Sanitary District Capacity. The following action shall be added to the 2005 General Plan if Scenario 5 or any other scenario that includes both the North Avenue and Western Cañada Larga expansion areas is selected:*

- *Allow development within the North Avenue expansion area or Western Cañada Larga expansion only when the Ojai Valley Sanitary District has adequate treatment capacity for projected wastewater flows or other mitigation is approved by the City Engineer.*

Response 23H

The commenter notes that the unavoidably significant impact relating to population projections is due to the comparison to SCAG growth forecasts. This is correct. However, it should be noted that the unavoidably significant impact does not prevent the City from approving the 2005 General Plan, nor does it mean that future individual projects would be inconsistent with the General Plan. The City merely needs to acknowledge the discrepancy between the forecasts and adopt a Statement of Overriding Considerations setting forth the reasons the project's benefits outweigh the impact. It is anticipated that SCAG will update its population forecasts for the City in response to new projections provided by the City following approval of the General Plan Update.

Response 23I

The commenter states agreement with the approach taken in General Plan Policy 3E and Action 3.17. No response is necessary.

TO: Carl Morehouse
B.S.

FROM: Bruce Smith, Manager
General Plan Section

DATE: July 18, 2005

SUBJECT: Draft Environmental Impact Report for Update of Comprehensive Plan (City of San Buenaventura)

The Ventura County Planning Division has reviewed the Draft Environmental Impact Report (DEIR) for the Update of the City of San Buenaventura Comprehensive Plan. While the EIR itself appears to adequately address the impacts of the Comprehensive Plan Update, we offer the following comments relative to conflicts with the County General Plan with respect to Saticoy and the North Ventura Avenue Area:

Conflict with Saticoy Area Plan

The City's proposed Comprehensive Plan indicates that the residential neighborhood between Nardo Street and Rosal Lane is designated as "Medium Density Residential (9-12 dwelling units per acre)". The area south of Rosal Lane is designated as "Industrial" by the Comprehensive Plan.

The Ventura County Saticoy Area Plan designates the Rosal Lane area as "2-Family Residential" which is consistent with the City's Plan, but the County's residential designation extends further south 225 feet into the area designated by the City as "Industrial". This conflict between the City and County plans creates an 8.5-acre "no-man's land" which is not developable because the City is unable to extend water service for a residential land use which is inconsistent with the Comprehensive Plan and the County cannot approve industrial development on land zoned and planned for residential development. The area cannot be annexed to the City as it is not currently contiguous to the existing City limits. The County plan designation has been in place since at least 1967. Land use in this "no man's land" area is largely vacant, but includes two or three residential units south of Rosal Lane at Alelia Avenue, and one small commercial property fronting on Los Angeles Avenue. We presume that the City does not intend a conflict and that the Comprehensive Plan map may reflect a mapping error. We ask that the City evaluate this conflict with the County's plan and determine whether or not a boundary adjustment is appropriate at this time.

Carl Morehouse Memorandum
DEIR for City of Ventura Comprehensive Plan Update
July 18, 2005
Page 2

Conflict with North Ventura Avenue Area Plan

In 1982 and 1984 the City and County jointly adopted an area plan for the North Ventura Avenue area. Policies of the joint plan required that future City and County amendments should be processed and approved by both jurisdictions to avoid conflicts between City and County plans for the area. Although there were minor differences between the City and County plans for the North Ventura Avenue area in formatting and terminology even when first adopted, the City plan has evolved over time and now evidences significant land use conflicts with the County Area Plan. The principal differences appear to be that the former "Floodplain" area is now largely designated as "Agriculture"; a portion of the former "Floodplain" area (the unincorporated portion of the City's wastewater treatment plant site) has been designated as "Industrial" and large areas formerly designated as "Oil Extraction Industrial" have been re-designated as "Industrial", "Agricultural" or "Open Space". While we have no particular concerns with most of the land use amendments the City has approved over time, we are concerned that the two plans are no longer in sync, resulting in confusion and unnecessary complications for applicants for discretionary applications. We suggest that the City direct its staff to work with the County to identify and eliminate where feasible conflicts between the City and County plan either by amendment of the County Plan, the City Plan or both, as appropriate.

We also suggest that the proposed "Industrial" designation of the unincorporated portion of the City treatment plant may be inappropriate because of the potential flood hazard. We suggest a designation of "Public and Institutional" would better serve as a land use designation for this site.

Thank you for the opportunity to review the Draft EIR and Comprehensive Plan Update.

B

Letter 25

COMMENTER: Bruce Smith, Manager, General Plan Section, County of Ventura Planning Division

DATE: July 18, 2005

RESPONSE:

Response 25A

The commenter notes a discrepancy between the General Plan land use map and the County's Saticoy Area Plan for properties along the south side of Rosal Lane. This discrepancy is addressed as part of the "Intensification/Reuse + Minor Map Clean-Up" alternative studied in Section 6.0, *Alternatives*. City staff are recommending revision of the General Plan land use map to provide a "Residential Medium Density" designation for the properties in question. It should also be noted that one of the property owners submitted a comment letter (Letter 5) correcting the APNs listed in the Draft EIR. Those numbers will be corrected in the Final EIR.

Response 25B

The commenter suggests that City and County staff work together to resolve discrepancies between the City and County plans for the North Ventura Avenue area. The commenter also suggests that the "Industrial" designation for the unincorporated portion of the City's treatment plant may be inappropriate because of the potential flood hazard in the area. City staff will continue to work with County staff regarding the planning of the North Ventura Avenue area. With respect to the water treatment plant site, it is presumed that the commenter is referring to the area immediately north of the treatment plant. That area is already designated "Industrial" in the current Comprehensive Plan. Therefore, the "Industrial" designation represents no change. Any development within the 100-year flood zone would need to comply with FEMA requirements as well as the requirements of the City's Floodplain Ordinance.

**VENTURA COUNTY
WATERSHED PROTECTION DISTRICT
PLANNING AND REGULATORY DIVISION**
800 South Victoria Avenue, Ventura, California 93009
PAUL CALLAWAY, Permit Manager - 805 654-2011

DATE: July 14, 2005
TO: CARL MOREHOUSE
FROM: PAUL CALLAWAY
SUBJECT: Comments to the DEIR for the Ventura's General Plan Update
RMA 04-086-2

We have reviewed the DEIR and have the following comments on our areas of concern

PERMIT SECTION:

In section 4.8 the DEIR discusses ways to mitigate the increase in peak runoff due to the increase in impervious area from the proposed future development scenarios. In reviewing the proposed mitigation measures to make the effect less than significant we found that these measures are acceptable but we think that developments and re-developments in the areas adjacent to our jurisdictional channels should be conditioned, as an additional possible mitigation measure, to dedicated right of way to meet the future needs of the Watershed Protection District (District), and to build and dedicate to the District improvements that will address the deficient facilities along and in those channels. These right of way needs will depend on the type of channel the city would like to see in these areas such as a soft environmentally friendly channel which would require a larger right of way compared to the District's preferred channel which is a vertical walled concrete channel with access road.

A

ENVIRONMENTAL SERVICES SECTION:

The Environmental Services Section of the District has reviewed the DEIR dated June 2005, and has the following comments.

B

The lands and land use changes that are evaluated in the DEIR, including project alternatives, may include impacts on engineered drainages, debris or detention basins, rivers or streams, and adjacent 100-year floodplains that are owned by the District or subject to the District's jurisdiction.

The proposed plan and the policies therein, present an opportunity for the District to work cooperatively with the City of Ventura to set aside undeveloped floodplains for the purpose of providing "soft" solutions to flood control and to maintain rivers and streams

In their natural state. These public trust resources are amenities that improve the quality of life in the City of Ventura and its Sphere of Influence.

Section 4.8 of the DEIR identifies flooding and flood mitigation measures for developable areas within the 100-year floodplain under each land use scenario. In addition, several Actions (Actions 1.10, 1.14, 5.2) described in this section indicate that the City will pursue removal concrete and renovation of flood control facilities for the purpose of creating "soft" flood control facilities (e.g., natural stream, wetlands, etc.) and greenbelts.

In most cases, natural channels generally require a much wider floodplain than engineered structures. However we note that the proposed plan does not present any land use goals, policies or actions that would limit development in the floodplains or encourage dedication of floodplain for such purposes. Further, policies that limit the use of variances that would allow development in the 100-year floodplain should also be considered and included in the adopted plan.

The DEIR also describes mitigation measures for development in 100-year floodplains in the various land use scenarios. These include structural or building solutions that elevate finish floors, and/or Letters of Floodplain Map Revision from FEMA. In light of the plan goals for soft solutions to flood control, these mitigation measures are incongruous. If the City intends to restore and maintain natural streams for flood control purposes over the life of the plan, land use policies which promote this approach to flood control and dedication of floodplain right-of-way must be adopted, applied, and enforced.

Establishing and strengthening protective policies for floodplains in this plan update is valuable. As history illustrates, over time, continued encroachment into the floodplain by urban development in cities and in unincorporated areas results in substantial flooding problems, which then require traditional flood control improvements. Moreover, the pressure for additional tax-payer funded flood control projects in natural rivers and streams will increase.

Letter 26

COMMENTER: Paul Callaway, Ventura County Watershed Protection District

DATE: July 14, 2005

RESPONSE:

Response 26A

The commenter suggests that the EIR should include an additional mitigation measure requiring the dedication of right-of-way for future Watershed Protection District needs for developments adjacent to jurisdictional channels. In response to this comment, Mitigation Measures HWQ-2 will be amended to read as follows (new text is added):

HWQ-2 *Additional Drainage Actions. The following actions shall be added to the 2005 General Plan to address existing storm drain system deficiencies:*

- *Develop a financing program for the replacement of failing corrugated metal storm drain pipes in the City.*
- *Adopt assessment districts or other financing mechanisms to address storm drain system deficiencies in areas where new development is anticipated and deficiencies exist (e.g., Downtown district, Ventura Avenue corridor, and Harbor district).*

The following actions are recommended to minimize the impact of future development on the local storm drain system and implement City goals regarding sustainable infrastructure:

- *As feasible, require new developments to incorporate stormwater treatment practices that allow percolation to the underlying aquifer and minimize offsite surface runoff. Such methods may include, but are not limited to, (1) the use of pervious paving material within parking lots and other paved areas to facilitate rainwater percolation; and (2) construction of retention/detention basins to limit runoff to pre-development levels and to encourage infiltration into the groundwater basin.*
- *Where deemed appropriate, require new developments adjacent to Ventura County Watershed Protection District channels to dedicate necessary right-of-way to meet future District needs.*

Response 26B

The commenter reiterates the need for dedicated right-of-way adjacent to District drainage channels and suggests that the General Plan should strengthen land use policies to direct development away from floodplains rather than providing for structural solutions to flooding issues. Please see Response 26A. Also, the proposed 2005 General Plan is primarily intended to direct development away from drainages and focus on intensification and reuse within the

already urbanized areas of the City and contains many policies and statements that enforce this intent. In the event that any structural solutions are considered, the City will discuss them with the Watershed Protection District.

27

JUL 15 2005

**VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT**
Memorandum

TO: Carl Morehouse, Planning **DATE:** July 13, 2005
FROM: Alicia Stratton *AS*
SUBJECT: Request for Review of Draft Environmental Impact Report for the Update of 1989 Comprehensive Plan, City of Ventura (Reference No. 04-086-2)

The proposed project involves the update of the 1989 Comprehensive Plan, which serves as the blueprint for the development of the City. Each of the Comprehensive Plan elements other than the Housing Element (an update of which was approved earlier this year) will be updated with goals, policies, and objectives that reflect the current needs and preferences of the community. The land use map will also be updated.

The City intends to emphasize infill development and reuse of developed lands within the current Sphere of Influence over the life of the Comprehensive Plan Update (through 2025), and has identified a number of growth districts and corridors where infill/reuse is to be focused. However, as part of the Comprehensive Plan update, the City is also considering inclusion of certain areas outside the current Sphere of Influence for future development.

We wish to submit the following comments on the draft environmental impact report:

1. Table 4.3-1 on Page 4.3-2 should be revised to reflect that the federal one-hour ozone standard has been revoked, effective June 15, 2005 (see attached). The corresponding paragraph discussing the table should be revised accordingly (Pages 4.3-2 and 4.3-3).
2. The discussion on Current Ambient Air Quality on Page 4.3-5 should be revised to include data from the APCD air quality monitoring station at Emma Wood near Ventura. Data from this monitoring station is representative of air quality in the coastal areas of Ventura; data from the El Rio monitoring station is more representative of the inland portions of Ventura. The Emma Wood station only monitors ozone levels.
3. The discussion of the 1994 Air Quality Management Plan (AQMP) in Section 4.3.1 Setting (d) on Page 4.3-5 should include this statement following the last sentence of the fifth paragraph: "To that end, the APCD is currently developing a new AQMP, which will be completed in 2007. The 2007 AQMP will contain

A

B

C

strategies for attainment of the new eight-hour federal ozone standard by 2010. It will also incorporate updated projections of population, dwelling units and motor vehicle emissions."

4. The second paragraph on Page 4.3-14 should be revised to state that: "The Ventura County AQMP provides recommendations for reducing emissions from transportation-related sources by reducing vehicle use or improving traffic flow. These techniques are referred to as Transportation Control Measures (TCMs)." D
5. The Mitigation Measures discussion on Page 4.3-20 should be expanded to include this additional measure: "Require other air pollutant mitigation measures found feasible at the time of project approval." E

If you have any questions, please call me at 645-1426 or email me at alicia@vcapcd.org.

National Ambient Air Quality Standards (NAAQS)

The Clean Air Act, which was last amended in 1990, requires EPA to set National Ambient Air Quality Standards for pollutants considered harmful to public health and the environment. The Clean Air Act established two types of national air quality standards. **Primary standards** set limits to protect public health, including the health of "sensitive" populations such as asthmatics, children, and the elderly. **Secondary standards** set limits to protect public welfare, including protection against decreased visibility, damage to animals, crops, vegetation, and buildings.

The EPA Office of Air Quality Planning and Standards (OAQPS) has set National Ambient Air Quality Standards for six principal pollutants, which are called "criteria" pollutants. They are listed below. Units of measure for the standards are parts per million (ppm) by volume, milligrams per cubic meter of air (mg/m³), and micrograms per cubic meter of air (µg/m³).

National Ambient Air Quality Standards

Pollutant	Primary Stds.	Averaging Times	Secondary Stds.
Carbon Monoxide	9 ppm (10 mg/m ³)	8-hour ¹	None
	35 ppm (40 mg/m ³)	1-hour ¹	None
Lead	1.5 µg/m ³	Quarterly Average	Same as Primary
Nitrogen Dioxide	0.053 ppm (100 µg/m ³)	Annual (Arithmetic Mean)	Same as Primary
Particulate Matter (PM ₁₀)	50 µg/m ³	Annual ² (Arith. Mean)	Same as Primary
	150 µg/m ³	24-hour ¹	
Particulate Matter (PM _{2.5})	15.0 µg/m ³	Annual ³ (Arith. Mean)	Same as Primary
	65 µg/m ³	24-hour ⁴	
Ozone	0.08 ppm	8-hour ⁵	Same as Primary
Sulfur Oxides	0.03 ppm	Annual (Arith. Mean)	-----
	0.14 ppm	24-hour ¹	-----
	-----	3-hour ¹	0.5 ppm (1300 µg/m ³)

¹ Not to be exceeded more than once per year.

² To attain this standard, the 3-year average of the weighted annual mean PM₁₀ concentration at each monitor within an area must not exceed 50 µg/m³.

³ To attain this standard, the 3-year average of the weighted annual mean PM_{2.5} concentrations

EPA National Ambient Air Quality Standards (NAAQS)

Page 2 of 2

from single or multiple community-oriented monitors must not exceed 15.0 ug/m³.

⁴ To attain this standard, the 3-year average of the 98th percentile of 24-hour concentrations at each population-oriented monitor within an area must not exceed 65 ug/m³.

⁵ To attain this standard, the 3-year average of the fourth-highest daily maximum 8-hour average ozone concentrations measured at each monitor within an area over each year must not exceed 0.08 ppm.

Letter 27

COMMENTER: Alicia Stratton, Ventura County Air Pollution Control District

DATE: July 13, 2005

RESPONSE:

Response 27A

The commenter suggests revising Table 4.3-1 to reflect the fact that the federal one-hour ozone standard was revoked on June 15, 2005. That table and the corresponding text will be revised accordingly in the Final EIR. This minor text change will not affect any EIR findings or conclusions.

Response 27B

The commenter suggests that the discussion of ambient air quality on page 4.3-5 should be revised to include data for the Emma Wood monitoring station. In response to this comment, the following table will be added to EIR Section 4.3-3 and the accompanying text will be revised accordingly. Subsequent tables will be renumbered.

**Table 4.3-3
 Ambient Air Quality Data for the Emma Wood Monitoring Station**

Pollutant	Air Pollution Data		
	2002	2003	2004
Ozone, ppm - maximum hourly concentration (ppm)	0.078	0.094	0.093
Number of days of state exceedances (>0.09 ppm)	0	3	1
Number of days of federal exceedances (>0.12 ppm)	0	0	0
Ozone, ppm - maximum 8-hour concentration (ppm)	0.069	0.078	0.082
Number of days of federal exceedances (>0.08 ppm)	0	0	1

Source: ARB, Air Quality Data Statistics; available at <http://www.arb.ca.gov/aqd/aqdpag.htm>.

Response 27C

The commenter suggests the addition of a sentence about the 2007 AQMP. In response to this comment, the following will be added to the end of the first paragraph under subsection d (Air Quality Management Plan):

To that end, the APCD is currently developing a new AQMP, which will be completed in 2007. The 2007 AQMP will contain strategies for attainment of the new eight-hour

federal ozone standard by 2010. It will also incorporate updated projections of population, dwelling units, and motor vehicle emissions.

This minor text changes does not affect the EIR findings or conclusions.

Response 27D

The commenter suggests a clarification with respect to AQMP programs to reduce vehicle use and improve traffic flow. In response to this comment, the first two sentences of the first full paragraph of page 4.3-14 will be replaced with the following:

The Ventura County AQMP provides recommendations for reducing emissions from transportation-related sources by reducing vehicle use or improving traffic flow. These techniques are referred to as Transportation Control Measures (TCMs).

This minor text change does not affect the EIR findings or conclusions.

Response 27E

The commenter suggests an additional mitigation measure. In response to this comment, the first bullet point of Measure AQ-2 will be revised to read as follows (new text is underlined):

- *Require air quality analysis of individual development projects in accordance with the most current version of the Ventura County Air Pollution Control District Air Quality Assessment Guidelines and, when significant impacts are identified, require implementation of air pollutant mitigation measures determined to be feasible at the time of project approval.*

28

PUBLIC WORKS AGENCY
 TRANSPORTATION DEPARTMENT
 Traffic, Advance Planning & Permits Division
MEMORANDUM

DATE: June 23, 2005

TO: Resource Management Agency, Planning Division
 Attention: Carl Morehouse

FROM: Nazir Lalani, Deputy Director *NL*

SUBJECT: Review of Document 04-086-2, Draft EIR
 Update of the 1988 Comprehensive Plan for the City of Ventura
 Project involves updating the 1988 plan through the year 2025 with the current goals, policies and objectives that reflect the current needs and preferences of the community. The plan will also consider inclusion of certain areas outside the current Sphere of Influence for development.
 Project Applicant/ Lead Agency: City of San Buenaventura

The Public Work Agency - Transportation Department has reviewed the revised the Draft Environmental Impact Report (DEIR) to update the City of Ventura Comprehensive Plan, which serves as a blue print for development in the City. Our comments are the same as in our memo dated November 1, 2004 and are as follows:

The EIR should address the following comments:

1. Road improvements associated with all six scenarios along the major transportation corridors should match those shown in Appendix 8.3 of the County's General Plan Update DEIR. A copy of Appendix 8.3 is attached. The major corridors include Victoria Avenue, Olivas Park Drive, Harbor Blvd, Ventura Avenue, Foothill Road, Telegraph Road, Hwy 118 and Hwy 232. This would include bicycle and pedestrian facilities. A
2. On Page S-1, the DEIR makes reference to North Avenue, Olivas Park, Serra, Western Canada Larga and Poinsettia areas. A map should be provided to indicate the limits of these areas. B
3. Page 4.12-10 "Presently, two trains in both AM and PM operate the entire length of the route between Ventura and Union Station." There are three Metrolink trains that operate currently along this stretch. The EIR should make this correction. C
4. As noted in our memo on the Notice of Preparation of the DEIR, dated January 20, 2005, in accordance with the Ventura LAFCO Commissioner's Handbook, section 3.2.1, cities shall annex entire roadway sections adjacent to territory proposed to be annexed and shall include complete intersections. The EIR should require conditions for annexing county roadway section adjacent to the development, when the proposed expansion areas are developed. D

5. As noted in our memo on the Notice of Preparation of the DEIR, dated January 20, 2005 the updated 2025 comprehensive plan should address annexing of unincorporated islands in the County such as Montalvo, and developed areas immediately adjacent to the City limits such as Saticoy and existing development on North Ventura Avenue. E
6. One of the alternatives being considered by the Comprehensive Plan Update includes annexation and development of the Canada Larga arca. As demonstrated by the 2005 winter storms, this area is prone to major damage by flooding. The EIR should address this issue. F
7. Ventura Avenue south of Shell Road is subject to severe flooding during winter storms. Annexation of this area by the City should address the need to provide an adequate storm drain system. G
8. All of the scenarios are associated with major intersection and road segment improvements that will be needed to mitigate the traffic growth generated by the land use changes. The EIR should address how these improvements are to be funded. H
9. The cumulative impacts of the development of this project when considered with the cumulative impact of all other approved (or anticipated) development projects in the County will be potentially significant. To address the cumulative adverse impacts of traffic on the County Regional Road Network, the appropriate Traffic Impact Mitigation fees should be paid to the County when development occurs. With payment of the Traffic Impact Mitigation Fees, the Level of Service and safety of the existing roads would remain consistent with the County's General Plan. I

Our review of this project is limited to the impacts this project may have on the County's Regional Road Network.

Please call me at 654-2080 if you have questions.

LOS is based on thresholds from Figure 4.2.2 in the Ventura County General Plan

Letter 28

COMMENTER: Nazir Lalani, Deputy Director, County of Ventura Public Works Agency,
Transportation Department

DATE: June 23, 2005

RESPONSE:

Response 28A

Road improvements associated with all six scenarios along the major transportation corridors such as Victoria Avenue, Olivias Park Drive, Harbor Boulevard, Ventura Avenue, Foothill Road, Telegraph Road and Highways 118 and 23 match those shown in Appendix 8.3 of the County's General Plan update DEIR as stated by the commenter. Following adoption of the 2005 General Plan (and the Circulation Element), the City will discuss the changes in land use and circulation resulting from the General Plan Update with the County. The discussion will compare inconsistencies in roadway classifications in the City's Circulation Element with those in the County's General Plan to some of the minor roadways. Since the traffic analysis carried out for the General Plan Update uses the most recent long-range traffic data for circulation planning purposes, it can thereby provide a technical basis for evaluating those differences. An agreement can then be reached as to where future changes to the County's General Plan may be appropriate to establish consistency.

Response 28B

The commenter requests clarification with respect to the locations of the potential expansion areas considered in the Draft EIR. These areas are depicted on Figure 2-4 through 2-8 of Section 2.0, *Project Description*.

Response 28C

The commenter notes that three Metrolink trains operate between Ventura and Union Station in Los Angeles rather than the two trains noted in the Draft EIR. This will be corrected in the Final EIR. This minor text change will not affect the EIR findings or conclusions.

Response 28D

The commenter states an opinion that the EIR should include conditions for annexing County roadway sections adjacent to expansion areas at such time as those areas are developed. The scenario being recommended by City staff is the "Intensification/Reuse Only" scenario with some minor map clean-up. Because no expansion areas are being recommended at this time, the condition suggested by the commenter is not applicable. If and when any of the expansion areas are considered for annexation, appropriate conditions regarding annexation of adjacent roadways will be made part of the annexation.

Response 28E

The commenter suggests that the City should consider annexation of unincorporated islands such as Montalvo and developed areas adjacent to the City limits, such as in Saticoy and the North Avenue area. Annexation of these areas is one of City's goals for the 2005 General Plan. Portions of several of the districts and corridors that are to be the focus of future development are within the Saticoy and North Avenue areas.

Response 28F

The commenter notes that portions of the Western Cañada Larga area are subject to flooding. Flooding issues are addressed in Section 4.8, *Hydrology and Water Quality*. Portions of that expansion area are within the 100-year flood zone. As noted in Response 27D, City staff are not recommending inclusion of the Western Cañada Larga area as a potential expansion area on the 2005 General Plan land use map.

Response 28G

The commenter notes that Ventura Avenue south of Shell Road is subject to severe flooding. The area to which the commenter refers is within the North Avenue District, which the City anticipates annexing and making one of the focal points for future industrial development. Flooding issues along that stretch of Ventura Avenue will be addressed as that area redevelops.

Response 28H

The commenter states an opinion that the EIR should address how future roadway improvements are to be funded. Subsequent to adoption of the 2005 General Plan, the City will undertake a revision to its traffic impact fee program. As part of that revision, the cost of planned improvements and development impact fees will be determined.

Response 28I

The commenter states that potentially significant cumulative impacts to the County road network can be mitigated by requiring developers to pay the County's Traffic Impact Mitigation Fees. The City will continue to require developers to pay the County's Traffic Impact Mitigation Fees, in accordance with the City's agreement with the County.

RE: CITY OF VENTURA GENERAL PLAN DEIR

Dear Ms. Gialketsis:

Thank you for the opportunity to review and provide input to the Draft Environmental Impact Report (DEIR) for the proposed update to the General Plan of the City of Ventura. We appreciate the opportunity to review the plan and the associated environmental report because it provides us the opportunity to better coordinate our planning and development of the electrical facilities needed to provide services to the existing and future residents and businesses in the city.

Although the proposed General Plan document and its DEIR did not have any specific discussions about electrical facilities, whether existing or planned, we believe that future development projects deemed consistent with the proposed document may have impacts on SCE facilities and thus may require detailed environmental evaluation. For example, the General Plan proposes the widening of many roads and arterials. Such activities may require the construction or relocation of SCE facilities, and those SCE actions may themselves have environmental consequences cognizable under the California Environmental Quality Act (CEQA). If those environmental consequences are properly identified and adequately addressed in the development documents and CEQA approval process, SCE may not be required to pursue the mandatory CEQA review through

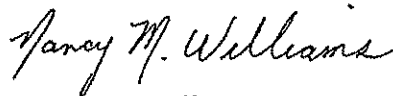

the California Public Utilities Commission (CPUC) and its General Order 131-D process (the CPUC being the CEQA "lead agency" for SCE projects unless one of the exemptions in G.O. 131-D applies).

We are hopeful that the City will continue to require the evaluation of site-specific environmental impacts of subsequent non-exempt development proposals in compliance with CEQA, including mandatory noticing and public review requirements. This will allow SCE and other affected stakeholders the opportunity to work with the City to address relevant environmental issues and recommend viable mitigation measures.

If any of the subsequent development proposals implementing the General Plan affect SCE facilities, it is essential that their environmental impacts are adequately addressed. This is particularly true for projects that do not fit into any GO 131-D exemptions and would otherwise require CEQA review by the CPUC, a process that could delay project implementation.

We look forward to working with you as you update your General Plan, and on its implementation upon adoption. SCE does have the capacity to continue to serve the existing and future developments in the city, and we are committed to working with the City, project proponents and developers to facilitate the design and subsequent construction of relevant facilities to serve all proposed projects. If you have any questions or seek clarifications, please contact me at 805 654-7226. Thank you.

Sincerely Yours

Nancy M. Williams
Region Manager

Letter 29

COMMENTER: Nancy M. Williams, Region Manager, Southern California Edison

DATE: July 18, 2005

RESPONSE:

The commenter notes that SCE has the capacity to continue to serve existing and future developments in Ventura, but notes that certain projects that may be accommodated under the 2005 General Plan (road widenings, for example) may require the construction or relocation of SCE facilities. As the commenter notes, the City will undertake project-specific environmental reviews for individual projects accommodated under the 2005 General Plan. Any impacts to SCE facilities, including potential secondary effects associated with the relocation of facilities, will be addressed as part of future project-specific environmental documents.

DELIVERED VIA E-MAIL AND FAX

RE: City of San Buenaventura 2005 General Plan Draft EIR

Dear Ms. Gialketsis:

On behalf of HOME (Housing Opportunities Made Easier) thank you for the opportunity to comment on the City of Ventura's proposed 2005 General Plan and its accompanying Draft Environmental Impact Report, dated June 2005. HOME is a volunteer-based alliance of non-profit organizations, area business leaders, elected officials and concerned citizens who have as a common goal, working together to create a more receptive environment for the development of high-quality workforce housing in Ventura County. HOME's mission is to facilitate community engagement and support for proactive solutions to create a greater diversity in housing choices.

HOME supports smart growth strategies, which include mixed-use, higher density, and pedestrian/transit oriented development by concentrating growth, when possible, on infill sites and by the revitalization of older, underutilized, or deteriorating properties and areas of the community located near transit, or within walking/biking distance of jobs and services. We applaud Ventura's leadership in this area, and encourage you to continue your efforts to streamline the development process for these types of properties. We do, however, have several concerns regarding the assumptions, and the implementation feasibility of the 2005 General Plan. HOME offers the following comments for your consideration:

- A) The Project Objectives section of the DEIR lists the Ventura Vision Goals, which have been translated into the required General Plan Elements. While we appreciate this creative approach to integrating the community's priorities (as expressed in the "Ventura Vision" document) into the City's General Plan Update, we are concerned that the General Plan does not contain enough specificity, in some areas, to successfully implement the Vision. We understand that, following the Ventura Vision, the 2005 General Plan is "the second in a series of three connected documents that will guide future conservation and change in the City" (DEIR 1-2). However, until the City completes the third step in this process, the form-based Development Code, which will provide the regulatory structure for implementation of the 2005 General Plan, it may prove difficult to successfully, and efficiently implement some of the General Plan Policies.

We encourage the City to create greater clarity in how development proposals will be reviewed and regulated, until stage three (new form-based Development Code) is adopted. Numerous General Plan Action items, including 3.11, 3.17, and 3.18, indicate the City's intent to re-write its zoning ordinances and development codes to better facilitate its intensification/reuse strategy. HOME encourages the City to expedite this process, and to make clear and decisive policy decisions as to how it will respond to proposed development projects, which are submitted during the period prior to the adoption of the new codes. Without the adoption of the form-based Development code, it would appear that it will be all but impossible to process a new proposed development.

Infill Development is already inherently risky, and can often be more costly and difficult to complete, due to existing site issues, constraints, and perceived conflicts with existing uses. In order to: "Utilize infill development to accommodate the targeted number and type of housing units described in the Housing Element" (Action 3.11), it is incumbent upon the City to work diligently to remove regulatory obstacles and barriers to realization of this goal.

- B) Alternatives:** While we recognize that, for the reasons mentioned in the DEIR, the "No Project" Alternative is not realistic, we disagree with the assertion that since "this alternative assumes that no further development occurs in the City..." then "environmental conditions do not change" (DEIR S-4). HOME recognizes that while this statement may be "technically accurate" based on the definitions and guidelines for environmental review under CEQA, it is "functionally inaccurate", in that development does not, in and of itself, dictate population growth; nor will the lack of it allow the City to avoid the environmental impacts created by a failure to plan for realistic projections of future population growth. HOME strongly advocates the reform of this type of "one-sided" view of the environmental review process, as implemented under CEQA. In order to facilitate the production of workforce housing, while also protecting our natural and existing built environment, we must begin to clearly and objectively assess both the positives and negatives of our land use decisions, including the negative impacts which may be caused from a failure to adequately plan for the future housing needs of our workforce, and all of Ventura's residents. B
- C) Population Growth Projections:** The Intensification/Reuse Only Scenario assumes an annual population growth rate of 0.88%, while all of the other Scenarios are based on a projected rate of 1.14%. While the 0.88% annual rate reflects Ventura's actual growth rate for the past 10 years (1994-2004), we believe that this growth rate was uncharacteristically low for that timeframe, due in part to the 1990s recession, which hit the construction industry hard. We believe that the 1.14% growth rate, which is much closer to the Countywide rate of 1.2%, and reflects the City of Ventura's most recent (2000-2005) actual growth rate of 1.0%, is a more realistic projection of growth that will actually occur, and for which the City should plan. It appears as though the 0.88% growth rate was selected largely due to concerns regarding the potential to exceed SCAG and/or AQMP growth projections, even though these limitations are discounted elsewhere in the DEIR as being outdated. This "two-sided" argument, both for and against adherence to these growth projections, could likely be used by "no growth" advocates to challenge future development approvals. C
- D) Our Well Planned Community:** In order to satisfy State requirements, every General Plan must include policies for the seven required "elements", including the Land Use Element, which "establishes the general distribution and intensity of land uses, including housing, commerce, industry, open space, education and public facilities." (2005 GP page 11) D

The proposed 2005 General Plan includes a number of "over-arching goals for the City of Ventura", including: "Our Well Planned and Designed Community", which has been incorporated into the Land Use, Housing, and Community Design Elements. Table 2-1 of the DEIR (page 2-11), gives the following "Examples of Topics Covered" under these General Plan Elements: "Development patterns, neighborhoods, visual character, urban design, demographics, housing needs, affordability, constraints on production." And yet, the 2005 General Plan offers this description of the General Plan Chapter, called "Our Well Planned Community ... Our goal is to protect our hillsides, farmlands, and open spaces; enhance Ventura's historic and cultural resources; respect our diverse neighborhoods; reinvest in older areas of our community; and make great places by insisting on the highest standards of quality in architecture, landscaping and urban design."

While the items expressed in this section may certainly be valid goals for the City to pursue, HOME questions the appropriateness of including them in the "Land Use Element" of the General Plan. It seems to us, that many of these priorities are more appropriately expressed elsewhere in the Plan,

(i.e. the Conservation, Open Space, and/or Culture Elements). The Land Use Element should focus on such things as development patterns and urban design, not conservation issues. While the 2005 General Plan clearly defines infill as a priority, and refers to planning tools such as form-based codes that the City intends to adopt in the future, we are concerned that the City currently lacks the regulatory structure that will allow it to implement its planning goals, and land use policies. Chapter 3 of the 2005 General Plan effectively describes the City's vision, but provides limited details as to how, or when, it will adopt and/or revise the existing codes and programs (like the RGMP-Action 3.18) in order for this vision to be realized. It is not enough for the City to simply "insist on the highest standards of quality in architecture, landscaping and urban design", it is incumbent upon the City to provide the development community with the proper tools and regulatory structure, to facilitate quality development.

One further concern regarding the Land Use Element is in the area of open space, education, and public facilities. The DEIR points to several limitations to the City's ability to adequately plan for and meet its needs in these areas, via the Intensification/Reuse Only Scenario. The DEIR identifies several "potentially significant impacts" relating to the need for new facilities that cannot be adequately mitigated with an infill only strategy. While HOME fully supports infill development, whenever and wherever possible, we also recognize the inherent limitations of this approach in meeting some of the more land-intensive needs of the community's growth. We encourage the City to refrain from limiting its ability to include additional land in its planning inventory, which could allow it to meet the need for additional public facilities, parks, and open space.

- E) **Housing Affordability:** As previously stated, HOME's mission revolves around "workforce housing", which may include, but is not limited to "affordable housing" per the legal definitions. However, we are very concerned about issues that impact housing affordability, including the costs associated with the development and construction of new housing units. As such, there are numerous references in the DEIR, which identify City infrastructure deficiencies that will need to be upgraded, repaired, and/or replaced in order to accommodate the intensity of development that is called for in Scenario 1. We encourage the City to aggressively pursue an action plan, and funding sources, to correct existing infrastructure deficiencies, which would not place the entire burden of financing these community-wide needs on the backs of builders and new home buyers. E
- F) **Process:** Section 1.5 of the DEIR clearly defines the CEQA Environmental Review Process, which requires that the City's decision making bodies have an opportunity to review and consider the FINAL EIR, including all public comments and responses, prior to making a decision on Final EIR Certification of the proposed project (the 2005 General Plan). HOME questions the City's ability to meet this CEQA requirement, given the proposed timeframes for closing the public comment period on July 18th, while scheduling Public Hearings with the Planning Commission and City Council on July 19th and August 8th, respectively. How can the City possibly consider and respond to all public input within such a compressed timeframe? F
- G) **Conflicting Priorities:** We are concerned that some of the stated Policies, Actions and Priorities expressed in the 2005 General Plan may be internally inconsistent or lacking sufficient specificity for the GP to be a useful tool in guiding future growth and development. Some of these inconsistencies are addressed above, as in the focus on Intensification/Reuse to meet the projected growth, in spite of clearly identified physical and regulatory constraints in many of the areas targeted for infill development. Another, more subtle example of this issue is Action 1.20, which calls for the City to "Adopt development code provisions to protect mature trees..." without defining "mature trees" or how they will be "protected". Furthermore, Section 4.5 of the DEIR discussed the prevalence of Cultural and Historic Resources in several of the areas that have been identified for intensification/reuse, without fully acknowledging the extent to which the City's *Historic* G

Preservation Regulations, which are much broader and less clearly defined than State or Federal Historic Preservation Policies, may limit development in these locations.

H) Parks: The City of Ventura is a mature city with existing park and recreation areas that have come on line as needed. We are fortunate enough to have an incredible park that inland cities would die for in our beaches. Yet, the EIR is recommending that we apply the same park acreage as required in non-coastal cities. When the Form Base Code guidelines come on line, it would seem that minimum 5 acre parks would be too rigid and unnecessary. Park space should be designed and formatted with the same flexibility that Form Based Code itself offers. Changing housing stock and the impending change of lifestyle that will accompany it, will lead to creative design and uses of parkland that should not be restricted by outdated and less fluid guidelines. H

I) Biological Resources: The specificity of the buffer area in Action 1.8 related to rivers, creeks and barrancas is too binding. While we acknowledge the need to protect these precious environs, an arbitrary set back of 50 feet could severely limit the creativeness and integration that the Form Based Code encourages. Strictly applied, this buffer area could squash entire infill developments. We encourage arbitrary requirements like this to be removed from the EIR and left to the already strenuous and rigorous review that all projects must be subjected. I

Thank you for the opportunity to submit our comments. HOME is truly excited about the principles of Form Based Code that the City of Ventura has embraced, and we are pleased to see the City's leadership in promoting a new way to grow our incredible city.

HOME sincerely looks forward to the adoption of the new General Plan and EIR.

Brad Golden
Vice Chair of HOME and Ventura resident

Letter 30

COMMENTER: Brad Golden, Vice Chair of HOME and Ventura resident

DATE: July 26, 2005

RESPONSE:

Response 30A

The commenter urges the City to expedite the preparation of a new development code, noting that processing of new developments may be difficult until the new code is adopted. The City will be initiating preparation of the new development code upon adoption of the 2005 General Plan. However, in the interim period between adoption of the General Plan and the new development code, the City will continue to process applications based on the current code requirements and the guidance provided in the 2005 General Plan.

Response 30B

The commenter states disagreement with the approach to the analysis of the "no project" alternative, which is based on the assumption that no physical changes to the environment would occur. The commenter is correct that a moratorium on development would not necessarily stop population growth in the City and that failure to provide new housing may lead to a variety of undesirable conditions (overcrowded housing, higher housing prices, etc.). The Draft EIR acknowledges these facts as well as the fact that the "no project" alternative is not feasible.

Response 30C

The commenter states opinions that the 1.14% annual growth rate is more realistic than the 0.88% growth rate and that it appears as though the 0.88% annual growth was selected due to concerns about SCAG and AQMP growth projections. The opinion regarding the appropriate growth rate is noted. Both growth rates discussed in the Draft EIR were selected by the City Council and represent historic growth rates in the City (the 1.14% rate is the 20-year growth rate while the 0.88% growth rate is the 10-year growth rate). SCAG and AQMP population forecasts were not used to develop either rate and, in fact, both growth rates exceed the SCAG and AQMP forecasts. The Draft EIR acknowledges this exceedance. However, it is anticipated that, following adoption of the 2005 General Plan, both SCAG and the Ventura County APCD will update their population forecasts for the City to reflect the new General Plan.

Response 30D

The commenter states opinions about the format and content of the 2005 General Plan and notes that the Draft EIR points out several limitations associated with the "Intensification/Reuse Only" scenario. The commenter also encourages the City not to limit its ability to include additional land in its planning inventory. The comments about the 2005 General Plan are not relevant to the adequacy of the Draft EIR, but will be considered by the City Council as they review the final General Plan. It is true that the Draft EIR points out certain limitations for

the “Intensification/Reuse” scenario, particularly relating to land available for new schools and parks. However, the Draft EIR does not identify such limitations as “significant” impacts. Although City staff are not recommending inclusion of any of the expansion areas at this time, several of the expansion areas could provide acreage for parks and schools and the City may consider future General Plan amendments to allow development of one or more of these areas in the future if such an amendment would meet planning objectives that cannot be met through intensification or reuse. It should be noted, however, that conversion of any of the expansion areas except for portions of the Western Cañada Larga area would be allowed only following voter approval under the SOAR Ordinance.

Response 30E

The commenter encourages the City to pursue action plans for addressing infrastructure deficiencies that will not place the entire burden of financing community-wide needs on builders and new home buyers. The City will develop such action plans to address needed improvements to roads, storm drains, and water and sewer lines. Builders will be responsible for financing improvements needed to serve their developments, but not to correct existing deficiencies.

Response 30F

The commenter questions how the Final EIR can be completed within a compressed timeframe. Responses to comments on the Draft EIR were completed and provided to agency commenters 10 days prior to the City Council’s August 8 hearing (at which the Council may certify the Final EIR), thus complying with CEQA’s requirement that public agency commenters receive responses at least 10 days prior to certification.

Response 30G

The commenter states an opinion that the General Plan may include conflicting priorities, specifically by calling for the preservation of mature trees and historic resources in areas where intensification and reuse are expected to occur. Every General Plan (and every community) has certain priorities that can be in conflict. The two examples cited by the commenter reflect the City’s desire to preserve its resources. The exact manner in which these actions are to be implemented will be detailed in the new development code. New developments that are consistent with general policy goals while potentially conflicting with others will need to be addressed on a case-by-case basis to determine whether and how such conflicts can be reconciled and which priorities take precedence.

Response 30H

The commenter states an opinion that park standards need to be flexible. This opinion is noted. The Draft EIR discusses the City’s general standards in order to provide an overall analysis of citywide impacts associated with projected growth; however, the City will continue to seek creative and flexible ways of meeting the community’s needs with respect to parks and recreation. In addition, language has been added to the General Plan under Policy 6A as follows:

Update standards for citywide public parks and open space to include an expanded menu of shared park types, and identify locations and potential funding sources for acquiring new facilities in existing neighborhoods.

Response 30I

The commenter states an opinion that the 50-foot buffer from riparian areas in Action 1.8 is overly restrictive. This opinion is noted. The 50-foot buffer has been determined to provide the minimum distance needed to effectively protect riparian habitat and associated wildlife movement corridors. This minimum distance is consistent with that adopted by a number of communities in the southern California region. It should be noted that this requirement only applies to waterways that retain natural soil slopes.

COMMUNITY DEVELOPMENT

RECEIVED

JUL 18 2005

PLANNING DIV. *RA*

July 15, 2005

31

Carolyn Briggs, Chair and
Members of the Planning Commission
501 Poli Street
Ventura, California 93002

Dear Chair Briggs and Members of the Planning Commission:

These preliminary comments on the draft 2005 Ventura General Plan (May 2005) ("DGP") and draft Environmental Impact Report ("DEIR") are made on behalf of the Ventura Port District ("District"). In 1999, the City Council and the Board of Port Commissioners entered into a Memorandum of Understanding ("MOU") for the preparation of a Master Plan for the Harbor Area. The MOU is attached as Exhibit A. It was contemplated that the Master Plan would be adopted as a Specific Plan and constitute the land use plan and zoning for the Harbor Area. The draft Master Plan and Master Environmental Impact Report ("MEIR") have been complete for over two years. The District has, however, refrained from circulating the documents for public review in an effort to reach agreement with the City on how to address an existing deficiency in fire service response times in and around the Harbor Area. The DGP and DEIR raise a number of issues of concern with respect to the draft Master Plan/Specific Plan, some of which are outlined below.

1. Harbor Master Plan.

The DGP (p. 3-8) establishes the "Harbor District" and describes it as an area with visitor serving uses and marine facilities to be regulated by a Harbor master plan. The DGP land use map designates The Harbor as "Draft Harbor Master Plan." This should be "Specific Plan." Because the draft Harbor Master Plan has been incorporated by reference into the DGP, it should become the overriding policy document for land use, water use, and future development of the Harbor upon adoption of the DGP, whether the Master Plan has itself been adopted or not or as a Specific Plan. The policy language in the DGP should be expanded and clarified to make it clear, without question, that the Harbor Master Plan/Specific Plan is the overriding policy document for the Harbor. A copy of a booklet describing the master plan is enclosed. This booklet was distributed at the joint City Council/Board of Port Commissioners meeting in April 2005.

www.venturaharbor.com

July 15, 2005
Page Two.

2. Local Coastal Program.

B

The draft Master Plan/Specific Plan are based on the City's certified Local Coastal Program ("LCP"). Apparently, the DGP is intended to supercede the Land Use Plan ("LUP") of the LCP. If this were to occur, there would be serious procedural and substantive issues, some of which are outlined below.

a. The DGP may not be specific enough to satisfy the Coastal Act or the California Coastal Commission ("CCC") and the CCC would want to review the LUP together with the Local Implementation Plan [zoning]. For example, the Land Use Plan does not show "visitor serving uses" or public access ways. The District could be caught between the City and the CCC. Until a development code is adopted and approved by the CCC, there would be a lack of certainty regarding what may or may not be built in the Harbor.

b. Processing a LUP amendment is very time-consuming. A whole new LUP could take years to get in place.

c. If the certified LUP is repealed or superceded while the CCC reviews a new one, this would leave the City without the ability to process any projects in the coastal zone during the interim. Applicants would need to seek approvals from the CCC, which is time consuming and difficult without a certified LUP. Further, it is unlikely a new LCP or LUP with residential units would be certified by the CCC.

d. The Harbor would need to separately seek CCC approval of the Master Plan/Specific Plan. This would otherwise be unnecessary because the draft Master Plan is consistent with the existing LUP.

e. The Sondermann/Ring project, which is critical to the economic vitality of the Harbor, may be greatly delayed.

f. Because the DGP does not appear to be inconsistent with the certified LUP, it would be wise to leave the LUP in place and overlay applicable DGP policies and "actions." This would avoid seeking CCC approval at all.

g. If there is an inconsistency between the DGP and the LUP, a specific amendment to the LUP could be sought concurrently with the LCP amendment required to support the Sondermann/Ring project.

h. The certified LUP could be attached as an appendix to the DGP for easy reference. The maps could be revised to specify LUP in the coastal zone.

i. Specific plan areas could be shown as "Specific Plan." The Harbor area should be titled "Harbor Specific Plan," not draft Master Plan.

July 15, 2005

Page Three.

j. These changes to the DGP are not complex and would avoid what could become a procedural nightmare and engender costly litigation from developers unable to process their projects in the coastal zone.

3. Fire Services. C

The DEIR suggests that a new fire station and nine firefighters are needed to accommodate anticipated growth in the Harbor. The DGP and DEIR also state that a new fire station is needed to address current deficiencies. Thus, the 9 firefighters needed for the new station are also necessitated by an existing condition. Based on a desired ratio of 0.98 per 1,000 residents (the City now operates at 0.69 firefighters per 1,000 population), development of Parcels 15 and 18, hotel expansion, and the marine learning center, do not, themselves come close to justifying a new station or 9 firefighters. These developments should, like any other new development, provide a fair share toward the capital costs of a new station. Neither the DGP nor the DEIR justify requiring the Harbor to fully fund development and the operation and maintenance of a fire station. While the DGP calls for resolving extended response times by adding a fire station at the "Pierpont/Harbor area," it only calls for studying the feasibility of funding services from fees, taxes or assessments "as new subdivisions designed on the New Urbanism concept are established." Action 7.13, which is intended to address fire response mistakenly refers to police services. In addition, neither the DGP nor the DEIR actually address the need for firefighting capabilities for non-residential use. The only concept of fair share related to the ratio of firefighters to population is set forth in the DEIR. The discussion of plans for a fire station in the Harbor are more detailed than called for by the DGP. (See DEIR, p. 4.11-28.) It is not certain that impact fees would be sufficient to pay for fire facilities and equipment. Impact fees cannot be used to cure existing deficiencies or for operational costs. (See, DEIR, p. 4.11-31.) Assessments require voter approval.

4. Process. D

Cooperation and input from the District in the preparation of the DGP policies was not requested. DEIR p. 1-2 describes 11 City Council meetings from Feb. - Aug. 2004 taking input from the CPAC and Planning Commission. Nowhere in the DGP and DEIR is there a discussion of the District's input into the process. As discussed below, the DGP policies and actions could conflict with contractual rights of District lessees.

5. Responsible Agency. E

The District should be designated as a "responsible agency" under the CEQA definition. The District is a public agency that would carry out policies of the DGP and LCP as it pertains to the Harbor.

July 15, 2005
Page Four.

6. Assumed Net Increase in Development at Buildout.

The level of future development assumed within the Harbor is not clearly called out in the DEIR, but can be determined from tables estimating water and sewer impacts. Based on these tables, the proposed DGP assumes a net increase within the Harbor of 300 dwelling units at 216,000 square feet of non-residential building area. Of this non-residential area, 150,000 square feet are identified as hotel use, leaving 66,000 square feet for expansion of other non-residential uses within the Harbor. This is insufficient to provide for development of the Marine Learning Center (approximately 77,000 square feet) and commercial uses within Parcels 15 and 18.

7. Protecting and Restoring Coastal Resources.

DGP Action 1.3 would require the District to determine and carry out appropriate methods for protecting and restoring coastal resources, including supplying sand at beaches (from dredging operations). This could be costly and unreasonable for the District to carry out this action on its own. It is uncertain whether dredging spoils would be suitable for such beach restoration.

8. Preservation of Sensitive Wetland and Coastal Areas.

DGP Action 1.11 would require sensitive wetland and coastal areas to be preserved as undeveloped open space wherever feasible. This could affect the District's ability to develop vacant Parcels 8, 15 and 18 depending on how "sensitive wetland and coastal areas" are defined. The CCC has very specific and rigorous restrictions on development in and adjacent to environmentally sensitive habitat areas (see California Coastal Act Section 30240). Although it does not appear that "sensitive wetland and coastal areas" affect any of the areas planned for development within the Harbor, it is necessary to make sure that such definitions will not apply.

9. Updating and Enforcing Stormwater Quality and Watershed Protection Measures.

DGP Action 1.14 requires compliance with directives from regulatory authorities to update and enforce stormwater quality and watershed protection measures. This could be costly, extensive, and unreasonable for the District to carry out such regulatory directives since watersheds extend miles inland from the Harbor. The Harbor is the "end user" and should be responsible for actions within the Harbor, and not for stormwater protection in the entire watershed.

10. Prohibition on Dredging.

DGP Action 1.18 would prohibit dredging during fish spawning and bird migration cycles. Without clear and specific definitions of species and types of fish spawning and bird migration, this could severely limit or shut down dredging operations in The Harbor.

July 15, 2005

Page Five.

11. Promote Channel Islands Tours and Develop an Aquarium.

DGP Action 2.17 would establish a partnership between the City, District, and National Park Service to promote Channel Islands tours and develop an Aquarium. This is helpful, but not a definitive commitment, nor are details are provided.

12. Prioritization of Uses in the Harbor Master Plan Area.

DGP Action 2.18 would prioritize uses in the Harbor Master Plan area as follows: (1) commercial visitor-serving, (2) recreation, boating, fishing, (3) commercial fishing, and (4) public service facilities. This prioritization of uses conflicts with the range of uses in the Harbor Master Plan. For example, residential use is excluded from the prioritized list of uses, even though the CCC has taken specific action to permit such uses within the mobile home park and on Parcels 15 and 18. Commercial fishing is the number two priority in the Master Plan and is a critical use required to sustain the District's eligibility for federal dredging funds.

13. Public View and Solar Access Preservation.

DGP Action 3.3 would require preservation of public view sheds and solar access. This policy could affect the District's ability to develop vacant Parcels 15 and 18 depending on how "public view sheds and solar access" areas are defined.

14. Public Access.

DGP Actions 3.4, 4.20-6.5, and 6.6 would require (and encourage) public pedestrian and bicycle access to and along the coast on all shoreline development. The policies would affect the design of new development on vacant Parcels 8, 15 and 18, and may impact the Yacht Club due to lack of shoreline access on the Yacht Club parcel. Clarification is needed to determine if the public access system set forth in the Master Plan fulfills these actions.

15. Form-Based Development Code.

DGP Action 3.17 would affect building and site design on Harbor parcels to emphasize pedestrian orientation, integration of land uses, treatment of streetscapes as community living space, and environmentally sensitive building design and operation. While form-based codes have a number of benefits, it is questionable whether the CCC would accept such a code as the sole basis for a Local Implementation Plan.

16. Minimize Truck Traffic on Residential Neighborhoods.

DGP Action 4.9 would identify, designate, and enforce truck routes to minimize the impact of truck traffic on residential neighborhoods. This policy could adversely impact the movement of goods and cargo in and out of the District depending on how it is implemented. Action 4.9 should be clarified to specify the location of truck routes.

I

July 15, 2005
Page Six.

17. Alternative Transportation Modes and Transit.

DGP Actions 4.15, 4.16, 4.17, 4.18, 4.27, 4.31, 4.32, and 4.34 encourage alternative modes of transportation and transit systems to reduce vehicle trips and congestion. This could affect circulation and access to the Harbor depending on how these policies are implemented.

18. Expanded Recreational Opportunities.

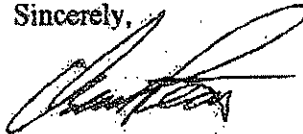

DGP Actions 6.15 and 6.16 call for new recreational programs that would occur in the Harbor, such as surfing, sailing, kayaking, bird watching, and additional boating and swimming access. Care must be taken in how these expanded recreational uses are conducted, for example, allowing swimming in boat navigation channels could be hazardous.

19. Cultural, Historical, and Archaeological Resources.

DGP Actions 9.2, 9.3, 9.12, 9.13, 9.14, 9.15, 9.16, 9.17, 9.18, and 9.19 would affect activities, operations, redevelopment, design and restrictions on District parcels. District input on these policies would be appreciated.

Thank you for considering these comments. The District respectfully requests that the hearings on the DGP and DEIR be continued for three months to provide an opportunity for the District and the City to resolve these and other issues.

Sincerely,

Oscar F. Peña
General Manager

James E. Neuerburg

Agreement No. 99-88City Council Approved: 8/4/99

**MEMORANDUM OF UNDERSTANDING
AND LEAD AGENCY AGREEMENT**

This Agreement is made by and between the City of San Buenaventura ("City") and the Ventura Port District ("District") in consideration of the following facts.

A. The District desires to update its master plan for the Ventura Harbor in accordance with requirements set forth in the 1998 Local Coastal Program ("LCP") amendment.

B. The City and the District desire to work together to initiate a joint process for developing a specific plan for the Harbor area.

C. It is contemplated that the master plan would be the land use plan for the specific plan and the specific plan would constitute the zoning for the Harbor area.

These regulations are hereinafter referred to collectively as the "Specific Plan".

D. Amendments to the LCP may be desirable to realize the objectives of the Specific Plan.

E. It is contemplated that a master environmental impact report ("MEIR") will be prepared for the project.

F. The parties desire to (1) designate a Lead Agency for the MEIR; (2) specify general procedures for actions relating to A through E, above; (3) allocate costs for preparing and processing the MEIR and the Specific Plan; and (4) specify the currently contemplated time frame for processing the MEIR and Specific Plan.

G. All parties desire to process the foregoing planning documents in an efficient and timely manner that maximizes public input and stakeholder involvement.

To that end, it is hereby agreed as follows:

1. This Agreement shall become effective between the City and the District upon approval by the City Council and the District Board.
2. The District will act as Lead Agency for the MEIR and the City shall be a Responsible Agency as defined by the California Environmental Quality Act.
3. The District and the City will jointly select consultants necessary for processing the MEIR and the Specific Plan.
4. Public workshops will be held to solicit input from all stakeholders and the public, including, but not limited to, lessees, franchisees, businesses in the Harbor area, potential developers, surrounding residents and environmental and special interest groups such as fishing, boating and surfing organizations.
5. During the public review period, the City Planning Commission may convene hearings on the draft master plan and MEIR, as it deems appropriate, to provide comments to the District.
6. Prior to adoption of the master plan and certification of the final MEIR, the District will fully consider and evaluate all City recommendations, and explain in writing the reason(s) any such recommendation is rejected.

7. The parties contemplate that the Specific Plan will be adopted by the City Council after adoption of the master plan and certification of the MEIR by the District.

8. The cost of preparing and processing the Specific Plan, the MEIR and LCP amendments, if any, (excluding administrative overhead expense) will be shared equally by the District and the City, up to a budgeted \$100,000 for each agency.

9. District and City will separately, and jointly, as the case may be, apply for grants to defray the costs of the Specific Plan and MEIR (herein the "Project Costs"). In addition, it is contemplated that Harbor tenants and developers whose development proposals are to be considered or included as part of the Specific Plan and MEIR may contribute to funding of the Project Costs. Upon receipt of such grant funds, and/or tenant and developer contributions, such grant funds and contributions, together with any District and City funds required to be contributed as grant matching funds, shall be applied first to Project Costs. Thereafter, District and City funds shall be applied to Project Costs only when the grant funds, and/or tenant and developer contributions are exhausted. Excess funds, if any, remaining after completion of the Specific Plan and MEIR shall be returned to District and City in amounts proportional to their contributions to Project Costs which are contemplated to be equal. District and City will also establish a procedure, pursuant to Government Code section 65456 and Public Resources Code section 21157(c), whereby tenants and developers who haven't contributed their fair

share of the Project Costs prior to commencement of work on the Specific Plan and MEIR will be charged a fee in an amount equal to their proportionate share of the Project Costs, at the time of application for a permit, or other entitlement for a development project considered or included in the Specific Plan and MEIR. All revenues received from such fees shall be used to reimburse District and City for their Project Costs in amounts proportional to their contributions to the Project Costs.

10. The District will contract with the consultant(s) and forward a copy of approved bills to the City's Director of Management Services. The City will pay the District one-half of the approved bills within 30 days of City's receipt of the approved bill.

11. In the event litigation is filed challenging the MEIR and/or the Specific Plan, the District and the City will cooperate in the defense of the action and equally share their expenses of the defense.

12. In the event LCP amendments are proposed, such amendments will be processed with the California Coastal Commission following adoption of the Specific Plan by the City.

13. The currently contemplated time line for processing the Specific Plan and possible LCP amendments, if desirable, is attached as Exhibit A.

14. Notices shall be provided as follows:

VENTURA HARBOR MASTER PLAN

Ventura Port District
City of San Buenaventura

April 4, 2005

Purpos

- Define a consistel
- Create a planning Harbor.
- Facilitate a Master

Existing Setting

■ Central Harbor

Existing Setting

■ Southwest Harbor

Figure 1.4A
Photographic Study
Southwest Harbor

VENTURA HARBOR
MASTER PLAN

L 2 A

Existing Setting

- South Peninsula

Existing Setting

■ Northeast Harbor

Coastal Act Priorities

- Coastal Dependent and Ocean-Related Uses
- Commercial Fishing
- Coastal Access
- Visitor-Serving Commercial and Recreational Uses

Land Use Objectives

- Create a recognizable visitor-serving destination, well integrated with the functions of a working harbor.
- Provide a human-scaled environment, and provide gathering places and amenities for people to enjoy.
- Facilitate walking and biking for recreation and transportation.
- Emphasize views of the harbor, ocean, and coastal mountains.
- De-emphasize the visual prominence of automobiles within the Harbor.

Land Use Plan

- All existing uses are considered to be permitted uses, may remain, and expand.
- Future land uses are options for future development.
- Master EIR to facilitate future development review for new permitted uses and expansion of existing uses.

Land Use Plan

Circulation: Roadway Improvements

- Harbor Boulevard
 - Signal at Oyster Street and modifications to slow traffic speeds. (Not part of Master Plan)
- Beachmont Street
 - One-way crossing of the Arundell Barranca.
 - Traffic calming.
- Anchors Way
 - Limit northbound left turns; improve ease of permitted turning movements.

Circulation: Roadway Improvements

- Spinnaker Drive
 - Reconfigure intersection at Navigator Drive to eliminate left turns from Navigator.
 - Access to commercial center on Harbor Boulevard would be right in/out only along Spinnaker Drive.
 - End public street right-of-way at Parcel 6, and reconfigure parking areas.
- Schooner Drive
 - Modify median to permit left turns into Parcel 19A.

Parking

- Projected deficit of 195 spaces (weekend) at build out.
- Solution: establish common parking areas and shuttle service.
- Potential locations for common parking:
 - Parcels 19A, 5, and 7.
 - Vacant land adjacent to mini-warehouses.

Coastal-Related Services and Facilities

- Pedestrian and Bicycle Access
 - Improve crossings of boat storage (Parcel 20), boat launch (Parcel 12).
 - Connection through Parcels 15, 16, 18.
 - Improve crossing of fish off-loading area (striping and signage).
 - Improve connections to beach.
- Waterfront Promenade
- Beachfront Boardwalk
- Spinnaker Drive Crossings
 - Signage.
 - New crossing at Parcel 3A to the existing parking.

Recreational Opportunities

- Marina Facilities
 - Provide additional space for large boats.
- Channel Islands National Park
 - Assist NPS in meeting headquarters needs.
 - Facilitate Channel Islands visitation.
- Marine Learning Center and Aquarium
- Boat Launch
- Park on Parcel 16

Visitor-Serving Opportunities

- Hotel Expansion
- Expand Harbor Village
- Park and waterfront trail on Parcels 15, 16, 18
- Sport fishing and charters (Parcel 5)
- Expanded facilities for Island Packers

Public Services and Facilities

- Water Facilities
- Sewer Facilities
- Drainage
- Electricity and Natural Gas
- Public Safety Services
 - Law Enforcement
 - Fire Protection

Fire Protection Issues

- Majority of existing Harbor area does not meet Fire Department response time objectives.
- Majority of service calls are for emergency medical assistance.

Recommended Fire Service Provisions

- Port District to assume responsibility as first responder for emergency medical calls within Harbor.
- New commercial, retail, office, and public facilities development over 500 s.f. of building area will install automatic fire sprinkler systems, or meet requirements of City's Automatic Sprinkler Ordinance, whichever is more restrictive.
- Use of fire-resistant construction materials.

Recommended Fire Service Provisions (cont'd)

- Provide adequate address signage to facilitate emergency response.
- Pursue joint training of Harbor Patrol and Fire Department personnel to better respond to water-related emergencies within the general Harbor area.
- Port District to make available a fire boat for fire and emergency service within the Harbor and Keys area and catastrophic emergency services to the City pier.
- Provide fire hydrants and water lines in compliance with UFC and City requirements.

Recommended Fire Service Provisions (cont'd)

- Design internal circulation on development sites to accommodate fire suppression equipment with adequate turn-around areas.
- Ensure that City fire flow standards are met.
- Provide a usable 1/2-acre site within the northern end of Parcel 19A for establishment of an "all risk" fire station by the City upon notice that the City is prepared to construct and establish service at the station.
- Payment of fees pursuant to City ordinance, if adopted.

Master EIR

- Notice of Preparation (NOP) distributed on January 30, 2002.
- Issues addressed in the MEIR:
 - Aesthetics
 - Air Quality
 - Hydrology
 - Noise
 - Public Services
 - Traffic and Circulation
- No significant unavoidable impacts identified.

Master EIR (cont'd)

- Effects found not to be significant:
 - Agricultural Resources
 - Biological Resources
 - Cultural Resources
 - Geology and Soils
 - Hazards and Hazardous Materials
 - Land Use and Planning
 - Mineral Resources
 - Population and Housing
 - Park Services; Recreation

Purpose

- Define a common vision for the Harbor, consistent with the City's "Seize the Future."
- Create a consolidated reference document for planning and development within Ventura Harbor.
- Facilitate future development review through a Master EIR.

Process

- Analyze existing conditions, issues, and opportunities. Workshops.
- Prepare alternatives and select preferred alternative (March 2000). Workshop.
- Prepare, review and revise Master Plan (September 2002). Workshop.
- Revise Master Plan and prepare EIR (August 2003).
- Resolve fire service issues (ongoing).

Land Use Issues and Opportunities

Issues

- Land use incompatibilities (wastewater treatment, oil storage).
- Seasonal economy; lack of a focal point.
- Limitations on office use.
- Fire protection.

Land Use Issues and Opportunities

Opportunities

Issues

- Commercial fishing fleet.
- Regionally central location.
- Marine Learning Center and Channel Islands National Park Headquarters.

- Land use opportunities (water treatment, oil storage).
- Regional economy: lack of a focal point.
- Limitations on office use.

Land Use Plan: Northeast Harbor

- Parcels 15, 16, 18
 - Mixed-use with 300 du's, 150 boat slips, and 20,000 s.f. commercial
- Expand hotel
- Improve entry to Parcels 10A and 10B
- Retain Mobile Home Park, restaurant, and boat yard

Land Use Plan: Central Harbor

- Improve Harbor entry and provide directional signage.
- Hotel expansion on Parcel 19.
- Continue marina uses and provide for future expansion.

Land Use Plan

Overall planned land use is substantially less than is now permitted.

- Existing LCP permits 2.4 million s.f. of building area and 610 dwellings.
- 2002 Master Plan anticipates 894,556 s.f. of building area and 610 dwellings.
- Current Master Plan anticipates 896,056 s.f. of building area and 610 dwellings.

Table 4-A - Anticipated Land Uses

Parcel	Existing Land Use	Total Land Area (sq. ft.)	Existing Dwelling Units (sq. ft.)	Commercial Building Area (sq. ft.) Permitted under LCP	Anticipated Development	Net Increase
1	Residential	168,000	45,000	128,000	Head and Specialty Retail	75,000
1R	Residential	340,000	100,000	245,000	Head	145,000
2,3	Various Use Storage	320,000	50,000	240,000	Marina	3,000
4	Commercial Fishing (restaurant, office, and support facilities)	3,910,000	200,000	247,300	Commercial Fishing, Office, and Storage	0
5	Commercial Fishing (bulk and, office, and support facilities)	61,000	0	46,000	Commercial Fishing and Associated Facilities	31,000
6	Mobile Home Park	3,625,000	95,000	3,745,000	Mobile Home Park	46,500
7	Rural	200,000	25,000	100,000	Value-Adding Commercial, Recreation	0
8	Vacant	78,919	5,000	35,500	Coastal Yacht Club	3,000
9	Vacant	171,000	10,000	85,500	Yacht-Storage Commercial, Recreation	42,000
10	Vacant	80,534	0	70,500	Recreation	71,000
11	National Park Service	78,919	10,000	35,500	National Park Service	0
12	Timberland Resort	160,000	5,000	130,000	Timberland Resort	0
13	Post District	14,000	7,000	11,000	Post District Office	0
14	Dry Dock Storage	70,000	0	50,000	Dry Dock Storage	0
15	Public Boat Launch	100,000	0	0	Public Boat Launch	0
16	Parking	66,500	1,500	0	Parking	0
17	Park Supply	50,000	0	42,000	Park Supply	0
18	Vacant	92,000	0	300,000	Recreation	200,000
19	Vacant	172,000	0	172,000	Commercial	150,000
20	Vacant	300,000	0	190,000	Marina, Restaurant, Boat, Storage, Commercial	100,000
21	Parking	150,000	0	110,000	Parking	0
22	Residential	2,000,000	5,000	1,570,000	Residential with City storage facility (restaurant)	0
TOTAL		5,304,142	100,140	2,416,919		545,006

Land Use Plan: Southwest Harbor

- Wharf (Parcels 3A and 3B).
- Connections to wildlife ponds, Santa Clara River mouth, McGrath State Beach.
- Expand Harbor Village and improve connections to the beach.

Land Use Plan: South Peninsula

- Marine Learning Center and Aquarium (Parcel 8).
- Expand recreational opportunities.
- Reconfigure Spinnaker Drive and parking area.

Recreational Opportunities

- Marina Facilities
 - Provide additional space for large boats.
- Channel Islands National Park
 - Assist NPS in meeting headquarters needs.
 - Facilitate Channel Islands visitation.
- Marine Learning Center and Aquarium
- Boat Launch
- Park on Parcel 16

Visitor-Serving Opportunities

- Hotel Expansion
- Expand Harbor Village
- Park and waterfront trail on Parcels 15, 16, 18
- Sport fishing and charters (Parcel 5)
- Expanded facilities for Island Packers

Letter 31

COMMENTER: Oscar F. Peña, General Manager, Ventura Port District

DATE: July 15, 2005

RESPONSE:

Response 31A

The commenter states that the draft General Plan should be revised to clarify that the Harbor Master Plan/Specific Plan is the overriding policy document for Ventura Harbor. The text of the 2005 General Plan will be revised to clarify that the City and Port District are working together to cooperatively complete the Master Plan/Specific Plan for the Harbor area. Once the Harbor Specific Plan is adopted, it will become the overriding policy document for Ventura Harbor.

Response 31B

The commenter is concerned that the Draft General Plan is intended to supercede the current Land Use Plan and Local Coastal Program (LCP). The Port District's Draft Master Plan/Specific Plan is based on the City's current certified LCP. While the Port District's concerns are valid, it is not the intent of the 2005 General Plan to supercede the existing LCP. City staff has engaged in several discussions with the Port District to address this issue. In fact the Planning Commission Resolution recommending approval of the Draft 2005 General Plan (July 26, 2005) was specifically written to ensure that this is not the case. The intent is that the existing LCP would remain in full force and effect until the Coastal Commission adopts the new LCP. Thus, all areas of the City within the Coastal zone boundary and subject to the LCP would remain under the same regulations until either an LCP amendment (including the Draft Harbor Master Plan/Specific Plan) is adopted or the new LCP is adopted. In addition, there is specific language in the Draft 2005 General Plan that indicates that the City intends to work with the Port District to complete the Draft Harbor Master Plan and Specific Plan. Therefore, the concerns stated in the Port District's comment letter regarding requiring processing of Land Use Plan amendments would not require any different processing than currently is the case under the existing LCP/LUP.

The draft 2005 General Plan also contemplates the development that is considered in the Draft Harbor Master Plan and is not intended to preclude any current development proposals such as the Sonderman/Ring project.

City staff is not proposing to attach the existing LUP as it is not recommended that it will be superceded with adoption of the 2005 General Plan. The "Commerce" and "Mobile Home Park" designations shown on the proposed General Plan diagram are consistent with the current land use designations in the Harbor area and thus will not create any inconsistencies.

Response 31C

The commenter notes that a new fire station is needed in the Harbor area, but states that developments within the Harbor do not in themselves justify a new fire station or nine firefighters. The commenter also notes a typographical error in Action 7.13 of the General Plan. The typographical error will be corrected. As discussed in Section 4.11, *Public Services*, the Fire Department already has plans to construct a new fire station in the Harbor area in response to an existing service deficiency. If the City adopts a fire impact fee program, new development in the City, including development within the Harbor, would be subject to such fees. Though not an environmental impact of the 2005 General Plan, the VFD has identified the need for approximately 30 new firefighters to offset current staff deficiencies in addition to the new firefighters needed for the new Harbor station. As with all firefighting staff, funding for new personnel to staff a new station would come from the City's general fund unless other negotiated means can be determined.

Response 31D

The commenter states that the input from the Harbor was not requested for the draft 2005 General Plan. The draft plan has been circulated for public review since May 2005 in order to solicit comments prior to preparation and approval of a final plan. The City will incorporate relevant concerns from the Harbor into the final 2005 General Plan.

Response 31E

The commenter notes that the Port District should be designated as a "responsible agency." The Port District will be listed as a responsible agency in Section 1.0, *Introduction*.

Response 31F

The commenter states the level of development assumed for the Harbor does not account for all planned Harbor development. The Marine Learning Center and other developments in the Harbor have been accounted for in the EIR traffic and related noise analysis. The estimates of water demand and wastewater generation do not specifically include all of the facilities included in the Harbor Master Plan; however, on a per capita basis, the estimate of future water demand amounts to about 0.269 acre-feet per person per year, which is about 50% higher than the current per capita demand of about 0.179 acre-feet per year. Thus, the estimates of water demand and wastewater generation are conservative and more than account for additional non-residential development that may occur in the Harbor. The Draft EIR analysis is not intended to provide a "full buildout" estimate for the City, but rather to provide a reasonable estimate of growth that may occur over the next 20 years. Nevertheless, the table depicting possible Harbor development in the 2005 General Plan will be revised to reflect buildout estimates included in the Draft Harbor Master Plan.

Response 31G

The commenter expresses concerns about 2005 General Plan policies pertaining to protection of coastal resources and sensitive wetland and coastal areas, and enforcement of stormwater quality measures (items 7-9 of the Port District letter). None of these policies/actions are

expected to affect operations at the Harbor or restrict the Harbor's plans for development under its Master Plan.

Response 31H

The commenter expresses concerns about Action 1.18, which relates to dredging. In response to this and another comment, that action will be revised to read as follows:

Action 1.18: Conduct coastal dredging in accordance with the U.S. Army Corps of Engineers and California Department of Fish and Game requirements in order to avoid impacts to sensitive fish and bird species.

Response 31I

The commenter expresses concerns about a number of 2005 General Plan actions and how they might affect the Harbor (items 11-19 in the Port District letter). While these comments do not pertain to the adequacy of the DEIR, the Port District's concerns are being addressed through discussions with City staff and as determined appropriate, will be incorporated into the final 2005 General Plan.

Letter 32

COMMENTER: McLoughlin Family Ranch

DATE: July 15, 2005

RESPONSE:

Response 32A

The commenter states an opinion that the 1.14% annual population growth rate assumed for Scenarios 2-6 is more realistic than the 0.88% growth rate assumed for Scenario 1. This opinion is noted. The growth rates used in the Draft EIR were directed by the City Council. These assumptions were used for analytical purposes. The actual growth rate in the City varies from year to year and is dependent upon a variety of factors.

Response 32B

The commenter states an opinion that, given the complications associated with intensification and reuse, the City should allow the opportunity to consider development of the expansion areas. The commenter also notes that the Draft EIR identifies limitations on available land under the Intensification/Reuse Only scenario.

Although City staff are recommending adoption of the land use map included in Scenario 1 (Intensification/Reuse Only), the City will continue to have the option of allowing development of one or more of the expansion areas. Any land use designation change for the expansion areas that are subject to the SOAR Ordinance, whether sought as part of the 2005 General Plan or as a future General Plan amendment application, would be subject to voter approval.

It is correct that the Draft EIR identifies limitations on available land for the development of schools and parks under the Intensification/Reuse Only scenario. Impacts relating to schools and parks are not significant under CEQA. However, as noted in the Draft EIR, the relative lack of available land may limit the ability to develop new large park facilities or schools.

Response 32C

The commenter points out several potential benefits associated with development of the Olivas expansion area. Some of the benefits noted by the commenter, including potential circulation improvements and restoration of the Arundell Barranca, are discussed in the Draft EIR. In addition, in Section 4.15, the Draft EIR notes that the Intensification/Reuse Only scenario may restrict the types of housing available as compared to Scenarios 2, 3, 4, and 6, emphasizing multi-family housing over single family housing.

Response 32D

The commenter notes that although development of the Olivas area may conflict with the California Coastal Act policy relating to Prime farmland conversion, it could implement other Coastal Act policies relating to coastal access and recreation and enhancement of water quality.

This is correct. As discussed in Section 4.14 of the Draft EIR, possible future development within the Olivas expansion area could be found to be consistent with several Coastal Act policies.

Response 32E

The commenter notes that earlier documents included the Olivas expansion area in a “staff recommended” or “City Council preferred” scenario and requests that the City Council include the Olivas area within its proposed Sphere of Influence (SOI) boundary. It is true that the City Council identified three expansion areas, including the Olivas area, in its “preferred scenario” in July/ August 2004. However, because the City’s desire to focus on intensification/reuse, staff are now recommended adoption of the Intensification/Reuse Only scenario. It should be noted that the City will not be seeking SOI boundary adjustments at this time. The Ventura LAFCO will, however, be performing an analysis of the SOI boundary within the next year that will likely result in adjustments that exclude areas not planned for development within the next five years (including areas subject to SOAR) from the SOI.

Re: City of San Buenaventura 2005 General Plan Draft EIR

Dear Ms. Gialketsis:

On behalf of the members of the McLoughlin Family, who own approximately 300 acres of land located along Olivas Park Drive, in the City of Ventura ("*McLoughlin Ranch*"), thank you for the opportunity to comment on the City of Ventura's proposed 2005 General Plan and its accompanying Draft Environmental Impact Report, dated June 2005.

The *McLoughlin Ranch* property is located within the 930 acre Olivas Potential Expansion Area ("*Olivas PEA*"), as described in the City's General Plan Update and accompanying documents. There are six additional families/entities that own parcels of various sizes within the *Olivas PEA*. While the McLoughlin Family has been in communication with the other *Olivas PEA* property owners, who have expressed a desire and willingness to work cooperatively on any potential future planning efforts for the Olivas PEA, it should be noted that the comments expressed in this letter are those of the McLoughlin Family, and we are not intending to speak for, or represent the views of the other *Olivas PEA* property owners.

It is our understanding that the new Draft General Plan sets forth an unambiguous emphasis regarding the City's desire to focus on accommodating future growth with infill, intensification, and re-use of sites within the currently urbanized areas of the City, prior to considering any potential expansion of the City. And yet, there is strong indication of a number of potentially significant benefits to the City, and its General Plan Goals, that could only be accommodated through future development in one or more of the Potential Expansion Areas ("*PEAs*");

"...the community has indicated that before the city expands any further, the first priority to achieving planning goals should be in the vacant and underutilized areas of the City. Yet even the most successful efforts to achieve community planning goals through infill may need to be supplemented at some point by expanding into areas outside the city limits. Such expansion may not only be necessary to fulfill development objectives; it may also be needed to provide open space, parklands and natural areas to be preserved and restored... These areas (PEAs) were identified because they embody opportunities for achieving a variety of community vision objectives that may not be feasible within existing city limits." (VGP-Attachment D-Long Term Potential Expansion Strategy)

We also understand that the City will, at a yet undefined future date, be considering and making a decision regarding a Long-Term Potential Expansion Strategy, which will include: a) Guidelines for Timing and Consideration of PEAs; b) Framework for Development of Expansion Areas; and c) Criteria and Process for Site Selection. We know that any future development of the PEAs will require the preparation and approval of a Specific Plan, including the necessary environmental review, and will ultimately require a SOAR vote, and approval of the development concept by Ventura's electorate. We are not seeking to address the details of those future deliberations and policy decisions at this time.

While we are aware that the City has chosen to position its Draft 2005 General Plan as an Intensification/Reuse Only strategy (Scenario 1), and that the decision regarding which, if any, of the potential expansion strategies (Scenarios 2-6) will be selected for future planning has been segregated from the approval and adoption process for the 2005 General Plan Update, there are a number of issues/comments that we would like to address in response to the DEIR analysis, which is being used as a basis for this decision. Please consider the following:

- 1) **Growth Rate:** The Intensification/Reuse Only Scenario assumes a citywide annual population growth rate for the planning time frame of the 2005 VGP (2005-2025) to be 0.88%, while all of the Scenarios that include PEAs are based on a projected annual growth rate of 1.14%. While the 0.88% annual rate reflects Ventura's actual growth rate for the past 10 years (1994-2004), we believe that this growth rate was restricted by a number of factors including: the national, regional and local economic recession of the 1990s; the loss of several major employers from the area (including Kinko's relocation of corporate offices from Ventura to Texas); and the limited supply of new housing units that were produced in Ventura during that time frame due to restrictions imposed by the City's Residential Growth Management Program (RGMP).

A

We believe that the 1.14% growth rate is a more realistic and prudent projection for the City to use in its planning efforts, because this represents the longer range historic view of Ventura's actual growth (1984-2004), and is also much closer to the Countywide growth rates, and the City's actual growth during the recent past from 2000 to 2005.

- 2) **City's Ability to Accommodate Projected Growth with Infill Only:** Scenario 1 proposes to meet all of the City's anticipated growth, as projected using the 0.88% growth rate through 2025 (which assumes 8,300 new residential dwelling units and nearly 4.9 million new square feet of commercial, office, and industrial space), through the intensification and reuse of land within currently urbanized areas. While we appreciate and support the community's desire to accommodate as much of its anticipated growth as possible, through infill development, we question the feasibility of actually being able to accommodate this much growth within areas defined in Scenario 1. The DEIR identifies the primary areas where this growth is expected to occur, including defined Planning Districts and Corridors, many of which are located in the Downtown, Westside, and Midtown communities.

B

However, infill development can be much more complicated and costly, and faces many challenges that do not affect "Greenfield" development. Meeting the City's growth needs through Scenario 1 will require significant private investment, cooperation with existing neighbors, and less restrictive zoning and land use regulations than those that currently exist in Ventura. Until the City has completed an update of its zoning ordinance, and adopts the proposed form-based codes, it may be virtually impossible to legally approve enough projects at the levels of density that would be required in order to meet the proposed level of development. It is our understanding that the City plans to begin re-writing its zoning and development codes after the General Plan Update is approved, and that the process of developing the form based codes could take as long as two additional years to complete.

Given the inherent limitations of infill development, combined with probable conflicts between 2005 General Plan Policies and the existing regulatory framework, we believe that it would be prudent for the City to keep its options open by allowing for the opportunity to consider future development of the PEAs. It should also be noted that due to the requirements for Specific Plans and SOAR votes, any future development in the PEAs would require a multi-year planning effort. If the City waits until it discovers that its infill strategy has not been successful in yielding the needed level of development, it may be too late to meet growth projections within the planning period (2005-2025) through development in one or more of the PEAs.

Furthermore, the DEIR clearly indicates that there is a shortage of available land in Scenario 1 to meet the increased demand for Public Services that would be generated under even this lower growth rate scenario. Of particular concern is the lack of available infill sites large enough to provide additional fire, police, schools, and recreational facilities. The DEIR further states that "...limited available land for new schools may necessitate condemnation of property for new school sites and/or more intensive use of existing facilities." (Impact PS-3), and "Large sites to accommodate citywide park facilities are also lacking under this scenario" (Impact PS-6). Future development in one or more of the PEAs will alleviate these issues, especially the Olivas PEA, which offers adequate land to mitigate any impacts of Olivas development and additionally to offset the unmet needs from Scenario 1.

- 3) **Constraints on Intensification/Reuse Only Strategy:** In addition to the acreage, social, and regulatory limitations of Scenario 1, as described above, there are numerous specific and significant potential constraints associated with this strategy which are identified throughout the DEIR, and particularly in Section 4. The Intensification/Reuse Scenario assumes that a large percentage of the City's future growth will be met within the Planning Districts and Corridors, as identified in the Draft General Plan Update, and that a significant amount of this growth would occur in the older urbanized areas of the City, including Downtown, Midtown and the Westside. However, these older areas of town present a myriad of development challenges, which could very likely limit the potential growth in those areas, and/or negatively impact the financial viability of infill development. Some of these areas of concern, as identified in Section 4, include: Cultural and Historic Resources; Geologic Hazards; Hazardous Materials; Hydrology and Water Quality; Public Services; and Utilities.

Section 4 details numerous deficiencies in existing water, sewer and storm water facilities, especially in the older parts of town, that will require extensive re-investment and upgrades to infrastructure. This could affect the cost, timing, and/or ultimate viability of infill development in some areas. Also, the downtown and Westside areas are ripe with identified and potential unidentified cultural and historic/prehistoric resources. Development in these areas may well conflict with other General Plan and Ventura Vision priorities regarding historic and cultural preservation. The Westside and portions of the Downtown communities also contain identified hazardous material issues. Any of these factors could severely limit the true development potential under Scenario 1.

- 4) **Benefits of Olivas Expansion Area:** While there are certainly some potential challenges associated with future development in the Olivas PEA, the DEIR also identifies numerous potential benefits to the City, which could be obtained through the future planning of a high quality, mixed-use, new urbanist village at this location. In addition to the benefits listed above, Olivas offers opportunities to improve, enhance, and/or mitigate numerous issues of community wide importance, and to fulfill several General Plan and Vision Goals/Priorities, including:
- a. Completion of critical multi-modal circulation linkages that will enhance and improve circulation between existing neighborhoods, and promote alternative modes of transportation, by: I) connecting the Olivas/Ventura Harbor area to midtown through the extension of Mills Road, II) enhancing the Arrundell Barranca Bike and Pedestrian Pathway to create a safer and more appealing alternate circulation corridor, III) possible creation of a multi-modal transit center along the railroad line on Olivas PEA. (GP Policies 4A, 4B, and 4C)
 - b. Enhancing the economic viability of both the Ventura Harbor and the Pacific View Mall, by improving access and visibility, and creating better connectivity between these two vital commercial/tourist attractions, thus generating higher sales tax revenue to the City. (Impact TC-2)
 - c. Development in the Olivas PEA could allow for the restoration of the Arrundell Barranca into a more natural state (Vision Goal), and the creation of a beautiful parkland and bio-filtration area surrounding the Barranca, which would help to alleviate the siltation problems that are negatively affecting the waterways of the Ventura Keys and the Harbor. This would help meet several environmental, Coastal Commission, Vision, and General Plan priorities by using BMPs to improve storm water quality, enhancing the viability of commercial fishing and recreational boating in the Harbor, and creating attractive recreational opportunities for all residents. (Impact HWQ-2 and HWQ-3, GP Action 5.2, and Action 1.10, among others)
 - d. Scenario 1 will produce mostly multi-family housing, do to the limited amount of land available, and the desire to intensify development in currently urbanized areas. Future development in Olivas will allow for a greater diversity of housing choices. (DEIR page 4.15-10)
- 5) **Coastal Commission Priorities:** While it is noted that the preservation of Prime Agricultural land in the Coastal Zone is a priority of the

C

D

California Coastal Commission, the DEIR also discusses several other priorities/policies of the California Coastal Act (CCA) that could be served by a development in the Olivas PEA which adheres to policies of the Act, with the potential benefits outweighing any loss associated with the conversion of agricultural land. These are located in Section 4.14 of the DEIR and include: Article 2-Public Access (connecting Harbor to other areas of town and enhanced bike/ped trails); Article 3-Recreation (opportunities for coastal-related recreational activities/facilities, and visitor-serving commercial uses); Article 4- Marine Environment (enhance water quality and protection of commercial fishing & recreational boating); Article 6-Land Resources (allows for conversion of prime farmland when would allow for concentration of development in close proximity to existing developed areas with adequate services); and Article 6- Development.

Finally, we would like to note that in the initial Notice of Preparation for this DEIR, which was issued in September 2004, the Olivas PEA was included in the Staff Recommended Scenario; and in the Revised NOP that the City issued in December 2004, Olivas was included in the City Council Preferred Scenario; but it has now been removed from a priority position in the DEIR. Given the numerous potential benefits from future development in the Olivas PEA, and the ability to realize numerous City Vision and General Plan Goals, we respectfully request that the City Council include the Olivas PEA in its proposed Sphere of Influence boundaries, in its application to LAFCO.

E

Thank you for your time and consideration of our comments.

Sincerely,

McLoughlin Family

COMMENTER: McLoughlin Family Ranch

DATE: July 15, 2005

RESPONSE:

Response 32A

The commenter states an opinion that the 1.14% annual population growth rate assumed for Scenarios 2-6 is more realistic than the 0.88% growth rate assumed for Scenario 1. This opinion is noted. The growth rates used in the Draft EIR were directed by the City Council. These assumptions were used for analytical purposes. The actual growth rate in the City varies from year to year and is dependent upon a variety of factors.

Response 32B

The commenter states an opinion that, given the complications associated with intensification and reuse, the City should allow the opportunity to consider development of the expansion areas. The commenter also notes that the Draft EIR identifies limitations on available land under the Intensification/Reuse Only scenario.

Although City staff are recommending adoption of the land use map included in Scenario 1 (Intensification/Reuse Only), the City will continue to have the option of allowing development of one or more of the expansion areas. Any land use designation change for the expansion areas that are subject to the SOAR Ordinance, whether sought as part of the 2005 General Plan or as a future General Plan amendment application, would be subject to voter approval.

It is correct that the Draft EIR identifies limitations on available land for the development of schools and parks under the Intensification/Reuse Only scenario. Impacts relating to schools and parks are not significant under CEQA. However, as noted in the Draft EIR, the relative lack of available land may limit the ability to develop new large park facilities or schools.

Response 32C

The commenter points out several potential benefits associated with development of the Olivas expansion area. Some of the benefits noted by the commenter, including potential circulation improvements and restoration of the Arundell Barranca, are discussed in the Draft EIR. In addition, in Section 4.15, the Draft EIR notes that the Intensification/Reuse Only scenario may restrict the types of housing available as compared to Scenarios 2, 3, 4, and 6, emphasizing multi-family housing over single family housing.

Response 32D

The commenter notes that although development of the Olivas area may conflict with the California Coastal Act policy relating to Prime farmland conversion, it could implement other

Coastal Act policies relating to coastal access and recreation and enhancement of water quality. This is correct. As discussed in Section 4.14 of the Draft EIR, possible future development within the Olivas expansion area could be found to be consistent with several Coastal Act policies.

Response 32E

The commenter notes that earlier documents included the Olivas expansion area in a “staff recommended” or “City Council preferred” scenario and requests that the City Council include the Olivas area within its proposed Sphere of Influence (SOI) boundary. It is true that the City Council identified three expansion areas, including the Olivas area, in its “preferred scenario” in July/August 2004. However, because the City’s desire to focus on intensification/reuse, staff are now recommended adoption of the Intensification/Reuse Only scenario. It should be noted that the City will not be seeking SOI boundary adjustments at this time. The Ventura LAFCO will, however, be performing an analysis of the SOI boundary within the next year that will likely result in adjustments that exclude areas not planned for development within the next five years (including areas subject to SOAR) from the SOI.

Appendix H

Mitigation Monitoring and Reporting Program

MITIGATION MONITORING AND REPORTING PROGRAM

CEQA requires that a reporting or monitoring program be adopted for the conditions of project approval that are necessary to mitigate or avoid significant effects on the environment (Public Resources Code 21081.6). The mitigation monitoring and reporting program is designed to ensure compliance with adopted mitigation measures during project implementation. For each mitigation measure recommended in the Environmental Impact Report, specifications are made herein that identify the action required and the monitoring that must occur. In addition, a responsible agency is identified for verifying compliance with individual conditions of approval contained in the Mitigation Monitoring and Reporting Program (MMRP).

The following table is a checklist to be used to verify compliance with the mitigation measures included in the Final EIR for the "Intensification/Reuse Only" scenario.

2005 Ventura General Plan EIR
Mitigation Monitoring and Reporting Program

Mitigation Measure/Condition of Approval	Action Required	When Monitoring to Occur	Monitoring Frequency	Responsible Agency or Party
AIR QUALITY				
<p>AQ-2 Additional Air Quality Actions. The following actions should be added to the 2005 General Plan to address air quality impacts of future development on a case-by-case basis:</p> <ul style="list-style-type: none"> Require air quality analysis of individual development projects in accordance with the most current version of the Ventura County Air Pollution Control District Air Quality Assessment Guidelines and, when significant impacts are identified, require implementation of air pollutant mitigation measures determined to be feasible at the time of project approval. In accordance with Ordinance 93-37, continue to require payment of fees to fund regional transportation demand management (TDM) programs for all projects generating emissions in excess of Ventura County APCD thresholds. 	<p>Verification that actions are included in the final 2005 General Plan; review of individual projects over the life of the 2005 General Plan</p>	<p>Verification of inclusion of recommended actions prior to publication of the final 2005 General Plan; review and assessment of fees prior to issuance of building permits for individual development projects</p>	<p>Once prior to final 2005 General Plan publication; review of individual projects as needed over the life of the 2005 General Plan</p>	<p>Planning Department</p>
<p>AQ-3 Construction Mitigation. The following action should be added to the 2005 General Plan to address air quality impacts of future construction projects on a case-by-case basis:</p> <ul style="list-style-type: none"> Require individual construction contractors to implement the construction mitigation measures included in the most recent version of the Ventura County APCD's Ventura County Air Quality Assessment Guidelines and, when 	<p>Verification that the action is included in the final 2005 General Plan; verification that construction plans for individual projects include provisions that are consistent with APCD guidelines</p>	<p>Verification of inclusion of the recommended action prior to publication of the final 2005 General Plan; review and approval of construction plans prior to issuance of grading permits for individual development projects</p>	<p>Once prior to final 2005 General Plan publication; review of individual projects as needed over the life of the 2005 General Plan</p>	<p>Planning Department</p>

Mitigation Measure/Condition of Approval	Action Required	When Monitoring to Occur	Monitoring Frequency	Responsible Agency or Party
significant impacts are identified, require implementation of air pollutant mitigation measures determined to be feasible at the time of project approval.				
HYDROLOGY AND WATER QUALITY				
<p>HWQ-2 Additional Drainage Actions. The following actions shall be added to the 2005 General Plan to address existing storm drain system deficiencies:</p> <ul style="list-style-type: none"> • Develop a financing program for the replacement of failing corrugated metal storm drain pipes in the City. • Adopt assessment districts or other financing mechanisms to address storm drain system deficiencies in areas where new development is anticipated and deficiencies exist (e.g., Downtown district, Ventura Avenue corridor, and Harbor district). <p>The following actions are recommended to minimize the impact of future development on the local storm drain system and implement City goals regarding sustainable infrastructure:</p> <ul style="list-style-type: none"> • As feasible, require new developments to incorporate stormwater treatment practices that allow percolation to the underlying aquifer and minimize offsite surface runoff. Such methods may include, but are not limited to, (1) the use of pervious paving material within 	Verification that actions are included in the final 2005 General Plan; inclusion of infrastructure plans in future development plans (e.g., specific plans, redevelopment plans) for areas where deficiencies exist	Verification of inclusion of recommended actions prior to publication of the final 2005 General Plan; verification that appropriate infrastructure plans are in place prior to approval of development plans for affected areas	Once prior to final 2005 General Plan publication; verification of infrastructure plans as needed over the life of the 2005 General Plan	Planning Department, Public Works Department, Planning Commission, City Council

CITY OF SAN BUENAVENTURA

2005 VENTURA GENERAL PLAN

ADOPTED AUGUST 8, 2005

RESOLUTION NOS.2005-072 AND 2005-073

The following people contributed to the preparation of the 2005 Ventura General Plan:

CITY COUNCIL

Brian Brennan, Mayor
Carl E. Morehouse, Deputy Mayor
Neal Andrews, Council Member
Bill Fulton, Council Member
James L. Monahan, Council Member
Sandy E. Smith, Council Member
Christy Weir, Council Member

PLANNING COMMISSION

Carolyn Briggs, Chair
Curt Stiles, Vice Chair
Ronald Allen, Commissioner
Michael Faulconer, Commissioner
Martel Fraser, Commissioner
Bill Growdon, Commissioner
John Hecht, Commissioner

GENERAL PLAN COMMITTEE

Carolyn Briggs, Planning Commission Chair
Michael Faulconer, Commissioner
Bill Fulton, Council Member
John Hecht, Commissioner
Sandy E. Smith, Council Member
Christy Weir, Council Member

"The building of cities is one of man's greatest achievements. The form of his city always has been and always will be a pitiless indicator of the state of his civilization. This form is determined by the multiplicity of decisions made by the people who live in it."

— Edmund N. Bacon
Design of Cities, 1967

We, the people of Ventura, in order to ensure that our City remains a great place for us to live ...

. . . establish these goals for our community's future:

OUR NATURAL COMMUNITY

Our goal is to be a model for other communities of environmental responsibility, living in balance with our natural setting of coastline, rivers, and hillside ecosystems.

OUR PROSPEROUS COMMUNITY

Our goal is to attract and retain enterprises that provide high-value, high wage jobs; to diversify the local economy; to increase the local tax base; and to anticipate our economic future in order to strengthen our economy and help fund vital public services.

OUR WELL-PLANNED COMMUNITY

Our goal is to protect our hillsides, farmlands, and open spaces; enhance Ventura's historic and cultural resources; respect our diverse neighborhoods; reinvest in older areas of our community; and make great places by insisting on the highest standards of quality in architecture, landscaping and urban design.

OUR ACCESSIBLE COMMUNITY

Our goal is to provide residents with more transportation choices by strengthening and balancing bicycle, pedestrian and transit connections in the City and surrounding region.

OUR SUSTAINABLE INFRASTRUCTURE

Our goal is to safeguard public health, well being and prosperity by providing and maintaining facilities that enable the community to live in balance with natural systems.

OUR ACTIVE COMMUNITY

Our goal is to add to and enhance our parks and open spaces to provide enriching recreation options for the entire community.

OUR HEALTHY AND SAFE COMMUNITY

Our goal is to build effective community partnerships that protect and improve the social well being and security of all our citizens.

OUR EDUCATED COMMUNITY

Our goal is to encourage academic excellence and life-long learning resources to promote a highly-educated citizenry.

OUR CREATIVE COMMUNITY

Our goal is to become a vibrant cultural center by weaving the arts and local heritage into everyday life.

OUR INVOLVED COMMUNITY

Our goal is to strive to work together as a community to achieve the Ventura Vision through civic engagement, partnerships, and volunteer service.

State law requires each California city to adopt a comprehensive, long-term General Plan for the physical development of the community that guides local decision-making by expressing community goals about the future distribution and character of land uses and activities. The plan should be comprehensive by both covering the City's entire planning area and addressing the broad range of issues facing the community, including physical, social, aesthetic and economic concerns. The plan must be internally consistent and serve as a long-term guide, establishing policies for day-to-day land use decisions over an approximately 20-year period.

Introduction and Background

“To remain successful, Ventura must periodically renew itself, re-examine its goals and create a shared vision to guide the community into the future.”

With these opening words, the citizens of our community proclaimed the **Ventura Vision**, which was unanimously accepted by the City Council in March 2000. That landmark report captured the results of “a partnership encompassing city government, non-profit organizations, community groups, businesses, schools and individual residents to chart the community’s future through a process of visioning.”

Building on that shared vision, the City embarked on an effort to revise the 1989 Comprehensive Plan that served as the General Plan that all cities are required by State law to use to guide land use, transportation and other important policy decisions. This new General Plan is the culmination of that effort to translate the Ventura Vision into a coherent and comprehensive implementation plan to guide future development and preservation.

Throughout the visioning process and at the ballot box, Ventura residents have made clear we want a well-planned approach to managing growth. We don’t want continued suburban sprawl paving over farm land and sensitive hillside areas. Instead, we want vacant or run-down properties to be improved with high quality “infill” to provide new jobs, new homes and new stores and services.

Managing growth to improve our quality of life and standard of living is the smart thing to do.

Ventura residents don’t want uncontrolled growth and suburban sprawl. We also don’t want traffic gridlock, more “cookie cutter” tract houses or housing prices that make Ventura unaffordable for working families. By targeting new development to areas that would benefit from reinvestment – and by respecting our historic character and sense of place – “smart growth” is a better alternative.

Our vision is for a prosperous and well-planned community.

Smart Growth emphasizes reusing existing buildings and land, revitalizing our historic downtown and neighborhoods, and protecting the environment for future generations. Smart Growth channels new businesses and homes into appropriate areas. It also provides options for public transportation, creates neighborhoods where homes are in walking distance of local services and ensures green space for public use.

We seek to protect and enhance our unique “sense of place”

that builds on our pride in Ventura’s history and natural setting. Instead of new development that looks like everywhere else, our vision is for interesting, unique neighborhoods and districts, which reflect our values and heritage. The policies for pursuing these goals are spelled out in this new General Plan.

The Ventura General Plan

The *2005 Ventura General Plan* is the second in a series of three connected documents that will guide future conservation and change in the city. The *Ventura Vision* set the stage for this plan and enumerated four overarching principles that were affirmed by the community to guide Ventura into the future:

- Reach broadly and deeply into the community.
- Build on existing cultural, natural, and economic assets.
- Emphasize and encourage connections within the community.
- Work proactively and collaboratively to achieve the community's shared vision.

The final piece of the trilogy is a form-based *Development Code*. This code represents a new approach to zoning that prioritizes the appearance of development, while still ensuring that neighboring land uses are compatible and appropriate.

The *General Plan* will be put into action through the *Development Code* and a variety of other mechanisms, such as a mobility plan, specific plans, community plans, and capital improvement projects that will together shape the future of Ventura. The *General Plan* purposefully anticipates the *Code* focusing on the districts, corridors, and neighborhood centers where future change will be most pronounced.

The following vision statements reflect a high level of community consensus about a desired future for Ventura.

In the future, Ventura is a community that...

Environment

- Seeks sustainability by simultaneously promoting ecological health, economic vitality, and social well-being for current and future generations.
- Acts as an environmentally responsible model for other coastal areas.
- Protects and restores the natural character of its beaches, ocean views, hillsides, barrancas, and rivers as a scenic backdrop for its high quality urban environment.

Economy

- Develops a flourishing and balanced economy by encouraging a broad range of high quality employment and entrepreneurial opportunities.
- Encourages private economic development that supports public services and amenities associated with high quality of life.
- Has a vital, prosperous, and stable economy while maintaining its small-town feel.
- Is noted for private and public sector cooperation that enhances economic vitality.
- Actively participates in regional economic development efforts.

Planning, Design, and Circulation

- Retains its character as an attractive coastal town by growing slowly and sustainably, and by emphasizing its history, diversity, and natural environment.
- Cherishes its distinctive, diverse, and eclectic neighborhoods, and preserves their character.
- Has safe, accessible, and balanced transportation that promotes multiple modes of travel to local and regional destinations.

Social Activity

- Is known as an inclusive, diverse, and tolerant place that welcomes and celebrates all people.
- Provides all residents access to quality and affordable health and social services.
- Recognizes the importance of children and seniors by providing exceptional cultural, educational, and social support programs.
- Offers a diverse range of active and passive recreation for residents and visitors of all ages and abilities.
- Is dedicated to educational excellence and an emphasis on lifelong learning.
- Celebrates and is enriched by the arts and diverse cultural opportunities.

Collaboration

- Encourages residents to collaborate with each other and City government in an informed, active, and constructive manner to assess and resolve common issues.

Building on the Vision

Following adoption of the *Ventura Vision*, the City Council established a 19-member Comprehensive Plan Advisory Committee (CPAC) to shape the *Vision* concepts into issues and priorities for revision of the 1989 Comprehensive Plan. The CPAC included representatives of varied interests, including neighborhoods, agriculture, seniors and schools, as well as one member from the Planning Commission and one from the City Council. The committee met more than 30 times over almost three years. During that effort, the City published the August 2002 *Comprehensive Plan Update Background Report*, which provides a highly detailed account and analysis of opportunities and constraints that affect planning and land use in Ventura. This ultimately led to their findings, contained in the September 2003 *CPAC Issues & Alternatives Report*.

CPAC endeavored to create strategies to resolve planning and land use issues in Ventura utilizing the smart growth principles formulated by the U.S. Environmental Protection Agency:

- Mix land uses.
- Achieve compact building design.
- Provide a range of housing opportunities.
- Create walkable neighborhoods.
- Foster distinctive, attractive communities with a strong sense of place.
- Preserve open space, farmland, natural beauty, and critical environmental areas.
- Strengthen and direct development toward existing communities.

- Provide a variety of transportation choices.
- Make development decisions predictable, fair, and cost effective.
- Encourage community collaboration in planning decisions.

The recommendations of the CPAC were presented to the Planning Commission and City Council. After several months of reviewing the CPAC recommendations, the Planning Commission in December 2003 made some modifications to the CPAC's recommended land use scenario.

The City Council met 11 times from February through August 2004 to consider the CPAC and Planning Commission recommendations, review relevant data, and formulate broad goals, policies, and a diagram to guide growth and change in the City until 2025. In September 2004, the City Council established an ad-hoc General Plan Committee consisting of three Planning Commissioners and three City Council members to work with City staff and consultants to ensure that the *General Plan* would be completed expeditiously and with ample public participation, and to ensure open communication, transparency, and coordination among all parties interested in the creation of the *Plan*. All of the CPAC, Planning Commission, City Council, and General Plan Committee workshops, meetings, and hearings were open to the public and included significant, meaningful, and often extensive citizen input and participation.

Goals summarize how conservation, development, and future growth should occur by identifying physical, economic and social ends that the community wishes to achieve.

Policies establish basic courses of action for the Planning Commission and City Council to follow in working to achieve community goals, by directly guiding the response of elected and appointed officials to development proposals and related community actions.

Actions need to be undertaken by the City to implement policies.

Plan Format

The comprehensive and involved process of creating what is really a totally new (not just updated) *General Plan* – based on a new community vision and smart growth principles – resulted in a new set of goals, policies, and actions to guide future decision-making in Ventura that truly reflect the planning objectives of the community. These policy directives are organized by subject area in *General Plan* Chapters 1 through 10, which follow the organizational framework established in the *Ventura Vision* (see Table 1). Each topic is introduced with an overarching goal that carries forward the *Vision*, a description of issues needing resolution and methods for remedying them, and finally measurable policies and actions to achieve those solutions. Each of the policies contained within the Plan are intended to be understood and read with the following preface: “It is the intent of the City of San Buenaventura to...”. All of the actions are summarized in table form in Appendix A, along with the City department or division responsible for implementing each action and timeframe for completion. Also included in the Plan are the legally binding Appendices B through E. Attachment A is provided as a reference, while Attachment B is provided to serve as guidelines for future development until an update to the Zoning Ordinance is completed.

**Table 1
General Plan Organization**

Vision/General Plan Chapter	Required/<i>Optional</i> Elements	Examples of Topics Covered
1. Our Natural Community	Conservation Open Space	Open space, hillsides, watersheds, riparian areas, sensitive plants and animals
2. Our Prosperous Community	<i>Economic Development</i>	Commercial and industrial growth, economic diversification, job opportunities, tourism
3. Our Well-Planned and Designed Community	Land Use/ <i>Design</i> Housing <i>Park & Recreation</i>	Development patterns, neighborhoods, visual character, urban design, streetscapes, demographics, housing needs, affordability, constraints on production
4. Our Accessible Community	Circulation	Traffic, street network, parking, transit services, bike routes
5. Our Sustainable Infrastructure	Land Use	Water supply, wastewater treatment, drainage
6. Our Active Community	Land Use <i>Park & Recreation</i>	Park and recreation facilities, youth and senior programs
7. Our Healthy and Safe Community	Safety Noise Land Use	Development in hazardous areas, hazardous waste management, seismicity, flood control, water quality, brownfields, noise, police, fire, air quality
8. Our Educated Community	Land Use	Schools and libraries
9. Our Creative Community	<i>Culture</i>	Arts, events, community programs, cultural and historic resources
10. Our Involved Community	<i>Citizen Input</i>	Participation in governance

The format of the *General Plan* satisfies the State requirement that every general plan include policies for seven “elements,” as follows:

Land use – establishes the general distribution and intensity of land uses, including housing, commerce, industry, open space, education, and public facilities.

Circulation – identifies the location and type of existing and proposed highways, arterial and collector roadways, bicycle routes, and other transportation facilities.

Conservation – addresses treatment of natural and cultural resources, including watersheds, wetlands, trees, rivers and barrancas, and cultural and historic landmarks.

Housing – assesses current and projected housing needs of all segments of the community and identifies land to provide adequate housing to meet those needs. Although the City’s Housing Element and Technical Report is contained in a separate document to facilitate the frequent updating required by the State, the goals, policies and programs of the Housing Element must be and are consistent with the goals, policies, and actions of the *2005 Ventura General Plan*. (See Chapter 3, page 3-28, for 2004 Housing Element Goals and Policies.)

Noise – appraises noise sources in the community and develops means to mitigate nuisances.

Open Space – details techniques for preserving open space areas for natural resources, outdoor recreation, public health and safety, and agricultural activities.

Safety – establishes policies to protect the community from risks associated with seismic, geologic, flood, fire, and other hazards.

The *General Plan* also contains a number of special elements that aren’t required by State law but are integral to the unique identity of Ventura. These cover a range of topics including education, recreation, arts and culture, and community involvement in local government. Another chapter treats the very important subject of the local economy, providing guidance to citizens, City staff and policy makers regarding strategies and priorities for economic development in Ventura.

California Coastal Act

The *General Plan* also satisfies State requirements for the City's **Local Coastal Program** in accordance with the California Coastal Act (*Public Resources Code § 30000 et seq.*). Actions in the *General Plan* that affect coastal resources are intended to become part of the Land Use Plan of the Local Coastal Program, which will be accomplished through specific or community plans for those areas. These actions are identified with the logo of the California Coastal Commission (which oversees all Local Coastal Programs). The basic goals of the State for the coastal zone are to:

- Protect, maintain, and where feasible, enhance and restore the overall quality of the coastal zone environment and its natural and artificial resources.
- Assure orderly, balanced utilization and conservation of coastal zone resources taking into account the social and economic needs of the people of the state.
- Maximize public access to and along the coast and maximize public recreational opportunities in the coastal zone consistent with sound resources conservation principles and constitutionally protected rights of the private property owners.

- Assure priority for coastal-dependent and coastal-related development over other development on the coast.
- Encourage state and local initiatives and cooperation in preparing procedures to implement coordinated planning and development for mutually beneficial uses, including educational uses, in the coastal zone.

(Public Resources Code § 30001.5)

"As age comes on, one source of enjoyment after another is closed, but Nature's sources never fail. Like a generous host, she offers her brimming cups in endless variety, served in a grand hall, the sky its ceiling, the mountains its walls, decorated with glorious paintings and enlivened with bands of music ever playing."

— John Muir
20th Century Naturalist

CITY OF
VENTURA

OUR NATURAL COMMUNITY
ventura's general plan

1. OUR NATURAL COMMUNITY

Our goal is to be a model for other communities of environmental responsibility, living in balance with our natural setting of coastline, rivers, and hillside ecosystems.

Natural Context

Ventura's natural setting is one of its greatest assets, and preserving the environment is a top community priority. Situated between the ocean, hills, and two rivers, the city affords its residents and visitors with a significant amount of accessible, beautiful, and biologically diverse open space. Although a number of programs are in place to protect coastal and watershed ecosystems and to maintain and preserve existing open lands, some natural features in and around the city have been compromised by the impacts of human activity.

As in many communities across the nation, concern is growing in Ventura about human impacts on natural resources. The historic spread of local development has given rise to grassroots efforts aimed at preserving Ventura's viable agricultural land, open space, and hillsides. The 1995 Save Our Agricultural Resources initiative (see Appendix B) and the 2001 Hillside Voter Participation Area (Appendix C) measure require voter approval before the city can expand into open space areas. The Ventura Hillsides Conservancy formed in 2003 seeks to preserve local hillsides, canyons, and open space.

Ventura, Oxnard, Ventura County, and the County Local Agency Formation Commission have adopted agreements to preserve agricultural and open space land located between the cities. A change that amends these greenbelts requires the approval of all signatories.

Protecting Ventura's fragile natural resources is a fundamental focus of the *2005 Ventura General Plan*. Policies and actions in this chapter intend to ensure that coastal, hillside, and watershed features are preserved, remain visible and accessible, and demarcate boundaries for urban development to define and enhance the city's identity.

The community cherishes the shoreline as one of Ventura's best features. Coastal facilities in the city include:

- Emma Wood State Beach
- Ventura Seaside Park and Fairgrounds
- Surfers Point at Seaside Park
- Beachfront Promenade Park
- San Buenaventura State Beach
- Pierpont Community Beach
- Marina Beach/Cove Port District Beach
- Channel Islands National Park Headquarters
- Surfers Knoll
- Santa Clara River Mouth

Coastal Resources

Ventura boasts seven miles of beautiful sand beaches and valuable shoreline habitat. This “string of pearls” has long been identified by the community as one of the city’s most prized features. At its eastern end, the Ventura Harbor offers opportunities for residents and visitors to explore the local marine environment, including the Channel Islands National Park and Marine Sanctuary. Elsewhere along the coast, shoreline and dune habitat provide nesting, feeding, and mating grounds for a wide variety of wildlife, including threatened or endangered species such as the western snowy plover and the least tern.

Shoreline conservation programs underway include the Surfers Point Managed Shoreline Retreat, San Buenaventura State Beach restoration, Ventura Harbor wetland rehabilitation, and coastline water quality monitoring. The City will continue to invest in restoration to enhance the shoreline ecosystem, with the actions in this chapter augmenting current efforts.

Hillsides

The hills of the Transverse Range rise 1,200 feet above Ventura, providing an important visual backdrop that frames the City. Not only do these hills provide residents and visitors with scenic vistas, they are also part of a larger integrated ecosystem comprised by the hillsides, coastal areas, rivers and barrancas that together provide a rich habitat for many species. It is vital to the community that these hillsides that lie outside the city limits (with a County land use designation of either Open Space or Agriculture), are protected and preserved.

These hillsides, by definition, are coterminous with the Hillside Voter Participation Area, and comprise the Hillside Open Space community as depicted on the General Plan Diagram (page 3-22). Because the Hillside Voter Participation Area measure prohibits the extension of City urban services to the hillsides through 2030 without voter approval, the General Plan Diagram identifies the hillsides affected by the measure with a Planning Designation of Open Space. The full text and map of the Hillside Voter Participation Area appears in Appendix C (as required by the act). This chapter calls working with land conservation organizations to establish a Ventura hillsides preserve, and Chapter 6, *Our Active Community*, contains actions to work with the County to create public trails in the hillsides.

Definitions for “Hillside Open Space,” “Hillside Area,” “hillsides,” and “Hillside Voter Participation Area” can be found in the Glossary (Attachment A).

Rivers and Barrancas

The Ventura River flows south to the Pacific Ocean along the western edge of the city, and the Santa Clara River bisects the Oxnard coastal plain south of Ventura. A series of seasonal watercourses called barrancas traverse the city in narrow incised drainage channels running down from the hillsides. The rivers and barrancas and their larger watersheds provide undeveloped open space, riparian vegetation, wildlife habitat and corridors, recreational opportunities, and aesthetic beauty.

Where local watercourses have not been channelized, riparian trees and shrubs grow in fringing woodlands and thickets. Several sensitive bird species breed in these areas, including the least Bell's vireo, willow flycatcher, yellow warbler, and yellow-breasted chat. Steelhead and rainbow trout seasonally inhabit both the Ventura and Santa Clara Rivers.

Riparian and freshwater marsh areas in Ventura represent only a remnant of pre-human coverage, but the City has initiated conservation and restoration efforts such as the Ventura River Estuary Program to help reverse this trend. The estuaries at the mouths of the Ventura and Santa Clara Rivers serve as breeding grounds and feeding areas for migratory and resident shorebirds and waterfowl, as well as home to many terrestrial animals, fish, and free-swimming invertebrates.

Actions in this chapter – such as maintaining adequate buffers from watercourses, requiring

restoration of natural drainage features, and prohibiting the placement of manmade materials in drainages – can protect and improve water and habitat quality in local watersheds. The bolder action of removing concrete channel structures would further enhance natural functions and aesthetics.

Resource Conservation

As Ventura continues to grow, conserving resources, increasing energy efficiency, and achieving environmental sustainability become ever more important. The City desires to incorporate green building measures into the design, construction, and maintenance of public and private buildings which can result in significant cost savings and promote overall health and productivity of residents, workers, and visitors to the city. Raising conservation awareness can help minimize waste and pollution released into the natural environment. Improving energy efficiency in buildings, expanding recycling programs, and reducing transportation-related energy consumption will make the city a greener place. The policies and actions in this chapter provide clear direction to guide conservation, green practices, and responsible use of resources.

Policy 1A: Reduce beach and hillside erosion and threats to coastal ecosystem health.

Action 1.1: Adhere to the policies and directives of the California Coastal Act in reviewing and permitting any proposed development in the Coastal Zone. 

Action 1.2: Prohibit non-coastal-dependent energy facilities within the Coastal Zone, and require any coastal-dependent facilities including pipelines and public utility structures to avoid coastal resources (including recreation, habitat, and archaeological areas) to the extent feasible, or to minimize any impacts if development in such areas is unavoidable. 

Action 1.3: Work with the State Department of Parks and Recreation, Ventura County Watershed Protection Agency, and the Ventura Port District to determine and carry out appropriate methods for protecting and restoring coastal resources, including by supplying sand at beaches under the Beach Erosion Authority for Control Operations and Nourishment (BEACON) South Central Coast Beach Enhancement program. 

Action 1.4: Require new coastal development to provide non-structural shoreline protection that avoids adverse impacts to coastal processes and nearby beaches. 

Action 1.5: Collect suitable material from dredging and development, and add it to beaches as needed and feasible. 

Action 1.6: Support continued efforts to decommission Matilija Dam to improve the sand supply to local beaches. 

Action 1.7: Update the Hillside Management Program to address and be consistent with the Planning Designations as defined and depicted on the General Plan Diagram.

Policy 1B: Increase the area of open space protected from development impacts.

Action 1.8: Buffer barrancas and creeks that retain natural soil slopes from development according to State and Federal guidelines. 

Action 1.9: Prohibit placement of material in watercourses other than native plants and required flood control structures, and remove debris periodically. 

Action 1.10: Remove concrete channel structures as funding allows, and where doing so will fit the context of the surrounding area and not create unacceptable flood or erosion potential. 

Action 1.11: Require that sensitive wetland and coastal areas be preserved as undeveloped open space wherever feasible and that future developments result in no net loss of wetlands or “natural” coastal areas. 

Action 1.12: Update the provisions of the Hillside Management Program as necessary to ensure protection of open space lands.

Action 1.13: Recommend that the City's Sphere of Influence boundary be coterminous with the existing City limits in the hillsides in order to preserve the hillsides as open space.

Action 1.14: Work with established land conservation organizations toward establishing a Ventura hillsides preserve.

Action 1.15: Actively seek local, State, and federal funding sources to achieve preservation of the hillsides.

Policy 1C: Improve protection for native plants and animals.

Action 1.16: Comply with directives from regulatory authorities to update and enforce stormwater quality and watershed protection measures that limit impacts to aquatic ecosystems and that preserve and restore the beneficial uses of natural watercourses and wetlands in the city.

Action 1.17: Require development to mitigate its impacts on wildlife through the development review process.

Action 1.18: Require new development adjacent to rivers, creeks, and barrancas to use native or non-invasive plant species, preferably drought tolerant, for landscaping.

Action 1.19: Require projects near watercourses, shoreline areas, and other sensitive habitat areas to include surveys for State and/or federally listed sensitive species and to provide appropriate

buffers and other mitigation necessary to protect habitat for listed species.

Action 1.20: Conduct coastal dredging in accordance with the U.S. Army Corps of Engineers and California Department of Fish and Game requirements in order to avoid impacts to sensitive fish and bird species.

Action 1.21: Work with State Parks on restoring the Alessandro Lagoon and pursue funding cooperatively.

Action 1.22: Adopt development code provisions to protect mature trees, as defined by minimum height, canopy, and/or trunk diameter.

Action 1.23: Require, where appropriate, the preservation of healthy tree windrows associated with current and former agricultural uses, and incorporate trees into the design of new developments.

Action 1.24: Require new development to maintain all indigenous tree species or provide adequately sized replacement native trees on a 3:1 basis.

Policy 1D: Expand the use of green practices.

Action 1.25: Purchase and use recycled materials and alternative and renewable energy sources as feasible in City operations.

Action 1.26: Reduce pesticide use in City operations.

Action 1.27: Utilize green waste as biomass/compost in City operations.

Action 1.28: Purchase low-emission City vehicles, and convert existing gasoline-powered fleet vehicles to cleaner fuels as technology becomes available.

Action 1.29: Require all City funded projects that enter design and construction after January 1, 2006 to meet a design construction standard equivalent to the minimum U.S. Green Building Council LEED™ Certified rating in accordance with the City's Green Building Standards for Private and Municipal Construction Projects. 

Action 1.30: Provide information to businesses about how to reduce waste and pollution and conserve resources.

Action 1.31: Provide incentives for green building projects in both the public and private sectors to comply with either the LEED™ Rating System, California Green Builder, or the Residential Built Green program and to pursue registration and certification; incentives include “Head-of-the-Line” discretionary processing and “Head-of-the-Line” building permit processing. 

Action 1.32: Apply for grants, rebates, and other funding to install solar panels on all City-owned structures to provide at least half of their electric energy requirements. 

Action 1.33: Publicly acknowledge individuals and businesses that implement green construction and building practices.

"Every increment of construction should be done in such a way as to heal the city."

— Christopher Alexander
Author of *A Pattern Language*, 1977

CITY OF
VENTURA

OUR PROSPEROUS COMMUNITY
ventura's general plan

2. OUR PROSPEROUS COMMUNITY

Our goal is to attract and retain enterprises that provide high-value, high wage jobs; to diversify the local economy; to increase the local tax base; and to anticipate our economic future in order to strengthen our economy and help fund vital public services.

Adapting in the 21st Century

Great communities are prosperous communities. A successful city brings people, institutions, ideas, and capital together in creative ways that enrich the lives of those who live and work there. In today's global economy, high-wage high-value jobs are the foundation of the prosperity that instills a city with the financial resources necessary to provide high quality of life and excellent community amenities.

Ventura has been blessed with a history of prosperity, thanks in large part to success in harnessing the area's natural assets for economic benefit. For most of the 20th Century, Ventura was sustained largely by its role as the hub of the region's oil and agriculture industries. These two sectors not only provided a stable source of jobs and business opportunities, but also helped to shape Ventura's role as the legal, governmental, and cultural center of the County.

In the 21st Century, however, Venturans can't take continued prosperity for granted. Competition occurs regionally, nationally, and globally for innovative businesses, top talent, and

good jobs. The community must build on its resources and constantly be on the lookout for new economic opportunities.

County government will likely remain the city's largest employer, providing an important element of economic stability, but government employment is not likely to grow significantly. Oil and agriculture will continue to be important, but their roles are diminishing. While Ventura is a regional center for healthcare, that industry will continue to face intense pressures to reduce costs. Still, the City of Ventura is positioned to move into an era dominated by innovation and reliant on emerging technologies. Cities and regions that excel in the "New Economy" promote high tech industries and boast a high quality of life. Likewise, to remain competitive, Ventura must continue to support economic development, but also create a more attractive living environment, including by providing appropriate housing for all segments of the local workforce. Efforts to boost economic development must be supported by a high quality of life, including a thriving cultural arts scene, award winning schools, and an engaged community. Tourism is also a strong market for Ventura. The beaches, museums, downtown, harbor and the nearby Channel Islands National Park attract more than 1.5 million visitors a year.

The policies and actions in this chapter seek to identify business niches that can thrive locally to diversify the economic base and ensure future community prosperity.

Economic Challenges

Ventura faces a variety of interrelated challenges to continued economic vitality, including:

1. Capturing a share of high-value job markets, such as biotechnology, computer software, communications, entertainment, multimedia, education, and business and financial services.
2. Diversifying the local economy to reduce dependence on the service, retail, and government sectors.
3. Building on the success of the tourism, manufacturing, business, and financial services sectors through marketing and job training programs that will ensure retention and attraction of these enterprises.
4. Finding appropriate locations for commercial and industrial land, including through revitalization opportunities in the Westside and Downtown and possibly via annexations of sites in the North Ventura Avenue and 101 Business Corridor areas.
5. Expanding the retail base, because sales tax represents a major City revenue source.
6. Providing housing for the full range of workforce households at all income levels.
7. Providing adequate infrastructure and financing resources.

Meeting all of these challenges in an integrated, strategic manner will be necessary to achieve long-term economic stability and success. The City must endeavor to identify the businesses most likely to remain and grow in an area that has very high costs – especially for housing – but also has outstanding community amenities, including good weather, a spectacular natural setting, and a safe and desirable community fabric.

The *Ventura Vision* calls for targeting industries that demonstrate the greatest promise for long-term community prosperity by:

- Providing high-wage, high skilled jobs,
- Possessing a local competitive advantage in the global economy,
- Being committed to local responsibility,
- Growing from local ownership, control or management,
- Practicing environmental leadership in their markets, and
- Strengthening the community's creative, cultural identity.

The *Vision* also offers principles for the City to pursue in charting future strategies for economic development:

- Encourage a broad range of high-quality employment and entrepreneurial opportunities.
- Encourage private economic prosperity that can support public services and quality-of-life amenities.

- Develop a vital, prosperous, and stable economy while maintaining a “small-town” flavor.
- Encourage the public and private sectors to work together to achieve prosperity.
- Participate constructively in regional economic development efforts.

Implementing these strategies will not be simple or easy. For one reason, California’s current tax system contains provisions that result in some of the lowest-paying economic sectors providing the city with the most tax revenue, and vice versa.

Pillars for Prosperity

Community prosperity is not something that a city government can create by itself. Any successful economic development effort requires the participation of many partners, including community-based business organizations, educational and training institutions, venture capitalists, individual entrepreneurs and business owners, networks of suppliers, and other government agencies that have a mission to enhance prosperity.

Together, the City and its economic partners must ensure that the building blocks for community prosperity are in place. These foundations include organizations and institutions that can coordinate local economic development efforts, as well as land and other economic infrastructure required to make Ventura an attractive business location.

This organizational infrastructure is evolving in Ventura. Business groups such as the Chamber of Commerce and the Ventura County Economic Development Association (a countywide group) are already active, but a wider network is needed to assemble the resources and capacity of entrepreneurs, venture capitalists, educators, and other stakeholders in building a healthy business climate. Greater synergy is needed among the area’s higher education institutions – including California State University Channel Islands, Ventura College, Brooks Institute, and satellite campuses of other colleges and universities.

Appropriate and sufficient land will also be necessary to ensure continued economic prosperity over the next 20 years, even as we seek to protect open space and combat sprawl. Demand for land to support retail and office development is likely to outstrip current supply unless allowable building intensities are significantly increased. While some increased density is likely, and some older industrial land may be recycled for new business uses, the City must take care to reserve sufficient land for these purposes – especially in an environment where short-term pressure is likely to encourage conversion of land to commuter housing.

Thus, the strategy for community prosperity must be coordinated with area-specific planning efforts, especially on the Westside (where industrial land is likely to be recycled), Downtown (which must stress office, studio, and retail business growth as well as an emerging residential component), and in the 101 Corridor between Mills Road and

Johnson Drive (where most of the city's business activity now takes place). The City will advance on a set of defined focused areas:

Auto Center – efforts over the short term will focus on making the area a regional retail destination. The City will strengthen its partnership with Auto Center dealers to realize beautification projects and facilitate land use entitlements for additional dealerships.

McGrath Property – the 76-acre site provides Ventura with the very best opportunity to attract new industry with high-value, high-wage jobs. The City and property owners will work on securing project entitlement approvals and recruiting desired tenants. The objective is to attract targeted industries and provide the impetus for initial site development over the short-term.

Westside – the feasibility of establishing a redevelopment project area will be considered by the City and Westside citizens. Such legal designation would provide the resources needed to leverage and implement planned initiatives in various Westside plans. Brownfield reuse efforts will also continue to secure funding for much needed site assessment and remediation activities.

Upper North Avenue – the objective is to transform this area from an oilfield industrial area to a dynamic economic engine. Development efforts will address reuse of the former USA Petroleum site, including and evaluation of the

site's potential to emerge as a component of a campus expansion opportunity for Brooks Institute. Keys to this effort are site remediation, compatibility issues, and future annexation to the City.

Downtown – proposed initiatives include well defined design standards in the updated Downtown Specific Plan, enhanced efforts to market the Downtown Cultural District, formation of a downtown management entity, and attracting uses that create “around-the-clock” activity.

Anticipating Our Economic Future – Ventura's economic growth is built on a foundation of concerted efforts that fuel innovation, collaboration, and continuous learning. The focus will be on attracting high technology and knowledge-based businesses including biotechnology, non-durable manufacturing, and business and financial services. Continuous learning opportunities for job seekers, workers, and employers will acknowledge demographic pressures and rapidly changing skill needs. Through specific strategies, the community will develop leaders for tomorrow, and attract and retain new graduates and skilled employees. Critical players will include the Workforce Investment Board, Ventura College, California State Channel Islands, and the Brooks Institute.

The policies and actions in this chapter attempt to provide the means to support these targeted efforts to achieve a stable and balanced economic base.

Policy 2A: Establish a clear economic strategy.

Action 2.1: Track economic indicators for changes that may affect City land resources, tax base, or employment base, such as terms and conditions of sale or lease of available office, retail, and manufacturing space.

Action 2.2: Prepare an economic base analysis that identifies opportunities to capture retail sales in sectors where resident purchasing has leaked to other jurisdictions.

Action 2.3: Maintain and update an Economic Development Strategy to implement City economic goals and objectives.

Policy 2B: Make the local economic climate more supportive of businesses investment.

Action 2.4: Map priority locations for commercial and industrial development and revitalization, including a range of parcel sizes targeted for high-technology, non-durables manufacturing, finance, business services, tourism, and retail uses. 

Action 2.5: Share economic and demographic information with organizations that may refer businesses to Ventura.

Action 2.6: Encourage intensification and diversification of uses and properties in districts, corridors, and neighborhood centers, including through assembly of vacant and underutilized parcels. 

Action 2.7: Partner with local commerce groups to recruit companies and pursue funding for business development and land re-utilization.

Action 2.8: Carry out Housing Element programs that provide housing to all segments of the local workforce.

Action 2.9: Expedite review for childcare facilities that will provide support to local employees.

Policy 2C: Encourage niche industries.

Action 2.10: Expedite review of the entitlement process for installation of infrastructure necessary to support high technology and multimedia companies.

Action 2.11: Allow mixed-use development in commercial and industrial districts as appropriate. 

Action 2.12: Allow uses such as conference centers with resort amenities on appropriately sized and located parcels. 

Action 2.13: Market the city to businesses that link agriculture with high technology, such as biotechnology enterprises.

Action 2.14: Partner with local farms to promote farmers markets and high quality locally grown food. 

Policy 2D: Expand tourism opportunities.

Action 2.15: Provide incentives for use of waterfront parcels for recreation, visitor-serving commerce, restaurant, marina, and fishing uses. 

Action 2.16: Work with the State to create year-round commercial opportunities at the fairgrounds. 

Action 2.17: Partner with the Harbor District and National Park Service to promote Channel Islands tours and develop a marine learning center. 

Action 2.18: Prioritize uses within the Harbor master plan area as follows: (1) coastal dependent, (2) commercial fishing, (3) coastal access, and (4) visitor serving commercial and recreational uses. 

Action 2.19: Partner with hotels and the Chamber of Commerce to promote city golf courses. 

Action 2.20: Promote outdoor recreation as part of an enhanced visitor opportunities strategy. 

"Communities should be designed to serve the cycle of the day and the cycle of the lifetime."

— Andres Duany
Architect & Town Planner

3. OUR WELL PLANNED & DESIGNED COMMUNITY

Our goal is to protect our hillsides, farmlands and open spaces; enhance Ventura’s historic and cultural resources; respect our diverse neighborhoods; reinvest in older areas of our community; and make great places by insisting on the highest standards of quality in architecture, landscaping and urban design.

Our City

Ventura is a unique coastal community, proud of our heritage and dedicated to being a national model for effectively managing growth to protect our natural environment and continue to be a great place for us to live.

It is our public responsibility to plan and shape the physical realm to achieve these goals. Past policies, particularly the 1989 Comprehensive Plan, reined in rapid outward suburban sprawl. The 1992 Downtown Specific Plan set the direction for revitalization of the historic heart of our community. Voter-approved measures clearly underscored a mandate to protect agricultural resources and open space, particularly in our hillsides.

Guided by the Ventura Vision of 2000, the centerpiece for this General Plan is creating a “well-planned and designed community.” The policies build on the foundation of the past.

This plan also represents an historic commitment to *smart* growth:

1. Mix land uses
2. Take advantage of compact building design
3. Create a range of housing opportunities and choices
4. Create walkable communities
5. Foster distinctive, attractive communities with a strong sense of place
6. Preserve open space, farmland, natural beauty, and critical environmental areas
7. Strengthen and direct development toward existing communities
8. Provide a variety of transportation choices
9. Make development decisions predictable, fair, and cost effective
10. Encourage community and stakeholder collaboration in development decisions

Source: U.S. Environmental Protection Agency

Infill First

Ventura today is the product of decades of earlier growth and development. These patterns have largely established our community’s character and will continue to do so in the future. The passage of SOAR, the Hillside Voter Protection Area, and other land-use constraints, along with natural boundaries, such as the ocean and the rivers, make it abundantly clear that before we expand outward any further, we must pursue an “Infill First” strategy. Such a strategy will help avoid sacrificing farmland and sensitive areas in our hillsides and along our rivers.

"Smart growth is about being good stewards of our communities and of our rural lands, parks, and forests. It is about ensuring that the best of the past is preserved, while creating new communities that are attractive, vital, and enduring."
--Michael Leavitt, EPA Administrator

Our “Infill First” strategy for Ventura means avoiding suburban sprawl by directing new development to vacant land in the City and Sphere of Influence (with the exception of SOAR land), and by focusing new public and private investment in carefully selected districts, corridors, and neighborhood centers where concentrated development and adaptive reuse will improve the standard of living and quality of life for the entire community.

Recognizing that the rate of future population growth is not subject to City control, this plan has been analyzed (in the accompanying Environmental Impact Report) on the basis of estimates of what new homes and other development might be expected to take place over the next twenty years (see Table 3-2). Looking at the rate of growth over the past decade and recognizing the challenges to “infill” development compared to “greenfield” expansion, a projection of roughly 8,300 additional housing units and approximately 5 million square feet of non-residential development has been used for the plan’s 20 year planning horizon. Table 3-2 provides estimates of the amount of development that could reasonably be expected to occur in the City and Sphere of Influence.

The actual distribution of future growth in the City may vary based on market forces and other factors. The districts, corridors, and neighborhood center areas, shown on Figure 3-1 Infill Areas, could accommodate more development and/or a different mix of

development than shown in Table 3-2. To demonstrate this, Table 3-1 shows the potential development based on the overall carrying capacity of the land.

Distribution of growth in the districts and corridors is based on the following general assumptions:

- Development in the Downtown and Harbor Districts will conform to the plans for those areas,
- The Downtown area and, to a lesser extent, the Ventura Avenue corridor will be the focus of future residential and commercial growth, and
- The Arundell, North Avenue, and Upper North Avenue areas will be the focus of future economic growth, potential expansion of the Brooks Institute, with some residential uses.

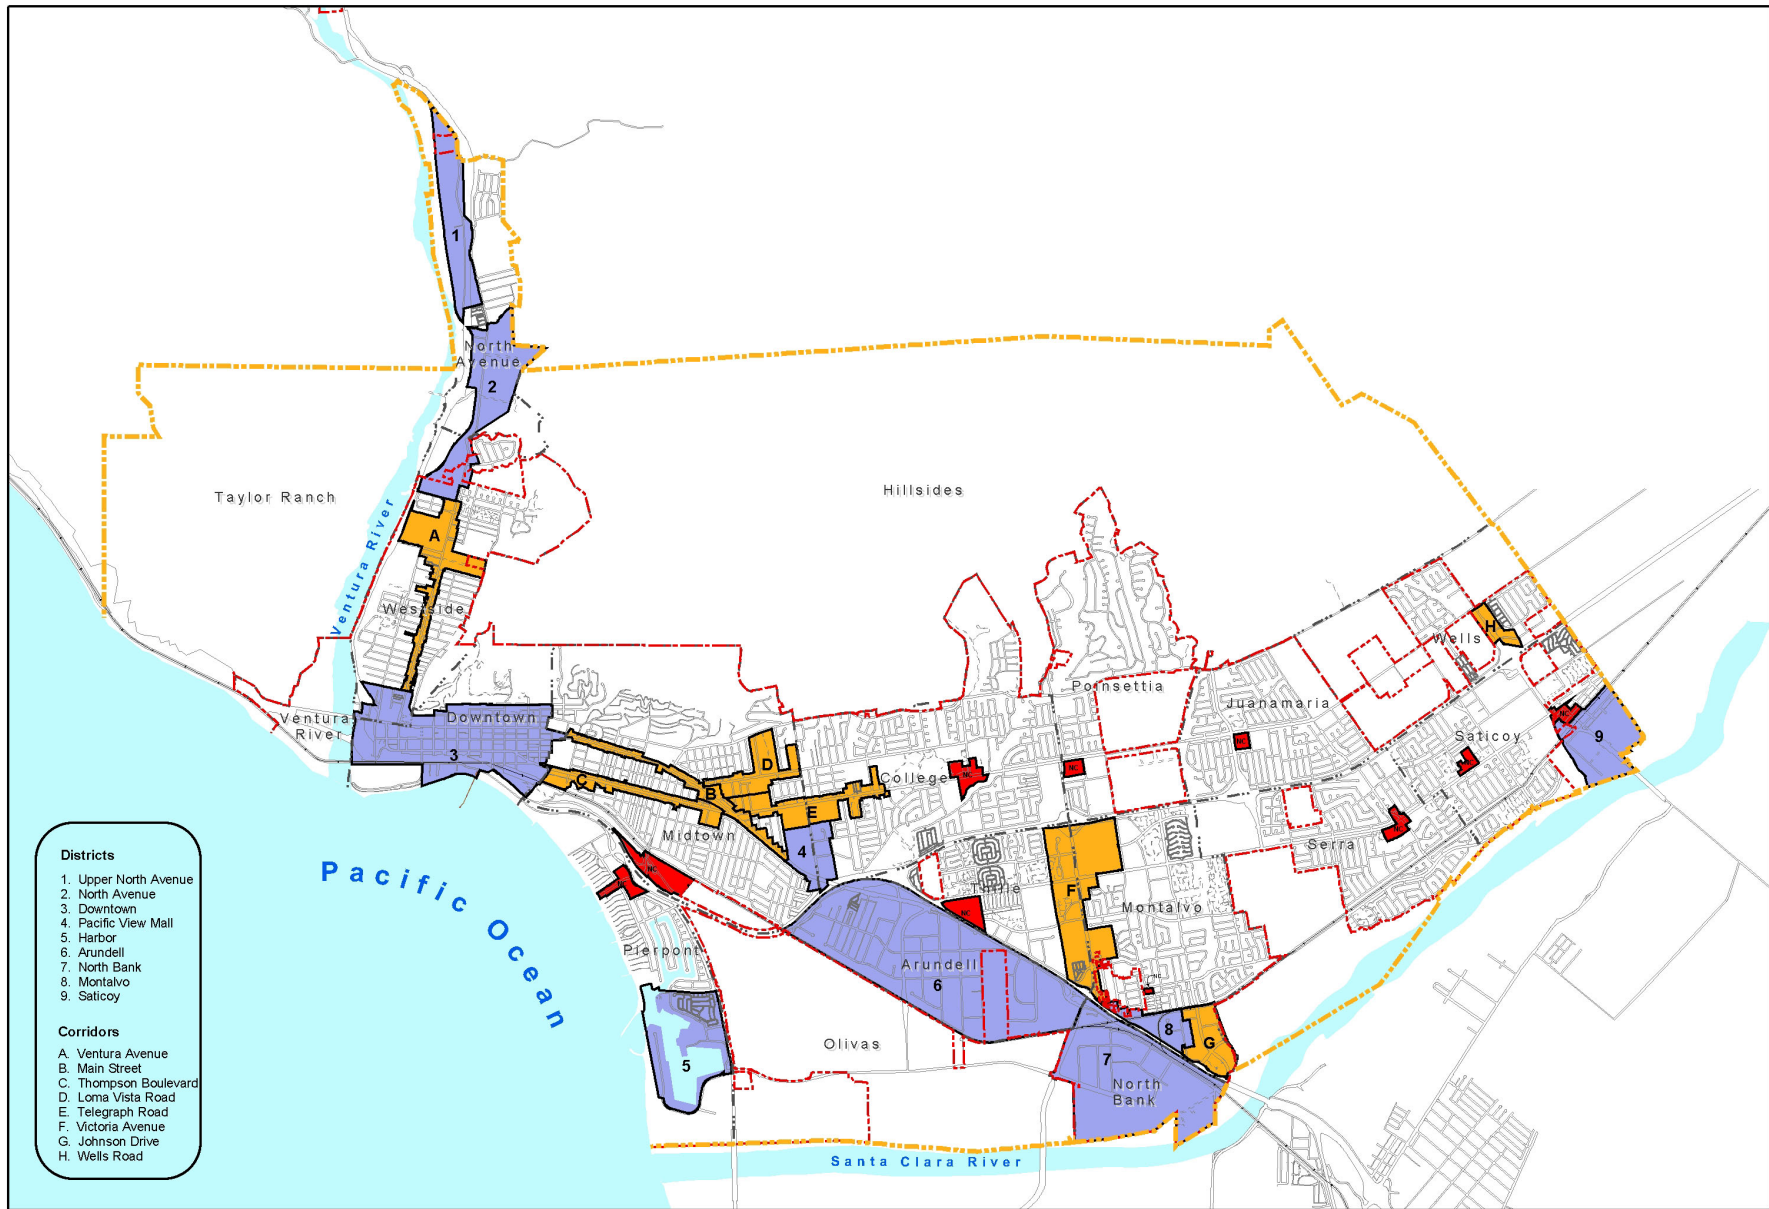

Table 3-1. Potential Development Based on Carrying Capacity of Land Area

Planning Designation	Allowed Density (du/acre)	Existing Development 2004					General Plan Capacity			
		Single Family Units	Multi Family Units	Comm./Ind. Sq. Ft.	Parcels	Acres	Vacant		Additional Potential ³	
							Parcels	Acres	Units	Sq. Ft.
Neighborhood Low	0-8	19,425	3,335	49,386	22,511	4,629	108	426	1,221	
Neighborhood Medium	9-20	1,163	8,965	149,513	4,414	1,061	32	116	4,859	
Neighborhood High	21-54	814	2,468	194,143	1,634	303	8	16	8,477	
Commerce ¹		257	490	4,995,248	1,366	808	95	108	7,892	22,328,276
Industry ²		29	31	8,299,840	1,037	1,401	89	392	4,724	34,215,483
Public & Institutional		4	0	54,422	66	571				
Park & Open Space		6	0	15,491	264	11,693				
Agriculture		4	0	19,550	154	6,857				
Downtown Specific Plan	21-54	332	1,543	1,795,401	1,174	307	45	20	2,500	450,000
Harbor District		0	310	350,160	10	254	1	21	300	876,100
Total		22,034	17,142	15,923,154	32,630	27,884	378	1099	29,910	57,869,859

1. Commerce residential unit capacity is for property within a Corridor, District, or Neighborhood Center and assumes buildout to the maximum FAR and that 25% of floor area would be commercial (with the remainder residential).
 2. Industry residential unit capacity is for property within a Corridor, District, or Neighborhood Center and assumes buildout to the maximum FAR and that 75% of floor area would be industrial (with the remainder residential).
 3. "Additional Potential" assumes a historic buildout rate of 70% for both residential and non-residential.

Figure 3-1
Infill Areas

Footnotes for Table 3-2:

Growth estimates for the Arundell community consider the likely development of the 75-acre McGrath property with a mix of uses and development of other vacant lands. Growth estimates for the North Bank area consider the possibility of a large retailer in that area. Estimates of growth in the SOI/Other Infill sites are based on the following general assumptions: (a) 101/126 Orchard site will develop similarly to a project recently proposed for that site; (b) Wells/Saticoy sites will develop in accordance with ongoing planning efforts for those areas; (c) the Pierpont area will develop generally in accordance with a conceptual project recently considered by the City; (d) Second Units will be added at a rate of 15/year; (e) roughly half of underutilized lands identified in the Housing Element will be re-developed over the next 20 years; (f) all vacant lands outside the districts and corridors will be developed in accordance with the proposed planning designations. Planned and Pending Developments based upon the City's 2004 Pending Projects list. Building areas do not include self storage facilities.

The following potential projects not included in the 2004 Planned and Pending Developments list have been included in the future development totals: (1) 150,000 square feet of industrial development in the North Bank area; (2) 165,000 square feet of retail development along Wells Road in the Saticoy area; (3) 50,000 square feet of office development on a 3.5-acre site along Ralston Drive. The Auto Center industrial project is included in the North Bank district; the other two projects are included in the "vacant" category. The square footage associated with these projects has been added to the projections of future growth to provide a conservative analysis of possible future impacts.

Together Table 3-2 and Figure 3-1, Infill Areas, offer a sense of how much growth Ventura might experience by 2025, and a picture of where such change is likely to occur. Precisely how and when development happens and what resources are conserved will be determined by the actions presented in the ten chapters of the *General Plan*, and by the specific land development standards. This plan is one of many tools the City will use to control where and how any future development takes place.

21st Century Tool Kit

The City has a wide array of tools at its disposal to achieve our “Infill First” strategy in ways that respect Ventura’s heritage and result in beautiful buildings, blocks, streetscapes, and public places that enhance and enrich quality of life for the entire community. Shaping the City’s physical form in the 21st Century will be achieved most effectively and aesthetically by combining Planning Designations with a transect-based approach, and with a new form-based Development Code. Together these can strongly influence the design and functioning of Ventura’s distinct and unique neighborhoods, districts, and corridors.

The policies and actions in this chapter seek to enrich Ventura’s urban fabric through appropriate design that showcases the attractive features of neighborhoods, districts, and corridors. To promote high-quality infill, the policies and actions encourage neighborhood centers, pedestrian access, established and desirable building types, and dynamic, neighborhood-serving nodes of mixed-use development along primary streets and corridors. This chapter specifically calls for detailed attention to community design through a form-based approach.

Neighborhoods: The Basic Building Blocks of Community

Like any great city, Ventura has grown around the basic unit of the neighborhood. A true neighborhood is not a subdivision of similar

houses disconnected from surrounding places. Instead it is an identifiable area containing a neighborhood center with a pedestrian-friendly mix of uses and a palette of housing types for people in all stages of their lives. Neighborhoods are often defined by a quarter-mile “pedestrian shed” (see Figure 3-2), in which most residents’ daily needs can be met within a five-minute walk. The organic nature of neighborhoods and their interdependency is what makes them viable for generations. Neighborhoods are not static places that resist change, but rather evolve naturally through periods of transformation to accommodate new residents’ needs and desires.

“In a neighborhood, everything that is needed is there and everything that is there is needed.”
- Anonymous

| | |  | Theoretical 10 minute walk (1/2 mile) |  | Actual 10 minute walk (1/2 mile) |

This map is a product of the City of San Buenaventura, California. Although reasonable efforts have been made to ensure the accuracy of this map, the City of San Buenaventura cannot guarantee its accuracy.

The City is rich in a variety of neighborhoods, most of which are within one of Ventura's distinct communities. A total of 17 communities were identified in the 1989 Comprehensive Plan and have been carried forward, with some modifications to allow for a more detailed approach to describe Ventura's geography. Figure 3-3 illustrates 19 distinct communities, some of which are composed of a group of neighborhoods, each boasting their own unique attractions and potential. The oldest settled area is nearest the ocean, with newer areas found eastward, with the exception of Saticoy. Some of Ventura's communities have neighborhood centers established around parks, community gathering places, or civic buildings, and contain or are near services they share with surrounding areas, such as schools, libraries, post offices, and specialty shopping.

Ventura also has residential subdivisions and commercial and industrial districts that could evolve into true neighborhoods. A long-term strategy should be developed to gradually transform these areas that do not yet follow the neighborhood pattern. Existing subdivisions could be linked by pedestrian routes to new small-scale retail and service centers. Congested commercial areas could be redesigned as mixed-use centers on a grid of streets with walkable blocks that connect with surrounding neighborhoods and central plazas. These streets could be lined with buildings containing upper level housing and lower level commercial, office, and civic spaces that hide internal parking structures. Industrial sites that are fast converting

to light industry, high tech manufacturing, and assembly could become factory villages with green space, multiple types of housing, small-scale retail to serve workers, and spin-off businesses.

Ventura's 19 communities (Figure 3-3) can each be enriched by using the *transect* (see discussion page 3-10) as a lens to understanding the ways in which it functions and by applying form-based development controls to respect and enhance its character to ensure that, where appropriate, each community provides one, if not more, walkable neighborhoods.

Figure 3-3
 Planning Communities

This map is a product of the City of San Buenaventura, California. Although reasonable efforts have been made to ensure the accuracy of this map, the City of San Buenaventura cannot guarantee its accuracy.

Taylor Ranch

This area is essentially undeveloped, with agriculture as the primary activity. Taylor Ranch is within the City's Planning Area, including a portion within the Coastal Zone Boundary.

Ventura River

This area includes the Ventura River Basin, is within the Coastal Zone Boundary, and with Emma Wood State Beach Park, its major activity is recreation offering day use and overnight camping. Opportunities exist for passive recreation and nature study.

Hillside Open Space

Within the City's Planning Area, is undeveloped, and designated Open Space. Plant communities include chaparral, riparian willow forest, and oak woodland. This area has tremendous potential for passive recreation including scenic trails with panoramic views. This area is coterminous with the Hillside Voter Participation Area or "HVPA" (see Chapter 1 and Appendix C).

North Avenue

Within the City's Planning Area. Historically, largely oilfield industrial. Includes both the Upper North Avenue and North Avenue districts, and is home to the Brooks Institute, which is world renown for its professional photographic and motion picture education. Opportunities exist to strengthen the economy of this area and provide for the expansion of the Brooks Institute into a campus-village including spin-off businesses with a mix of housing types and transit options for all ages.

Westside

Includes the Ventura Avenue corridor and is home to several neighborhood centers that are surrounded by well-connected neighborhood blocks. Opportunities exist to realize the potential of neighborhood improvements initiated in ongoing and past grassroots efforts, such as the Westside Revitalization Plan. This community includes "Hillside Areas" (see definition in Attachment A), which are subject to the Hillside Management Program that provides necessary development criteria in order to retain the natural qualities and minimize potential hazards.

Downtown

The area is regulated by the Downtown Specific Plan. This community is both an urban core with opportunity to grow economically stronger, and the historic center of the City. Civic uses include City Hall, Seaside Park, Grant Park, the Ventura County Museum, San Buenaventura Mission, and is home to a number of historic sites and landmarks. Additional opportunity to enhance the area's already strong cultural climate, including art, cookery, music, performance, and entertainment. Tremendous potential to create "around-the-clock activity" leading to increased vitality. This community includes "Hillside Areas".

Midtown

Includes the Main, Thompson, and Loma Vista corridors, a portion of the Telegraph corridor, as well as the Seaward/Alessandro neighborhood center. Home to the Pacific View Mall, the City's Bus Transfer Center, Ventura High School. Blanche Reynolds Park, Ocean Avenue Park,

and Memorial Park. Includes a small amount of agriculture. Opportunities exist to realize potential improvements initiated in ongoing and past grassroots efforts, such as Midtown by Design, and more recently the Midtown Urban Design Charrette. This community includes “Hillside Areas”.

Pierpont

Within the Coastal Zone Boundary, a unique-beach oriented predominantly residential community, with high-quality beachfront homes. Includes the Harbor district and the Pierpont neighborhood center. Home to the Ventura Harbor, Seaward Elementary School, a mobile home park, and Marina Park. Currently offers highway retail such as motels, hotels, and fast food, but opportunity exists to offer residents and visitors with more attractive and improved neighborhood and coastal oriented services and to develop a specific plan for the Harbor district.

College

Includes a portion of the Telegraph corridor, and the College/Day neighborhood center. Major civic uses are Arroyo Verde and Camino Real Park, Ventura Community College and Buena High School. This community includes “Hillside Areas”.

Thille

Includes the Gateway neighborhood center and shares the Victoria corridor with Montalvo to the east. Contains mix of housing types built mostly between 1960 and 1980, with some newer development in the 1990’s and early 2000’s. Its

primary civic use is the County Square Linear Park

Arundell

This community contains the main industrial and warehouse district of Ventura, but also has mixed-use areas with retail, restaurants, and offices within walking distance of many workers. Callens Road, the historic center of this community, has great potential to expand and increase the mix of uses it contains, including residential. A significant vacant parcel, the 75-acre McGrath property, offers great economic opportunity to attract new industry that provides high value, high wage jobs to the City.

Olivas

Predominantly agricultural. Its major civic use is the Olivas Park Golf Course and is home to the Olivas Adobe. Contains some commercial and industrial.

North Bank

This community contains a portion regulated by the Auto Center Specific Plan. Its major civic use the Buenaventura Golf Course. Predominantly industrial, with some agriculture. Opportunity to enhance the area as a regional retail destination, while providing workforce serving retail uses.

Poinsettia

Includes the Victoria Plaza neighborhood center. Its primary civic uses include elementary and middle schools. Predominantly residential, with some housing in the Hillside Area, and a significant amount of agricultural operations.

Montalvo

Includes the Johnson Drive corridor, Bristol neighborhood center, and shares the Victoria corridor with Thille to the west. Its major civic use is the County Government Center (equal size to 12 downtown blocks), but also the Rancho Ventura Linear Park and the Barranca Vista Park. Contains mix of housing types and is home to the Metrolink Station.

and a mix of housing types at various intensities. Its major civic uses are the Fritz Huntsinger Youth Sports Complex, Saticoy Regional Golf Course and the Saticoy neighborhood park.

Serra

Includes the Telephone/Petit neighborhood center, and is home to the City's newest civic use – the Community Park, set to open Fall 2005. Also includes the Chumash Park, Junipero Serra Park, North Bank Linear Park, and Bristol Bay Linear Park. Contains a significant amount of agricultural land.

Juanamaria

Includes the Kimball/Telegraph neighborhood center. Primary civic use is Hobert Park; this community contains some agricultural land.

Wells

Includes the Wells corridor. The Brown Barranca runs through the northerly portion of this area. Contains agricultural land.

Saticoy

Includes the Telephone/Cachuma and Saticoy neighborhood centers and the Saticoy district. Developed originally as a rural town in the late 1800s, Saticoy has the full range of transect characteristics: from the Santa Clara river and the rural eastern edge, to its neighborhood centers,

Planning Designations and Transect Zones

Land in the City's Planning Area is divided into eight basic Planning Designations on the General Plan Diagram (page 3-22). Each acknowledges a particular predominant development pattern that exhibits certain desirable characteristics, such as building types and functions that can be measured and described.

The wide range of building forms in Ventura offers great potential for compatible infill and viable mixed-use projects in existing neighborhoods, districts, corridors, and neighborhood centers. The wealth of building types includes attached and detached housing, duplexes, courtyard bungalows, second units (often over garages), lofts (some live-work), urban villas, neighborhood shopfronts, concentrated retail developments, and civic buildings. Public buildings retain special importance by serving as prominent landmarks that shape the visual character of the city.

Streetscapes set the tone for quality of life in Ventura by providing the shared outdoor living space of the community. Although the city's distinct neighborhoods, commercial and industrial districts, and agricultural areas are linked by corridors that have evolved primarily to accommodate motor vehicles, opportunities abound to make those streets more livable and to focus activities in neighborhood centers that emphasize walking, biking, and public gathering, and thereby ease traffic and reinforce community vitality. Accordingly, new development needs to

be high quality, compact, and walkable, and it should incorporate design diversity that increases lifestyle choices and bolsters commerce and industry.

Determining which building types are most appropriate in specific locations requires shifting away from conventional zoning that emphasizes use toward a form-based approach that prioritizes function, appearance, and compatibility with surrounding context. A powerful tool for understanding this context is the *Transect*, which depicts the continuum from rural to urban conditions (see Figure 3-4).

The transect is a tool that can be used by the community to understand and describe the full range of unique environmental and built characteristics within each of Ventura's neighborhoods. Using the six parenthetical transect zones to better understand the broad Planning Designations of the General Plan Diagram, a finer-grained (site specific) set of development standards can be created to ensure that new development is in keeping with local preferences for building.

This new Development Code will better accommodate the diversity of lifestyles Ventura desires – from the *rural* farm to the *sub-urban* house and yard to the *urban core* with apartments above shops – and will contribute to the identity and character desired by the community. Common elements that the transect will help measure and describe, and that the Development Code will prescribe, include the types and

arrangements of buildings, their “intensity” of lot coverage, height and mass, the details of streets, public and private frontages and the requirements for and character of open spaces. In general it will prescribe individual neighborhood preferences for urban design and building characteristics, including standards.

In many cases, area specific codes, applying the Planning Designations including districts, corridors, and neighborhood centers, will be developed as part of community or specific plans that establish a detailed strategy for public and private investment and policies to promote the appropriate preservation and development of community desired character.

The following descriptions of the Planning Designations include a parenthetical reference to the transect zones they encompass that will be used as guidance in interpreting the planning designations while drafting detailed plans and codes:

"A **transect** is a geographical cross-section of a region used to reveal a sequence of environments. For human environments, this cross-section can be used to identify a set of habitats that vary by their level and intensity of urban character, a continuum that ranges from rural to urban. In transect planning, this range of environments is the basis for organizing the components of the built world: building, lot, land use, street, and all of the other physical elements of the human habitat."
 --SmartCode, Volume 6.5, 2005

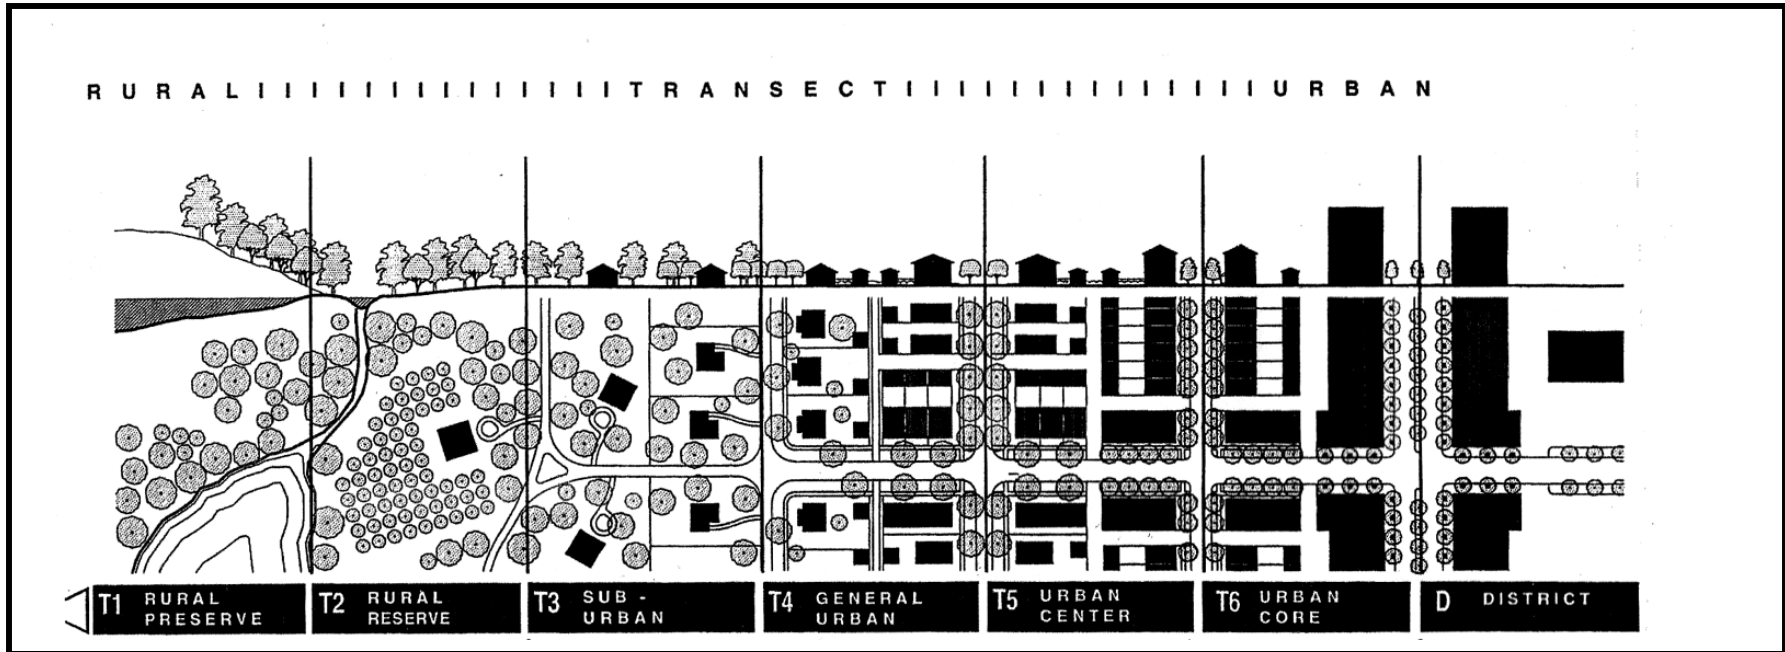

"All architecture should be beautiful. All towns should be beautiful. Beauty nurtures the soul and the spirit. It makes life worth living."
 -Camillo Sitte

- **Neighborhood Low – (T3 Sub-Urban and T4 General Urban)**
 emphasizes detached houses with some attached units in a small mix of building types from 0 up to 8 dwelling units per acre. Predominantly residential, with opportunity for limited home occupation and neighborhood services sensitively located along corridors and at intersections.
- **Neighborhood Medium – (T3 Sub-Urban, T4 General Urban and T5 Urban Center)**
 anticipates a mixture of detached and attached dwellings and higher building types at approximately 9 to 20 dwelling units per acre. Predominantly residential with small scale commercial at key locations, primarily at intersections and adjacent to corridors.
- **Neighborhood High – (T3 Sub-Urban through T6 Urban Core)**
 accommodates a broader mix of building types, primarily attached, from 21 to 54 dwelling units per acre; A mix of residential, commercial, office, and entertainment that includes mixed-use buildings.
- **Commerce – (T4 General Urban through T6 Urban Core, neighborhood center downtown, regional center, town center or village center)**
 encourages a wide range of building types of anywhere from two to six stories (depending on neighborhood characteristics) that house a mix of functions, including commercial, entertainment, office and housing.
- **Industry – (T2 Rural through T6 Urban Core)**
 encourages intensive manufacturing,

processing, warehousing and similar uses, as well as light, clean industries and support offices; also encourages workplace-serving retail functions and work-live residences where such secondary functions would complement and be compatible with industrial uses. Primarily large-scale buildings. Also can be developed as Transit Oriented Development, employment center or working village with a mix of uses.

- **Public and Institutional – (T1 Preserve through T6 Urban Core)**
 accommodates civic functions such as government offices, hospitals, libraries, schools and public green space.
- **Agriculture – (T2 Rural)**
 predominantly commercial cultivation of food and plants and raising of animals.
Pursuant to SOAR: The Agricultural use (not to be considered until after the Year 2030) category identifies those lands that are designated for agricultural use on the General Plan Diagram. The target date of 2030 associated with the Agricultural Use designation indicates a review date after which agriculturally designated lands may be reconsidered for urban uses. However, during the life of this Plan as amended by initiative, it is intended that only agricultural uses are permitted on these lands, except as such lands may be appropriate to public open space and recreational usage. Furthermore, any updates to this Plan are not intended to imply that development would necessarily be appropriate at that time.
- **Parks and Open Space – (T1 Preserve through T6 Urban Core)**
 designate lands to public recreation and leisure and visual resources, and can range from neighborhood tot lots and pocket parks to urban squares and plazas and playgrounds to large regional parks and natural preserves.

Figure 3-4. The Transect

Transect: a system of ordering human habitats in a range from the most natural to the most urban. For convenience, the Transect is divided into six zones which describe the physical character of place at any scale, according to the intensity of land use and urbanism. The T-Zones are T1 Natural, T2 Rural, T3 Sub-Urban, T4 General Urban, T5 Urban Center, and T6 Urban Core.

Natural Zone (T1): consists of lands approximating or reverting to a wilderness condition, includes lands unsuitable for settlement due to topography, hydrology, or vegetation.

Rural Zone (T2): consists of lands in open or cultivated state or sparsely settled. These may include woodlands, agricultural lands, grasslands and irrigable deserts.

Sub-Urban Zone (T3): though similar in density to conventional suburban residential areas, differs by its superior connectivity and by allowing home occupations. It is typically adjacent to other urban T-zones. This zone is naturalistic in its planting. Blocks may be large and the roads irregular to accommodate site conditions.

General Urban (T4): has a denser and primary residential urban fabric. Mixed-use is usually confined to certain corner locations. This zone has a wide range of building types: singles, side yard and rowhouses. Setbacks and street tree settings are variable.

Urban Center (T5): is the equivalent of the main street area. This zone includes mixed-use building types that accommodate retail, offices and dwellings, including rowhouses and apartments. This zone is a tight network of streets and blocks with wide sidewalks, steady street tree planting and buildings set close to the frontages.

Urban Core (T6): is the equivalent of a downtown. It contains the densest urbanism – the tallest buildings and the greatest variety of uses, particularly unique ones such as financial districts and important civic buildings. This zone is the least naturalistic of all the zones; street trees are formally arranged or non-existent.

Source: Duany, Plater Zyberk & Company's SmartCode, Volume 6.5, Spring 2005

The General Plan Diagram (page 3-22) also depicts the Downtown, Auto Center, and Saticoy Village Specific Plan areas, which are subject to detailed standards for form and use. In addition, the Diagram identifies Districts, Corridors, and Neighborhood Centers – where the development of housing alongside commercial uses is specifically encouraged. These Districts, Corridors, and Neighborhood Centers make up the growth priority areas as the City’s “Infill First” strategy (See Figure 3-1 Infill Areas).

Districts, Corridors, and Neighborhood Centers

One of the primary objectives for infill in Ventura is to produce mixed-use development that places most people’s daily needs within walking distance of their dwellings. This may include encouraging “flex space” where a single building functions as both living and working area for the owner, combining housing and commercial uses in the same structures, or sensitively integrating small-scale retail, service, and entertainment within convenient distance of residential areas. Mixed-use places inherently reduce automobile trips and improve the pedestrian experience, resulting in safer neighborhoods, healthier citizens, and better access to everyday needs. The City’s corridors and districts already encompass significant mixed-use development. Opportunities exist to augment those areas in ways that complement and enhance existing urban form and streetscapes to better serve Ventura’s residents.

Districts

Districts consist of streets or areas emphasizing specific types of activities and exhibiting distinct characteristics. A neighborhood or parts of neighborhoods can form a district. A thoroughfare may also be a district, such as when a major shopping avenue runs between adjoining neighborhoods. The following nine districts are depicted on the General Plan Diagram:

1. Upper North Avenue – home to a mix of industrial uses, including an abandoned oil refinery and Brooks Institute. Tremendous opportunities exist for the remediation and reuse of the former USA Petroleum site, as well as for the expansion of the Brooks Institute as a campus village, surrounded by a green edge to define the upper limits of Ventura.
2. North Avenue – an area with oilfield, industrial, and residential development, which has potential to fully develop into a more balanced mix of building types and uses with unique character, to serve as a major neighborhood anchor for northwest Ventura.
3. Downtown – the most intensely developed area of the city and its urban core. The Downtown Specific Plan regulates this area. Proposed initiatives include well-defined design standards via the Downtown Specific Plan update; enhanced efforts to market the Downtown Cultural District; formation of a

downtown management entity; and attracting uses that create “around-the-clock” activity.

4. Pacific View Mall – an enclosed shopping center and adjacent commercial uses. Large expanses of surface parking paired with significant building mass offer opportunity for the reintroduction of the block pattern and a reinvention of single-use retail into a much more sustainable mix of high intensity uses.
5. Harbor – an area with visitor serving uses, marine facilities, boating and commercial and recreational fishing activities, as well mixed-use places. A specific plan (based on the draft Harbor Master Plan) is being prepared for the Harbor District that will ensure a mix of uses, including residential, and highly defined public frontages and shared civic space for increased accessibility to ocean-front amenities.
6. Arundell – is currently an industrial center with a mix of small-scale industrial uses, business park development, and limited retail services. The McGrath Property – is a 76-acre site of undeveloped land that could provide the catalyst for Ventura’s redefinition of 21st Century light industry, manufacturing, research and development, and technological innovation. It is centrally located in the Arundell area, which is ripe for redevelopment into a new form of community plan and building that incorporates large-scale employment, workforce housing and neighborhood commercial in an economically diverse setting.
7. North Bank – a combination of automobile retail, regulated by the Auto Center Specific Plan, and industrial/business park uses. Auto Center – efforts over the short term will focus on making the area a regional retail destination. The City will strengthen its partnership with Auto Center dealers to realize beautification projects and facilitate land use entitlements for additional dealerships, as well as nurture creative partnerships to discover potential for unique attractions of regional interest.
8. Montalvo – an area of industrial and heavier commercial uses, and currently home to the Metrolink Station. Because of the strategic location of this area between east and west Ventura and its transportation-rich infrastructure, it needs a strong plan for connectivity and a strategic mix of uses for evolution that is economically sustainable.
9. Saticoy – a mix of homes, older industrial and agricultural operations, and the planned site for the County maintenance yard. The Saticoy Village Specific Plan governs a small portion of this area. A larger effort should ensure Saticoy’s seamless connection with adjacent areas, including a greenspace and circulation plan.

Corridors

Corridors, which can be natural or urban, often form boundaries, as well as connections, between neighborhoods and/or districts. Natural corridors can be those such as streams, barrancas, canyons, or green parkways. Urban corridors can be transportation thoroughfares that frequently encompass major access routes, especially ones with commercial destinations, including transit routes and rail lines. The following eight urban corridors are depicted on the General Plan Diagram. Each has the potential to evolve into a vibrant mixed-use City street with a distinct character borrowed from the neighborhoods that share it:

- A. Ventura Avenue – a mix of older, small-scale commercial, industrial, and residential uses, with potential to grow even more vibrant by building on existing strengths, including its historic role as a major “working center.” Using the warehouse model and diversity of building materials as a cue, “The Avenue” could harness cultural expression and become an eclectic center for the emerging arts and manufacturing crafts.
- B. Main Street – currently a commerce-oriented area with a limited amount of mixed use development, this corridor displays the broadest range of architectural types and styles in the city, as well as the widest spectrum of transect characteristics. It has the most potential for increased mixed use and housing with improved streetscape and pedestrian enhancement to slow traffic.
- C. Thompson Boulevard – a commercial thoroughfare in need of streetscape improvements and pedestrian amenities, this corridor is much like Main Street in that it boasts tremendous history as a “gateway to Ventura” and epitomizes a beach town character. It is a natural for a major transit or streetcar corridor, where nodes of mixed-use development and pedestrian and bike enhancement could support parallel neighborhoods and increase access to the ocean.
- D. Loma Vista Road – a mix of commercial and residential development at varying scales, with a high concentration of medical facilities, this is the ideal place for Ventura to focus on creating a concentration of medical and research-centered business, with a high intensity of workforce housing and services housed in large-scale mixed-use buildings of high-tech character and serviced by increased transit.
- E. Telegraph Road – a sub-urban-scale commercial area with some detached homes and multifamily buildings. The City’s bus transfer station is located along this corridor, creating the perfect opportunity for a multi-modal connection with an intense node of housing and employment. The streetscape could change character along its length, with a mixture of intensities of development.
- F. Victoria Avenue – currently a wide artery with high traffic volumes and shopping centers, Victoria needs effective traffic management

and pedestrian and streetscape improvements with strong attention to additional mobility options. Actions in this General Plan, along with the new Development Code, will call for revitalizing this corridor by redesigning the current array of single-use shopping centers and retail parcels with a mix of building types, uses, and public and private frontages. By eliminating "big box", mega-block, auto-oriented strip development, and the traffic patterns it generates, Victoria Avenue could create tremendous opportunity for healthy economic investment in walkable blocks, connected to better serve surrounding neighborhoods. Creative solutions, including dedicating transit or streetcar lanes, wider sidewalks, and bike lanes could transform Victoria's image into a regional thoroughfare of great and sophisticated diversity. All new commercial development within the Victoria Avenue corridor must follow this approach.

- G. Johnson Drive – a connector between eastern Ventura and Highway 101 with sub-urban scale retail. Opportunities exist for high-quality, mixed-uses (such as child-care, restaurants, offices, light industrial, and housing) with ground floor commercial space to strengthen its economic presence and provide a visual gateway.
- H. Wells Road – a mix of older industrial uses and newer sub-urban commercial and residential development. Well's Road should be returned to the neighborhoods it serves, so that new development can

emulate the country charm that existed prior to its widening. Traffic calming in appropriate locations would encourage neighborhood connectivity, and end the current trend toward walls and buildings that turn their back to the street. This would also encourage redevelopment of the old neighborhood centers.

Neighborhood Centers

Community evolves from individual conversations and the best places to grow community are in individual neighborhoods. Every neighborhood should have at least one center where people can meet by chance at a local coffee shop, market, bookstore, diner, or even hardware store. *Our Involved Community* needs places to gather to have meaningful conversations and share civic information. Ventura's existing neighborhood centers have the opportunity to become such places. The General Plan Diagram identifies 10 neighborhood centers – where the development of housing alongside commercial uses is specifically encouraged. These centers include:

- (1) Pierpont, (2) Seaward/Alessandro, (3) College/Day, (4) Gateway Plaza, (5) Victoria Plaza, (6) Bristol, (7) Kimball/Telegraph, (8) Petit/Telephone, (9) Telephone/Cachuma, and (10) Saticoy.

Note: Areas prone to flooding are shown on Figure 7-1 in Chapter 7.

Figure 3-5

GENERAL PLAN DIAGRAM

This map is a product of the City of San Buenaventura, California. Although reasonable efforts have been made to ensure the accuracy of this map, the City of San Buenaventura cannot guarantee its accuracy.

Special Topics

Agricultural Lands

During the 20th Century, the value of agricultural land in Ventura became secondary to that for development. However, this pattern is not irreversible, and protecting green land to save the aesthetic beauty of open space, preserve the cultural landscape of the community’s heritage, and conserve land for environmental quality are high priorities in Ventura. In fact, the land’s historic role for food production may soon be more highly valued once again, as prime agricultural areas continue to disappear to development at an astounding rate.

Ventura is fortunate to retain much of its rural landscape. Agriculture still plays an important role in the economy of the City and County of Ventura. Significant yields are made possible by the presence of high quality soils, adequate water supply, favorable climate, long growing season, and level topography. Mechanisms such as the California Land Conservation Act (more popularly known as the Williamson Act), the Save Our Agricultural Resources (SOAR) initiative (see Appendix B), and greenbelt agreements with neighboring jurisdictions continue to help maintain a balance between urban growth and agricultural preservation. The SOAR initiative that was adopted by the voters in 1995, and that, by its own terms, remains in full legal effect until 2030, refers to specific policies from the 1989 Comprehensive Plan that are still in effect and, as such, have been carried forward into this Plan under Policy 3D and Action 3.20 in addition to

being incorporated in this General Plan as set forth in Appendix B.

A primary agricultural concern is the potential conflict with adjacent urban uses over pesticides, dust, odors, noise, and the visual impact of large greenhouses. Other issues of importance to agricultural producers include restrictions on farm-related activities, access to water, and provision of farmworker housing. Paralleling these concerns is a community interest in sustainability, the ability to provide for the needs of future generations. The policies and actions in this chapter intend to sustain viable farm operations in areas designated for agricultural use.

Growth Management

Growth management seeks to preserve public good, improve social equity, and minimize adverse impacts of development while still accommodating new housing and business attraction. The effects of growth management policies on housing prices are complex due to the idiosyncrasies of local real estate markets. Properly designed, growth management programs can plan for all development needs, such as open space, access to public transportation, and walkable neighborhoods.

The City’s Residential Growth Management Program (originally established in 1979 to ensure that housing development would not outpace needed infrastructure) has not always contributed to housing affordability or quality design. This General Plan calls for revising the Residential

Subsequent to the adoption of the **SOAR** initiative, there have been two general plan amendments, which redesignated individual agricultural properties through a vote of the electorate as required by SOAR. These remain in full legal effect and have been carried forward into this Plan. These include the new Community Park at Kimball Road and the southeast corner of Montgomery and Bristol (see Appendix E and F).

Growth Management Program with an integrated set of growth management tools. Such tools not only include the adoption of a new form-based Development Code, but also community or specific plans based on availability of infrastructure and resources.

Long Term Potential Expansion Strategy

Indeed, the community has indicated that before the City expands any further, the first priority for achieving planning goals should be in the vacant and underutilized areas of the City. Yet, even the most successful effort to achieve community planning goals through infill may need to be supplemented at some point by expanding into areas outside the city limits. Such expansion may not only be necessary to fulfill development objectives; it also may be needed to provide open space, parklands, and natural areas to be preserved and restored. To address this, citizens discussed during the preparation of this General Plan which areas, if any, should be possible expansion areas. These areas were identified because they embody opportunities for achieving a variety of community vision objectives that may not be feasible within existing city limits. The community further went on to agree upon a set of rules about how these areas should be planned. These areas were analyzed in the environmental impact report prepared for this General Plan, and a “long term potential expansion strategy” will be formulated to guide the process of prioritizing any potential future expansion areas to fulfill General Plan objectives that may not be able to be achieved by our “Infill First” approach. Should

any areas be selected for future planning, a specific plan, a public vote (if required pursuant to SOAR), and an amendment with the regulatory planning framework would have to occur.

The policies and actions in this chapter call for measured and appropriate growth in Ventura by prioritizing areas appropriate for additional development based on community values and infrastructure potential.

Policy 3A: Sustain and complement cherished community characteristics.

Action 3.1: Preserve the stock of existing homes by carrying out Housing Element programs. 

Action 3.2: Enhance the appearance of districts, corridors, and gateways (including views from highways) through controls on building placement, design elements, and signage. 

Action 3.3: Require preservation of public view sheds and solar access. 

Action: 3.4 Require all shoreline development (including anti-erosion or other protective structures) to provide public access to and along the coast, unless it would duplicate adequate access existing nearby, adversely affect agriculture, or be inconsistent with public safety, military security, or protection of fragile coastal resources. 

Action 3.5: Establish land development incentives to upgrade the appearance of poorly maintained or otherwise unattractive sites, and enforce existing land maintenance regulations. 

Action 3.6: Expand and maintain the City's urban forest and thoroughfare landscaping, using native species, in accordance with the City's Park and Development Guidelines and Irrigation and Landscape Guidelines. 

Action 3.7: Evaluate whether lot coverage standards should be changed based on neighborhood characteristics.

Policy 3B: Integrate uses in building forms that increase choice and encourage community vitality.

Action 3.8: Adopt new development code provisions that designate neighborhood centers, as depicted on the General Plan Diagram, for a mixture of residences and small-scale, local-serving businesses. 

Action 3.9: Adopt new development code provisions that designate areas within districts and corridors for mixed-use development that combines businesses with housing, and focuses on the redesign of single-use shopping centers and retils parcels into walkable, well connected blocks, with a mix of building types, uses, and public and private frontages. 

Action 3.10: Allow intensification of commercial areas through conversion of surface parking to building area under a district-wide parking management strategy in the Downtown Specific Plan. 

Action 3.11: Expand the downtown redevelopment area to include parcels around future transit areas and along freeway frontage. 

Action 3.12: The City will work with the hospitals on the new Development Code treatment for the Loma Vista corridor, which includes both hospitals.

Action 3.13: Assess whether the City's Affordable Housing Programs respond to current needs, and modify them as necessary within State mandated Housing Element updates.

Specific Plan Requirements

Specific Plans must include a statement of its relationship to the General Plan and specify all of the following:

1. distribution, location, and extent of uses
2. distribution, location, extent, and intensity of public and private transportation, sewage, water, drainage, solid waste disposal, energy
3. standards and criteria by which development will proceed and standards for conservation, development, and utilization of natural resources
4. program of implementation measures, including regulations, programs, public works projects, and financing
5. any other subjects that are necessary

(§65450-65452)

Policy 3C: Maximize use of land in the city before considering expansion.

Action 3.14: Utilize infill, to the extent possible, development to accommodate the targeted number and type of housing units described in the Housing Element.

Action 3.15: Adopt new development code provisions that ensure compliance with Housing Element objectives.

Action 3.16: Renew and modify greenbelt agreements as necessary to direct development to already urbanized areas. 

Action 3.17: Continue to support the Guidelines for Orderly Development as a means of implementing the General Plan, and encourage adherence to these Guidelines by all the cities, the County of Ventura, and the Local Agency Formation Commission (LAFCO); and work with other nearby cities and agencies to avoid urban sprawl and preserve the rural character in areas outside the urban edge. 

Action 3.18: Complete community or specific plans, subject to funding, for areas such as Westside, Midtown, Downtown, Wells, Saticoy, Pierpont, Harbor, Loma Vista/Medical District, Victoria Corridor, and others as appropriate. These plans will set clear development standards for public and private investments, foster neighborhood partnerships, and be updated as needed. 

Action 3.19: Preparation of the new Development Code will take into account existing or proposed

community or specific plans to ensure efficient use of City resources and ample citizen input. 

Policy 3D: Continue to preserve agricultural and other open space lands within the City's Planning Area.

Action 3.20: Pursuant to SOAR, adopt development code provisions to "preserve agricultural and open space lands as a desirable means of shaping the City's internal and external form and size, and of serving the needs of the residents.

Action 3.21: Adopt performance standards for non-farm activities in agricultural areas that protect and support farm operations, including requiring non-farm uses to provide all appropriate buffers as determined by the Agriculture Commissioner's Office. 

Action 3.22: Offer incentives for agricultural production operations to develop systems of raw product and product processing locally. 

Policy 3E: Ensure the appropriateness of urban form through modified development review.

Action 3.23: Develop and adopt a form-based Development Code that emphasizes pedestrian orientation, integration of land uses, treatment of streetscapes as community living space, and environmentally sensitive building design and operation. 

Action 3.24: Revise the Residential Growth Management Program (RGMP) with an integrated set of growth management tools including:

- community or specific plans and development codes based on availability of infrastructure and transit that regulate community form and character by directing new residential development to appropriate locations and in ways that integrate with and enhance existing neighborhoods, districts and corridors;
- appropriate mechanisms to ensure that new residential development produces high-quality designs and a range of housing types across all income levels; and,
- numeric limitations linked to the implementation of community or specific plans and development codes and the availability of appropriate infrastructure and resources; within those limitations, the RGMP should provide greater flexibility for timing new residential development.

Action 3.25: Establish first priority growth areas to include the districts, corridors, and neighborhood centers as identified on the General Plan Diagram; and second priority areas to include vacant undeveloped land when a community plan has been prepared for such (within the City limits). 

Action 3.26: Establish and administer a system for the gradual growth of the City through identification of areas set aside for long-term preservation, for controlled growth, and for encouraged growth. 

Action 3.27: Require the use of techniques such as digital simulation and modeling to assist in project review.

Action 3.28: Revise the planning processes to be more user-friendly to both applicants and neighborhood residents in order to implement City policies more efficiently.

Policies and actions related to the preservation of **historic architecture and resources** are contained in Chapter 9.

2000-2006 HOUSING ELEMENT GOALS AND POLICIES, City Council Adopted Resolution 2004-014. Adopted April 12, 2004

Goal 1

Maintain and improve the quality of existing housing and residential neighborhoods in Ventura.

Policy 1.1 Encourage citizen involvement in addressing the maintenance and improvement of the housing stock and neighborhood quality.

Policy 1.2 Continue to preserve and maintain the City’s historical and architecturally significant buildings and neighborhoods.

Policy 1.3 Encourage homeowners and landlords to maintain properties in sound condition through the City’s residential rehabilitation assistance programs and code enforcement efforts.

Policy 1.4 Cooperate with housing providers in the acquisition, rehabilitation, and maintenance of older residential properties as long-term affordable housing.

Policy 1.5 Permit the conversion of apartments to condominiums only when such conversion would not

adversely affect the overall supply and availability of rental units, particularly units occupied by lower- and moderate-income households.

Policy 1.6 Continue to support the provision of rental assistance to lower-income households, and encourage property owners to list units with the Housing Authority.

Policy 1.7 Continue to preserve the affordability of mobile homes through the Rent Stabilization Ordinance. Support the acquisition and ownership of mobile home parks by non-profit housing providers and resident organizations.

Policy 1.8 Preserve the existing stock of affordable housing, including mobilehomes, through City regulations, as well as financial and other forms of assistance.

Goal 2

Facilitate the provision of a range of housing types to meet the diverse needs of the community.

Policy 2.1 Provide high quality housing for current and future residents with a diverse range of income levels.

- | | | | |
|-------------------|--|--------------------|--|
| Policy 2.2 | <p>Promote housing that is developed under modern sustainable community standards.</p> <p>Provide expanded housing opportunities for the City's workforce. Promote the City's affordable housing programs with employers in Ventura.</p> | Policy 2.6 | <p>Support a variety of housing types to address the needs of agricultural workers, including affordable rentals, mobilehome parks, single room occupancy hotels (SROs), and group housing for migrant laborers.</p> |
| Policy 2.3 | <p>Continue to offer and promote homeownership assistance programs to lower- and moderate-income households to purchase both new and existing housing. Pursue participation in other homeownership programs available in the private market.</p> | Policy 2.7 | <p>Facilitate the provision of housing to address Ventura's growing senior population, including senior housing with supportive services, assisted living facilities, and second units.</p> |
| Policy 2.4 | <p>Continue to provide financial and regulatory incentives to non-profits, private housing developers, and public agencies for the construction of the types of housing required to meet identified needs.</p> | Policy 2.8 | <p>Encourage the provision of housing adaptable to the physically disabled through integration of universal design features in new development, and compliance with Title 24 of the California Health and Safety Code.</p> |
| Policy 2.5 | <p>Support the provision of quality rental housing with three or more bedrooms to accommodate large families, and encourage room additions in the existing housing stock to address household overcrowding.</p> | Policy 2.9 | <p>Encourage the provision of supportive housing for persons with mental illness to address the severe shortage of housing for this special needs population.</p> |
| | | Policy 2.10 | <p>Support efforts by non-profits to expand transitional and emergency housing in Ventura, including support of grant applications and assistance in identification of suitable sites.</p> |

Policy 2.11 Evaluate adoption of an inclusionary housing ordinance as a means of integrating affordable units within new residential development: 1) Require affordable units to be provided on or off-site, with allowance for payment of an in-lieu fee at the discretion of the City; 2) Evaluate the financial impact of inclusionary requirements on development, and assess incentive-based alternative strategies for provision of affordable housing.

Policy 2.12 Facilitate the provision of second units as a means of providing affordable rental housing in existing neighborhoods. Ensure compatibility with the primary unit and surrounding neighborhood.

Policy 2.13 Encourage the production of housing that meets the needs of all economic segments, including lower, moderate, and above moderate-income households, to achieve a balanced community.

Policy 2.14 Promote and facilitate non-traditional housing types and options, including co-housing, assisted living facilities, live-work spaces, and artist lofts.

Policy 2.15 Direct City-controlled housing funds towards programs that address the needs of very low- and low-income households.

Policy 2.16 Prioritize affordable housing opportunities and assistance for public service employees.

Policy 2.17 Annually monitor the City's progress in meeting its housing needs for all income levels.

Goal 3

Provide adequate housing sites through appropriate land use and zoning designations to accommodate the City's share of the regional housing needs.

Policy 3.1 Maintain an up-to-date inventory of vacant and underutilized parcels and provide to interested developers in conjunction with information on available development incentives. Within redevelopment project areas, provide assistance in land assembly in support of affordable housing.

Policy 3.2 Implement smart growth principles by rewarding quality infill projects that utilize existing infrastructure.

Policy 3.3 Encourage efficient utilization of the City’s limited land resources by encouraging development at the upper end of the permitted Zoning Code/Comprehensive Plan density.

Policy 3.4 Utilize the Urban Infill Overlay Zone and Downtown Specific Plan as a tool to facilitate higher density residential and mixed-use development.

Policy 3.5 Explore residential reuse opportunities on obsolete commercial properties, such as older motels and underutilized historic structures.

Policy 3.6 Pursue use of publicly owned land, such as public parking lots, for development of affordable housing.

Policy 3.7 Identify opportunities for housing development that achieves other community goals such as neighborhood improvement, recreation opportunities, and the preservation of sensitive lands and neighborhood character.

Policy 3.8 Facilitate the development of mixed-use projects in appropriate commercial areas, including stand-alone residential developments

(horizontal mixed-use) and housing above ground floor commercial uses (vertical mixed-use).

Policy 3.9 Promote higher density housing as part of mixed-use developments along parts of Thompson Boulevard and Main Street in Midtown Ventura, as well as other areas such as Westside, Downtown and East Ventura.

Policy 3.10 Promote mixed-use developments on the Westside of Ventura.

Policy 3.11 Ensure that the updated Land Use Element designates adequate sites for housing for executives to enhance the City’s ability to attract businesses with higher paying jobs.

Goal 4

Mitigate or remove any potential governmental constraints to housing production and affordability.

Policy 4.1 Provide regulatory and/or financial incentives, where appropriate, to offset or reduce the costs of affordable housing development, including density bonuses and flexibility in site development standards.

Policy 4.2 Utilize the Affordable Housing Program to provide incentives for production of affordable units, including streamlined permit processing, reduced fees and exemption from the required competition for RGMP allocations.

Policy 4.3 Amend the City's Residential Growth Management Plan (RGMP) to better facilitate housing production, while discouraging sprawl and maintaining quality of life goals.

Policy 4.4 Undertake a comprehensive review of the City's residential development project review procedures and establish modified procedures as appropriate to streamline processing times, while maintaining adequate levels of public review.

Policy 4.5 Provide flexibility in development standards to accommodate new models and approaches to providing affordable housing, such as co-housing, live/work units and assisted living facilities.

Goal 5

Promote equal opportunity for all residents to reside in the housing of their choice.

Policy 5.1 Continue to enforce fair housing laws prohibiting arbitrary discrimination in the building, financing, selling or renting of housing on the basis of race, religion, family status, national origin, physical or mental disability, or other such factors.

Policy 5.2 Continue to support organizations that offer fair housing and mediation services to Ventura residents.

Policy 5.3 Promote housing that meets the special needs of large families, elderly persons, agricultural workers, and the disabled.

Policy 5.4 Continue to enforce notification and provide relocation assistance for lower-income persons displaced due to demolition, reuse, condominium conversion, or rehabilitation as a result of code enforcement.

"Restore human legs as a means of travel.
Pedestrians rely on food for fuel and need no
special parking facilities."

— Lewis Mumford
Author of *The City in History*, 1961

4. OUR ACCESSIBLE COMMUNITY

Our goal is to provide residents with more transportation choices by strengthening and balancing bicycle, pedestrian and transit opportunities in the City and surrounding region.

An Integrated Mobility System

Central to the well-being of Ventura's citizens and visitors is *mobility*, the ability to get from one place to another. Mobility depends on the range, efficiency, and connectivity of the various components that comprise the transportation network – sidewalks, bicycle routes, and thoroughfares, as well as transit services – and that enable people to access the things they need, from the most basic to the extraordinary (See Figures 4-1 Bicycle Facilities, 4-2 Bus and Rail Routes, and 4-3 Roadway Classification Plan). Ventura is a community that recognizes that thoroughfares serve a variety of functions and are not simply conduits for automobile traffic.

Balancing automobile use with other means of travel is essential to maintaining social and physical health. Safe and enjoyable routes for pedestrians and bicyclists should connect every part of the city, and neighborhoods need to be linked by ample and convenient transit service along corridors. Ventura also must be connected to the larger region by a variety of transportation modes.

Thoroughfares have a tremendous effect on neighborhood character and therefore quality of life for both residents and visitors.

Thoroughfares are essentially the stage of public life where a diversity of citizens interact. They can create places of remembrance, chance encounters, and discovery. Ensuring that Ventura thoroughfares are *great places* requires improving design and quality as well as connectivity. In some cases, city thoroughfares are over-engineered to accommodate the worst-case scenario.

Slowing down automobiles, especially in residential neighborhoods, is a desire shared by many residents. Vehicle travel should be directed toward routes that minimize congestion, avoid conflicts with walkers and bicyclists, and keep residential neighborhoods free of excessive cut-through traffic. Additionally, in some areas of the city, suburban patterns have resulted in less connectivity than is desired by the community. Transportation modes and land uses in the city need to be distributed so that residents have close and easy access to meet their basic needs and travel destinations.

Traffic congestion is a major concern among Ventura residents. Although traffic on local roads is generally free-flowing, a few key intersections and road segments experience congestion during peak traffic hours. Simply widening roads to add lanes will not solve traffic congestion. Instead, the system needs integrated solutions that improve mobility for all

The essential qualities of a properly functioning mobility system are:

1. Well connected, interesting components
2. Convenient accessibility
3. Integrated linkage of all modes
4. Comfort and safety
5. Design reflecting natural and urban context

means of travel. While walking, biking, and transit use are already popular, these alternative modes need to be enhanced and better linked. For example, bus and rail systems serve Ventura, but not thoroughly enough to provide a reasonable alternative to auto use for most travelers. And while pedestrian access exists in most areas of Ventura, the network lacks continuous routes in some key locations.

As expressed in the *Ventura Vision*, a top community priority is to minimize automobile use through a fully integrated multi-modal transportation system. The policies and actions in this chapter aim to achieve this objective.

Travel Modes

Walking

Sidewalks are arguably the most important component of the city's mobility system. As with circulation in general, the utility of pedestrian systems is inextricably linked to land use patterns. Combined with urban design elements, land use patterns influence how much walking can safely and effectively occur in the community. Circulation systems that are designed with pedestrians in mind tend to increase outdoor activity and community interaction, while those oriented toward motor vehicles tend to create disincentives to walking.

Ventura's pedestrian system consists of sidewalks, access ramps, crosswalks, linear park paths, and overpasses and tunnels. Special corridors such as the Beachfront Promenade, California Plaza, and Figueroa Plaza have been designated especially for pedestrians. The pedestrian system also includes neighborhood and park path systems, and dedicated trail facilities that are shared with bicyclists and other users.

Pedestrian paths need to be interesting, enjoyable, and lead to a destination, from the most simple – such as a pocket park – to more grand points of arrival, such as major civic spaces. Creating a network of paths that connect key features such as parks, schools, civic facilities, shops, and services is vital to the success of reducing dependence on the

automobile. Those most in need of pedestrian access include children, teenagers, and the elderly, as well as those who cannot afford a car or choose not to drive.

The main deficiency of Ventura's pedestrian system is its discontinuity. Some sections of thoroughfares lack sidewalks, and pedestrian connections between some key use areas are in need of repair. Crosswalks are prohibited along some corridors, and pedestrian signal phases are not always long enough for all walkers. Traffic-calming measures also are needed to improve walkability in many neighborhoods. Citizens have placed a high emphasis on improving the pedestrian network, recommending specific improvements such as:

- narrowing selected thoroughfare segments,
- improving sidewalks and road crossings,
- lengthening pedestrian signal phases,
- adding marked crossings at key intersections,
- developing safe and attractive walkways from Downtown and Midtown to the beach,
- ensuring that new development provides ample pedestrian access,
- creating trails along watercourses and through the hillsides, and
- improving pedestrian facilities near schools.

Figure 4-1 illustrates the three State defined classes of bikeway facilities:

- Bike Path (Class I) – Class I bike paths are separated from roads by distance or barriers, and cross-traffic by motor vehicles is minimized.
- Bike Lane (Class II) – Class II bikeways are roadway lanes reserved for bicycles. These lanes are painted with pavement lines and markings and are signed.
- Bike Route (Class III) – Class III bike routes share existing roads and provide continuity to other bikeways or designated preferred routes through high traffic areas. There are no separate lanes, and bike routes are established by placing signs that direct cyclists and warn drivers of the presence of bicyclists.

Policies and actions in this chapter intend to improve pedestrian access through this range of methods.

Biking

Because bicycles are an integral component of the city’s mobility system, they are allowed on *all* city thoroughfares. The City has adopted a General Bikeway Plan intended to create a safe, accessible, and interconnected network of bike paths, lanes, and routes that will ensure Ventura becomes and remains a truly bicycle-friendly community. The General Bikeway Plan is a flexible, comprehensive, and long-range guide for bicycle transportation and recreation planning, design, and budget decision-making. Accordingly, it is designed to:

- refine and implement City bicycle-related policies,
- establish bikeway design standards,
- enhance bicycle safety and education programs,
- set priorities and phasing for improvements and amenities depicted on the Select System of Bikeways map, and
- identify funding means and opportunities for interagency cooperation.

The City places high emphasis on improving the local bicycle network by following the recommendations of the General Bikeway Plan, which include:

- connecting schools, parks, activity areas, housing areas, and employment centers with bike paths and lanes, particularly in areas without thoroughfares,
- constructing additional Class I or Class II bikeways in a number of locations, including along the Santa Clara River and the coast to connect to the Ventura River Trail,
- installing bicycle racks,
- updating bicycle facility standards to ensure proper design and maintenance,
- constructing improvements to resolve bicycle/automobile conflicts,
- establishing a highly visible route identification and signage program that fits the character of the community, and
- mitigating impacts on bicyclists from new development and during and following construction of roadway projects.

Policies and actions in this chapter seek to improve bicycle access and safety by carrying out these recommendations.

Public Transit – Bus & Rail

Transit service in Ventura includes bus and rail operations (see Figure 4-2). South Coast Area Transit (SCAT) provides local bus service, Ventura Intercity Transit Authority (VISTA) runs regional routes, and Greyhound offers statewide and national connections. Metrolink provides rail service to and from Los Angeles – although on a very limited schedule, while Amtrak trains that stop in Ventura run between San Luis Obispo and San Diego.

Although local bus routes connect most activity centers, the East End is not well served, and more frequent service is needed to key destinations such as the beach and downtown. Metrolink and Amtrak need to be linked to each other and accessed by local bus routes. An agreement between the City and the Ventura County Transportation Commission calls for identifying a permanent Metrolink site, and the best way to integrate all of these services is with a major multi-modal transit center that also accommodates potential additional future alternative transportation modes.

SCAT buses are equipped with wheelchair lifts and adjustable steps to ensure access for all riders. SCAT also offers discounted fares for seniors and disabled riders, as well as dial-a-ride service. However, seniors and mobility-impaired persons also desire frequent fixed-route service in smaller vehicles, and all riders need upgraded amenities at a number of stops. Bus routes also need increased frequency and

stops to make transit a viable alternative to driving.

Other transit system needs include:

- reduced-emission vehicles,
- continued use of schedule synchronization to accommodate route transfers, and
- service to regional destinations such as California State University Channel Islands and airports.

Policies and actions in this Chapter aim to improve transit efficiency, encourage ridesharing, and preserve long-term transit options.

The Automobile and Types of Roadways

The most basic component of the mobility system is the *thoroughfare*, used not only by people who drive, but also by people who ride the bus, bike and walk. Thoroughfares encompass sidewalks, bicycle lanes, travel lanes, and are the most utilized means of travel in Ventura. This system is organized into the following classifications: local thoroughfares, collectors, and arterials (see Figure 4-3, Roadway Classification Plan – also known as “Circulation Plan”).

Local Thoroughfares

Local thoroughfares provide mobility within neighborhoods and are generally not shown on the Roadway Classification Plan. Local thoroughfares include *alleys*, *lanes*, and “*yield*” *streets*.

Collectors

Collectors serve as links between local thoroughfares. Collectors may front residential and neighborhood-serving commercial uses. Collectors can be configured as *boulevards*, *avenues*, *streets*, and *main streets*.

Arterials

Arterials are the primary mechanism for cross-town travel and serve the major centers of activity. These roads typically carry a high proportion of the total urban area travel. Arterials can be configured as *boulevards*, *avenues*, and *streets*.

Collector and arterial thoroughfare segments in the City are characterized in two ways that describe their physical features: *design* classification and *functional* classification. Design Classification defines the number of travel lanes using the following categories: Primary Arterial (6 lanes or more), Secondary Arterial (4 lanes), and Collector (2 lanes), as shown on the Roadway Classification Plan, Figure 4-3. Functional Classification describes how a thoroughfare is used: essentially as a *boulevard*, *avenue*, *street*, or *main street*.

Functional Classification also identifies whether roadways have medians, parking, bike lanes, and other streetscape attributes needed to achieve objectives other than just moving traffic, such as accommodating pedestrians, bicycles, and adjoining land uses and public spaces. Table 4-1 shows the design and functional classifications for thoroughfares in the City.

Ventura is mainly connected by 2-lane and 4-lane thoroughfares. The classification for each type of road segment represents a balance between vehicle capacity, pedestrian and bicycle access, parking requirements, streetscape character, and right-of-way limitations.

Boulevard

A multi-lane and generally urban corridor with a central, planted median.

Avenue

Avenues are typically multi-lane, short distance connectors, with a painted median, used in both residential and commercial areas, and often terminate at prominent buildings or plazas.

Table 4-1 Thoroughfare Sizes and Types

	Street Sizes (Engineering Design Classification)		
	Primary Arterial (6 or more lane roadway)	Secondary Arterial (4 lane roadway)	Collector (2 lane roadway)
Existing			
Future Widening			
Future Extension			
	Thoroughfare Types (Functional Classification)		
	Boulevard	Boulevard	Boulevard
	Avenue	Avenue	Avenue
		Street	Street
			Main Street

Source: Definitions for Design Classifications are the City's modifications to the American Association of State Highway and Transportation Officials (AASHTO) standards. Definitions for Functional Classifications are the City's modifications to the Traditional Neighborhood Development Street Design Guidelines.

Street

Street typically allows two way travel and may be multi-lane and does not have a central median and generally provides access to predominantly residential areas.

Main Street

Main streets have 2 vehicle lanes. Their main purpose is to provide low-speed access to commercial, mixed-uses, and higher density neighborhoods.

Consistency between the design and functional classifications is determined based on the number of through lanes. Temporary improvements, such as restriping to change the number of lanes are allowed, however a permanent improvement that moves the curbs and changes the number of lanes would require an amendment to this plan.

The *Ventura Vision* offers several key recommendations to improve the city thoroughfare system:

- add or enhance north-south arterials;
- consider an additional Santa Clara River bridge, Portola Avenue overcrossing of U.S. 101, and Johnson Drive overcrossing of Route 126; and
- soften the barrier impact of U.S. 101 by working with Caltrans to improve signage, aesthetics, undercrossings, and overcrossings.

Policies, actions, and the Roadway Classification Plan work together to address these recommendations. To improve the safety and functioning of the thoroughfare network and to maintain its compatibility with the character of the community, the policies and actions in this

chapter also call for upgrading problem thoroughfares and intersections, improving and constructing freeway ramps, and connecting unfinished roadways. Additional actions intend to protect views from scenic routes, including State-designated scenic highways.

Policy 4A: Ensure that the transportation system is safe and easily accessible to all travelers.

Action 4.1: Direct city transportation investment to efforts that improve user safety and keep the circulation system structurally sound and adequately maintained. First priority for capital funding will go to our pavement management program to return Ventura streets to excellent condition.

Action 4.2: Develop a prioritized list of projects needed to improve safety for all travel modes and provide needed connections and multiple route options.

Action 4.3: Provide transportation services that meet the special mobility needs of the community including youth, elderly, and disabled persons.

Action 4.4: Combine education with enforcement to instill safe and courteous use of the shared public roadway.

Action 4.5: Utilize existing roadways to meet mobility needs, and only consider additional travel lanes when other alternatives are not feasible. 

Action 4.6: Require new development to be designed with interconnected transportation modes and routes to complete a grid network.

Action 4.7: Update the traffic mitigation fee program to fund necessary citywide circulation system and mobility improvements needed in conjunction with new development. 

Action 4.8: Implement the City's Neighborhood Traffic Management Program and update as necessary to improve livability in residential areas.

Action 4.9: Identify, designate, and enforce truck routes to minimize the impact of truck traffic on residential neighborhoods. 

Action 4.10: Modify traffic signal timing to ensure safety and minimize delay for all users.

Action 4.11: Refine level of service standards to encourage use of alternative modes of transportation while meeting state and regional mandates.

Action 4.12: Design roadway improvements and facility modifications to minimize the potential for conflict between pedestrians, bicycles, and automobiles. 

Action 4.13: Require project proponents to analyze traffic impacts and provide adequate mitigation in the form of needed improvements, in-lieu fee, or a combination thereof. 

Policy 4B: Help reduce dependence on the automobile.

Action 4.14: Provide development incentives to encourage projects that reduce automobile trips. 

Action 4.15: Encourage the placement of facilities that house or serve elderly, disabled, or socioeconomically disadvantaged persons in areas with existing public transportation services and pedestrian and bicycle amenities.

Action 4.16: Install roadway, transit, and alternative transportation improvements along existing or planned multi-modal corridors, including primary bike and transit routes, and at land use intensity nodes. 

Action 4.17: Prepare and periodically update a Mobility Plan that integrates a variety of travel alternatives to minimize reliance on any single mode. 

Action 4.18: Promote the development and use of recreational trails as transportation routes to connect housing with services, entertainment, and employment. 

Action 4.19: Adopt new development code provisions that establish vehicle trip reduction requirements for all development. 

Action 4.20: Develop a transportation demand management program to shift travel behavior toward alternative modes and services.

Action 4.21: Require new development to provide pedestrian and bicycle access and

facilities as appropriate, including connected paths along the shoreline and watercourses. 

Action 4.22: Update the General Bikeway Plan as needed to encourage bicycle use as a viable transportation alternative to the automobile and include the bikeway plan as part of a new Mobility Plan. 

Action 4.23: Upgrade and add bicycle lanes when conducting roadway maintenance as feasible. 

Action 4.24: Require sidewalks wide enough to encourage walking that include ramps and other features needed to ensure access for mobility-impaired persons. 

Action 4.25: Adopt new development code provisions that require the construction of sidewalks in all future projects. 

Action 4.26: Establish a parking management program to protect the livability of residential neighborhoods, as needed.

Action 4.27: Extend stubbed-end streets through future developments, where appropriate, to provide necessary circulation within a developing area and for adequate internal circulation within and between neighborhoods. Require new developments in the North Avenue area, where applicable, to extend Norway Drive and Floral Drive to connect to Canada Larga Road; and connect the existing segments of Floral Drive. Designate

the extension of Cedar Street between Warner Street and south of Franklin Lane and the linking of the Cameron Street segments in the Westside community as high priority projects.

Policy 4C: Increase transit efficiency and options.

Action 4.28: Require all new development to provide for citywide improvements to transit stops that have sufficient quality and amenities, including shelters and benches, to encourage ridership. 

Action 4.29: Develop incentives to encourage City employees and local employers to use transit, rideshare, walk, or bike.

Action 4.30: Work with public transit agencies to provide information to riders at transit stops, libraries, lodging, and event facilities.

Action 4.31: Work with public and private transit providers to enhance public transit service.

Action 4.32: Coordinate with public transit systems for the provision of additional routes as demand and funding allow. 

Action 4.33: Work with Amtrak, Metrolink, and Union Pacific to maximize efficiency of passenger and freight rail service to the City and to integrate and coordinate passenger rail service with other transportation modes. 

Action 4.34: Lobby for additional transportation funding and changes to Federal, State, and regional transportation policy that support local decision-making.

Action 4.35: The City shall pursue funding and site location for a multi-modal transit facility in coordination with VCTC, SCAT, U.P.R.R., Metrolink, Greyhound Bus Lines, and other forms of transportation.

Policy 4D: Protect views along scenic routes.

Action 4.36: Require development along the following roadways – including noise mitigation, landscaping, and advertising – to respect and preserve views of the community and its natural context. 

- State Route 33
- U.S. HWY 101
- Anchors Way
- Brakey Road
- Fairgrounds Loop
- Ferro Drive
- Figueroa Street
- Harbor Boulevard
- Main Street
- Navigator Drive
- North Bank Drive
- Poli Street/Foothill Road
- Olivas Park Drive
- Schooner Drive
- Spinnaker Drive
- Summit Drive

- Telegraph Road – east of Victoria Avenue
- Victoria Avenue – south of U.S. 101
- Wells Road

Action 4.37: Request that State Route 126 and 33, and U.S. HWY 101 be designated as State Scenic Highways.

Action 4.38: Continue to work with Caltrans to soften the barrier impact of U.S. HWY 101 by improving signage, aesthetics and undercrossings and overcrossings. 

Action 4.39: Maintain street trees along scenic thoroughfares, and replace unhealthy or missing trees along arterials and collectors throughout the City. 

Note: Bike facilities shown on this figure are taken from the 1999 General Bikeway Plan and may change as updates to the General Bikeway Plan are completed.

Figure 4-3
Roadway Classification Plan

"Now, I truly believe, that we in this generation, must come to terms with nature, and I think we're challenged as mankind has never been challenged before to prove our maturity and our mastery, not of nature, but of ourselves."

— Rachel Carson
Biologist, Writer, Ecologist 1907-1964

5. OUR SUSTAINABLE INFRASTRUCTURE

Our goal is to safeguard public health, well-being and prosperity by providing and maintaining facilities that enable the community to live in balance with natural systems.

Essential Support Systems

Infrastructure is an extremely important though largely unnoticed foundation of quality of life in Ventura. Efficient water supply, wastewater treatment, and drainage systems are vital to most daily activities. These facilities on which the community depends need regular maintenance, and they frequently require upgrading both to meet the demands of a growing population and to be sensitive to environmental resources.

To ensure that citizens get high-quality drinking water, the City owns and operates a State-certified laboratory where water quality is tested continuously. Each City treatment plant is also run by State-certified operators who monitor water quality. As a result, City water exceeds State and federal water quality requirements.

The City employs conservation measures and emerging technology in its effort to achieve a high standard for wastewater treatment while protecting natural systems. As a result, treatment capability historically has outpaced community needs, with even peak flows typically reaching only 75 percent of plant capacity. Even so, further expanding the use of reclaimed water and

reducing water consumption will be vital to maintaining long-term water supplies.

Much of the storm drain system is aging and in need of repair or replacement, especially corrugated metal pipes in some of the older areas of Ventura. Collecting adequate fees that truly reflect the cost of serving development can help support City efforts to preclude additional deficiencies, and relying on and complementing natural drainage features can both help avoid the need for expensive and environmentally damaging channelization and improve the functioning of the overall drainage system.

Water Supply

The City provides drinking water, and water for fire protection, to households and businesses in Ventura through a complex system with more than 500 miles of distribution mains, 3 water treatment plants, 22 booster pump stations, 25 treated water reservoirs, and 13 wells. Five distinct sources provide surface and ground water to the City supply system:

- Casitas Municipal Water District
- Ventura River surface water intake, subsurface water and wells (Foster Park)
- Mound groundwater basin
- Oxnard Plain groundwater basin (Fox Canyon Aquifer)
- Santa Paula groundwater basin

The City also holds a State Water Project entitlement of 10,000 acre-feet per year;

however, new facilities would need to be constructed to transport this water to the City. The City updates its Urban Water Management Plan every two years (instead of every five years as required by State law) as part of its ongoing effort to ensure that City-managed water supplies will continue to accommodate demand in Ventura.

Meeting future water demands requires saving and reusing every drop possible. The City utilizes recycled water from its reclamation facility (a tertiary wastewater treatment plant) near the Harbor to augment the municipal water supply. Recycled water is used to irrigate City and private landscaping in the area and the Buenaventura and Olivas Park municipal golf courses. The remaining effluent is discharged to the Santa Clara River Estuary.

Largely as a result of conservation efforts, water consumption per city resident has generally declined (see Table 5-1). Projections anticipate that the City will continue to be able to meet consumer needs. Policies and actions in this chapter seek to refine demand management practices and conservation programs to further reduce per capita water use so that Ventura can sustain water resources for many more generations.

**Table 5-1
Historic and Projected Water Production (Acre Feet)**

Year	Estimated Population Served	Per Capita Use ¹	Treated Water Production	Raw Water Production	Total Water Production
Historic					
1980	73,774	0.236	17,381	4,766	22,147

2015	122,447	0.179	21,918	1,000	22,918
2020	129,504	0.179	23,181	1,000	24,181

Sources: City of Ventura Urban Water Management Plan, Dec. 2000, City of Ventura 2004 Biennial Water Supply Report, as amended, September 2004.

¹ Per Capita use excludes raw water.

Wastewater Treatment

Ventura residents generate millions of gallons of wastewater each day, which is carried by more than 450 miles of sewer mains and 12 lift stations to the water reclamation facility in the Harbor area near the mouth of the Santa Clara River. While most residents receive sewer service directly from the City, three other sanitary sewer agencies with their own treatment facilities provide service to some citizens in the Montalvo, Saticoy, and North Ventura Avenue areas. As shown in Table 5-2, all local treatment facilities operate well below capacity.

About two-thirds of the wastewater treated locally is discharged to the Santa Clara River Estuary, as allowed by the Regional Water Quality Control Board. The remaining effluent is either transferred to recycling ponds, where some is delivered as reclaimed water, or it percolates to underground aquifers or evaporates. The policies and actions in this chapter call for improving treatment system efficiency to reclaim and reuse as much water as possible.

Table 5-2 Treatment Facilities

Treatment Facilities	Treatment Type	Capacity	Average Daily Flow
Ventura Water Reclamation Facility	Tertiary	14 MGD	9.0 MGD (68% capacity)
Montalvo Municipal Improvement District Treatment Plant	Secondary	0.36 MGD	0.242 MGD (67% capacity)
Saticoy Sanitary District Treatment Plant	Secondary ²	0.25 MGD	0.16 MGD (64% capacity)
Ojai Valley Sanitary District Treatment Plant	Tertiary	3 MGD	2.0 MGD (71% capacity)

² Includes nutrient removal prior to percolation.

Storm Drainage

Storm runoff travels from the hills above Ventura through the City until it is absorbed into the ground or reaches the Ventura River, the Santa Clara River, or the Pacific Ocean. To convey the occasional high flows associated with storms, the Ventura County Flood Control District oversees about 20 natural or concrete lined barrancas that serve as the major drainage courses for local watersheds. The City has about 20 miles of off-street drain system designed to convey runoff from all but the most severe of storms, in which case water also runs off via city streets.

Maintaining the barrancas and other watercourses that are not already lined with concrete as natural flood channels can help reduce peak flows by limiting water velocity. Incorporating natural features into drainage systems rather than hard treatment devices also can improve water quality and reduce maintenance costs. The policies and actions in this chapter seek to prevent increases in future storm water impacts by incorporating natural drainage and flood control features such as wildlife ponds and wetlands – instead of cement retention basins – into the storm drain system where possible. Such less intensive approaches not only cost less, but they also preserve environmental resources and protect water quality.

Policy 5A: Follow an approach that contributes to resource conservation.

Action 5.1: Require low flow fixtures, leak repair, and drought tolerant landscaping (native species if possible), plus emerging water conservation techniques, such as reclamation, as they become available. 

Action 5.2: Use natural features such as bioswales, wildlife ponds, and wetlands for flood control and water quality treatment when feasible. 

Action 5.3: Demonstrate low water use techniques at community gardens and city-owned facilities.

Action 5.4: Update the Urban Water Management plan as necessary in compliance with the State 1983 Urban Water Management Planning Act.

Action 5.5: Provide incentives for new residences and businesses to incorporate recycling and waste diversion practices, pursuant to guidelines provided by the Environmental Services Office. 

Policy 5B: Improve services in ways that respect and even benefit the environment.

Action 5.6: Require project proponents to conduct sewer collection system analyses to determine if downstream facilities are adequate to handle the proposed development. 

Action 5.7: Require project proponents to conduct evaluations of the existing water distribution system, pump station, and storage

requirements in order to determine if there are any system deficiencies or needed improvements for the proposed development. 

Action 5.8: Locate new development in or close to developed areas with adequate public services, where it will not have significant adverse effects, either individually or cumulatively, on coastal resources. 

Action 5.9: Update development fee and assessment district requirements as appropriate to cover the true costs associated with development. 

Action 5.10: Utilize existing waste source reduction requirements, and continue to expand and improve composting and recycling options. 

Action 5.11: Increase emergency water supply capacity through cooperative tie-ins with neighboring suppliers.

Action 5.12: Apply new technologies to increase the efficiency of the wastewater treatment system. 

Action 5.13: Increase frequency of city street sweeping, and post schedules at key points within each neighborhood. 

Action 5.14: Develop a financing program for the replacement of failing corrugated metal storm drain pipes in the City. 

Action 5.15: Establish assessment districts or other financing mechanisms to address storm drain system deficiencies in areas where new development is anticipated and deficiencies exist. 

Action 5.16: Require new developments to incorporate stormwater treatment practices that allow percolation to the underlying aquifer and minimize offsite surface runoff utilizing methods such as pervious paving material for parking and other paved areas to facilitate rainwater percolation and retention/detention basins that limit runoff to pre-development levels. 

Action 5.17: Require stormwater treatment measures within new development to reduce the amount of urban pollutant runoff in the Ventura and Santa Clara Rivers and other watercourses. 

Action 5.18: Work with the Ventura Regional Sanitation District and the County to expand the capacity of existing landfills, site new landfills, and/or develop alternative means of disposal that will provide sufficient capacity for solid waste generated in the City.

"Leave all the afternoon for exercise and recreation, which are as necessary as reading. I will rather say more necessary because health is worth more than learning."

— Thomas Jefferson
3rd President of the United States
1801-1809

6. OUR ACTIVE COMMUNITY

Our goal is to add to and enhance our parks and open spaces to provide enriching recreation options for the entire community.

Higher Standards

For many people, spending time outdoors and participating in recreational activities represent some of life’s most cherished rewards. Ventura’s superb public park, open space, and recreation system offers a myriad of ways to partake in these privileges. The city offers 34 developed parks, 45 miles of linear park and trail network, stellar beaches, specialized play and sports facilities and programs, communitywide events, senior and youth activities, and two 18-hole tournament class public golf courses. Figure 6-1 at the end of this chapter shows the locations of various public facilities in the city.

The City is committed to ensuring that its citizens have ample access to high quality spaces for leisure and active recreation. The City’s adopted standard of 10 acres per 1,000 residents has created far more park area than would be possible under the basic State level of 3 acres per 1,000, and also tops the more ambitious National Park and Recreation Association benchmarks for specific park types (see Table 6-1). The City continues to create customized facilities like the Community Park (approved by the voters pursuant to SOAR) to expand opportunities for local residents to enjoy healthy, active lifestyles.

Park Type	Standards	
	City of Ventura	National Park & Recreation Association
Neighborhood	2 acres	1.5 acres
Community	3 acres	2.5 acres
Citywide	5 acres	5 acres
Total	10 acres	9 acres

Sources: City of Ventura, www.nrpa.org.

City Parks and Open Space

The public park and open space system in Ventura includes neighborhood, community, citywide, and linear parks. As shown in Table 6-2, the City oversees nearly 600 acres of developed park facilities, plus the linear park network, which provides important connections among watersheds for both people and wildlife.

As the City continually strives to improve the quality of leisure and recreation opportunities for everyone in the community, it must address a number of challenges such as:

- modernizing existing facilities,
- finding appropriate land for new facilities,
- developing useful and enjoyable public spaces, such as plazas and mini-parks in urban settings,
- formalizing shared use arrangements for non-City facilities like school playfields,
- meeting increasing demand for athletic courts, fields and pools,
- provide opportunities for passive recreation, and
- providing services needed by youth, seniors, and residents with special needs.

Neighborhood Parks

Typically less than 8 acres each, these smaller parks primarily serve specific residential areas in the community. The 18 neighborhood parks in Ventura cover about 73 total acres. Any future development outside the current city limits will have to provide new neighborhood parks to serve the added population.

Community Parks

These parks are designed to offer specialized opportunities and facilities to residents of more than one neighborhood. Amenities in community parks may include formal athletic fields, courts, recreation buildings, preschool and youth play structures, group and individual picnic areas, and landscaped areas for informal activity or leisure.

Citywide Parks

These parks feature recreational opportunities that draw a wide range of age and interest groups from throughout the city. They offer a variety of attractive amenities, such as large open spaces, unique natural resources, interpretive centers, cultural amenities, group picnic areas, sports facilities, and equestrian, bicycling, and hiking trails. The Ventura Community Park also serves some citywide park functions and attracts visitors from outside the city with its high-quality playing fields and aquatic center.

Linear Parks

Ventura's unique linear park network intersperses trails and picnic areas among a mostly undeveloped web of barranca and riverbanks that provide valuable wildlife habitat and migration corridors. The linear parks also merge with a number of neighborhood and community parks, complementing developed recreation areas with natural riparian qualities. Extending trails through the linear park network can create additional opportunities for low-impact contact with nature, and in some cases even provide pleasant non-automobile commuting options.

Table 6-2 City Park Facilities

Park	Park Size (in acres)				
	Neighborhood Parks	Community Parks	Citywide Parks	Special Use Facilities	Total
Albinger Archaeological Museum				0.9	0.9
Arroyo Verde Park	2.0	23.0	104.3		129.3

Westpark	1.5	5.8			7.3
Total	60.8	142.7	275.8	97.8	577.1

Sources: City of Ventura, 2004. Note: several parks serve functions in more than one category.
¹ Acreage varies with ocean high levels.
² Acreage varies with fluctuations in Ventura River level.

As with most parks in the city, resources for linear park system improvements typically come through conditions placed on adjacent development. City regulations establish standards for park width, landscaping, fencing, lighting, and tree rows that apply specifically along barrancas, freeways, rivers, the shoreline, harbor, hillsides, and utility rights-of-way.

Recreation Programs

The City operates four neighborhood centers where recreation programs and senior services are available: the Ventura Avenue Adult Center, Senior Recreation Center, Barranca Vista Center, and Westpark Community Center. The City also offers a wide range of sports programs, including youth and adult sports programs, classes, aquatics, and corporate games. Other City-sponsored recreational activities include arts and environmental education, community gardening, recreation programs for special needs residents, and after-school activities and summer camps.

A variety of other recreation opportunities are available in Ventura in addition to City programs. Foremost among these are all of the activities possible at State beaches and developed waterfront areas. Other local non-City facilities include the County Fairgrounds and local golf courses. In addition, joint-use agreements allow city residents to use sports fields, pools, and gymnasiums during certain times at public schools and Ventura College.

The policies and actions in this chapter seek to further expand local park and recreation choices by:

- identifying sites for new parks,
- increasing public access to open space, including via linear park trails,
- collaborating with schools and other local agencies and organizations,
- ensuring universal and equal access to parks and recreation facilities, and
- allowing appropriate revenue-generating activities at City parks.

Policy 6A: Expand the park and trail network to link shoreline, hillside, and watershed areas.

Action 6.1: Develop new neighborhood parks, pocket parks, and community gardens as feasible and appropriate to meet citizen needs, and require them in new development. 

Action 6.2: Require higher density development to provide pocket parks, tot lots, seating plazas, and other aesthetic green spaces. 

Action 6.3: Work with the County to plan and develop trails that link the City with surrounding open space and natural areas, and require development projects to include trails when appropriate. 

Action 6.4: Request Flood Control District approval of public access along unchannelized watercourses for hiking. 

Action 6.5: Seek landowner permission to allow public access on properties adjacent to open space where needed to connect trails. 

Action 6.6: Update plans for and complete the linear park system as resources allow. 

Action 6.7: Work with the County of Ventura to initiate efforts to create public trails in the hillsides.

Action 6.8: Update and require periodic reviews of the Park and Recreation Workbook as necessary to reflect City objectives and community needs.

Action 6.9: Require dedication of land identified as part of the City's Linear Park System in conjunction with new development. 

Action 6.10: Evaluate and incorporate, as feasible, linear park segments in the General Bikeway Plan.

Action 6.11: Update standards for citywide public parks and open space to include an expanded menu of shared park types, and identify locations and potential funding sources for acquiring new facilities in existing neighborhoods.

Action 6.12: Update and carry out the Grant Park Master Plan.

Action 6.13: Foster the partnership between the City and Fair Board to improve Seaside Park. 

Policy 6B: Ensure equal access to facilities and programs.

Action 6.14: Improve facilities at City parks to respond to the requirements of special needs groups.

Action 6.15: Adjust and subsidize fees to ensure that all residents have the opportunity to participate in recreation programs.

Action 6.16: Update the project fee schedule as necessary to ensure that development provides its fair share of park and recreation facilities.

Policy 6C: Provide additional gathering spaces and recreation opportunities.

Action 6.17: Update and create new agreements for joint use of school and City recreational and park facilities.

Action 6.18: Offer programs that highlight natural assets, such as surfing, sailing, kayaking, climbing, gardening, and bird watching. 

Action 6.19: Provide additional boating and swimming access as feasible. 

Action 6.20: Earmark funds for adequate maintenance and rehabilitation of existing skatepark facilities, and identify locations and funding for new development of advanced level skatepark facilities.

Policy 6D: Increase funding and support for park and recreation programs.

Action 6.21: Promote the use of City facilities for special events, such as festivals, tournaments, and races.

Action 6.22: Enter into concession or service agreements where appropriate to supplement City services.

Public Facilities

This map is a product of the City of San Buenaventura, California. Although reasonable efforts have been made to ensure the accuracy of this map, the City of San Buenaventura cannot guarantee its accuracy.

"A city, like a living thing, is a united and continuous whole."

— Plutarch
ca. 50-120 AD, author of *Moralia*

CITY OF
VENTURA

OUR HEALTHY & SAFE COMMUNITY

ventura's general plan

7. OUR HEALTHY AND SAFE COMMUNITY

Our goal is to build effective community partnerships that protect and improve the social well-being and security of all our citizens.

Community Wellness

Keeping the small town feel of Ventura depends on working together as a community to look out for the well being of all residents, especially those most at risk. Community wellness requires comprehensive preventative care, as well as careful preparation for and response to dangers within the built environment and to risks posed by natural processes (see Figure 7-1).

Adequate shelter, sufficient medical services, walkable neighborhoods, and proper nutrition create an essential foundation for a healthy community. Reducing as much as possible the threat to people and property from earthquakes, landslides, floods, and fires further enhance the collective wellness of the city. In addition, a healthy Ventura community requires thorough protection from crime, and freedom from pollution, unwanted noise, and the threat of hazardous materials.

Alquist-Priolo designation requires a geologic investigation prior to the approval of a development permit to determine if a specific site within the zone is threatened by surface displacement from future fault movement.

Geologic and Flood Hazards

Ventura lies in an active geologic region and is therefore subject to a variety of seismic hazards, including ground shaking, liquefaction, and slope failure. State law requires the City to regulate development in mapped seismic hazard zones. Major faults in the city include the Ventura-Foothill (a State-designated Alquist-Priolo Earthquake Fault Zone), Oak Ridge, McGrath, Red Mountain and Country Club Faults. Areas closest to these faults are most likely to experience ground shaking or rupture in the event of an earthquake. Liquefaction during an earthquake is most likely to occur in areas with loose, granular soils where the water table lies within 50 feet of the surface. As the soil liquefies, buildings and other objects may tilt or sink.

Hillside stability varies based on slope, soil, rock type and groundwater depth. The hills north of Poli Street/Foothill Road have experienced many historic landslides and are prone to future movement. The City Hillside Management Program limits development in the area to minimize dangers from landsliding, erosion, flooding, and fire, and to retain natural and scenic character.

The Federal Emergency Management Agency regulates development along watercourses based on the likelihood of flooding: the basic benchmark – the 100-year flood – has a one percent chance of occurring in any given year. Although the mapped 100-year flood hazard areas for local rivers and barrancas are fairly limited in size, the largest recorded flood events along the Ventura

and Santa Clara Rivers, both following heavy rains in 1969, exceeded the 100-year flood zone. The policies and actions in this Chapter intend to limit harm from geologic and flood events by requiring detailed risk analyses and mitigation prior to development of sites in hazard prone areas.

Fire and Emergency Response

The Ventura Fire Department responds to fire, medical, and disaster calls from six stations in the city. The Department's goal is to reach the scene within 4 minutes 90% of the time. The Department has a reciprocal agreement with the County Fire Protection District to ensure that Ventura residents receive the swiftest service possible. The Department also has a responsibility to provide disaster preparedness for the City. Particular fire department concerns in the City include:

- the need for reliable and sustainable source of fire service revenue,
- lengthy response times to areas farthest from existing stations (See Figure 7-2),
- firefighter and support staffing levels that are far below the .98 firefighter per 1,000 population averages of other municipal fire departments with comparable city size, age, and population,
- the threat of wildland fire entering urban area, and
- the lack of fire protection systems in older structures.

The policies and actions in this Chapter aim to optimize firefighting and emergency response capabilities through oversight of new development, improved facilities, and added staff.

Police Protection

Ventura Police response to crimes in progress or alarm soundings averages less than six minutes, and less than sixteen minutes for most other calls. While the local crime rate is slightly higher than State average, the Department hopes to better engage the community in policing efforts to lower crime levels. As part of a Strategic Planning Process, the Department has established the following goals:

- reduce crime and the fear of crime
- improve the quality of life in neighborhoods
- enhance community and police partnerships
- develop personnel
- continued accountability

One-time grant funding has helped add officers dedicated to community crime prevention, gang control, and youth mentoring programs. As these grants end the City must face the challenge of funding these services. Actions in this Chapter seek to improve the full range of police services to maximize community safety by increasing staffing, outreach efforts, and public access to police services.

Noise

Noise is generally defined as unwanted sound. Its effects can range from annoyance to nuisances to health problems. State law requires the City to identify and address noise sources and establish projected noise levels for roadways, railroads, industrial uses, and other significant generators. The Noise Contours map (Figure 7-3) is used to help guide land use in a way that minimizes exposure of residents to excessive noise.

Vehicle traffic is by far the greatest source of noise affecting Ventura residents. Other sources include the Seaside Park raceway, the Grant Park shooting range, and railroad, commercial, and industrial activity. Homes, schools, hotels, and hospitals are considered sensitive receptors where excessive noise can interfere with normal activities.

Noise intensity is customarily measured on the decibel scale, an index of loudness. Sounds as faint as 10 decibels (dB) are barely audible, while noise over 120 dB can be painful or damaging to hearing (Table 7-1 shows some typical noise levels). A sound 10 dB higher than another is perceived as about twice as loud. A 5 dB change is readily noticeable, but a 3 dB difference is barely perceptible.

As shown in Table 7-2, normally acceptable outdoor noise in residential areas may reach 65 decibels. The Ldn label in the table indicates that sound is averaged over time to account for the fact that sources like traffic or aircraft may cause fluctuations of more than 20 dB over a few

seconds. CNEL refers to the fact that 5 dB is added to noise after 7 p.m. and 10 dB added from 10 p.m. to 7 a.m., when quieter conditions make sound more noticeable.

The State Building Code requires an acoustical study whenever outdoor noise would exceed 60 decibels at a proposed duplex, multifamily residence, hotel, motel or other attached dwelling. The study must show that the proposed project design would result in interior noise levels of 45 dB or less.

Although future increases in traffic are not expected to produce a significant change in perceived noise levels, other specific sound generators have been identified as problems in the community. The policies and actions in this chapter look to reduce the exposure of people in Ventura to these noise sources.

Table 7-1. Typical Noise Levels

Type of Noise or Environment	Decibels
Recording Studio	20
Soft Whisper; Quiet Bedroom	30
Busy Open-plan Office	55
Normal Conversation	60-65
Automobile at 20 mph 25 ft. away	65
Vacuum Cleaner 10 ft. away	70
Dump Truck at 50 mph 50 ft. away	90
Train Horn 100 ft. away	105
Claw Hammer; Jet Takeoff 200 ft. away	120
Shotgun at shooter's ear	140

**Table 7-2
Acceptable Noise Levels**

LAND USE CATEGORY	COMMUNITY NOISE EXPOSURE Ldn or CNEL, dBA						
	55	60	65	70	75	80	85
RESIDENTIAL - LOW DENSITY SINGLE FAMILY, DUPLEX, MOBILE HOMES	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
RESIDENTIAL - MULTI-FAMILY	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
TRANSIENT LODGING - MOTELS, HOTELS	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
SCHOOLS, LIBRARIES, CHURCHES, HOSPITALS, NURSING HOMES	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
AUDITORIUMS, CONCERT HALLS, AMPHITHEATRES	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
SPORTS ARENA, OUTDOOR SPECTATOR SPORTS	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
PLAYGROUNDS, NEIGHBORHOOD PARKS	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
GOLF COURSES, RIDING STABLES, WATER RECREATION, CEMETERIES	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
OFFICE BUILDINGS, BUSINESS COMMERCIAL AND PROFESSIONAL	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]
INDUSTRIAL, MANUFACTURING, UTILITIES, AGRICULTURE	[Yellow bar from 55 to 60]		[Cyan bar from 60 to 70]		[Dark Cyan bar from 70 to 75]		[Black bar from 75 to 80]

NORMALLY ACCEPTABLE
Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

CONDITIONALLY ACCEPTABLE
New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

NORMALLY UNACCEPTABLE
New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

CLEARLY UNACCEPTABLE
New construction or development should generally not be undertaken.

Hazardous Materials

Hazardous materials include medical and industrial wastes, pesticides, herbicides, radioactive materials, and combustible fuels. Improper use, storage, transport, or disposal of these materials may result in harm to humans, surface or ground water degradation, air pollution, fire, or explosion. Most of the several hundred facilities in Ventura that use or store hazardous materials lie along Ventura Avenue or in the Arundell industrial district.

The Fire Department maintains a team specially trained and equipped to respond to hazardous materials emergencies. Additional equipment and personnel for large-scale hazardous materials incidents is available from the County Fire Protection District, the City of Oxnard, and the U.S. Naval Construction Battalion Center in Port Hueneme.

The Westside and North Avenue neighborhoods include about 30 brownfields: sites that may possess contaminated soils but also have potential for reuse. Cleanup of these sites will make them more attractive for redevelopment that can improve the neighborhoods and generate employment and tax revenue. The City has established a Brownfield Assessment Demonstration Pilot Program to fund site assessments and initiate remediation. The policies and actions in this chapter intend to minimize the risk of adverse health effects of hazardous materials by regulating their location and seeking funding for cleanup of brownfield sites to encourage their reuse.

Policy 7A: Encourage wellness through care and prevention.

Action 7.1: Work with interested parties to identify appropriate locations for assisted-living, hospice, and other care-provision facilities.

Action 7.2: Provide technical assistance to local organizations that deliver health and social services to seniors, homeless persons, low-income citizens, and other groups with special needs.

Action 7.3: Participate in school and agency programs to:

- provide healthy meals,
- combat tobacco, alcohol, and drug dependency,
- distribute city park and recreation materials through the schools, and
- distribute information about the benefits of proper nutrition and exercise.

Action 7.4: Enhance or create ordinances which increase control over ABC licensed premises.

Action 7.5: Investigate the creation of new land use fees to enhance funding of alcohol related enforcement, prevention and training efforts.

Policy 7B: Minimize risks from geologic and flood hazards.

Action 7.6: Adopt updated editions of the California Construction Codes and International Codes as published by the State of California and the International Code Council respectively. 

Action 7.7: Require project proponents to perform geotechnical evaluations and implement mitigation prior to development of any site: 

- with slopes greater than 10 percent or that otherwise have potential for landsliding,
- along bluffs, dunes, beaches, or other coastal features
- in an Alquist-Priolo earthquake fault zone or within 100 feet of an identified active or potentially active fault,
- in areas mapped as having moderate or high risk of liquefaction, subsidence, or expansive soils,
- in areas within 100-year flood zones, in conformance with all Federal Emergency Management Agency regulations.

Action 7.8: To the extent feasible, require new critical facilities (hospital, police, fire, and emergency service facilities, and utility “lifeline” facilities) to be located outside of fault and tsunami hazard zones, and require critical facilities within hazard zones to incorporate construction principles that resist damage and facilitate evacuation on short notice. 

Action 7.9: Maintain and implement the Standardized Emergency Management System (SEMS) Multihazard Functional Response Plan.

Action 7.10: Require proponents of any new developments within the 100-year floodplain to implement measures, as identified in the Flood Plain Ordinance, to protect structures from 100-year flood hazards (e.g., by raising the finished floor elevation outside the floodplain). 

Action 7.11: Prohibit grading for vehicle access and parking or operation of vehicles within any floodway. 

Policy 7C: Optimize firefighting and emergency response capabilities.

Action 7.12: Refer development plans to the Fire Department to assure adequacy of structural fire protection, access for firefighting, water supply, and vegetation clearance. 

Action 7.13: Resolve extended response time problems by: 

- adding a fire station at the Pierpont/Harbor area,
- relocating Fire Station #4 to the Community Park site,
- increasing firefighting and support staff resources,
- reviewing and conditioning annexations and development applications, and
- require the funding of new services from fees, assessments, or taxes as new subdivisions are developed.

Action 7.14: Educate and reinforce City staff understanding of the Standardized Emergency Management System for the State of California.

Policy 7D: Improve community safety through enhanced police service.

Action 7.15: Increase public access to police services by:

- increasing police staffing to coincide with increasing population, development, and calls for service,
- increasing community participation by creating a Volunteers in Policing Program, and,
- require the funding of new services from fees, assessments, or taxes as new subdivisions are developed.

Action 7.16: Provide education about specific safety concerns such as gang activity, senior-targeted fraud, and property crimes.

Action: 7.17: Establish a nexus between police department resources and increased demands associated with new development.

Action 7.18: Continue to operate the Downtown police storefront. 

Action 7.19: Expand Police Department headquarters as necessary to accommodate staff growth.

Policy 7D: Minimize exposure to air pollution and hazardous substances.

Action 7.20: Require air pollution point sources to be located at safe distances from sensitive sites such as homes and schools. 

Action 7.21: Require analysis of individual development projects in accordance with the most current version of the Ventura County Air Pollution Control District Air Quality Assessment Guidelines and, when significant impacts are

identified, require implementation of air pollutant mitigation measures determined to be feasible at the time of project approval. 

Action 7.22: In accordance with Ordinance 93-37, require payment of fees to fund regional transportation demand management (TDM) programs for all projects generating emissions in excess of Ventura County Air Pollution Control District adopted levels. 

Action 7.23: Require individual contractors to implement the construction mitigation measures included in the most recent version of the Ventura County Air Pollution Control District Air Quality Assessment Guidelines. 

Action 7.24: Only approve projects involving sensitive land uses (such as residences, schools, daycare centers, playgrounds, medical facilities) within or adjacent to industrially designated areas if an analysis provided by the proponent demonstrates that the health risk will not be significant.

Action 7.25: Adopt new development code provisions that ensure uses in mixed-use projects do not pose significant health effects.

Action 7.26: Seek funding for cleanup of sites within the Brownfield Assessment Demonstration Pilot Program and other contaminated areas in West Ventura.

Action 7.27: Require proponents of projects on or immediately adjacent to lands in industrial,

commercial, or agricultural use to perform soil and groundwater contamination assessments in accordance with American Society for Testing and Materials standards, and if contamination exceeds regulatory action levels, require the proponent to undertake remediation procedures prior to grading and development under the supervision of the County Environmental Health Division, County Department of Toxic Substances Control, or Regional Water Quality Control Board (depending upon the nature of any identified contamination). 

Action 7.28: Educate residents and businesses about how to reduce or eliminate the use of hazardous materials, including by using safer non-toxic equivalents.

Action 7.29: Require non-agricultural development to provide all necessary buffers, as determined by the Agriculture Commissioner's Office, from agricultural operations to minimize the potential for pesticide drift. 

Action 7.30: Require all users, producers, and transporters of hazardous materials and wastes to clearly identify the materials that they store, use, or transport, and to notify the appropriate City, County, State and Federal agencies in the event of a violation. 

Action 7.31: Work toward voluntary reduction or elimination of aerial and synthetic chemical application in cooperation with local agricultural interests and the Ventura County agricultural commissioner. 

Policy 7E: Minimize the harmful effects of noise.

Action 7.32: Require acoustical analyses for new residential developments within the mapped 60 decibel (dBA) CNEL contour, or within any area designated for commercial or industrial use, and require mitigation necessary to ensure that: 

- Exterior noise in exterior spaces of new residences and other noise sensitive uses that are used for recreation (such as patios and gardens) does not exceed 65 dBA CNEL, and
- Interior noise in habitable rooms of new residences does not exceed 45 dBA CNEL with all windows closed.

Action 7.33: As funding becomes available, construct sound walls along U.S. 101, SR 126, and SR 33 in areas where existing residences are exposed to exterior noise exceeding 65 dBA CNEL. 

Action 7.34: Request that sound levels associated with concerts at the County Fairgrounds be limited to 70 dBA at the eastern edge of that property. 

Action 7.35: Request the termination of auto racing at the County fairgrounds. 

Action 7.36: Amend the noise ordinance to restrict leaf blowing, amplified music, trash collection, and other activities that generate complaints. 

Action 7.37: Use rubberized asphalt or other sound reducing material for paving and re-paving of City streets. 

Action 7.38: Update the Noise Ordinance to provide standards for residential projects and residential components of mixed-use projects within commercial and industrial districts.

"A vigorous culture capable of making corrective, stabilizing changes depends heavily on its educated people, and especially upon their critical capacities and depth of understanding."

— Jane Jacobs
Dark Age Ahead

8. OUR EDUCATED COMMUNITY

Our goal is to encourage academic excellence and life-long learning resources to promote a highly-educated citizenry.

Lifelong Learning

Education is more important than ever before as the foundation for the vitality of informed community participation in Ventura. The *Ventura Vision* calls for the city to be “a community dedicated to educational excellence and an emphasis on lifelong learning.” A truly educated community is key to achieving most of the goals in this General Plan because:

- In the 21st Century information economy a highly educated and skilled workforce is vital to community prosperity,
- Education and the institutions that provide it are critical to achieving environmental and cultural leadership, and
- An educated and informed citizenry is essential to sound planning and decision-making.

While Ventura has a comparatively well-educated population (see Table 8-1), the high costs of doing business and finding housing in the city will force even greater emphasis on businesses and jobs that require ever-higher levels of skill. The need and desire for lifelong learning will require relentlessly expanding educational resources and access to them in the years ahead. Plus, the assets that strong educational institutions provide

are necessary to bring a rich cultural life to the community as well.

Ventura can build on an impressive base of well-regarded public schools, array of private alternatives, major community college, satellite university campuses, expanding media-training institute, law school, and three branch libraries, among other educational resources. The key to becoming renowned as a local “learning community” lies in creating stronger linkages between these existing resources and integrating them into the physical and social landscape of our community.

Leveraging our Assets

Excellence in public education is the top priority for the Ventura Unified School District (whose boundaries extend beyond the city). In Ventura, the District manages 16 elementary schools, four middle schools, three high schools, and one continuation high school, plus independent study and adult education programs.

In addition to District schools, the city also is home to more than a dozen private schools (see Table 8-2), serving 13 percent of elementary and high school students living in Ventura, according to the 2000 Census. Figure 6-1 shows school locations in the city.

**Table 8-1
Education Level**

Schooling Completed	Percent of Population
High School	21.7
Some College	28.2
Associate Degree only	9.6
Bachelors Degree only	15.4
Graduate Degree	9.3
High School Diploma & Above	84.1
Associate Degree & Above	34.2

St. Paul's Parish Day	K-8
Grace Lutheran Christian Day	K-6
Jameson	K-12
Ventura County Christian	K-12
Hill Road Montessori Preschool	K-3
Wells Road Baptist Academy	K-12

Most public schools operate at or near capacity (see Table 8-3), and continuing growth in Ventura requires the District to search for sites for new schools (see Table 8-4). Developers of new projects are required to dedicate land or pay fees for school purposes, and any major annexation of land outside the city is likely to have to provide a school site to serve new resident children. Still, the scarcity and cost of suitable sites means that greater thought will need to be given to shared facility use and other non-traditional approaches to expanding capacity.

Table 8-3. Ventura Unified School District Enrollment

Schools – No.	Students	Capacity
Elementary – 17	8,093	95%
Middle – 4	4,304	93%

Source: Ventura Unified School District, 2003

Ventura is increasingly becoming recognized as a center for higher education. Ventura College is a highly respected two-year school with more than 12,000 students, providing everything from a

distinguished transfer opportunity for the University of California to certificates and associates degrees in important fields such as manufacturing and nursing. Students also can obtain four-year degrees in certain fields at the UCSB Ventura Center. Brooks Institute of Photography provides education in photojournalism, filmmaking, and related fields, providing the city with a significant cultural asset. Residents can earn graduate degrees in law, public policy, and education at the Ventura campuses of California Lutheran University, Azusa Pacific University, the Ventura College of Law, and the Southern California Institute of Law. The opening of the nearby California State University Channel Islands has drawn many students and faculty to live in Ventura, especially those in creative fields.

Combined, these institutions of higher learning provide Ventura with tremendous educational assets. Through the policies and actions in this chapter, the City is committed to nurturing these institutions, creating synergy among them, and instilling both cultural and economic opportunities.

Libraries of the Future

The County public library system in Ventura currently operates three branch libraries that serve about 200,000 visits annually (see Table 8-5). But in a digital age where more and more content is available online, the traditional book borrowing function is becoming outmoded. Library administrators and staff, the City’s Library Advisory Commission, and patrons have all pointed to needs for adding library space, extending operating hours, and updating and expanding learning resources.

At a more fundamental level, the ideas of what constitutes a library and how it fits the patterns of a learning community need to be reexamined. Integration with school libraries, including the Ventura College Learning Center, is a top priority for this reevaluation, as embodied in the policies and actions in this chapter.

City and Community Programs

Traditional classroom settings alone cannot provide the complete set of educational skills and experience needed by people of all ages. The City provides a variety of learning opportunities, including youth and adult art programs, environmental education, adaptive recreation programs, youth after-school activities, and summer camps. Community organizations also provide a range of classes and experiences, including tours, museums, lectures, and hands-on activities. Expanding venues for such activities and promoting participation in them are key challenges.

Policies and actions in this chapter seek to expand lifelong learning opportunities for everyone in the community.

Table 8-5. Local Libraries

Library	Card-Holders	2003-2004 Patronage	Hours Open Weekly	Facility Size (sq. ft.)
E. P. Foster	48,195	366,134	54	31,000
H. P. Wright			39	12,000
Avenue			25	3,000

Source: Ventura County Library Administration, 2005

Policy 8A: Reach out to institutions and educators to advance lifelong learning.

Action 8.1: Work closely with schools, colleges, and libraries to provide input into site and facility planning.

Action 8.2: Organize a regional education summit to generate interest in and ideas about learning opportunities.

Action 8.3: Adopt joint-use agreements with libraries, schools, and other institutions to maximize use of educational facilities.

Action 8.4: Distribute information about local educational programs.

Policy 8B: Increase the availability and diversity of learning resources.

Action 8.5: Install infrastructure for wireless technology and computer networking in City facilities.

Action 8.6: Establish educational centers at City parks. 

Action 8.7: Work with the State Parks Department to establish a marine learning center at the Harbor. 

Action 8.8: Work with the Ventura Unified School District to ensure that school facilities can be provided to serve new development.

Policy 8C: Reshape public libraries as 21st Century learning centers.

Action 8.9: Complete a new analysis of community needs, rethinking the role of public libraries in light of the ongoing advances in information technology and the changing ways that individuals and families seek out information and life-long learning opportunities.

Action 8.10: Reassess the formal and informal relationships between our current three branch public libraries and school libraries – including the new Ventura College Learning Resource Center – as well as joint use of facilities for a broader range or compatible public, cultural, and educational uses.

Action 8.11: Develop a Master Plan for Facilities, Programs, and Partnerships to create an accessible, robust, and vibrant library for the 21st Century system, taking into consideration that circulation of books is no longer the dominant function but will continue to be an important part of a linked network of learning centers.

Action 8.12: Develop formal partnerships, funding, capital strategies, and joint use agreements to implement the new libraries Master Plan.

"Whatever you can do, or dream you can,
begin it. Boldness has genius, power and
magic in it."

— Johann Wolfgang von Goethe

CITY OF
VENTURA

OUR CREATIVE COMMUNITY
ventura's general plan

9. OUR CREATIVE COMMUNITY

Our goal is to become a vibrant cultural center by weaving the arts and local heritage into everyday life.

A Rich Foundation

Local history, artistic expression, and cultural diversity play vital roles in making Ventura a vibrant and interesting place. The heritage of Chumash civilization, which developed over the course of about 9,000 years, and influences of Mexican settlement establish a rich tableau for the modern development of the city. Art in museums, galleries, and public places, as well as space and energy devoted to the creation of artwork and crafts connect the community in complex and fundamental ways. Cultural expression in the form of festivals and informal gatherings provide additional and essential bonds that strengthen the community.

Historic Context

Abundant food and water, temperate climate, and ample material for tool manufacturing attracted early local inhabitants. Chumash peoples were living in a string of coastal villages when Spanish explorers arrived in 1542. Shisholop village (at the south end of present-day Figueroa Street) was a thriving Chumash provincial capital at the time of the Spanish arrival. Other Chumash villages and burial sites have been found in what are now the North Avenue and Saticoy neighborhoods, as well as north of the Ventura River. Mexican settlers began to arrive in earnest

**Table 9-1
Key Historical and Cultural Sites**

Site	Description
Albinger Museum	Artifacts spanning 3,500 years excavated from a site next to the Mission are on display in this former adobe at 113 East Main Street.
Downtown	Downtown Ventura is home to a variety of 19 th Century buildings that house restaurants and retail establishments in a small-town setting with a variety of cultural amenities.
Olivas Adobe Park	Completed in 1849 for the Raymundo ranching family, the well-preserved hacienda at 4200 Olivas Park Road is utilized as concert and banquet facility.
Ortega Adobe	Built in 1857, the adobe is only remaining example of the middle class homes that once lined West Main Street. The building has since been used as a police station and restaurant.
San Buenaventura Mission	Built in 1782, the Mission anchors the western part of the downtown area and is still used for regular Catholic services.
Santa Gertrudis Chapel	The Chapel was originally completed around 1809. The site is located along Highway 33 near Foster Park.
San Miguel Chapel	The site is located at Thompson Boulevard and Palm Street. The original chapel dated back to the early 1800s.
Ventura County Museum of History and Art	The museum at 100 East Main Street houses exhibits featuring local artists and historical artifacts. Expansion plans include a 200-seat auditorium and a gallery with touring exhibits.

Source: City of Ventura

after the founding of Mission San Buenaventura in 1782.

More than 90 historic sites have been identified in the planning area (which includes areas outside the city). Notable ones include the Mission, the Ortega and Olivas Adobes, and the locations of the Santa Gertrudis and San Miguel Chapels (See Table 9-1 and Figure 9-1). Many of the existing buildings in Ventura were constructed between 1880 and 1940, a period that coincided with development of the railroads and harbor. City

Hall (formerly the County Courthouse) and the Mission aqueduct are listed as landmarks on the National Register of Historic Places, and structures in the following historic districts are protected by City architectural controls:

- the grounds within the Mission District,
- the Mitchell block (south of Thompson Boulevard between Chestnut and Fir Streets),
- the Selwyn Shaw block (north of Poli Street between Ann and Hemlock Streets), and
- the Simpson Tract (west of Ventura Avenue between Simpson and Prospect Streets).

Arts and Culture

When the City first adopted a Community Cultural Plan in 1992, Ventura’s creative community was in its fledgling stage. Few of the now-thriving professional art and cultural organizations existed (see Table 9-2). A burgeoning visual artist community had made the city its home, but was fairly invisible except to the more intrepid arts supporters and collectors.

Since completion of that plan, the City has either implemented or initiated all of its recommendations, which were developed through extensive public involvement. As a result, the growth of the cultural community has been extraordinary. Now Ventura is home to a wealth of active artists and arts organizations. From 1994-2004, the budgets of arts organizations in Downtown Ventura alone increased from \$500,000 to more than \$4 million.

Ventura also now has a complement of major cultural institutions unique for a city of its size, including the Ventura Music Festival, the Rubicon Theatre Company, the Ventura County Museum of History and Art, and Focus on the Masters. The individual artists who live and work in the city continue to comprise a major part of its cultural fabric, and are highlighted in popular cultural events like the Downtown ArtWalks.

A strong focus of the City’s general is to build the arts infrastructure of Ventura. A strong cultural infrastructure is the foundation of a healthy arts

ecosystem: this includes *places* (for arts creation, sales, exhibition, performance, rehearsal, living), *people* (artists, audiences, patrons), and *organizations* (production, support, and presentation).

In keeping with the community’s respect for its roots, the Ventura arts scene remains authentic, no small feat in today’s competitive environment. While many communities focus on importing Broadway shows or big-name art exhibits to increase their profile, Ventura successfully continues to highlight local artists, architecture, culture, history, and the environment – the unique threads that together comprise the rich tapestry of the Ventura community. Policies and actions in this chapter call for continuing to build the cultural foundations of the community by involving everyone in the production, support, and presentation of art and cultural programs, installing art in public places, providing working and display space for local artists, and identifying a site for an arts and cultural center.

**Table 9-2
Art and Cultural Institutions**

Name	Description	Years in Operation	Annual Patronage
Buenaventura Arts Association	Fine art gallery in downtown Ventura.	50	5,000
Channelaire Chorus	Women's chorus	42	2,500
City of Ventura Cultural Affairs Division	Supports local arts organizations; produces cultural programs (ArtWalks, Street Fairs, Music Under the Stars, Arts Education classes, grants, public art, etc.)	13	132,000
Focus on the Masters	Documentation of extraordinary artists (photographs, audio and video interviews)	10	15,000
Kids' Art	Ongoing, free kids' creative arts programs	12	350
Music 4 Kids	After school music instruction at Boys & Girls Clubs	4	800
Plexus Dance Theater	Professional modern dance performances	20	1,400
Rubicon Theater	Regional theater – classic and contemporary	6	37,000
San Buenaventura Foundation for the Arts	Arts umbrella organization - supports development of the Cultural Center and produces Arts Explosion	5	5,900
Ventura Area Theater Sports	Live improvisational theater in downtown Ventura	15	5,000
Ventura Artists' Union	Art gallery and weekly arts shows on California Plaza	15	17,000
Ventura College Opera Workshop	Opera and theater company at Ventura College	21	4,500
Ventura County Ballet	Ballet school with twice annual performances	6	11,000
Ventura County Master Chorale	Professional vocal music ensemble	23	6,000
Ventura County Museum of History and Art	Museum featuring exhibits on the history and art of Ventura County	26	55,000
Ventura Music Festival	Annual concert festival presenting international and local performers	11	9,000

Policy 9A: Increase public art and cultural expression throughout the community.

Action 9.1: Require works of art in public spaces per the City’s Public Art Program Ordinance.

Action 9.2: Sponsor and organize local art exhibits, performances, festivals, cultural events, and forums for local arts organizations and artists. 

Action 9.3: Expand outreach and publicity by: 

- promoting locally produced art and local cultural programs
- publishing a monthly calendar of local art and cultural features,
- distributing the *State of the Arts* quarterly report, and
- offering free or subsidized tickets to events.

Action 9.4: Support the creative sector through training and other professional development opportunities.

Action 9.5: Work with the schools to integrate arts education into the core curriculum.

Action 9.6: Promote the cultural and artistic expressions of Ventura’s underrepresented cultural groups.

Action 9.7: Offer ticket subsidy and distribution programs and facilitate transportation to cultural offerings.

Policy 9B: Meet diverse needs for performance, exhibition, and workspace.

Action 9.8: Increase the amount of live-work development, and allow its use for production, display, and sale of art.

Action 9.9: Work with community groups to locate sites for venues for theater, dance, music, and children’s programming.

Policy 9C: Integrate local history and heritage into urban form and daily life.

Action 9.10: Provide incentives for preserving structures and sites that are representative of the various periods of the city’s social and physical development. 

Action 9.11: Organize and promote multi-cultural programs and events that celebrate local history and diversity.

Action 9.12: Allow adaptive reuse of historic buildings. 

Action 9.13: Work with community groups to identify locations for facilities that celebrate local cultural heritage, such as a living history Chumash village and an agricultural history museum. 

Policy 9D: Ensure proper treatment of archeological and historic resources.

Action 9.14: Require archaeological assessments for projects proposed in the Coastal Zone and other areas where cultural resources are likely to be located. 

Action 9.15: Suspend development activity when archaeological resources are discovered, and require the developer to retain a qualified archaeologist to oversee handling of the resources in coordination with the Ventura County Archaeological Society and local Native American organizations as appropriate. 

Action 9.16: Pursue funding to preserve historic resources. 

Action 9.17: Provide incentives to owners of eligible structures to seek historic landmark status and invest in restoration efforts. 

Action 9.18: Require that modifications to historically-designated buildings maintain their character. 

Action 9.19: For any project in a historic district or that would affect any potential historic resource or structure more than 40 years old, require an assessment of eligibility for State and federal register and landmark status and appropriate mitigation to protect the resource. 

Action 9.20: Seek input from the City's Historic Preservation Commission on any proposed

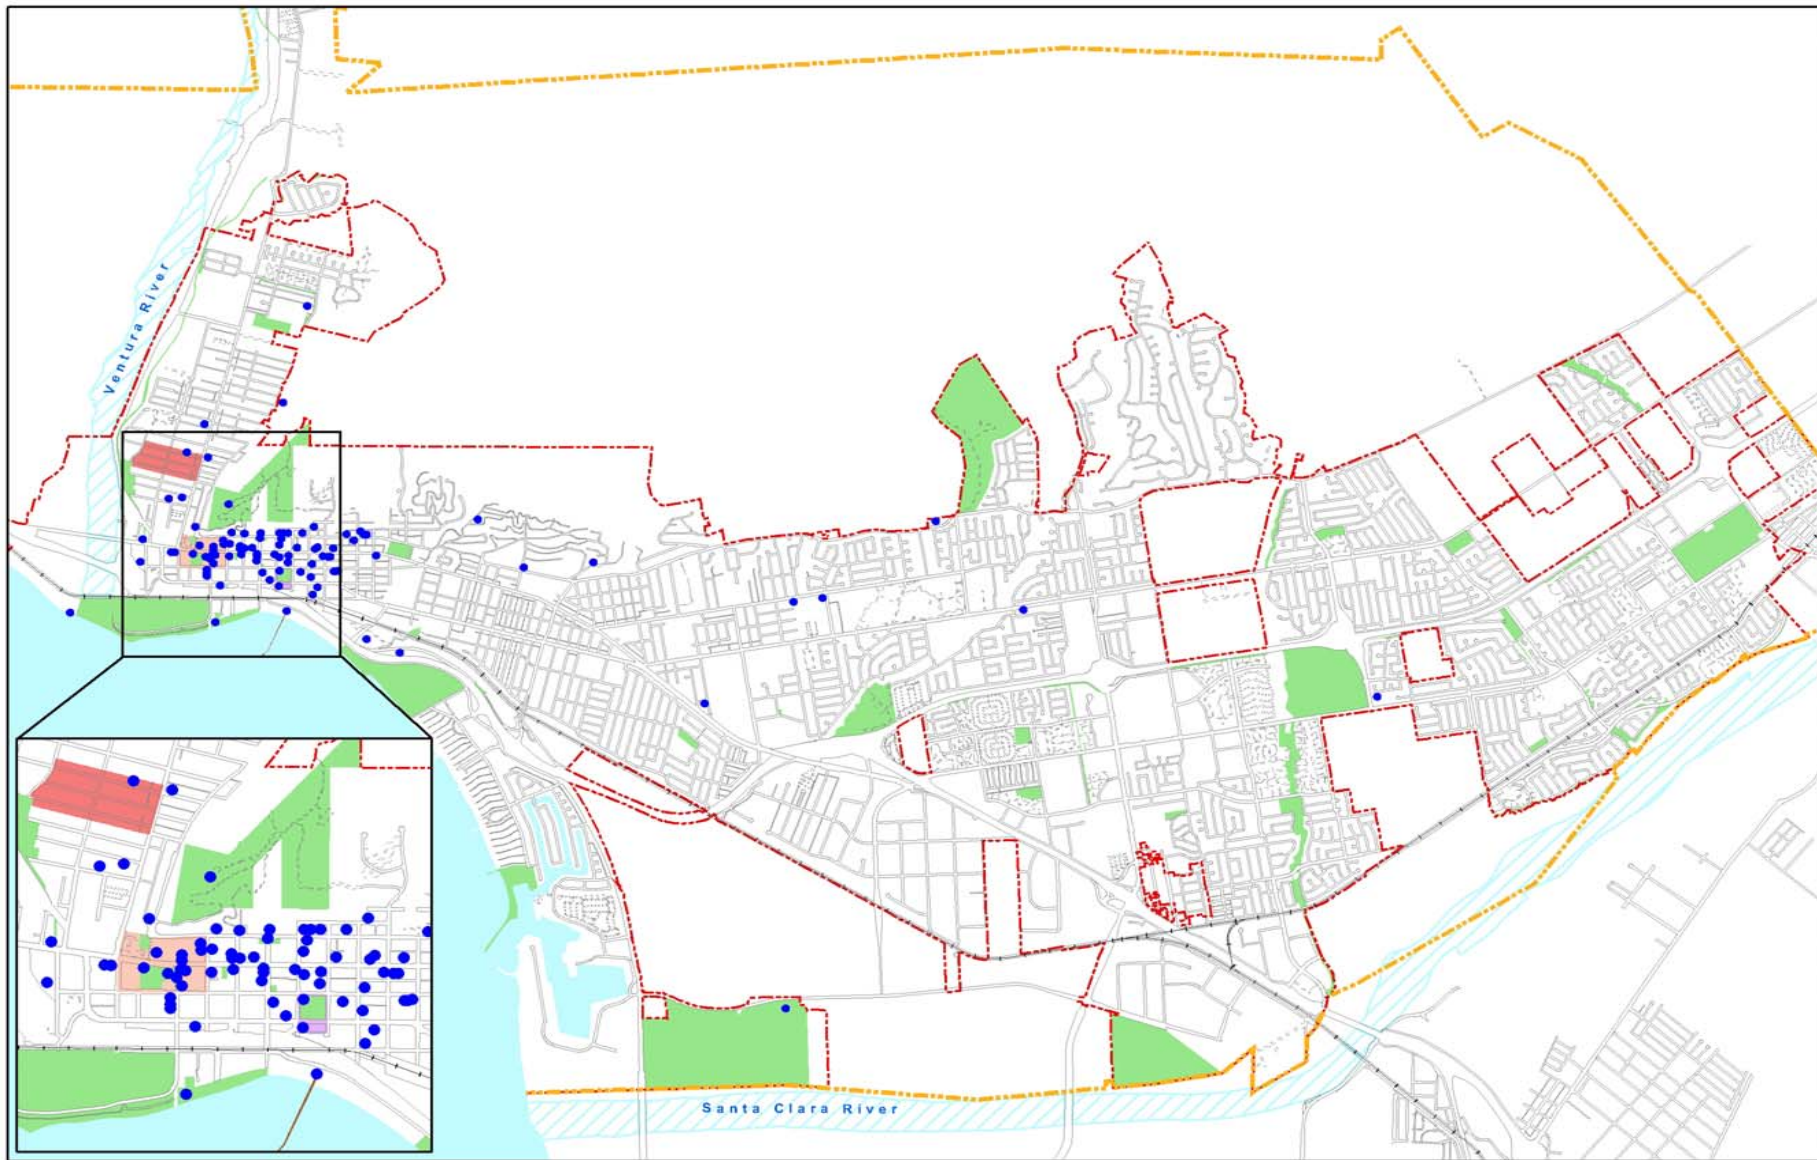

development that may affect any designated or potential landmark. 

Action 9.21: Update the inventory of historic properties. 

Action 9.22: Create a set of guidelines and/or policies directing staff, private property owners, developers, and the public regarding treatment of historic resources that will be readily available at the counter. 

Action 9.23: Complete and maintain historic resource surveys containing all the present and future components of the historic fabric within the built, natural, and cultural environments. 

Action 9.24: Create a historic preservation element.

"Never believe that a few caring people can't change the world. For indeed, that's all who ever have."

— Margaret Mead
Renowned Anthropologist

10. OUR INVOLVED COMMUNITY

Our goal is to strive to work together as a community to achieve the Ventura Vision through civic engagement, partnerships, and volunteer service.

Civic Engagement

It is not enough to have a vision of smart growth for Ventura. Achieving that vision requires the active and ongoing participation of an engaged and active community. Fortunately, Ventura builds on a strong foundation: thousands of Ventura citizens are involved in their schools and places of worship and give their time to civic, cultural, and charitable organizations. City Commissions, the Community Councils, the Chamber of Commerce and other well-established avenues provide opportunities for community leadership.

This is what Alexis De Toqueville celebrated in his famous book, *Democracy in America*, calling our nation, “the one country in the world, day in and day out, that makes use of an unlimited freedom of association.” Yet today in Ventura, as all across America, there is concern about the health of our democracy. Sociologist Robert Putnam gained national attention with his research showing that “by almost every measure, Americans’ direct engagement in politics and government has fallen steadily and sharply over the last generation.”

Among the symptoms in Ventura have been a decline in voter turnout in recent local elections – (a 36% drop from 1995 through 2003.) Over those years, the ability to build consensus about future development has been undermined by sharply polarized divisions, showdowns at the ballot box, and often rancorous public hearings. The complaint often recurs that planning decisions are made without adequate notice or consideration of the views of those affected. Many citizens criticize the City decision-making process as convoluted and counterproductive.

Moreover, ongoing participation of an engaged community requires civic places where citizens can come together. It is not insignificant that a decline in public participation and the quality of civic discourse has paralleled the loss of civic places in our cities. Historically, governments provided open spaces and buildings that were at the center of a community, physically and symbolically. Town squares and plazas, often faced by a hall for formal gathering and civic engagement, have all but disappeared. The poverty of American public places was apparent after the Columbine High School shooting in Colorado, when citizens gathered to mourn, not in a shared place for people, but in a parking lot.

Nearly everyone agrees we can and should do better. The best model for doing this was the citywide effort to craft the *Ventura Vision*. Thousands participated in a year-long partnership encompassing City government, non-profit organizations, community groups, business,

schools and individual residents to chart the community's future.

The vision of an "involved community" was described in the *Ventura Vision* report as: seeking "broad community collaboration; more widely publicizing city government services, planning processes and policies; better involvement of typically under-represented groups such as youth, seniors and ethnic minorities in community planning; and developing public parks, plazas, neighborhood greenways and other spaces that promote civic interaction and events."

Since that vision was adopted by the City Council in 2000, the City has worked to implement it, building on existing community assets and strengthening the linkages and interconnections that already exist among people, organizations, and shared community goals. A remarkable example of broad community collaboration earned attention throughout Southern California in late 2004. Facing the prospect of winter flooding, the City undertook to evacuate homeless people living in the channel of the Ventura River. This was accomplished by a partnership involving non-profit social service agencies, faith-based organizations, City staff, business leaders, community volunteers and the affected homeless population.

There are many more models of successful community collaboration in Ventura, including: the restoration of the pier, the community's rich array of after-school programs, the implementation of the 1992 Cultural Plan, the 2004 Downtown

Charrette, the 2005 Midtown Design Charrette and the establishment of conservancies to preserve the Grant Park cross and Ventura's cherished hillsides.

City government has learned from these efforts to reach broadly and deeply into the community. Civic engagement and trust are built when City representatives actively seek to involve everyone in positive and transparent partnerships. That goal requires a continually evolving effort to promote participation:

- through proactive and interactive media outreach in the press, on the web, on radio and television,
- by striving to include everyone in decision making and making it convenient for them to participate by seeking them out in their neighborhoods and gathering places like schools, houses of worship and public spaces, and
- through community dialogues, workshops, charrettes, town hall forums, and community councils, in addition to formal public hearings.

More effort needs to be put into building consensus about future growth and change upfront through community planning, rather than waiting until specific development projects are proposed. That effort will continue with the work to craft a citywide "form-based code" and concentrated planning efforts for specific neighborhoods and districts.

Focused attention should be paid to making our public decision-making processes easier to understand and participate in. Citizens have little time or patience for complicated planning and entitlement processes that drag on for years. By establishing clearer rules and public processes for applying them, the policies and actions in this chapter will enable more citizens to feel that they will be heard and their contributions valued. By involving a wider range of the community in clearly setting Ventura's planning goals and standards of quality, we can devote more time to achieving those goals and less time wrangling over specific proposals.

Ventura also needs to reestablish places for civic discourse. While the City will continue to encourage the use of our beautiful City Hall for its historic role of government by and for the people, we also need a hierarchy of civic spaces citywide that are strategically located in neighborhood centers and accessible by pedestrians (see Chapter Three, Action 3.8). Every neighborhood should have access to a physical location designated for public gathering and civic purposes.

Our long-range vision is to build an ethic and a fabric of robust civic engagement – what De Toqueville called “the habits of the heart.” His phrase evokes what the Ventura Vision called “direct engagement in public affairs” through “participation, hard work and collaboration . . . sustaining Ventura as an exceptional place.” The policies and actions in this chapter aim to do just that.

Policy 10A: Work collaboratively to increase citizen participation in public affairs.

Action 10.1: Conduct focused outreach efforts to encourage all members of the community – including youth, seniors, special needs groups, and non-English speakers – to participate in City activities.

Action 10.2: Obtain public participation by seeking out citizens in their neighborhoods and gathering places such as schools, houses of worship and public spaces.

Action 10.3: Invite civic, neighborhood, and non-profit groups to assist with City project and program planning and implementation.

Action 10.4: Provide incentives for City staff to participate in community and volunteer activities.

Action 10.5: Invite seniors to mentor youth and serve as guides at historical sites.

Action 10.6: Offer internships in City governance, and include youth representatives on public bodies.

Action 10.7: Continue to offer the Ambassadors program to obtain citizens assistance with City projects.

Policy 10B: Raise awareness of City operations and be clear about City objectives.

Action 10.8: Utilize the City website as a key source of information and expand it to serve as a tool for civic engagement.

Action 10.9: Publish an annual report that evaluates City performance in such areas as conservation, housing, and economic development.

Action 10.10: Continue to improve the user-friendliness of the media that communicate information about the City,

including the website, cable channels, newsletters, kiosks, and water billing statements.

Policy 10 C: Work at the neighborhood level to promote citizen engagement.

Action 10.11: Establish a clear policy toward the scope, role, boundaries, and jurisdiction of neighborhood Community Councils citywide, with the objectives of strengthening their roles in decision-making.

Action 10.12: Establish stronger partnerships with neighborhood Community Councils to set area priorities for capital investment, community policing, City services, commercial investment, physical planning, education, and other concerns, to guide both City policies and day-to-day cooperation and problem-solving. 

Action 10.13: Recognizing that neighborhood empowerment must be balanced and sustained by overall City policies and citywide vision and resources – establish a citywide Neighborhood Community Congress where local neighborhood Community Councils can collaborate and learn from each other. 

Action 10.14: Establish clear liaison relationships to foster communication, training, and involvement efforts between the City, neighborhood Community Councils and other community partners, including the Ventura Unified School District and business, civic, cultural and religious groups.

"Individual commitment to a group effort, that is what makes a team work, a company work, a society work, a civilization work."
— Vince Lombardi

ORDINANCE NO. 95-33

AN ORDINANCE OF THE PEOPLE OF THE CITY OF SAN BUENAVENTURA ADOPTING AN ORDINANCE AMENDING THE COMPREHENSIVE PLAN WITH RESPECT TO THE PRESERVATION OF AGRICULTURAL LANDS.

The people of the City of San Buenaventura do hereby ordain as follows:

Section 1. Findings and Purpose.

A. The protection of existing agricultural and watershed lands is of critical importance to present and future residents of the City of San Buenaventura (City of Ventura). Agriculture has been and remains the major contributor to the economy of the City and County of Ventura, creating employment for many people, directly and indirectly, and generating substantial tax revenues for the City.

B. In particular, the City of Ventura and surrounding area, with its unique combination of soils, micro-climate and hydrology, has become one of the finest growing regions in the world. Vegetable and fruit production from the County of Ventura and in particular production from the soils and silt from the Santa Clara and Ventura rivers have achieved international acclaim, enhancing the City's economy and reputation.

C. Uncontrolled urban encroachment into agricultural and watershed areas will impair agriculture and threaten the public health, safety and welfare by causing increased traffic congestion, associated air pollution, and potentially serious water problems, such as pollution, depletion, and sedimentation of available water resources. Such urban encroachment would eventually result in both the unnecessary, expensive extension of public services and facilities and inevitable conflicts between urban and agricultural uses.

D. The unique character of the City of Ventura and quality of life of City residents depend on the protection of a substantial amount of open space lands. The protection of such lands not only ensures the continued viability of agriculture, but also protects the available water supply and contributes to flood control and the protection of wildlife, environmentally sensitive areas, and irreplaceable natural resources.

E. The Resolution by which the City of Ventura adopted its Comprehensive Plan on August 28, 1989, Resolution No. 89-103, at page 4, contains in part the following “mitigation measures” in recognition of the importance of preserving agriculture resources:

“Any potential significant adverse impacts are mitigated by substantially limiting the amount of agricultural land converted from an agricultural land use designation limiting the amount of prime farmland converted, and by making the various agricultural land areas designated for potential development subject to conditions which narrowly limit the possible land use.”

F. The Comprehensive Plan sets out as Objective 4 (at II-9) the desire to:

“Continue to preserve agricultural and other open space lands within the City’s Planning Area.”

And, the Comprehensive Plan describes as the first Goal of its Resource Element (at II-3) the objective to:

“Preserve agricultural and open space lands as a desirable means of shaping the City’s internal and external form and size, and of serving the needs of residents.”

G. The purpose of this initiative is to ensure that the Goals and Objectives of the Comprehensive Plan are inviolable by transitory short-term political decisions and that agricultural, watershed and open space lands are not prematurely or unnecessarily converted to other non-agricultural or non-open space uses without public debate and a vote of the people. Accordingly, the initiative ensures that until December 31, 2030, the general plan provisions governing agricultural land use designation and intent may not be change except by vote of the people. In addition, the initiative provides that any lands designated as “Agriculture Use”, referring to both “Agricultural Use (not to be reconsidered until after the Year 2010” and Agricultural/Institutional” on the City of Ventura’s General Plan “Land Use Plan Map” adopted by the City Council by Resolution 89-103 on August 28, 1989, as amended through February 1, 1995, will remain designated as Agricultural Use until December 31, 2030, unless the land is redesignated to another land use category by vote of the people, or redesignated by the City Council for the City of San Buenaventura pursuant to the procedures set forth in this initiative.

H. This initiative allows the City Council to redesignate agriculture lands only if certain findings can be made, including (among other things) that the land is proven to be unsuitable for any form of agriculture and redesignation is necessary to avoid an unconstitutional taking of property without just compensation.

Section 2. General Plan Amendment.

The Agricultural Lands Preservation Initiative hereby reaffirms and readopts until December 31, 2030, The “Agricultural Use” designations as defined in the City of San Buenaventura Comprehensive Plan adopted August 28, 1989, as amended through February 1, 1995, at pages III-25 and III-26, with the modification that the “target date” is extended from 2010 until after December 31, 2030.

The following terminology shall replace the current “Agricultural Use” designation defined at page III-25 of The Plan:

Agricultural Use

The Agricultural Use (not to be reconsidered until after the Year 2030) category identifies those lands that are designated for agricultural use on the Land Use Plan Map.

The target date of 2030 associated with the Agricultural Use designation indicates a review date after which agriculturally designated lands may be reconsidered for urban uses. However, during the life of this plan as amended by initiative, it is intended that only agricultural uses are permitted on these lands, except as such lands may be appropriate to public open space and recreational usage. Furthermore, any updates to this Plan are not intended to imply that development would necessarily be appropriate at that time.

In addition, the initiative hereby reaffirms and readopts until December 31, 2030, the “Agricultural” designations set forth on the of the City of Ventura Comprehensive Plan “Land Use Plan Map” adopted by the City Council on August 28, 1989, as amended through February 1, 1995, which map is incorporated herein by reference, modified, as appropriate, to delete the reference year 2010 and replace it with the reference year 2030.

Finally, the text of the Amendment Procedures of the City of Ventura Comprehensive Plan adopted August 28, 1989, as amended through February 1, 1995, (at XI-I) shall be amended to add a new subsection which provides:

Limitation on General Plan Amendments Relating to “Agricultural Use”

- a) Until December 31, 2030, the provisions and designations governing the intent for lands designated “Agricultural Use” of the Land Use Element and Resource Element adopted on August 28, 1989, as amended through February 1, 1995, shall not be amended unless such amendment is approved by vote of the people.
- b) All those lands designated as “Agricultural Use” in the City of Ventura Comprehensive Plan “Land Use Plan Map” adopted by the City Council on August 28, 1989 as amended through February 1, 1995, shall remain so designated until December 31, 2030 unless redesignated to another general plan land use category by vote of the people, or redesignated by the City Council pursuant to the procedures set forth in subsections c) or d), below.
- c) Except as provided in subsection d), below, land designated as “Agricultural Use” may be redesignated by the City Council to a land use other than “Agricultural Use” as defined by the Comprehensive Plan adopted by the City Council on August 28, 1989, as amended through February 1, 1995, only if the City Council makes all of the following findings supported by the evidence:
 - i) The land is immediately adjacent to areas developed in a manner comparable to the proposed use;
 - ii) Adequate public services and facilities are available and have the capacity and capability to accommodate the proposed use;
 - iii) The proposed use is compatible with agricultural uses, does not interfere with accepted agricultural practices, and does not adversely affect the stability of land use patterns in the area;
 - iv) The land proposed for redesignation has not been used for agricultural purposes in the past 2 years and is unusable for agriculture due to its topography, drainage, flooding, adverse soil conditions or other physical reasons; and

- v) The land proposed for redesignation pursuant to this subsection (c) does not exceed 40 acres for any one landowner in any calendar year, and one landowner may not obtain redesignation in the Comprehensive Plan of “Agricultural Use” land pursuant to this subsection (c) more often than every other year. Landowners with any unity of interest are considered one landowner for purposes of this limitation.
- d) Land designated as “Agricultural Use” on the Land Use Plan Map may be redesignated to another land use category by the City Council if each of the following conditions are satisfied:
 - i) The City Council makes a finding that the application of the provisions of Section 2 (a) would constitute an unconstitutional taking of the landowners’ property; and
 - ii) In permitting the redesignation, the City Council allows additional land uses only to the extent necessary to avoid said unconstitutional taking of the landowner’s property.
- e) Approval by a vote of the people is accomplished when a Comprehensive Plan amendment is placed on the ballot through any procedure provided for in the Election Code, and a majority of the voters vote in favor of it. Whenever the City Council adopts an amendment requiring approval by a vote of the people pursuant to the provisions of this subsection, the City Council’s action shall have no effect until after such a vote is held and a majority of the voters vote in favor of it. The City Council shall follow the provisions of the Election Code in all matters pertaining to such an election.

Section 3. Implementation.

A. Upon the effective date of this initiative, the initiative shall be deemed inserted in the City of Ventura’s Comprehensive Plan as an amendment thereof; except, that if the four amendments of the mandatory elements of the general plan permitted by state law for any given calendar year have already been utilized in 1995, prior to the effective date of this initiative, this Comprehensive Plan amendment shall be deemed inserted in the City’s General Plan on January 1, 1996. At such time as this Comprehensive Plan amendment is deemed inserted in the City’s Comprehensive Plan (hereinafter, the “insertion date”) any provisions of the City’s Zoning Ordinance inconsistent with that amendment shall not be enforced to the extent of the inconsistency. Within 180 days of the insertion date, the City shall complete

such revisions of its Comprehensive Plan, including, but not limited to, the Comprehensive Plan Land Use Plan Map adopted by the City Council on August 28, 1989, (as amended through February 1, 1995) and accompanying test, as are necessary to achieve consistency with all provisions of this initiative. Also, within 180 days of the insertion date, the City Council shall complete such revisions of its Zoning Ordinance and other land use regulations as are necessary to conform to and be consistent with all provisions of this initiative.

B. The provisions of this initiative shall prevail over any revisions to the City of Ventura's Comprehensive Plan as amended through February 1, 1995, or to the City of Ventura's Land Use Plan Map as amended through February 1, 1995 which conflict with the initiative. Except as provided in Section 4 below, upon the specific plans, tentative or final subdivision maps, parcel maps, conditional use permits, building permits or other ministerial or discretionary entitlements for use not yet approved or issued shall not be approved or issued unless consistent with the policies and provisions of this initiative.

Section 4. Exemptions for Certain Projects.

This initiative shall not apply to or affect any property owner whose property has acquired any of the following prior to its effective date:

- A. A vested right pursuant to state law;
- B. A validly approved and fully executed development agreement with the City; or
- C. Approval of a vesting tentative map.

Section 5. Severability.

If any portion of this initiative is declared invalid by a court, the remaining portions are to be considered valid.

Section 6. Amendment or Repeal.

This initiative may be amended or repealed only by the voters at a general election.

STATE OF CALIFORNIA)
COUNTY OF VENTURA) ss
CITY OF SAN BUENAVENTURA)

I, BARBARA J. KAM, City Clerk of the City of San Buenaventura, California, do hereby certify that the foregoing Ordinance was adopted by the voters of the City of San Buenaventura at the General Municipal Election held on November 7, 1995 and subsequently declared adopted by the City Council of the City of San Buenaventura on November 27, 1995. The Ordinance shall take effect December 7, 1995. This ordinance shall not be repealed or amended except by a vote of the people, unless provision is otherwise made in the original ordinance.

Dated this 30th day of November, 1995.

Barbara J. Kam, CMC
City Clerk

Ventura Hillside Voter Participation Measure

The people of the City of San Buenaventura do ordain as follows:

Section 1. Title

This measure shall be known as the Ventura Hillside Voter Participation Measure.

Section 2. Purpose

The overall purpose of this measure is to allow City voters to participate in the review process relating to non-exempt development projects that may be proposed in a certain portion of the “Hillside Area” of the City as defined in the City’s Comprehensive Plan Update to the Year 2010 (hereafter the “Comprehensive Plan”). The portion of the Hillside Area under consideration lies generally north of the City, constitutes an area approximately 9108 acres in size, and is further depicted as the “Hillside Voter Participation Area” indicated in Exhibit “A” attached hereto and made a part hereof. The proposed Hillside Voter Participation Area (also referred to from time to time hereafter as “HVP Area” or “HVPA”) is outside the Ventura City limits, but it is within the “Planning Area” of the City of San Buenaventura as further indicated on Exhibit “A.” The Comprehensive Plan Land Use Map currently designates the properties within the proposed Hillside Voter Participation Area as “Hillside Planned Residential” or “HPR” rather than “Agricultural” and, therefore, these properties are not subject to the Save Our Agricultural Resources (“SOAR”) Initiative adopted by the voters in 1995.

In the recent past, some property owners within the proposed Hillside Voter Participation Area have publicly presented initial proposals to develop those properties with a combination of residential uses and open space and recreational areas proposed to include, among other things, hiking and equestrian trails for use by the public. In the course of public meetings and informational workshops discussing these proposals, it has become apparent that there is a high level of public concern over potential issues of scenic resource protection, open space and recreational opportunities, infrastructure needs, traffic circulation, and other development-related issues arising from any proposed changes in the use of this important part of the City’s Planning Area. This measure, in recognition of this heightened public concern, is intended to provide the electorate of the City of San Buenaventura with an opportunity to vote on the approval of any such development proposals or any similar proposals to extend urban services to the Hillside Voter Participation Area or develop property in the Hillside Voter Participation Area with urbanized land uses.

More particularly, this measure proposes to amend the Comprehensive Plan of the City of San Buenaventura by adding a requirement that approvals for extensions of “urban services” (defined in the City’s Hillside Management Program as the provision of domestic water and sewers) or any proposed “urbanized uses of land” (as defined herein) in the Hillside Voter Participation Area cannot be granted without prior approval by a majority vote of the electorate.

Section 3. Comprehensive Plan Amendment

The following text shall be inserted into the Land Use Element of the Comprehensive Plan at page 111-8 thereof:

Hillside Voter Participation Area

The electorate of the City of Ventura has adopted a Hillside Voter Participation Area (Ventura HVP Area). Its purpose, principles, implementation procedures, and methodologies for amendment are set forth in this Comprehensive Plan amendment.

A. PURPOSE

The City of Ventura Hillside Area, with its unique topography, viewsheds, watershed lands; its unique microclimate and hydrology, and its diversity of plant and wildlife resources, is one of the finest scenic resources in the Southern California region. The Comprehensive Plan recognizes the unique and important qualities and potential of the Hillside Area in, among other provisions, the declaration of specialized Objectives and Policies for the Hillside Area in the Resources Element of the Plan and the Plan’s requirements for continuing operation of, and compliance with, the City’s Hillside Management Program.

This Comprehensive Plan amendment is intended to provide for an increased level of public awareness and participation in the development review process applicable to that portion of the Hillside Area described and depicted in Exhibit “A” as the “Hillside Voter Participation Area.” It is further intended to provide assurance to the public that any proposed development in the Hillside Voter Participation Area appropriately takes into account the Area’s unique combination of viewshed, watershed, open space, scenic area, and environmentally sensitive habitat, and that agricultural, viewshed, watershed, and open space lands in the Hillside Voter Participation Area are not converted to urban or other non-open space uses without public discussion and a vote of the people. Increasing citizen participation in the development review process through the establishment of a Hillside Voter Participation Area enhances the City’s sense of community, allows for development unique to the City of Ventura, and promotes the efficient use of the City’s infrastructure.

More specifically, this Comprehensive Plan amendment is intended to provide an opportunity for the public to be involved in insuring that any development projects proposed in the Hillside Voter Participation Area, shall, at a minimum:

1. Maintain the scenic character of the hillsides in areas of future development, by preserving significant natural landmarks and scenic ridgelines and slopes.
2. Provide increased recreational opportunities for existing and future hillside and other City residents, by improving access to existing parks and establishing additional parks or open, non-developed areas in conjunction with future hillside development.
3. Maximize public access to hillside open space and recreation areas, by establishing a system of linear parks and hiking trails along scenic ridges and barrancas.
4. Minimize the impact of hillside development on sensitive natural habitats and historical or archaeological resources.

B. PRINCIPLES

Inappropriate urban encroachment into Hillside open space, viewshed, watershed, scenic areas, and biological resource areas would have the potential to impact sensitive environmental areas, unwarrantedly intrude on open space, diminish the quality of life and threaten the public health, safety and welfare by leading to increased traffic congestion, associated air pollution, erosion, alteration of sensitive lands in watershed areas and causing potentially serious water problems, such as pollution, depletion and sedimentation of available water resources not only for the City of Ventura, but for its jurisdictional neighbors. Inappropriate urban encroachment could further result in the unwarranted extension of public services and facilities into sensitive areas.

The unique character of the City of Ventura and quality of life of City residents depends on the appropriate protection of the Hillside Area's substantial amount of open space, viewshed, watershed, scenic resources, and biological resources. The increased public awareness and involvement in the fate of such lands through the implementation of this Comprehensive Plan amendment will provide the public a special opportunity to assure that future generations of Ventura citizens will not be deprived of the benefits of access to a viable water supply, flood and erosion control, protection of viewsheds, wildlife, environmentally sensitive areas, open space and recreational areas, and irreplaceable natural resources.

C. IMPLEMENTATION

(1) There is hereby established a Ventura Hillside Voter Participation Area (Ventura HVP Area). The Ventura HVP Area is that portion of the Hillside Area delineated and depicted in Exhibit “A” of this Comprehensive Plan amendment (hereafter, the “HVP Area Map”). As shown on the HVP Area Map, the southern boundary of the HVP Area generally follows the northern segment of the City’s incorporated limit as established by the Local Agency Formation Commission for the City of Ventura, except as the HVP boundary line runs northerly of some small residential lots on or near Foothill Road west of Arroyo Verde Park as further depicted on Exhibit “A.” East of Harmon Barranca, the HVP Area boundary generally follows the alignment of Foothill Road eastward to the boundary of the City’s Planning Area. The northerly boundary of the HVP Area continues, generally, as the northern boundary of the City’s Planning Area. The westerly boundary of the HVP Area alternately follows the City limit boundary or Sphere of Influence boundary easterly of the North Avenue area. The foregoing narrative description is intended to be general in nature and all of the foregoing is more particularly depicted and described in Exhibit “A’

Insofar as the HVP Area boundary described and depicted in this Comprehensive Plan amendment, including Exhibit “A” hereto, is said or shown to be coterminous with either the City’s incorporated limit or the City’s Sphere of Influence boundary, or with the boundary of the City’s Planning Area, such references are intended to be, and shall be construed to be, the location of the City limit boundary or Sphere of Influence boundary or boundary of the City’s Planning Area. as applicable, as each of those boundaries are established for the City of Ventura as of January 1, 2001. Although the HVP Area boundary is established, in part, in generally the same location as the City limit boundary, or in some instances, the Sphere of Influence boundary, the establishment of the HVP Area boundary is not intended to and shall in no way inhibit the Local Agency Formation Commission from changing or altering the City limit boundary or Sphere of Influence boundary in accordance with State law. The boundary of the HVP Area, although incidentally coterminous as of one point in time with the City limit boundary or Sphere of Influence boundary or boundary of the City’s Planning Area, is independent from these boundaries in legal significance and purpose. While the City limit boundary or Sphere of Influence boundary may be, from time to time, altered by the Local Agency Formation Commission, or the boundary of the City’s Planning Area may be changed, the HVP Area boundary shall not be changed except as provided herein.

(2) Until December 31, 2030, the City of Ventura shall not extend urban services into, and shall not authorize urbanized uses of land within, the Ventura Hillside Voter Participation Area unless otherwise authorized by a vote of the people, except for the purpose of construction of public potable water facilities, public parks or other city government facilities or as otherwise provided or excepted herein. Upon the effective date of this Hillside Voter Participation Area Comprehensive

Plan amendment, the City and its departments, boards, commissions, officers and employees shall not grant, or by inaction allow to be approved by operation of law, any Comprehensive Plan amendment, rezoning, specific plan, subdivision map, conditional use permit, building permit or any other ministerial or discretionary entitlement, which is inconsistent with the purposes of this Comprehensive Plan amendment, unless in accordance with the amendment procedures of Section 4 of this Comprehensive Plan amendment.

(3) "Urbanized uses of land" shall mean any development that would require the establishment of new community sewer systems or the significant expansion of existing community sewer systems; or, would result in the creation of residential densities greater than one primary residential unit per 40 acres in area; or, would result in the establishment of commercial or industrial uses that are neither agriculturally-related nor related to the production of mineral resources.

(4) The Land Use Map is amended to reflect the existence of the Ventura Hillside Voter Participation Area as generally described in paragraph (1) above and as depicted in Exhibit "A," attached hereto.

(5) The Hillside Voter Participation Area, as defined herein, may not be amended, altered, revoked or otherwise changed prior to December 31, 2030, except by vote of the people or by the City Council pursuant to the procedures set forth in Section 4 of this Comprehensive Plan amendment. For purposes of this Ordinance, approval by a vote of the people is accomplished when a Comprehensive Plan amendment is placed on the ballot through any procedure provided for in the Election Code, and a majority of the voters vote in favor of it. Whenever the City Council adopts an amendment requiring approval by a vote of the people pursuant to the provisions of this subsection, the City Council's action shall have no effect until after such a vote is held and a majority of the voters vote in favor of it. The City Council shall follow the provisions of the Election Code in all matters pertaining to such an election.

Section 4. Changes to Area: Procedures.

Until December 31, 2030, the foregoing Purposes, Principles and Implementation provisions of this Comprehensive Plan amendment, and the Hillside Voter Participation Area may be amended only by a vote of the people commenced pursuant to the initiative process by the public, or pursuant to the procedures set forth below:

A. The City Council may amend the boundary of the Hillside Voter Participation Area depicted on Exhibit "A" if it finds such amendment to be in the public interest, provided that the amended boundary enlarges said Hillside Voter Participation Area established by this Comprehensive Plan amendment.

B. The City Council, following at least one public hearing for presentation by an applicant and the public, and after compliance with the California Environmental Quality Act, may amend the Hillside Voter Participation Area described herein, based on substantial evidence in the record, if the City Council makes each of the following findings:

- (1) Application of the provisions of subsections (A) or (B) of the amendment procedures set forth in this Section 4 are unworkable and failure to amend the Hillside Voter Participation Area would constitute an unconstitutional taking of a landowner's property for which compensation would be required or would deprive the landowner of a vested right; and
- (2) The amendment and associated land use designations will allow additional land uses only to the minimum extent necessary to avoid said unconstitutional taking of the landowner's property or to give effect to the vested right.

C. The City Council, following at least one public hearing for presentations by an applicant and the public, and after compliance with the California Environmental Quality Act, may place any amendment to the Hillside Voter Participation Area or the provisions of this Comprehensive Plan amendment on the ballot pursuant to the mechanisms provided by state law.

D. The Comprehensive Plan may be reorganized and individual provisions, including the provisions of this ordinance, maybe renumbered or reordered in the course of ongoing updates of the Comprehensive Plan in accordance with the requirements of state law.

Section 5. No Changes to Save Our Agricultural Resources Initiative

Any restrictions imposed upon the City of San Buenaventura limiting the City's ability to redesignate, or allow development of, property designated "Agricultural" that are in effect as a result of the "SOAR" initiative approved by the voters in 1995 and adopted by the City Council as Ordinance No. 95-33 shall remain in full force and effect and shall not be amended, modified, altered, or abridged by the adoption of this ordinance.

Section 6. Exemptions:

The provisions of this ordinance do not apply to:

A. Construction or reconstruction of, or related to, public potable water facilities, public parks or other city government facilities; or

B. Construction or reconstruction of no more than one residential dwelling unit, and incidental uses or structures related thereto, on an individual parcel of land that is lawfully established of record as of the effective date of this Comprehensive Plan amendment and that is contiguous to the City's incorporation boundary but only to the extent that such a legally established parcel is developed with, or proposed to be developed with, no more than one residential dwelling unit; or

C. Any development that would result in the creation of residential densities equal to or less than one primary residential unit per 40 acres in area; or, would result in the establishment of commercial or industrial uses that are agriculturally-related or related to the production of mineral resources; or

D. Any development project that has obtained, as of the effective date of this Comprehensive Plan amendment, a vested right pursuant to state or local law; or

E. Uses that are "incidental" (as the City's Zoning Ordinance defines "incidental uses") to uses lawfully established as of the effective date of this Comprehensive Plan amendment.

Section 7. Interpretation

This ordinance shall be broadly construed in order to achieve the purposes stated in this ordinance. It is the intent of the voters that the provisions of this measure shall be interpreted by the City and others in a manner that promotes public participation in decision-making relating to future development proposals within in the Hillside Voter Participation Area.

Section 8. Insertion Date

A. Upon the effective date of this ordinance, Sections 3, 4, 5, 6, and 7 of this ordinance shall be deemed inserted in the Comprehensive Plan and the Land Use Map referred to in Part C of Section 3 shall be deemed amended even though the reprinting may not occur until it can be carried out by the staff of the City of San Buenaventura.

B. The Comprehensive Plan in effect at the time the City Council decided to place this measure on the ballot, and the Comprehensive Plan as amended by this ordinance, comprise an integrated, internally consistent and compatible statement of policies for the City of San Buenaventura. In order to ensure that the Comprehensive Plan remains an integrated, internally consistent and compatible statement of policies and to ensure that the actions of the voters in enacting this ordinance are given effect, any provision of the Comprehensive Plan that is adopted between July 23, 2001 and the effective date of this ordinance, to the extent that such provision is inconsistent with this ordinance, shall be amended as soon as possible and in the manner and time required by state law to ensure consistency between such provision and Section 3 of this ordinance. In the alternative, such interim-enacted inconsistent provisions shall be repealed.

Section 9. Amendment or Repeal

This ordinance may be amended or repealed only by the voters of the City of San Buenaventura at an election held in accordance with state law, except as expressly provided by Section 4 herein.

V E N T U R A C O M M U N I T Y P A R K S O A R A M E N D M E N T

The people of the City of San Buenaventura do ordain as follows:

Section 1. Title

This measure shall be known as the Ventura Community Park SOAR Amendment.

Section 2. Purpose

The purpose of this measure is to allow the City to develop a Community Park on a parcel of property located at the northwest corner of the intersection of Kimball Road and Telephone Road. The subject property, which is approximately 100 acres in size, is further described in Exhibit "A," attached hereto and made a part hereof, and is hereafter referred to as the "Property." Most of the Property is outside the Ventura City limits but within the "Planning Area" of the City of San Buenaventura and therefore covered by the City's Comprehensive Plan Update to the Year 2010 (hereafter the "Comprehensive Plan"). The Property is currently designated "Agricultural" under the Comprehensive Plan and, therefore, also subject to the 1995 Save Our Agricultural Resources ("SOAR") Initiative.

The City is proposing to develop the Property with community-oriented public park facilities that may include, among other things, athletic fields, an aquatic facility, a community center and other related buildings and structures for use by the public. If this measure is approved, the City may also construct and operate a fire station on a portion of the Property.

This initiative proposes to amend the Comprehensive Plan of the City of San Buenaventura, by changing the designation of the Property in the Comprehensive Plan Land Use Plan Map from "Agricultural" (or "A") to "Parks" (or "P"). This will allow the City of San Buenaventura to potentially develop the Property with a Community Park without being restricted by the SOAR Initiative.

Section 3. Comprehensive Plan Amendment

Part A.

The following paragraph titled “Parks Uses” is hereby added to the Land Use Element of the Comprehensive Plan, more particularly, to the provisions of the Serra Community Intent and Rationale Statement on page III-96, to read as follows:

“Parks Uses: The Parks Land Use Plan designation is applied to an approximately 100-acre site at the northwest corner of Kimball Road and Telephone Road for the purpose of developing a multi-purpose community-oriented public park on this site. It is further intended that this site should be zoned to the “P” (Parks) zone if and when it is annexed to the City. Design Review should be carried out by the City's Planning Commission prior to the development of any Recreation Services use types on the site to assure that the range of community park uses potentially permitted on the site by the "P" zone are well integrated on the site and compatible with adjacent land uses.”

Part B.

The Property is deleted from the discussion of “Agricultural Uses” in the Serra Community provisions of the Land Use Element of the Comprehensive Plan. To that end, the final paragraph with the heading “Agricultural Use” beginning at the bottom of page III-95 and ending at the top of page III-96 is hereby revised to read as follows:

“Agricultural Use: A 297-acre area between Telephone Road and the Southern Pacific Railroad and a 172-acre area between Bristol Road and the Santa Clara River are designated Agricultural Use, not to be reconsidered until after the Year 2010, to preserve their existing agricultural character.”

Part C.

The Land Use Plan Map incorporated in the Comprehensive Plan is hereby amended, and official copies thereof shall be revised by City staff, to reflect the foregoing amendments to the text of the Land Use Element.

Section 4. Zoning

Upon annexation to the City of San Buenaventura, the zoning classification for the Property shall be “P” (Parks) and the Official Zoning District Map incorporated in the Zoning Ordinance shall, by this Measure, be amended, and official copies thereof shall be revised by City staff, to reflect the foregoing zone change to the Property.

Section 5. Save Open-Space and Agricultural Resources

Any restrictions imposed upon the City of San Buenaventura limiting the City’s ability to redesignate, or allow development of, property designated “Agricultural” that are in effect on the day that this Initiative is approved by the voters shall remain in full force and effect except as to the Property. The City of San Buenaventura may allow development of a community park on the Property in accordance with this ordinance.

Section 6. Interpretation

This ordinance shall be broadly construed in order to achieve the purposes stated in this ordinance. It is the intent of the voters that the provisions of this ordinance shall be interpreted by the City of San Buenaventura and others in a manner that facilitates the development of a community park on the Property in accordance with the purposes of this ordinance.

Section 7. Insertion Date

Part A. Upon the effective date of this ordinance, Part A and Part B of Section 3 of this ordinance shall be deemed inserted in the Comprehensive Plan and the Land Use Map referred to in Part C of Section 3 shall be deemed amended even though the reprinting may not occur until it can be carried out by the staff of the City of San Buenaventura.

Part B. The Comprehensive Plan in effect at the time the City Council decided to place this measure on the ballot, and the Comprehensive Plan as amended by this ordinance, comprise an integrated, internally consistent and compatible statement of policies for the City of San Buenaventura.

V E N T U R A C O M M U N I T Y P A R K S O A R A M E N D M E N T

In order to ensure that the Comprehensive Plan remains an integrated, internally consistent and compatible statement of policies and to ensure that the actions of the voters in enacting this ordinance are given effect, any provision of the Comprehensive Plan that is adopted between [the date the City Council decided to place this measure on the ballot] and the effective date of this ordinance, to the extent that such provision is inconsistent with this ordinance, shall be amended as soon as possible and in the manner and time required by state law to ensure consistency between such provision and Section 3 of this ordinance. In the alternative, such interim-enacted inconsistent provisions shall be repealed.

Section 8. Amendment or Repeal

Section 3 and Section 4 of this ordinance may be amended or repealed only by the voters of the City of San Buenaventura at an election held in accordance with state law.

The people of the City of San Buenaventura do ordain as follows:

Section 1. Title

This ordinance shall be known as the First Assembly of God Land Initiative.

Section 2. Purpose

The purpose of this ordinance is to allow the First Assembly of God (hereafter “Church”) to develop a property located at the northwest corner of the intersection of Montgomery Avenue and Northbank Drive. Such property is 25.59 acres and is further described in Exhibit A, attached hereto and made a part hereof, and is hereafter referred to as “Property”. The Church wishes to develop the Property in accordance with City of San Buenaventura Ordinance No 95-33 (commonly known as “SOAR”) guidelines for a sanctuary, related Church buildings, and athletic fields for use by the community of San Buenaventura.

Since the Property is within the sphere of influence of the City of San Buenaventura, this ordinance (1) amends the Comprehensive Plan Update to the Year 2010 (hereafter the “General Plan”) of the City of San Buenaventura, and (2) rezones the Property to the R-1 Single Family zone with a subzone of R-1-1AC. This will allow the City of San Buenaventura to annex the Property with a restricted land use that is compatible with the Church’s development of the Property.

Section 3. General Plan Amendment

Part A.

The second paragraph under the heading “Residential Uses” appearing on page III-94 of the General Plan describes the areas that may be used for low-density, single family homes in the Serra Community area of the City of San Buenaventura. The single family use (designated as SF in the General Plan) is the most restrictive land use that will allow the Church to build a sanctuary, related church buildings, and athletic fields. Section 4 of this initiative will further restrict the Property by pre-zoning the Property and requiring a minimum of one acre for each parcel. This will make the Property unattractive for single family development but still acceptable for the Church sanctuary, related Church buildings, and athletic fields. This ordinance adds the Church’s 25.59 acre parcel to the SF land use.

The second paragraph under the heading “Residential Uses” appearing on page III-94 of the General Plan is hereby amended to read as follows:

“The SF category is applied to an approximately 3-acre site at the southeast corner of Henderson and Petit Avenue, a 1.7-acre site southerly of Darling Road extended, and a 25.59-acre site located at the northwest corner of Montgomery Avenue and Northbank Drive.”

Part B.

The final paragraph with the heading “Agricultural Use” beginning at the bottom of page III-95 and ending at the top of page III-96 of the General Plan describes that portion of the Serra Community area of the City of San Buenaventura which may only be used for agricultural uses. This ordinance deletes the Church’s 25.59 acre parcel from the agricultural use category.

The final paragraph with the heading “Agricultural Use” beginning at the bottom of page III-95 and ending at the top of page III-96 of the General Plan is hereby amended to read as follows:

“Agricultural Use: A 100-acre site at the northwest corner of Kimball Road and Telephone, a 297-acre area between Telephone Road and the Southern Pacific Railroad except for the 25.59-acre site located at the northwest corner of Montgomery Avenue and Northbank Drive, and a 172-acre area between Bristol Road and the Santa Clara River are designated Agricultural Use, not to be reconsidered until after the Year 2010, to preserve their existing agricultural character.”

Part C.

The map of the Land Use Plan contained in the General Plan shall be redrafted to reflect the foregoing amendments.

Section 4. Zoning

The most restrictive zoning in the City of San Buenaventura which will allow the Church to build a sanctuary, related Church buildings, and athletic fields on the Property is an R-1 Single Family zone with a subzone of R-1-1AC. The R-1-1AC subzone restricts the Property by requiring a minimum of one acre for each parcel. This will make the Property unattractive for single family development but still acceptable for the Church's sanctuary, related Church buildings, and athletic fields.

Therefore, upon annexation of the Property to the City of San Buenaventura the zoning designation for the Property shall be the R-1 Single Family zone with a subzone of R-1-1AC.

Section 5. Save Open-Space and Agricultural Resources

Any restrictions imposed upon the City of San Buenaventura limiting the City's ability to annex property and allow development of such property shall remain in full force and effect except as to the 25.59-acres of the Property.

Section 6. Construction

This ordinance shall be broadly construed in order to achieve the purposes stated in this ordinance. It is the intent of the voters that the provisions of this ordinance shall be interpreted by the City of San Buenaventura and others in a manner that facilitates the development of the Property in accordance with the purposes of this ordinance.

Section 7. Insertion Date

Part A. Upon the effective date of this ordinance, Part A and Part B of Section 3 of this ordinance shall be deemed inserted in the General Plan and the Land Use Map referred to in Part C of Section 3 shall be deemed amended even though the reprinting may not occur until deemed convenient by the City of San Buenaventura.

Part B. The General Plan in effect at the time the Notice of Intention to circulate this initiative was submitted to the City Clerk of the City of San Buenaventura, and the General Plan as amended by this ordinance, comprise an integrated, internally consistent and compatible statement of policies for the City of San Buenaventura. In order to ensure that the General Plan remains an integrated, internally consistent and compatible statement of policies and to ensure that the actions of the voters in enacting this ordinance are given effect, any provision of the General Plan that is adopted between the Notice of Intention and the effective date of this ordinance, to the extent that such provision is inconsistent with this ordinance, shall be amended as soon as possible and in the manner and time required by state law to ensure consistency between such provision and Section 3 of this ordinance. In the alternative, such interim-enacted inconsistent provisions shall be repealed.

Section 8. Amendment or Repeal

Section 3 and Section 4 of this ordinance may be amended or repealed only by the voters of the City of San Buenaventura at an election held in accordance with state law.

EXHIBIT "A"

PARCEL 1:

That portion of Subdivision 98 of Rancho Santa Paula y Saticoy, in the county of Ventura, state of California, as per map recorded in book "A" pag3 290 of Miscellaneous Records (Transcribed Records from Santa Barbara County), in the office of the county recorder of said county, described as follows:

Beginning at the point of intersection of the centerline of the right of way of the Southern Pacific Railroad and the boundary line between Subdivisions 98 and 99 of said Rancho Santa Paula y Saticoy; thence from said point of beginning,

1st: - North 10° 30' West 9.482 chains, more or less, to the southeast corner of that certain Parcel of land conveyed to Charles H. Fowler, by deed dated March 18, 1892, recorded in book 36 page 86 of Deeds; thence,

2nd: - South 79° 30' West 19.25 chains, along the south line of said lands of Charles H. Fowler, to the northeast corner of that certain Parcel of land as conveyed to Emma J. Tyler, by deed dated June 20, 1894, recorded in book 43 page 90 of Deeds; thence,

3rd: - South 10° 30' East 18.982 chains, more or less, along the east line of said lands of Emma J. Tyler, to a point in the centerline of the right of way of the Southern Pacific Railroad; thence along same,

4th: - North 53° 15' East 22.57 chains, more or less, to the point of beginning.

EXCEPT a strip of parcel of land 50 feet wide lying adjoining and immediately west of the east line of the above described land, conveyed to the County of Ventura, as a public highway, by deed recorded July 12, 1889, in book 28 page 338 of Deeds.

ALSO EXCEPT that portion thereof conveyed to the Southern Pacific Railroad Company by deed recorded January 27, 1887 in book 18 page 146 of Deeds.

RESERVING unto the grantor herein, all oil, gas and mineral rights in and to said land, without however, any right of surface entry in and to a depth of 500 feet.

PARCEL 3:

That certain parcel in Lot 99 of the Rancho Santa Paula y Saticoy, marked "not a part of this subdivision" on the map of Tract No. 1333-1, in the City of San Buenaventura, county of Ventura, state of California, as per map recorded in book 30 page 51 of Maps, in the office of the county recorder of said county, and lying northwesterly of the Southern Pacific Railroad right of way, easterly of Bristol Road and southwesterly of Montgomery Avenue, as shown on said map.

RESERVING unto the grantor herein, all oil, gas and mineral rights in and to said land, without however, any right of surface entry in and to a depth of 500 feet from the surface thereof.

"The desire for community is a constant of human nature."

ventura's general plan

21ST CENTURY TOOL KIT

Prelude

The 2005 Ventura General Plan envisions a new direction to protect and preserve its citizens' quality of life. This direction is based on the recognition that zoning and land development, as practiced for the past several decades, has not served our citizens, our city, or our environment as well as it should.

Currently, the two most successful movements created to alleviate this situation are "Smart Growth" and "New Urbanism." Smart Growth is a government initiated approach against sprawl that addresses underlying policy from the top-down, and is primarily marketed by government and similar agencies. New Urbanism is a grass roots, market response to outdated zoning and land use policy as it impacts development and the physical properties of the public realm. Its chief advocates are architects and town designers.

Smart Growth grew out of early New Urbanist work, and both are concerned with the real outcomes of the built environment and how it affects communities environmentally, economically, culturally, and socially.

The Ahwahnee Principles and the Charter for the New Urbanism, listed below, were created early on as "constitutions" that governed these movements. Both are valuable tools that Ventura would be wise to include in its 21st Century Tool Kit to understand and solve long-standing problems associated with growth and change.

AHWAHNEE PRINCIPLES**Preamble:**

Existing patterns of urban and suburban development seriously impair our quality of life. The symptoms are: more congestion and air pollution resulting from our increased dependence on automobiles, the loss of precious open space, the need for costly improvements to roads and public services, the inequitable distribution of economic resources, and the loss of a sense of community. By drawing upon the best from the past and the present, we can plan communities that will more successfully serve the needs of those who live and work within them. Such planning should adhere to certain fundamental principles.

Community Principles

1. All planning should be in the form of complete and integrated communities containing housing, shops, work places, schools, parks and civic facilities essential to the daily life of the residents.

2. Community size should be designed so that housing, jobs, daily needs and other activities are within easy walking distance of each other.
3. As many activities as possible should be located within easy walking distance of transit stops.
4. A community should contain a diversity of housing types to enable citizens from a wide range of economic levels and age groups to live within its boundaries.
5. Businesses within the community should provide a range of job types for the community's residents.
6. The location and character of the community should be consistent with a larger transit network.
7. The community should have a center focus that combines commercial, civic, cultural and recreational uses.
8. The community should contain an ample supply of specialized open space in the form of squares, greens and parks whose frequent use is encouraged through placement and design.
9. Public spaces should be designed to encourage the attention and presence of people at all hours of the day and night.
10. Each community or cluster of communities should have a well-defined edge, such as agricultural greenbelts or wildlife corridors, permanently protected from development.
11. Streets, pedestrian paths and bike paths should contribute to a system of fully-connected and interesting routes to all destinations. Their design should encourage pedestrian and bicycle use by being small and spatially defined by buildings, trees and lighting; and by discouraging high speed traffic.
12. Wherever possible, the natural terrain, drainage and vegetation of the community should be preserved with superior examples contained within parks or greenbelts.
13. The community design should help conserve resources and minimize waste.
14. Communities should provide for the efficient use of water through the use of natural drainage, drought tolerant landscaping and recycling.
15. The street orientation, the placement of buildings and the use of shading should contribute to the energy efficiency of the community.

Regional Principles

1. The regional land-use planning structure should be integrated within a larger transportation network built around transit rather than freeways.
2. Regions should be bounded by and provide a continuous system of greenbelt/wildlife corridors to be determined by natural conditions.
3. Regional institutions and services (government, stadiums, museums, etc.) should be located in the urban core.
4. Materials and methods of construction should be specific to the region, exhibiting a continuity of history and culture and compatibility with the climate to encourage the development of local character and community identity.

Implementation Principles

1. The general plan should be updated to incorporate the above principles.
2. Rather than allowing developer-initiated, piecemeal development, local governments should take charge of the planning process. General plans should designate where new growth, infill or redevelopment will be allowed to occur.

3. Prior to any development, a specific plan should be prepared based on these planning principles.
4. Plans should be developed through an open process and participants in the process should be provided visual models of all planning proposals.

CONGRESS FOR THE NEW URBANISM

THE CONGRESS FOR THE NEW URBANISM views disinvestment in central cities, the spread of placeless sprawl, increasing separation by race and income, environmental deterioration, loss of agricultural lands and wilderness, and the erosion of society's built heritage as one interrelated community building challenge.

WE STAND for the restoration of existing urban centers and towns within coherent metropolitan regions, the reconfiguration of sprawling suburbs into communities of real neighborhoods and diverse districts, the conservation of natural environments, and the preservation of our built legacy.

WE RECOGNIZE that physical solutions by themselves will not solve social and economic problems, but neither can economic vitality, community stability, and environmental health be sustained without a coherent supportive physical framework.

WE ADVOCATE the restructuring of public policy and development practices to support the following principles: neighborhoods should be diverse in use and population; communities should be designed for the pedestrian and transit as well as the car; cities and towns should be shaped by physically defined and universally accessible public spaces and community institutions; urban places should be framed by architecture and landscape design that celebrate local history, climate, ecology, and building practice.

WE REPRESENT a broad-based citizenry, composed of public and private sector leaders, community activists, and multidisciplinary professionals. We are committed to reestablishing the relationship between the art of building and the making of community, through citizen-based participatory planning and design.

WE DEDICATE ourselves to reclaiming our homes, blocks, streets, parks, neighborhoods, districts, towns, cities, regions, and environment.

We assert the following principles to guide public policy, development practice, urban planning, and design:

The region: Metropolis, city, and town

1. Metropolitan regions are finite places with geographic boundaries derived from topography, watersheds, coastlines, farmlands, regional parks, and river basins. The metropolis is made of multiple centers that are cities, towns, and villages, each with its own identifiable center and edges.
2. The metropolitan region is a fundamental economic unit of the contemporary world. Governmental cooperation, public policy, physical planning, and economic strategies must reflect this new reality.
3. The metropolis has a necessary and fragile relationship to its agrarian hinterland and natural landscapes. The relationship is environmental, economic, and cultural. Farmland and nature are as important to the metropolis as the garden is to the house.
4. Development patterns should not blur or eradicate the edges of the metropolis. Infill development within existing urban areas conserves environmental resources, economic investment, and social fabric, while reclaiming marginal and abandoned areas. Metropolitan regions should develop strategies to encourage such infill development over peripheral expansion.
5. Where appropriate, new development contiguous to urban boundaries should be organized as neighborhoods and districts, and be integrated with the existing urban pattern. Noncontiguous development should be organized as towns and villages with their own urban edges, and planned for a jobs/housing balance, not as bedroom suburbs.
6. The development and redevelopment of towns and cities should respect historical patterns, precedents, and boundaries.
7. Cities and towns should bring into proximity a broad spectrum of public and private uses to support a regional economy that benefits people of all incomes. Affordable housing should be distributed throughout the region to match job opportunities and to avoid concentrations of poverty.
8. The physical organization of the region should be supported by a framework of transportation alternatives. Transit, pedestrian, and bicycle systems should maximize access and mobility throughout the region while reducing dependence upon the automobile.
9. Revenues and resources can be shared more cooperatively among the municipalities and centers within regions to avoid destructive competition for tax base and to promote rational coordination of transportation, recreation, public services, housing, and community institutions.

The neighborhood, the district, and the corridor

1. The neighborhood, the district, and the corridor are the essential elements of development and redevelopment in the metropolis. They form identifiable areas that encourage citizens to take responsibility for their maintenance and evolution.
2. Neighborhoods should be compact, pedestrian-friendly, and mixed-use. Districts generally emphasize a special single use, and should follow the principles of neighborhood design when possible. Corridors are regional connectors of neighborhoods and districts; they range from boulevards and rail lines to rivers and parkways.
3. Many activities of daily living should occur within walking distance, allowing independence to those who do not drive, especially the elderly and the young. Interconnected networks of streets should be designed to encourage walking, reduce the number and length of automobile trips, and conserve energy.
4. Within neighborhoods, a broad range of housing types and price levels can bring people of diverse ages, races, and incomes into daily interaction, strengthening the personal and civic bonds essential to an authentic community.
5. Transit corridors, when properly planned and coordinated, can help organize metropolitan structure and revitalize urban centers. In contrast, highway corridors should not displace investment from existing centers.
6. Appropriate building densities and land uses should be within walking distance of transit stops, permitting public transit to become a viable alternative to the automobile.
7. Concentrations of civic, institutional, and commercial activity should be embedded in neighborhoods, and districts, not isolated in remote, single-use complexes. Schools should be sized and located to enable children to walk or bicycle to them.
8. The economic health and harmonious evolution of neighborhoods, districts, and corridors can be improved through graphic urban design codes that serve as predictable guides for change.
9. A range of parks, from tot-lots and village greens to ball fields and community gardens, should be distributed within neighborhoods. Conservation areas and open lands should be used to define and connect different neighborhoods and districts.

The block, the street, and the building

1. A primary task of all urban architecture and landscape design is the physical definition of streets and public spaces as places of shared use.
2. Individual architectural projects should be seamlessly linked to their surroundings. This issue transcends style.
3. The revitalization of urban places depends on safety and security. The design of streets and buildings should reinforce safe environments, but not at the expense of accessibility and openness.
4. In the contemporary metropolis, development must adequately accommodate automobiles. It should do so in ways that respect the pedestrian and the form of public space.
5. Streets and squares should be safe, comfortable, and interesting to the pedestrian. Properly configured, they encourage walking and enable neighbors to know each other and protect their communities.
6. Architecture and landscape design should grow from local climate, topography, history, and building practice.
7. Civic buildings and public gathering places require important sites to reinforce community identity and the culture of democracy. They deserve distinctive form, because their role is different from that of other buildings and places that constitute the fabric of the city.
8. All buildings should provide their inhabitants with a clear sense of location, weather and time. Natural methods of heating and cooling can be more resource-efficient than mechanical systems.
9. Preservation and renewal of historic buildings, districts, and landscapes affirm the continuity and evolution of urban society.

GLOSSARY OF TERMS IN THE 2005 VENTURA GENERAL PLAN

Abbreviations

ADT: Average number of vehicle trips per day
 CEQA: California Environmental Quality Act
 CIP: Capital Improvements Program
 CNEL: Community Noise Equivalent Level
 dB: Decibel
 DOF: California Department of Finance
 EIR: Environmental Impact Report
 FAR: Floor Area Ratio
 FEMA: Federal Emergency Management Agency
 LAFCo: Local Agency Formation Commission
 Ldn: Day and Night Average Sound Level
 Leq: Sound Energy Equivalent Level
 LOS: Traffic Intersection Level of Service
 RDA: City of Ventura Redevelopment Agency
 SCAG: Southern California Association of Governments
 SOI: Sphere of Influence
 TDM: Transportation Demand Management
 TOD: Transit-Oriented Development
 VCOG: Ventura County Council of Governments

Definitions

Acre: Approximately 43,560 square feet.

Acres, Gross: The entire acreage of a site calculated to the centerline of proposed bounding streets and to the edge of the right-of-way of existing or dedicated streets.

Acres, Net: The portion of a site that can actually be built upon. The following generally are not included in the net acreage of a site: public or private road rights-of-way, public open space, and flood ways.

Action: A strategy carried out in response to adopted policy to achieve a specific goal or objective. Policies and action statements establish the “who,” “how” and “when” for carrying out the “what” and “where” of goals and objectives.

Adaptive Reuse: The conversion of obsolescent or historic buildings from their original or most recent use to a new use; for example, the conversion of former hospital or school buildings to residential use, or the conversion of a historic single-family home to office use.

Affordable Housing: Housing capable of being purchased or rented by a household with very low, low, or moderate income, based on a household’s ability to make monthly payments necessary to obtain housing. Housing is considered affordable when a household pays less than 30 percent of its gross monthly income (GMI) for housing including utilities.

Alley: A narrow service way, either public or private, which provides a permanently reserved but secondary means of public access not intended for general traffic circulation. Alleys typically are located along rear property lines.

Ambient: Surrounding on all sides; used to describe measurements of existing conditions with respect to traffic, noise, air and other environments.

Annex, v: To incorporate a land area into an existing district or municipality, with a resulting change in the boundaries of the annexing jurisdiction.

Aquifer: An underground, water-bearing layer of earth, porous rock, sand, or gravel, through which water can seep or be held in natural storage. Aquifers generally hold sufficient water to be used as a water supply.

Arterial: Medium-speed (30-40 mph), medium-capacity (10,000-35,000 average daily trips) roadway that provides intra-community travel and access to the county-wide highway system. Access to community arterials should be provided at collector roads and local streets, but direct access from parcels to existing arterials is common.

Bicycle Lane (Class II): A corridor expressly reserved for bicycles, existing on a street or roadway in addition to any lanes for use by motorized vehicles.

Bicycle Path (Class I): A paved route not on a street or roadway and expressly reserved for bicycles traversing an otherwise unpaved area. Bicycle paths may parallel roads but typically are separated from them by landscaping.

Bicycle Route (Class III): A facility shared with motorists and identified only by signs, a bicycle route has no pavement markings or lane stripes.

Buffer: An area of land separating two distinct land uses that acts to soften or mitigate the effects of one land use on the other.

Building: Any structure used or intended for supporting or sheltering any use or occupancy.

Building Type: a structure category determined by function, disposition on the lot, and configuration, including frontage and height. For example, a rowhouse is a type, not a style.

Buildout: Development of land to its full potential or theoretical capacity as permitted under current or proposed planning or zoning designations.

California Environmental Quality Act (CEQA): Law requiring State and local agencies to regulate activities with consideration for environmental protection. If a proposed activity has the potential for a significant adverse environmental impact, an Environmental Impact Report (EIR) must be prepared and certified before taking action on the proposed project.

Capital Improvements Program (CIP): A program that schedules permanent City improvements at least five years ahead to fit projected fiscal capability. The CIP is reviewed annually.

Channelization: The straightening and/or deepening of a watercourse for purposes of runoff control or ease of navigation; often includes lining banks with retaining material such as concrete.

Character: Special physical characteristics of a structure or area that set it apart from its surroundings and contribute to its individuality.

Charrette: An interactive, multi-day public process in which the community works together with planning and design professionals and City staff and officials to create and support a feasible plan for a specific area of the City that will produce positive and transformative community change.

City: When capitalized, refers to the governmental entity; “city” refers to the geographic area.

Civic: the term defining not-for-profit organizations dedicated to the arts, culture, education, recreation, government, transit, and municipal parking.

Clustered Development: Buildings placed close together with the purpose of retaining open space area.

Co-housing: A residential development with dwelling units for grouped around a common kitchen, gathering room, and child-care facilities. Co-housing developments normally are organized as condominiums.

Collector: Relatively-low-speed (25-30 mph), relatively low-volume (5,000-10,000 average daily trips) street that provides circulation within and between neighborhoods. Collectors usually serve short trips and are intended for collecting trips from local streets and distributing them to the arterial network.

Commerce; Commercial: The buying and selling of commodities and services.

Community Noise Equivalent Level (CNEL): A 24-hour energy equivalent level derived from a variety of single-noise events, with weighting factors of 5 and 10 dBA applied to the evening (7 PM to 10 PM) and nighttime (10 PM to 7 AM) periods, respectively, to allow for the greater sensitivity to noise during these hours.

Community Park: Land with full public access intended to provide recreation opportunities beyond those supplied by neighborhood parks. Community parks are larger in scale than neighborhood parks but smaller than regional parks.

Corridor: Linear features that may form boundaries, as well as connections, between neighborhoods. Corridors frequently encompass major access routes, especially ones with commercial destinations. Corridors also can incorporate parks or natural features such as streams or canyons.

dB: Decibel; a unit used to express the relative intensity of a sound as it is heard by the human ear.

dBA: The "A-weighted" scale for measuring sound in decibels; weighs or reduces the effects of low and high frequencies in order to simulate human hearing. Every increase of 10 dBA doubles the perceived loudness though the noise is actually ten times more intense.

Dedication: The turning over by an owner or developer of private land for public use, and the acceptance of land for such use by the governmental agency having jurisdiction over the public function for which it will be used. Dedications for roads, parks, school sites, or other public uses often are made conditions for approval of a development by a city or county.

Density, Residential: The number of permanent residential dwelling units per gross acres of land.

Density Bonus: The allocation of development rights that allow a parcel to accommodate additional square footage or additional residential units beyond the maximum for which the parcel is zoned, usually in exchange for the provision or preservation of an amenity at the same site or at another location. Under California law, a housing development that provides 20 percent of its units for lower income households, or 10 percent of its units for very low-income households, or 50 percent of its units for seniors, is entitled to a density bonus.

Design Review: The comprehensive evaluation of a development and its impact on neighboring properties and the community as a whole, from the standpoint of site and landscape design, architecture, materials, colors, lighting, and signs, in accordance with a set of adopted criteria and standards.

Detention Basin: A structure constructed to retard flood runoff and minimize the effect of sudden floods. Water is temporarily stored and released through an outlet structure at a rate that will not exceed the carrying capacity of the channel downstream. Basins often are planted with grass and used for open space or recreation in periods of dry weather.

Developer: An individual or business that prepares raw land for the construction of buildings or causes to be built physical space for use primarily by others, and in which the preparation of the land or the creation of the building space is in itself a business and is not incidental to another business or activity.

Development: The physical extension and/or construction of urban land uses, including: subdivision of land; construction or alteration of structures, roads, utilities, and other facilities; installation of septic systems; grading; deposit of refuse, debris, or fill materials; and clearing of natural vegetative cover (with the exception of agricultural activities). Routine repair and maintenance activities are exempted.

Development Fee: (See "Impact Fee.")

District: An area of the city that has a unique character identifiable as different from surrounding areas because of distinctive architecture, streets, geographic features, culture, landmarks, activities, and/or land uses. A neighborhood or parts of neighborhoods can form a district. Districts consist of streets or areas emphasizing specific types of activities. A corridor may also be a district, as when a major shopping avenue runs between adjoining neighborhoods.

Dwelling Unit: A room or group of rooms (including sleeping, eating, cooking, and sanitation facilities, but not more than one kitchen), which constitutes an independent housekeeping unit, occupied or intended for occupancy by one household on a long-term basis.

Encourage, v: To stimulate or foster a particular condition through direct or indirect action by the private sector or government agencies.

Enhance, v: To improve existing conditions by increasing the quantity or quality of beneficial uses or features.

Environment: The existing physical conditions in an area that will be affected by a proposed project, including land, air, water, mineral, flora, fauna, noise, and objects of historic or aesthetic significance.

Environmental Impact Report (EIR): A report required by CEQA that assesses all the environmental characteristics of an area and determines what effects or impacts will result if the area is altered or disturbed by a proposed action.

Fault: A fracture in the earth's crust forming a boundary between rock masses that have shifted.

Flood, 100-Year: The magnitude of a flood expected to occur on the average every 100 years, based on historical data. The 100-year flood has a one percent chance of occurring in any given year.

Floodplain: The relatively level land area on either side of the banks of a stream regularly subject to flooding. That part of the flood plain subject to a one percent chance of flooding in any given year is designated as an "area of special flood hazard" by the Federal Insurance Administration.

Floodway: The channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the "base flood" without cumulatively increasing the water surface elevation more than one foot. No development is allowed in floodways.

General Plan: A compendium of city or county policies regarding its long-term development, in the form of maps and accompanying text. The General Plan is a legal document required by the State of California Government Code Section 65301 and adopted by the City Council.

Gateway: A point along the edge of a city at which a person gains a sense of having left the environs and entered the city.

Goal: A general, overall, and ultimate purpose, aim, or end toward which the City will direct effort.

Green: A whole-building and systems approach to siting, design, construction, and operation that employs techniques that minimize environmental impacts and reduce the energy consumption of buildings while contributing to the health and productivity of occupants.

Hazardous Material: Any substance that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. The term includes, but is not limited to, hazardous substances and hazardous wastes.

Hillside Area: All that area north of Foothill and Poli Street, and east of Cedar Street and within City limits. This area is subject to the Hillside Management Program.

Hillside Open Space: One of the 19 distinct communities within the City's Planning Area; coterminous with the Hillside Voter Participation Area; generally referred to as "hillsides".

Hillside Voter Participation Area or HVPA: The area subject to the "Hillside Voter Participation Act" (also known as Measure "P") as set forth in Appendix X and coterminous with the "Hillside Open Space" area depicted on the Land Use Diagram.

Hillsides: Synonymous and coterminous with HVPA and "Hillside Open Space".

Historic: Noteworthy for significance in local, state, or national history or culture, architecture or design, or housing works of art, memorabilia, or artifacts.

Household: Persons who occupy a housing unit.

Housing Element: A separately published State-mandated general plan element that assesses existing and projected housing needs of all economic segments of the community, identifies potential sites adequate to provide the amount and kind of housing needed, and contains adopted goals, policies, and implementation programs for the preservation, improvement, and development of housing. The Housing Elements is updated every five years.

Housing Unit: A rooms or a rooms intended for occupancy, separate from any other living space, with direct access from outside or through a common area.

Impact: The direct or indirect effect of human action on existing physical, social, or economic conditions.

Impact or Development Fee: A fee levied on the developer of a project as compensation for otherwise-unmitigated impacts the project will produce, not to exceed the estimated reasonable cost of providing the service for which the fee is charged.

Industry/Industrial: The manufacture, production, and processing of consumer goods. Industrial is often divided into "heavy industrial" uses, such as construction yards, quarrying, and factories; and "light industrial" uses, such as research and development and less intensive warehousing and manufacturing.

Infill: Development of vacant and/or underutilized land within areas already largely developed with urban uses.

Infrastructure: Public services and facilities, such as sewage-disposal systems, water-supply systems, and other utilities.

In-lieu Fee: Payment that substitutes for required dedication of land or provision of structures or amenities.

Institutional: Uses such as hospitals, museums, schools, places of worship, and nonprofit activities of a welfare, educational, or philanthropic nature that cannot be considered residential, commercial, or industrial activities.

Landmark: (1) A building, site, object, structure, or significant tree, having historical, architectural, social, or cultural significance and marked for preservation by the local, state, or federal government. (2) A visually prominent or outstanding structure or natural feature that functions as a point of orientation or identification.

Ldn: Day-Night Average Sound Level. The A-weighted average sound level for a given area (measured in decibels) during a 24-hour period with a 10 dB weighting applied to night-time sound levels. The Ldn is approximately numerically equal to the CNEL for most environmental settings.

Leq: The energy equivalent level, defined as the average sound level on the basis of sound energy (or sound pressure squared). The Leq is a "dosage" type measure and is the basis for the descriptors used in current standards, such as the 24-hour CNEL used by the State of California.

Lease: A contractual agreement by which an owner of real property (the lessor) gives the right of possession to another (a lessee) for a specified period of time (term) and for a specified consideration (rent).

Level of Service, Intersection (LOS): A scale that measures the amount of traffic an intersection is capable of handling. Levels range from A, representing free-flow, to F corresponding to significant stoppage.

Liquefaction: The transformation of loose water-saturated granular materials (such as sand or silt) from a solid into a liquid state, which can lead to ground failure during an earthquake.

Live-Work: A dwelling unit that contains, to a limited extent, a commercial component. A live-work unit is a fee-simple unit on its own lot with the commercial component limited to the ground level. (see Work-Live)

Local Agency Formation Commission (LAFCo): A commission in each county that reviews and evaluates proposals for formation of special districts, incorporation of cities, annexation to special districts or cities, consolidation of districts, and merger of districts with cities. LAFCo members include two county supervisors, two city council members, and one member representing the general public.

Local Coastal Program (LCP): A combination of City land use plans, zoning regulations, and zoning district maps that control land use in the Coastal Zone established under the California Coastal Act of 1976.

Local Street: Relatively low-volume, low-speed streets (not shown on the Roadway Classifications map), whose primary purpose is to provide access to fronting properties.

Lot: A legally-recognized parcel with frontage on a public or City-approved private street.

Low Income: Households with annual income 80 percent of the County median or less.

Maintain: Keep in an existing state. (See "Preserve.")

Median: The dividing area between opposing lanes of traffic.

Mitigate: Alleviate or avoid to the extent feasible.

Mixed Use: Properties on which various uses, such as office, commercial, and institutional, are combined with residences in a single building or site in an integrated development project with significant functional interrelationships and a coherent physical design. A single site may include contiguous properties.

Neighborhood: The basic building blocks of a community that together comprise the city. Each neighborhood is limited in physical area, with a defined edge and a center. The size of a neighborhood is usually based on the distance that a person can walk in five minutes from the center to the edge – a quarter-mile. Neighborhoods have a fine-grained mix of land uses, providing places to live, work, shop, and be entertained.

Neighborhood Center: The focal point of a neighborhood, commonly featuring places for work, shopping, services, entertainment, leisure, recreation, and social and civic interaction.

Neighborhood Park: A facility intended to serve the recreation needs of people living or working within a one-half mile radius of the park.

Noise: Sound that is undesirable because it interferes with speech and hearing, is intense enough to damage hearing, or is otherwise annoying.

Noise Contour: A line connecting points of equal noise level as measured on the same scale. Noise levels greater than the 60 Ldn contour (measured in dBA) require mitigation in residential development.

Office: Professional or consulting services in fields such as accounting, architecture, design, engineering, finance, law, insurance, medicine, real estate, and similar types of work.

Open Space: An area of land or water that is essentially unimproved and devoted to outdoor recreation and/or the preservation of natural resources.

Outdoor Recreation: Recreation in an urbanized outdoor setting (active recreation) or open-space outdoor setting (passive recreation).

- (a) *Active outdoor recreation* includes participant sports or other activities conducted in open or partially enclosed or screened recreational activities facilities. Typical uses include driving ranges, miniature golf courses, golf courses, amusement parks, swimming pools, and tennis courts and usually rely on permanent above-ground improvements, including, but not limited to, playing fields or courts, restrooms, and tables.
- (b) *Passive outdoor recreation* includes recreational activities, usually of an individual or small group nature, such as sunbathing, walking, hiking, bird watching, or nature study, conducted in an open-space setting and which, generally, do not rely on the use of permanent aboveground improvements or involve motorized vehicle use.

Parcel: A lot, or contiguous group of lots, in single ownership or under single control, usually considered a unit for purposes of development.

Parks: Open space lands whose primary purpose is recreation.

Parkway: The area between curb and sidewalk, usually planted with ground cover and/or trees.

Pedestrian Shed: an area defined by the average distance that may be traversed at an easy walking pace from its edge to its center. This distance is applied to determine the size of a neighborhood or extent of a community. A standard Pedestrian Shed is one quarter of a mile radius or 1,320 feet. With transit available or proposed, a long Pedestrian Shed has an average walking distance of ½-mile or 2,640 feet. Pedestrian Sheds should be conceived as oriented toward a central destination containing one or more important intersections, meeting places, civic spaces, civic buildings, and the capacity to accommodate a T5 Transect Zone in the future. Sometimes called a Walkshed.

Planning Area: The land area addressed by the General Plan, which includes the City Limits, potentially annexable land in the Sphere of Influence, and neighboring open space and agricultural areas of Ventura County that the City desires to remain in rural condition.

Policy: A statement of principle that anticipates specific actions to be undertaken to meet City goals.

Pollution: The presence of matter or energy whose nature, location, or quantity produces undesired environmental effects.

Preserve: Keep intact and safe from destruction or decay.

Protect: Maintain and preserve beneficial uses in their present condition.

Public and Quasi-public Facilities: Institutional, academic, governmental and community service uses, either publicly owned or operated by non-profit organizations.

Public Art: Signs, other monuments, sculptures, murals, statues, fountains, and other artistic installations in spaces accessible to the general public that accentuate or draw attention to a particular place or feature of the city, provide a focal point for public gathering, and/or serve a specific function, such as to provide seating.

Recreation, Active: A type of recreation that requires organized play areas, such as softball, baseball, football and soccer fields, tennis and basketball courts and various forms of children's play equipment.

Recreation, Passive: Recreation that does not require organized play areas.

Recycling: The process of extracting and reusing materials from waste products.

Redevelop: To demolish existing buildings, or increase the overall floor area existing on a property, or both, irrespective of whether a change occurs in land use.

Redevelopment Agency: The City division created under California Redevelopment Law for the purpose of planning, developing, re-planning, redesigning, clearing, reconstructing, and/or rehabilitating all or part of a specified area with residential, commercial, industrial, and/or public (including recreational) structures and facilities.

Regional: Pertaining to activities or economies at a scale greater than that of a single jurisdiction and affecting a broad geographic area.

Regional Park: A park typically 150-500 acres in size focusing on activities and natural features not included in most other types of parks and often based on a specific scenic or recreational opportunity.

Restore: Renew, rebuild, or reconstruct to a former state.

Ridesharing: Vehicle travel other than driving alone.

Ridgeline: A line connecting the highest points along a ridge and separating drainage basins or small-scale drainage systems from one another.

Right-of-way: Land intended to be occupied by transportation and public use facilities such as roadways, railroads, and utility lines.

Riparian: Areas adjacent to perennial and intermittent streams delineated by the existence of plant species normally found near fresh water.

Runoff: The portion of precipitation that does not percolate into the ground.

Seismic: Caused by or subject to earthquakes or earth vibrations.

Sidewalk: the paved layer of the public frontage dedicated exclusively to pedestrian activity.

Specific Plan: A legal tool allowed by State Government Code Section 65450 et seq. that prescribes detailed regulations, conditions, programs, and/or proposed legislation for a defined area of the city.

Sphere of Influence: The probable ultimate physical boundaries and service area of the city, as determined by LAFCo.

Streetscape: the urban element that establishes the major part of the public realm. The streetscape is composed of thoroughfares (travel lanes for vehicles and bicycles, parking lanes for cars, and sidewalks or paths for pedestrians) as well as the visible private frontages (building facades and elevations, porches, yards, fences, awnings, etc.), and the amenities of the public frontages (street trees and plantings, benches, and streetlights, etc.).

Structure: Anything constructed or erected that requires location on the ground (excluding swimming pools, fences, and walls used as fences).

Subdivision: The division of a land into defined lots or condominiums that can be separately conveyed by sale or lease.

Sustainable: Meeting the needs of the present without compromising the ability of future generations to meet their needs, and successfully balancing economic, environmental, and social equity concerns.

Tourism: The business of providing services for persons traveling for pleasure.

Transect: a system of ordering human habitats in a range from the most natural to the most urban. Based upon six Transect Zones that describe the physical character of place at any scale, according to the density and intensity of land use and urbanism.

Transit-Oriented Development (TOD): Relatively high-density development located within an easy walk of a major transit stop, generally with a mix of residential, employment, and shopping designed primarily for pedestrians.

Transit, Public: A system of regularly-scheduled buses and/or trains available to the public on a fee-per-ride basis.

Transportation Demand Management (TDM): Strategies for reducing the number of vehicle trips by increasing ridesharing, transit use, walking, and biking.

Trip: A one-way journey that proceeds from an origin to a destination via a single mode of transportation.

Truck Route: A route required for all vehicles exceeding set weight or axle limits, which follows major arterials through commercial or industrial areas and avoids sensitive areas.

Underutilized: Non-vacant properties that have not been fully developed with improvements that reach the allowed density and/or floor area.

Urban Design: The attempt to give form, in terms of both beauty and function, to selected urban areas or to whole cities. Urban design is concerned with the location, mass, and design of various urban components and combines elements of urban planning, architecture, and landscape architecture.

Use Permit: The discretionary and conditional review of an activity or function or operation on a site or in a building or facility.

Very Low Income: Households with annual income 50 percent of the County median or less.

View Corridor: The line of sight of an observer looking toward an object of significance (e.g., ridgeline, river, historic building, etc.).

Viewshed: The area within view from a defined point.

Watercourse: Presently or once naturally perennially or intermittently flowing water, including rivers, streams, barrancas, and creeks. Includes waterways that have been channelized, but not ditches or underground drainage and sewage systems.

Watershed: The total area above a given point on a watercourse that contributes water to its flow; also, the entire region drained by a watercourse.

Wetlands: Transitional areas between terrestrial and aquatic systems where the water table is usually at or near the surface, or the land is covered by shallow water. Federal agencies establish hydrology, vegetation, and soil criteria to define wetlands.

Work-Live: A dwelling unit that contains a commercial component. A Work-Live unit is a fee-simple unit on a lot with the commercial component anywhere within the unit. (see Live-Work)

Yield Street: A street whereby by two vehicles, going in opposite directions, one car will often have to pull over slightly and yield to the other vehicle, depending on how many cars are parked on the street. A standard residential street.

Zoning: The regulation of building forms and land uses throughout the city.

CITY PARKS

City Parks

General Information

The Parks Division maintains 39 traditional parks in addition to neighborhood, pocket, and linear parks totaling over 600 acres for residents and visitors to enjoy. Each park offers visitors a unique outdoor experience ranging from hiking trails with panoramic coastline views to picnic areas with BBQ grills near the beach.

City Beaches

City Beaches

The City of Ventura oversees two beach areas in Ventura:

- **City Beach Area 1:** stretch of beach from the Ventura Pier to Surfer's Point (near the Ventura County Fairgrounds)
- **City Beach Area 2:** stretch of beach from Marina Park to Camden Lane

Marina Park

This 15-acre beachfront park at the south end of Pierpont Boulevard is a great place to watch boats cruise out of the harbor, have a picnic, and let the kids play on the swings. Facilities include picnic and barbecue areas, a sand volleyball court, a children's play area with a replica of an antique sailing ship, and restrooms.

Promenade Park

Promenade Park, across from the beach and Surfer's Point, commemorates the site of an ancient Chumash village. Beach and park facilities include restrooms, showers, a spacious lawn, and picnic tables.

Surfers Point

Surfer's Point, off Figueroa Street, includes one of California's premier surfing spots. A paved pathway and bike trail connect this sandy beach to the Ventura Pier.

Hello 🙋. How can we help you?

Select Language ▼

Ventura Promenade

The Ventura Promenade is an oceanfront pathway that runs between the Ventura Pier and Surfer's Point. Trail users can continue east into the San Buenaventura State Beach area but the trail ends at San Pedro Street. The west end of the trail connects with a bike path that extends for 15 miles to Ojai.

Other Beaches

Other beaches located in the City of Ventura include:

Managed by California State Parks, 805-585-1850

- San Buenaventura State Beach
- Emma Wood State Beach

Managed by the Ventura Port District, 805-642-8538

- Harbor Cove Beach
- South Beach
- Surfer's Knoll Beach

Lifeguard Contract

The City of Ventura contracts with the State of California Department of Parks and Recreation to provide lifeguard services for Ventura beaches and coastline waterways. Lifeguard Services include water rescues of swimmers and surfers, boat rescues, and public safety concerns at City beaches including education and enforcement of beach rules.

City Golf Courses

The City of Ventura owns and operates two municipal golf courses less than two miles apart that offer two unique experiences for residents and guests. Buenaventura Golf Course is a more traditional golf course that features a bar and grill, pro shop and practice putting green. Olivas Links, located adjacent to the historic Olivas Adobe courtyard and rose garden, is a links-style course that offers a more challenging experience for golfers in the family and boasts a full practice facility including driving range and a chipping bunker.

Buenaventura Golf Course

5882 Olivas Park Dr
805-677-6772

This course offers recreational players and seniors a chance to experience traditional golf with tree-lined fairways and tour-caliber greens. Ranked as the best public golf course renovation in 2005 by Golf Digest Magazine, Buenaventura has become a favorite for residents and visitors alike.

- **Book a Tee Time**

Hello 🤖. How can we help you?

Olivas Links Golf Course

3750 Olivas Park Drive
805-677-6770

Select Language ▼

This course offers unique challenges for players of all skill levels. Dramatically redesigned in 2007 from a traditional course to a link-style course, Olivas has become the destination of choice for those players looking for a challenging golf experience. Planted with Seashore Paspalum turf that offers a durable, smooth playing surface, Olivas Links has achieved a status most courses only dream about. In 2009, Golf Week Magazine named it one of the top ten municipal golf courses in the country.

- **[Book a Tee Time](#)**

Golf Classes

[Check out our Activity Guide!](#) The City of Ventura offers a variety of group classes and clinics to introduce new and returning players to the game of golf. Family & friends and women only classes are offered throughout the year on Saturdays between 9 am-1 pm at Olivas Links Golf Course. Don't miss out; get your friends together today and get started with golf.

STATE OF CALIFORNIA

**STANDARDS FOR GAS SERVICE
IN THE STATE OF CALIFORNIA**

Prescribed by the
PUBLIC UTILITIES COMMISSION

OF THE

STATE OF CALIFORNIA

GENERAL ORDER No. 58A

December 16, 1992

GENERAL ORDER 58-A

PUBLIC UTILITIES COMMISSION OF THE
STATE OF CALIFORNIA

STANDARDS FOR GAS SERVICE IN THE STATE OF
CALIFORNIA

(37 C.R.C. 589)

(Original Order Approved August 1, 1919
Effective September 1, 1919)

(Revised Order Approved March 1, 1923
Effective April 1, 1923)

(Revised Order Approved May 31, 1932
Effective July 1, 1932)

(Decision No. 24827, Case No. 3181)

[Revised April 12, 1989 Effective April 12, 1989]
[Resolution G-2870]

Revised December 16, 1992, Effective December 16, 1992
Decision No. 92-12-062

23. Complaints	13
24. Reports to the Commission	13
25. General Provisions	13
26. Modification of Rules	13

1. Application of Rules

The following rules shall apply to any person, firm or corporation now or hereafter engaged as a public utility in the business of furnishing gas (fuel gas) for domestic, commercial, industrial or other purposes within the State of California where gas service is subject to the jurisdiction of the Public Utilities Commission of the State of California. In no case shall any public utility deviate from these rules except with specific written authorization from the Commission.

2. Definitions

a. British Thermal Unit (Btu)

The quantity of heat that must be added to one avoirdupois pound of pure water to raise its temperature from 58.5°F. to 59.5°F. under standard pressure.

b. Commission

The word "Commission" as used in these rules shall mean the Public Utilities Commission of the State of California.

c. Customer

The word "customer" as used in these rules shall mean any person, group of persons, firm, corporation, institution, municipality, or other civic body supplied directly with gas by any gas utility, or which may be entitled or permitted to use for compensation any of the facilities of any gas utility.

d. Gas (Fuel Gas)

Gas or Fuel Gas, as used in these rules, shall mean any combustible gas or vapor, or combustible mixture of gaseous constituents, used to produce heat by burning. It shall include, but shall not be limited to, natural gas, gas manufactured from coal or oil, gas obtained from biomass or from a land fill, or a mixture of any or all of the above.

e. LPG (Liquefied Petroleum Gas)

A gas containing certain specific hydrocarbons which are gaseous under ambient atmospheric conditions, but can be liquefied under moderate pressure at normal temperatures. Propane and butane are the principal examples.

f. Pressure Recording Device

As used in these rules, pressure recording device shall mean a mechanical or electronic device that automatically records gas pressure on an analog chart, or an electronic device which provides a printed log of the pressure or records it on storage media.

g. Standard Pressure

A pressure of 14.73 psia.

h. Standard Cubic Foot of Gas

The amount of gas that occupies one cubic foot at standard temperature under standard pressure and saturated with water vapor, or free of water vapor (dry) as specified.

- i. Standard Temperature
60°F., based on the international temperature scale.
- j. Heating Value
The term "heating value" as used in these rules shall mean the total heating value of the gas measured on a dry basis, which is defined as the number of British thermal units evolved by the complete combustion, at constant pressure, of one standard cubic foot of gas with air, the temperature of the gas, air and products of combustion being 60°F. and all of the water formed by the combustion reaction being condensed to the liquid state.
- k. Utility
The word "utility" and the term "gas utility" as used in these rules shall mean any person, firm or corporation engaged as a public utility in producing, transmitting, distributing or furnishing fuel gas for domestic, commercial, industrial or other purposes.

3. System Maps and Records

- a. Each gas utility shall keep on file with the Commission up-to-date maps of the general territory, which it holds itself in readiness to serve, outlining operating districts and showing major transmission lines.
- b. A suitable map or maps shall be kept on file in the principal office of each division or district. Maps shall at all times show the size, character and location of each street main, district regulator, operating valve and drip, and when practicable, each service connection in the corresponding territory served. In lieu of showing service locations on maps, a card record, a computerized system, or other suitable means may be used.
- c. In each division or district office there shall be available such information relative to the distribution system which will enable the local representatives at all times, to furnish necessary information regarding the rendering of service to existing and prospective customers.
- d. Each major gas control station and each compressor and holder station shall have available an accurate ground plan drawn to a suitable scale, showing the entire layout of the plant or station, the location, size and character of plant equipment, major pipelines, connections, valves and other facilities used for the control and delivery of gas, all properly identified.

4. Station and Other Records

- a. Each gas utility shall keep and preserve, for a period of at least three years, transmission line pressures from each compressor station and receiving station.
- b. Each gas utility shall keep and preserve for a period of three years, an accurate record of the operation of each compressor station, as follows:

1. The amount of fuel gas used each month for compression purposes.
 2. The amount of electricity or any other energy used each month for compression purposes.
 - c. Each gas utility serving liquefied petroleum gas, or a liquefied petroleum gas—air mix, shall keep and preserve, for a period of at least three (3) years, an accurate record of the operation of each vaporizing plant, as follows:
 1. The quantity of liquefied petroleum gas vaporized each month, recorded in Mcf.
 2. The quantity of liquefied petroleum gas, or liquefied petroleum gas—air mix, sent out each month, recorded in Mcf.
 3. The amount of liquefied petroleum gas used each month, recorded in gallons.
 4. The amount of fuel used each month for plant operations, in Mcf.
 5. The amount of electricity used each month.
 6. The heating value per gallon of each new supply of liquefied petroleum gas received.
 - d. Each gas utility serving fuel gas shall keep and preserve for a period of at least three years an accurate record of the volume of gas handled in Mcf as follows:

System

 - (1) Receipts (Daily)

Total volume of fuel gas purchased or received from major producers and at major supply points:

 - a. From producers (charts or flow computer readouts).
 - b. From transporting companies or utilities.
 - c. From owned supplies or sources.
 - d. From underground storage.
 - e. Holder variations.
 - (2) Disbursements (Monthly)

Total Volume of gas sent to:

 - a. Resale sales.
 - b. Storage.
 - c. Domestic and commercial use.
 - d. Industrial use.
 - e. Company use.
 - f. Transport for others.
 - g. Losses and unaccounted for.
- 5. Testing Equipment and Facilities**
- a. Each gas utility shall provide, or make arrangements for, meter testing equipment and facilities and other testing equipment and facilities as needed to perform the tests required by these rules or other orders of the Commission. The apparatus and equipment used shall be state-of-the-art, meeting industry standards, and shall be available at all times for inspection by any

authorized representative of the Commission. The equipment shall be of a type and form approved by the Commission.

- b. Each gas utility shall make such tests as are prescribed under these rules with such frequency and in such manner, and at such places as herein provided, or as may be approved or ordered by the Commission.
- c. Each gas utility shall file with the Commission a detailed statement showing the location of each meter testing shop and testing station owned, controlled or operated by the utility, and used to make the tests required by these rules, together with a full and complete description of each major testing or standardizing instrument or apparatus maintained therein. Any major change or addition to these facilities, or abandonment of facilities, shall be reported to the Commission within 10 days after the change has become effective.
- d. Where gas utilities do not maintain their own testing and meter repair facilities, they shall provide the Commission with a statement indicating the location and organization by whom such testing and meter repair work is performed. The proof settings and tolerances of new and repaired meters shall also be stated.

6. Heating Value of Fuel Gas

- a. Each gas utility supplying fuel gas for domestic, commercial or industrial purposes shall develop and maintain a plan establishing the heating value of the gas being supplied. This plan shall provide for the following requirements:
 - 1. Establish distinct distribution system areas in which a uniform quality of gas will be supplied.
 - 2. Identify a heating value range for each such area. Provide for verification of the average heating value of the gas supplied to each area, at intervals frequent enough to assure that the heating value is being maintained within the heating value range established for the area, and to assure adequate accuracy for customer billing.
 - 3. Provide for establishing, and maintaining for three years, records of the heating value of the gas provided in each area.
- b. Each gas utility shall establish and maintain, as outlined in General Order 58-B, Heating Value Measurement Standard For Gaseous Fuels, heating value measurement stations, and shall develop and implement the procedures necessary to determine the heating value of the fuel gas being supplied in each area, to meet the requirements of Section 6.a. If heating value determination of the same gas is satisfactorily made by another utility, supplier or qualified laboratory, it may be used for the purpose of the above record upon written approval of the Commission.

Such utility, supplier, or qualified laboratory shall use a heating value measurement device of a type that has been approved by the Commission.

- c. Each gas utility supplying a liquefied petroleum gas—air mix, shall establish and maintain, with the approval of the Commission, a standard heating value for its product. The maximum daily variation shall not exceed twenty-five (25) Btu per standard cubic foot above or below the standard heating value.
- d. Each gas utility supplying fuel gas, including liquefied petroleum gas and a liquefied petroleum gas—air mix, shall file with the Commission as a part of its schedule of rates, rules and regulations, the average total heating value of such gas together with the maximum fluctuation above and below the average total heating value which may be expected.
- e. The monthly average total heating value at any given test station shall be the average of all total heating value tests made during each month.
- f. As an alternative to establishing a heating value measurement station, samples may be taken near the center of a distribution system area. Where this is done, at least one determination per week shall be made of the total heating value of gas delivered to customers in distribution system areas identified as in Section 6.a.1. which have annual sales in excess of one hundred million (100,000,000) cubic feet of gas. Where a number of distribution system areas are so interconnected as to be certain of receiving gas from the same source, there may be established a testing or sampling station at a location where the gas tested will be representative of that served in all such distribution system areas.

7. Purity of Gas

- a. Hydrogen Sulfide
No gas supplied by any gas utility for domestic, commercial or industrial purposes in this state shall contain more than one-fourth (0.25) grain of hydrogen sulfide per one hundred (100) standard cubic feet.
- b. Total Sulfur
No gas supplied by any gas utility for domestic, commercial or industrial purposes shall contain more than five (5) grains of total sulfur per one hundred (100) standard cubic feet.
- c. Test procedures used to determine the amounts of hydrogen sulfide and total sulfur shall be in accordance with accepted gas industry standards and practices.
- d. When hydrogen sulfide, or total sulfur, exceeds the limits set forth in Section 7.a. and Section 7.b., the gas utility shall notify the Commission and commence remedial action immediately. The Commission shall be notified when the level of hydrogen sulfide, or total sulfur, has been reduced to allowable limits.
- e. Vinyl Chloride
No regulated gas utility shall knowingly purchase landfill gas if that landfill gas, when supplied to any existing gas customer, contains vinyl chloride in a concentration greater than 1,170 parts

per billion by volume. This value is adopted as instructed by Section 25421(b) of the California Health and Safety Code as the maximum amount of vinyl chloride that may be found in landfill gas supplied to a gas utility customer pursuant to Section 25421(a). Testing for vinyl chloride shall be performed as specified by Section 25421(d) of the Health and Safety Code. When vinyl chloride exceeds the limits set forth herein, the gas utility shall notify the Commission and commence remedial action immediately. The gas utility shall notify the Commission when the level of vinyl chloride is reduced to allowable limits. Direct delivery for industrial use of landfill gas is exempted from these requirements as provided by Section 25421(e). A gas utility desiring to purchase landfill gas with a vinyl chloride content that exceeds the Commission adopted standard shall file an application with the commission. The application shall demonstrate that dilution of landfill gas exceeding the Commission's standard with other natural gas in the utility's system shall not result in any customer receiving gas with a vinyl chloride concentration level exceeding the Commission's standard.

8. Standard Gas Delivery Pressure

- a. Each gas utility supplying gas for domestic, commercial or industrial purposes shall, subject to the approval of the Commission, adopt and maintain a standard gas delivery pressure measured at the outlet of any customer's meter. In adopting such a standard gas delivery pressure, each utility may divide its distribution system into sections and establish a separate standard gas delivery pressure for each section, or the utility may establish a single standard gas delivery pressure for its distribution system as a whole.
- b. The standard gas delivery pressure supplied by any gas utility to domestic, commercial, or industrial customers, as measured at the outlet of any such customer meter, shall not be less than two inches nor more than twelve inches of water column pressure.
- c. The standard gas delivery pressure adopted shall be filed with the Commission as a part of each gas utility's tariff schedules. These tariff schedules shall be open to public inspection at each office or location where applications for gas service are received.
- d. No change shall be made by any gas utility in the standard gas delivery pressure adopted by it for any section or system without the approval of the Commission.
- e. In the case of customers who require higher pressure than the standard established for domestic, commercial, or industrial service, the gas utility may supply gas at the desired pressure, and the volume of such gas shall be adjusted to standard pressure for accounting and billing purposes.
- f. The pressure of gas supplied at low pressure to domestic and commercial customers shall not vary more than fifty percent (50%) above or below the standard pressure which the utility has adopted for a section or system and no such variation in pressure shall be more than that equivalent to four inches of water column above or below the standard. No variation in pressure from the

standard pressure of two inches or more of water column shall occur in a time less than fifteen (15) minutes, excepting momentary fluctuations on individual services caused by the operations of customer's appliances or fluctuations caused by reasonable regulator buildups.

9. Pressure Testing Equipment and Tests

- a. Each gas utility shall own and maintain at least one recording pressure device on each principal distribution main leaving each major control facility such as a compressor station, holder station or transmission terminal. No utility shall maintain less than two such devices unless specifically relieved in writing by the Commission. Official pressure data taken from such devices shall be preserved as a continuous record for a period of at least one (1) year.
- b. Each gas utility shall own and maintain at least one low pressure, portable pressure recording device for each one hundred (100) miles or fraction thereof of low pressure main in any separate distribution system.
- c. On low pressure distribution systems each gas utility shall during the six months of the peak season of the year make at least one 24-hour record of pressure each week at the outlet of customer's meters for each one hundred (100) miles or less of distribution main in each district or separate distribution system. Such record shall bear the address of the customer where the pressure is taken and the dates, together with such other information as the Commission may from time to time direct and shall be filed and retained for a period of at least two calendar years in the principal office of each district or division. In lieu of fifty percent (50%) of the above required number of records from portable pressure recording devices at customer's premises there may be substituted an equal number of twenty-four (24) hour records from recording pressure devices permanently located at critical points on the distribution system.
- d. On high pressure distribution systems, gas utilities shall maintain permanently located pressure recording devices at critical points and shall preserve in the district or division offices the data from these devices for a period of at least one (1) year.
- e. Pressure conditions on a customer's premises served from a high pressure distribution system shall be determined by a test made with a water column manometer or other suitable test device, during service calls in answer to pressure complaints. A report on such tests shall be made on the complaint order, which report shall state the pressure observed when appliances were on and when all appliances (excepting pilot lights) were off. It shall state whether the test was made at the outlet of the meter or at the customer's appliance. A test shall be made for each pressure complaint received.

10. Meters and Regulators

- a. In the service of gas to domestic, commercial and industrial customers, each gas utility shall provide, and, unless otherwise specified, install at its own expense and shall continue to own, maintain and operate all equipment for the regulation and measurement of gas to the outlet of the meter set. Temperature correction is required where the average monthly use of gas is greater than one million (1,000,000) cubic feet per active month.

- b. Where an applicant for gas service requests installation of special facilities and the utility agrees to make such installation, the additional cost of the special facilities shall conform to the special facilities provisions set forth in the utilities' filed tariffs.

11. Service and Meter Installations

- a. Each utility shall install service lines and meters of adequate capacity to provide satisfactory service and to assure accurate meter registration under the load conditions imposed.
- b. Rules governing specific locations of service and meter installations, and relocations or replacements of service pipe, shall conform to the applicable provisions of the latest revision of General Order 112-D, and revisions thereto, and the utilities' applicable currently effective filed gas tariff rules.

12. Gas Meter Accuracy

- a. All tests to determine the accuracy of registration of any diaphragm gas meter shall be made with a suitable meter prover.
- b. Every diaphragm gas meter, when installed for the use of any customer, shall be in good order and shall have been adjusted to register within one percent (1%) over or two percent (2%) under the prover registration when passing gas at a rate which will cause a pressure drop across the meter not to exceed one-half inch of water column ($1/2$ " W.C.). The meter shall be adjusted so that the open flow test agrees with the check flow test within one percent (1%), provided, however, that no meter shall be put in service which on any test registers in excess of one percent (1%) over the prover registration.
- c. All gas meters other than diaphragm meters shall be tested for accuracy in accordance with accepted industry standards and practices. Any such test results shall not register less than minus two percent (2%) error or more than plus one percent (1%) error. In order to obtain the accuracy range set forth in this section, orifice meters shall be manufactured and installed in accordance with all guidelines specified in the current edition of ANSI/API 2530 (AGA Report No. 3), Orifice Metering of Natural Gas.

13. Periodic and Other Required Tests of Gas Meters

- a. No gas meters hereafter installed shall be allowed to remain in service more than ten (10) years from the time when last tested without being retested in the manner herein provided, and if found inaccurate, each such meter shall, at the time of each test, be readjusted to be correct within the prescribed limits before being installed.
- b. If during an inspection or the servicing of appliances or equipment on a customer's premises, a residential or small commercial meter is observed or is suspected to be out of calibration, it should be removed promptly, transported to a meter testing facility without alteration of its condition, and tested. If the meter is a large commercial or industrial meter, and suitable transfer prover equipment is available, the meter may be tested in place.

- c. Under certain conditions utilities may be authorized to deviate from Section 13.a. and use a statistical meter control program based on meter performance as demonstrated by sample testing in lieu of periodic testing of each meter. Applications to deviate shall be based on accepted principles of statistical sampling.

14. Standard Methods of Testing Gas Meters

Each gas utility shall adopt and maintain standard methods of testing gas meters. These methods and the facilities used shall be reported to the Commission for approval.

15. Meter Testing Equipment

- a. Unless otherwise specifically authorized by the Commission, each gas utility shall own at least one meter prover for diaphragm type meters, of a type approved by the Commission and shall maintain such equipment in proper adjustment and so calibrated that the error of indication shall not exceed one-half percent ($1/2\%$). No meter prover not having temperature compensation, shall be so placed as to be subject to excessive temperature variation and each meter prover shall be equipped with suitable thermometers and other necessary accessories.
- b. Each utility using orifice meters or other large volume meters shall determine meter accuracy in accordance with accepted industry standards and practices.
- c. The accuracy of all provers and methods of operation will be established from time to time by a representative of the Commission. Any alterations, accidents, or repairs which might affect the accuracy of any meter prover, or the method of operating same, shall be promptly reported in writing to the Commission.
- d. Proving and calibration devices used for the requirements specified in these rules shall be traceable to the National Institute of Standards and Technology.
- e. This section is applicable to those utilities authorized to use recognized meter test and repair shops, other than their own, for testing and/or repairing all or a portion of meters removed from service. Results of such tests, together with relevant data, shall be furnished the Commission with the utility's statement including:
 - 1. The name of the organization making such meter tests and/or repairs.
 - 2. The type and characteristics of meters used by the utility and showing the number of meters by types.
 - 3. Certification of meter testing equipment by a recognized governing agency.

4. A copy of the sheet titled "Gas Meter Performance Record During the Year" as furnished in the utilities' annual report to the Commission.

16. Records of Meters and Meter Tests

- a. A complete record of the tests made under these rules shall be kept by each gas utility. The record so kept shall contain complete information concerning each test, including the date when, and the place where the test was made, the name of the inspector conducting the test, the result of the test, and such other information as may be required by these rules, or as the Commission may from time to time direct, and such additional information as the utility making the test may deem desirable.
- b. Whenever any meter is tested, the test information shall be retained including the information necessary for identifying the meter, the reason for the test, the reading of the meter upon removal from service, together with all data taken at the time of the test in sufficiently complete form to permit the convenient checking of the methods employed and the results obtained. These records shall be retained for a period of not less than two (2) years.
- c. A record shall be kept, numerically arranged by meter number, indicating for each meter owned or used by a gas utility, its type, size and date purchased, together with the dates and locations of each installation, the date and result of each test, and the date and character of all repairs made. Where, because of the large number of meters involved, or for other valid operating reasons, the utility desires to adopt other methods for meter records, it shall present such proposal in detail to this Commission for approval. When the utility adopts a different method for meter records, no duplicate system need be maintained. These records shall be retained for a period of one year after the meter is sold, dismantled or destroyed.

17. Meter Testing at Request of A Customer

- a. Each gas utility shall at any time when requested by a customer upon not less than five (5) working days' notice, test the accuracy of any meter used to serve that customer. Conditions under which a gas utility will make meter tests at the request of its customers, charges for, and bill adjustments resulting from such requests shall be set forth by each utility in its filed tariff schedules. However, no charge will be made to the customer where a meter test is requested by this Commission. When a meter has been tested at the request of a customer, a retest for a meter at the same location within six months will not be made unless specifically requested by the Commission.
- b. A customer shall have the right to require the utility to conduct the test on the meter in his or her presence, if the customer so

desires. The test may be observed by a representative, other than from the utility or the Commission, appointed by the customer.

- c. A report giving the name of the customer requesting the test, the date of the request, the location of the premises where the meter was installed, the meter statement at time of removal, the date tested, and the result of the test at the check flow rate, the type, make, size and identification number of the meter, the date of removal and deductions drawn therefrom shall be supplied to such customer within a reasonable time after completion of the test.

18. Calculation of Gas Volumes

The procedures used by each utility to determine gas volumes used for billing purposes shall be in accordance with accepted industry standards and practices. Each utility shall include the procedures and gas measurement standards used in its applicable currently effective filed gas tariff rules.

19. Meter Readings and Bill Forms

- a. Each meter shall indicate clearly the cubic feet or other unit of gas registered by such meter. In cases where the dial readings of a meter must be multiplied by a constant to obtain the cubic feet or other unit consumed, the proper constant to be applied shall be clearly marked on the consumer's bill. Where gas is metered under high pressure or where the quantity is determined by calculations from recording devices, the company shall, upon application from the customer, supply the customer with such information as will cover the conditions under which the quantity is determined.
- b. Bills rendered to customers shall show the reading of the meters at the beginning and end of a period for which the bill is rendered, the number of cubic feet or other units of gas supplied and the date of the meter readings. Each bill shall bear upon its face the date when the bill was mailed to or left upon the premises of the customer. On all bills which are computed on any other basis than a definite charge per unit of service, the other factors used in computing the bill shall be clearly stated thereon or submitted to the customer upon request so that the amount of the bill may be readily recomputed.
- c. Copies of all forms of bills, bill stubs and notices appertaining to the payment of bills shall be filed with the Commission as a part of the schedule of rates, rules and regulations then in force. No change shall be made in any such bill, bill stub or notice, without the approval of the Commission.

20. Information for Customers

- a. Each gas utility, upon request, shall give its customers such information and assistance as is reasonable in order that customers may secure service at the most economical rate.
- b. Each gas utility shall inform its customers of any change made, or proposed to be made, in the character of the service supplied as would affect the safety of operation of the appliances or equipment which may be in use by said customer.
- c. Each gas utility shall adopt some means of informing its customers as to the methods of reading meters, either by printing on its bills a description of the method of reading meters, or by a notice to the effect that the method will be explained upon request at any office where requests for service are received.

21. Customers' Deposits

Each utility receiving deposits from customers for the establishment of credit shall keep a record showing the name of the customer making the deposit, the premises occupied by the customer, the date deposit was made, the amount of the deposit and the interest accrued, paid or credited. The record shall be kept for one year after the deposit has been refunded.

22. Maintenance and Operation of Facilities

- a. Each gas utility, unless specifically relieved in any case by the Commission from such obligation, shall operate and maintain in safe, efficient and proper condition all of the facilities and instrumentalities used in connection with the furnishing, regulation, measurement and delivery of gas to any customer up to and including the point of delivery, which point, for the purpose of these rules, shall be deemed to be the outlet fitting of the meter installed by the utility, or the point where the pipe owned and installed by the utility connects to the customer owned piping, whichever is further downstream.
- b. The gas utility may refuse to serve or may discontinue service to a customer:
 1. If any part of the facilities, appliances or other equipment for receiving or using service, or the use of that service, shall be determined by the utility to be unsafe, or
 2. If any condition existing upon the customer's premises shall be determined by the utility to endanger the utility's service facilities.

Service shall not be connected or restored until the utility determines that the customer's facilities, appliances or other gas equipment have been made safe, or; the utility has written notice from an appropriate governmental agency that the premises meet applicable laws, ordinances or regulations.

- c. Each gas utility, unless specifically relieved in any case by the Commission from such obligation, upon request of any cus-

tomers and without extra charge, shall make an inspection of appliances in use by that customer, in accordance with the rules and regulations of such utility filed with the Commission. Inspection of appliances does not include making repairs, without charge, other than those commonly referred to as adjustments to insure safe and efficient use of the gas service. Where it is recognized that unsafe or hazardous conditions exist, service shall be discontinued and the customer notified. Service shall not be restored until hazardous conditions have been corrected as provided by Section 22.b.

23. Complaints

- a. Each gas utility shall make a full and prompt investigation of all complaints made to it by its customers, either directly or through the Commission.
- b. Each gas utility shall keep a record of all complaints received which shall show in each case the name and address of the complainant, the date of receiving a complaint, its general nature, the date and method of disposal, and the name of service person responding to the complaint. The record shall be kept for a period of at least two (2) calendar years after the complaint has been resolved.

24. Reports to the Commission

Each gas utility shall at such time and in such form as the Commission shall prescribe, report to the Commission the result of all tests required to be made or the information contained in any record required to be kept by the utility.

25. General Provisions

- a. The adoption of these rules shall in no way preclude the Commission from altering or amending the same in whole or in part, or from requiring any other or additional service, equipment, facilities, standard or practice, either upon complaint or upon its own motion, or upon the application of any utility or customer.
- b. In any case where any gas utility is supplying gas to customers under conditions more favorable or advantageous to such customers than are provided in these rules, either as to quality or character of service, no change shall be made in such service conditions without further approval of the Commission.

26. Modification of Rules

- a. Any gas utility may of its own accord establish uniform, nondiscriminatory rules more favorable to its customers than the rules herein established. The rules herein established shall take precedence over all orders, general or special heretofore made by the Commission, insofar as said orders may be inconsistent with these rules.

- b. The rules herein established shall take precedence over all rules filed or to be filed by gas utilities insofar as inconsistent therewith. Rules now on file and inconsistent with the rules herein established shall be properly revised and refiled within thirty (30) days from the effective date of this order.
- c. If hardship would occur from the application of any rule herein prescribed because of special facts, application may be made to the Commission for a modification of such rule provided that no utility shall submit any rule or regulation for the approval of the Commission which is contrary to any section of this order without submitting therewith a full and complete justification of such rule.

Approved and dated at San Francisco, April 12, 1989.

GENERAL ORDER NO. 112-F

PUBLIC UTILITIES COMMISSION
of the
STATE OF CALIFORNIA

**RULES GOVERNING DESIGN, CONSTRUCTION, TESTING, MAINTENANCE, AND OPERATION OF
GAS GATHERING, TRANSMISSION, AND DISTRIBUTION PIPING SYSTEMS**

CHANGE LIST-FOLLOWING IS THE LIST OF DECISIONS AND RESOLUTIONS WHICH AUTHORIZED
CHANGES TO GENERAL ORDER 112 APPLICABLE TO GAS OPERATORS:

Decision or Resolution No.	Date Effective	Sections Herein Modified Amended or Added
Decision No. 61269	July 1, 1961	Adopted General Order 112 on December 28, 1960
Decision No. 66399	January 1, 1964	Adopted General Order 112-A on December 3, 1963
Decision No. 73223	December 1, 1967	Adopted General Order 112-B on October 24, 1967
Decision No. 78513	April 30, 1971	Adopted General Order 112-C on April 2, 1971
Decision No. 80268	July 18, 1972	Subpart I of Part 192 of Title 49 of CFR and Sections 192.607 And 192.611 (e)
Decision No. 82467	Feb. 13, 1974	192.12, 192.3, 192.379, 192.55, 192.65, 192.201(a), 92.717(b), 192.727 and Appendices A and B
Decision No. 85280	Dec. 30, 1975	192.59, 192.65, 192.225, 192.229, 192.241, 192.705, 192.706, 192.707 and Appendices A and B
Decision No. 85375	Jan. 27, 1976	192.229 (c)
Decision No. 86874	Jan. 18, 1977	192.3, 192.5, 192.13, 192.111, 192.145, 192.163, 192.167, 192.179, 192.225, 192.227, 192.243, 192.313, 192.317, 192.319, 192.327, 192.451, 192.465, 192.469, 192.481, 192.615, 192.619, 192.707, 192.713, 192.717, 192.727, 192.753, 192.755 and Appendices A and B
Decision No. 90372	June 5, 1979	Adopted General Order No. 112-D in OII No. 1 on June 5, 1979
Decision No. 90921	November 22, 1979	192.13, 192.14, 192.63, 192.121, 192.123, 192.313, 192.451, 192.452, 192.457, 192.465, 192.467, 192.473, 192.475, 192.477, 192.479, 192.481, 192.485, 192.491, 192.619 and Part II Appendices A and B
Decision No. 93791	December 1, 1981	192.121, 192.179, 192.281, 192.283, 192.285, 192.287, 192.455, 192.465 and Part II Appendix A
Decision No. 83-10-039	October 19, 1983	192.745 and 192.747
Decision No. 84-04-008	April 4, 1984	192.3, 192.227, 192.465, 192.477, 192.481, 192.704, 192.705, 192.706, 192.721, 192.723, 192.731, 192.739, 192.743, 192.745, 192.747 and 192.749
Decision No. 84-05-004	May 2, 1984	192.3, 192.7, 192.59, 192.113, 192.117, 192.123, 192.145, 192.163, 192.197, 192.225, 192.227, 192.229, 192.237, 192.239, 192.241, Part II Appendix A, Part II Appendix B, and Table of Contents
Decision No. 84-06-002	June 6, 1984	192.59, and 192.123
Decision No. 84-06-028	June 6, 1984	192.465
Decision No. 85-03-012	March 6, 1985	192.144, 192.283, 192.614, 192.707, 193.1015, II H, Part III Appendix A and Table of Contents
Decision No. 86-06-047	June 25, 1986	192.105, 192.143, 192.243, 192.245 and 192.313
Decision No. 88-11-023	November 9, 1988	192.55, 192.113, 192.223, 192.225, 192.227, 192.237, 192.239, 192.611, 192.719, 192.743, Part II Appendices A and B, Table of Contents and Index

Decision No. 95-08-053	September 11, 1995	Adopted General Order 112-E in Application 93-08-053 on August 11, 1995 and Modified Sections 101, 101.2, 101.3, 101.4, 102.1, 102.2, 103.1, 104.1, 105, 121.1, 122.1, 122.2, 123.1, 124.1, 125.1, 125.2, 126.1, 141.1, 142.1, 143.1, 143.2, 144.1, 161.1, 162.1, 162.2, 162.3, 181.1, 182.1, 182.2, 182.3, 182.4, 182.5, 182.6, 182.7, 182.8, 183.1, 183.2, 183.3, 183.4, 183.5, 201.1, 202.2, Appendix A and Appendix B
Resolution No. SU-41	May 22, 1996	Eliminated existing section 122.2 (c) and renumbered following sections
Resolution No. E-4184	August 21, 2008	Modified reporting requirements in Section 122.2 to provide for reporting via the Worldwide Web; Removed obsolete Appendix C
Decision No. 15-06-044	June 25, 2015	Adopted General Order 112-F in Rulemaking 11-02-019 on June 25, 2015 and Modified Sections 101, 101.2, 101.4, 102.1, 103.3, 103.4, 104.1, 104.2, 105, 122.1, 122.2, 123.1, 124.1, 125.1, 125.2, 141.1, 142.1, 143, 143.1, 143.2, 144.1, 161.1, 162.1, 162.2, 162.3, 181.1, 182.1, 182.7, 183.2, 183.4, 201, 202.2, and Appendix A; Added Sections 123.2, 123.3, 125.3, 125.4, 125.5, 125.6, 125.7, 143.4, 143.5, 143.6, 144.2, 145, 145.1, 162.4; and Added Subpart G with Sections 301 and 302. The effective date for operators to comply with revised Sections 105, 122, 123, 125, 142, 143, 144, 145, and 162 was ordered to be as soon as feasible but no later than January 1, 2017 unless extended pursuant to Rule 16.6 of the Commission's Rules of Practice and Procedure or its successor.

SUBPART A - GENERAL

101 PREAMBLE

101.1 This General Order shall be known as the "State of California Rules Governing Design, Construction, Testing, Operation, and Maintenance of Gas Gathering, Transmission, and Distribution Piping Systems." It will be referred to herein as "these rules."

101.2 These rules are incorporated in addition to the Federal Pipeline Safety Regulations, specifically, Title 49 of the Code of Federal Regulations (49 CFR), Parts 191, 192, 193, and 199, which also govern the Design, Construction, Testing, Operation, and Maintenance of Gas Piping Systems in the State of California. These rules do not supersede the Federal Pipeline Safety Regulations, but are supplements to the Federal Regulations. Absent modifications to 49 CFR by this General Order, the requirements and definitions within 49 CFR, Parts 191, 192, 193 and 199 prevail.

101.3 There shall be no deviation from this General Order except after authorization by the Commission. If hardship results from application of any rule herein prescribed because of special circumstances, application may be made to the Commission to waive compliance with such rule in accordance with Section 3(e) of the Natural Gas Pipeline Safety Act of 1968. Each request for such waiver shall be accompanied by a full and complete justification.

101.4 Operators shall maintain the necessary records to establish that they have complied with these rules and the Federal Pipeline Safety Regulations, 49 CFR, that are applicable. Such records shall be available for inspection at all times by the Commission or Commission Staff.

102 PURPOSE

102.1 The purpose of these rules is to establish, in addition to the Federal Pipeline Safety Regulations, minimum requirements for the design, construction, quality of materials, locations, testing, operations and maintenance of facilities used in the gathering, transmission and distribution of gas and in liquefied natural gas facilities to safeguard life or limb, health, property and public welfare and to provide that adequate service will be maintained by gas Operators under the jurisdiction of the Commission.

102.2 These rules are concerned with safety of the general public and employees' safety to the extent they are affected by basic design, quality of the materials and workmanship, and requirements for testing and maintenance of gas gathering, transmission and distribution facilities and liquefied natural gas facilities.

103 INTENT

103.1 The requirements of these rules, in addition to the Federal Pipeline Safety Regulations, are adequate for safety under conditions normally encountered in the gas industry. Requirements for abnormal or unusual conditions are not specifically proscribed. It is intended that all work performed within the scope of these rules shall meet or exceed the safety standards expressed or implied herein.

103.2 Existing industrial safety regulations pertaining to work areas, safety devices, and safe work practices are not intended to be supplanted by these rules.

103.3 Compliance with these rules is not intended to relieve an Operator from any statutory requirements.

103.4 The establishment of these rules shall not impose upon Operators, and they shall not be subject to any civil liability for damages, which liability would not exist at law if these rules had not been adopted.

104 PROCEDURES FOR KEEPING GENERAL ORDER UP-TO-DATE

104.1 It is the intent of the California Public Utilities Commission to automatically incorporate all revisions to the Federal Pipeline Safety Regulations, 49 CFR Parts 191, 192, 193, and 199 with the effective date being the date of the final order as published in the Federal Register.

104.2 In those instances where additional or more stringent specific state rules are appropriate, the gas Operators subject to these rules may file an application to update provisions, rules, standards and specifications of the General Order as they deem necessary to keep this General Order current in keeping with the purpose and intent thereof. However, nothing herein shall preclude other interested parties from initiating appropriate formal proceedings to have the Commission consider any changes they deem appropriate, or the Commission from acting upon its own motion.

105 DEFINITIONS

Commission or CPUC means the Public Utilities Commission of the State of California.

Holder means any structure used to store gas, which either has a displacement of 500 or more cubic feet, or will contain 10,000 or more standard cubic feet of gas at its maximum design pressure, except that a pipeline which is used primarily for transmission or distribution of gas, but which also serves a storage function, is not a holder for purposes of this General Order.

Inert gas means a gas which will not burn or support combustion, such as nitrogen, carbon dioxide or mixtures of such gases.

Utility means any person, firm, or corporation engaged as a public utility in transporting natural gas, liquefied natural gas (LNG), hydrocarbon gas, or any mixture of such gases for domestic, commercial, industrial, or other purposes.

Operator means any utility, person or entity operating a natural gas transmission or distribution system, including master-meter distribution system subject to PU Code Section 4351-4361, or a propane gas (LPG) distribution system subject to PU Code Section 4451-4465.

Vicinity means an area surrounding an event in which an Operator's gas pipeline facilities could have been a contributing factor to the event.

Public Attention means any event that escalates to a level that initiates calls/complaints concerning a common safety concern being submitted to an Operator from 10 or more individuals or organizations. This can include, for example, large scale reports of the smell of gas by customers in the vicinity of an Operator's gas facilities. Public Attention criterion does not necessarily include an individual, or a crowd of persons, watching work being performed on company facilities.

Covered Task means those tasks defined by 49 C.F.R §192.801, but also includes "new construction" in the federal definition of "covered task." Accordingly, the commission defines a covered task that will be subject to the requirements of 49 CFR §§ 192.803 through 192.809 as an activity, identified by the Operator, that:

- (a) Is performed on a gas pipeline;
- (b) Is an operations, maintenance, or new construction task;
- (c) Is performed as a requirement of 49 CFR, Part 192; and
- (d) Affects the operation or integrity of the gas pipeline.

High Consequence Area (HCA) is defined by 49 CFR §192.903, which allows two different methods to be used towards determining locations where HCAs exist. However, in an effort to be more conservative towards ensuring the safety in areas of more densely populated areas, the Commission restricts the use of Method 2 in 49 CFR §192.903, in determining HCAs to pipeline segments of 12-inches or less. Accordingly, the Commission modifies paragraph (2) of the High Consequence Area defined by 49 CFR §192.903 to read as follows:

(2) The area within a potential impact circle of a pipeline 12-inches or less in diameter containing –

HCAAs newly identified through the Commission's restriction on Method 2 shall be scheduled for baseline assessment in accordance with 49 CFR §192.905(c) and 49 CFR §192.921(f).

Near-miss events mean unplanned or undesired events that adversely affect an Operator's facilities or operations but do not result in injury, illness, damage, release of gas, loss of gas service, over-pressurization of gas pipeline facilities, or in a reportable incident, but had the potential to do so. Such events include, but are not limited to:

- (a) A subsurface pipeline facility not marked or mismarked for excavation purposes;
- (b) Excavation activity near a pipeline facility conducted without a valid Underground Service Alert ticket;
- (c) The incorrect, or unintentional, operation of a valve or pressure regulator;
- (d) An incorrectly mapped pipeline facility;
- (e) Work activity in which a standard, procedure, or process approved by an Operator was correctly applied but the activity, nonetheless, resulted in creating a situation or condition where damages or injuries could have easily occurred.

Number of excavation tickets or Number of excavation damages reported per the data requirements of Section 123, **Annual Reports**, means to include all original and renewal notices received by the Operator from the applicable One-Call center.

SUBPART B - REPORTS

121 GENERAL

121.1 In order that the Commission may be informed concerning the operation and the status of the more important facilities of the Operators, the following information shall be filed with the Commission.

122 GAS INCIDENT REPORTS

122.1 Each Operator shall comply with the requirements of 49 CFR Part 191, for the reporting of incidents to the United States Department of Transportation (DOT). The Operator shall submit such reports directly to the DOT, with a copy to the California Public Utilities Commission (CPUC).

122.2 Requirements for reporting to the CPUC.

(a) Each Operator shall report incidents to the CPUC that meet the following criteria:

1. Incidents which require DOT notification.
 - i. An event that involves a release of gas from a pipeline, or of liquefied natural gas, liquefied petroleum gas, refrigerant gas, or gas from an LNG facility, and that results in one or more of the following consequences:
 - A death, or personal injury necessitating in-patient hospitalization; or
 - Estimated property damage of \$50,000 or more, including loss to the Operator and others, or both, but excluding cost of gas lost;
 - Unintentional estimated gas loss of three million cubic feet or more;
 - ii. An event that results in an emergency shutdown of an LNG facility. Activation of an emergency shutdown system for reasons other than an actual emergency does not constitute an incident;
 - iii. An event that is significant in the judgment of the Operator, even though it did not meet the criteria of Sections 122.2(a)(1)(i) or (ii), above.
2. Incidents which have either attracted public attention or have been given significant news media coverage, that are suspected to involve natural gas and/or propane (LPG) gas, which occur in the vicinity of the Operator's facilities; regardless of whether or not the Operator's facilities are involved.

3. Incidents where the failure of a pressure relieving and limiting stations, or any other unplanned event, results in pipeline system pressure exceeding its established Maximum Allowable Operating Pressure (MAOP) plus the allowable build up set forth in 49 CFR § 192.201.
 4. Incidents in which an under-pressure condition, caused by the failure of any pressure controlling device, or any other unplanned event other than excavation related damage, results in any part of the gas pipeline system losing service or being shut-down.
- (b) In the event of an incident listed in 122.2(a) above, an Operator shall go to the Commission's website, select the link to the page for reporting emergencies and follow the instructions thereon. If internet access is unavailable, the Operator may report using the backup telephone system.
1. If the Operator is notified of the incident during its normal working hours, the report should be made as soon as practicable but no longer than 2 hours after the Operator is aware of the incident and its personnel are on the scene.
 2. If the Operator is notified of the incident outside of its normal working hours, the report should be made as soon as practicable but no longer than 4 hours after the Operator is aware of the incident and its personnel are on the scene.
 3. All reports required by this section shall be followed by the end of the next working day by an email or telefacsimile (fax) of the standard reporting form, "Report of Gas Leak or Interruption," CPUC File No. 420 (see attachment).

(c) Written Incident Reports .

1. The Operator shall submit to the CPUC on DOT Form PHMSA F7100.1 (<http://ops.dot.gov/library/forms/forms.htm#7100.1>) for distribution systems and on DOT Form PHMSA F7100.2 (<http://ops.dot.gov/library/forms/forms.htm#7100.2>) for transmission and gathering systems a report describing any incident that required notice under Item 122.2(a)(1).
2. Together with the form required by (c)(1) above, the Operator shall furnish a letter of explanation giving a more detailed account of the incident unless such letter is deemed not necessary by the CPUC staff. The Operator may confirm the necessity of a letter of explanation by email. If, subsequent to the initial report or letter, the Operator discovers additional material, information related to the incident, the Operator shall furnish a supplemental report to the CPUC as soon as practicable, with a clear reference by date and subject to the original report. These letters, forms, and reports shall be held confidential under the provisions of Paragraph 2, Exclusions, of General Order 66-C and Public Utilities Code Section 315.

3. The Operator of a distribution system serving less than 100,000 customers need not submit the DOT forms required by paragraph (1) above; however, such Operator must submit the letter of explanation required by (2) above, subsequent to any initial report to the CPUC, unless such letter is deemed unnecessary by the CPUC staff.
- (d) Quarterly Summary Reports. Each utility shall submit to the CPUC quarterly, not later than the end of the month following the quarter, a summary of all CPUC reportable and non-reportable incidents which occurred in the preceding quarter as follows:
1. Incidents that were reported through the Commission's Emergency Reporting website.
 2. Incidents for which either a DOT Form PHMSA F7100.1 or F7100.2 was submitted.
 3. Incidents which involved escaping gas from the utility's facilities and property damage including loss of gas in excess of \$1,000.
 4. Incidents which included property damage between \$0 and \$1,000, and involved fire, explosion, or excavation related damage.
 5. Incidents where the failure of a pressure relieving and limiting stations, or any other unplanned event, results in pipeline system pressure exceeding its established Maximum Allowable Operating Pressure (MAOP) plus the allowable build up set forth in 49 CFR § 192.201.
 6. Incidents in which an under-pressure condition, caused by the failure of any pressure controlling device, or any other unplanned event other than excavation related damage, results in any part of the gas pipeline system losing service or being shut-down.

123 ANNUAL REPORTS

123.1 Each Operator shall submit to the DOT, with a copy to the CPUC, annual reports and mechanical fitting failure reports as required by 49 CFR, Part 191, §§191.11, 191.12 and 191.17. Such reports shall be submitted in the manner prescribed in 49 CFR Part 191.

123.2 At the same time copies of the reports required by paragraph 123.1 are submitted, each utility shall submit, in a format and guidance provided by the Commission's Safety and Enforcement Division or its successor, the following information to demonstrate to the Commission and the public an utility's efforts towards minimizing the risk from system leaks and failures:

- a) Number of gas leaks repaired associated with grades, causes, pipeline materials, sizes, and decades of installation.
- b) For leaks repaired in the calendar year, show time between finding the leak and its repair in intervals of 0-3 months; 3-6 months; 6-9 months; 9-12

months; 12-15 months; and greater than 15 months. For the aggregated value of leaks repaired greater than 15 months, segregate the value into leaks that are never regraded; regraded once; regraded twice; regraded three times; and regraded more than three times.

- c) Response times in five-minute intervals, segregated first by business hours (0800 – 1700 hours), after business hours and weekends/legal state holidays, and then by Division, District, and/or Region, to reports of leaks or damages reported to the utility by its own employees or by the public. The intervals start with 0-5 minutes, all the way to 40-45 minutes, an interval of 45-60 minutes and then all response times greater than 60 minutes.

The timing for the response starts when the utility first receives the report and ends when an utility's qualified representative determines, per the utility's emergency standards, that the reported leak is not hazardous or the utility's representative completes actions to mitigate a hazardous leak and render it as being non-hazardous (i.e., by shutting-off gas supply, eliminating subsurface leak migration, repair, etc.) per the utility's standards. In addition, the utility must report, using the same intervals, the times for the first company responder to arrive on scene.

- d) The number of events in which pressure in any pipeline facility exceeded the maximum allowable operating pressure (MAOP) by 50% or more of the build-up allowed for by 49 CFR § 192.201. For any transmission pipeline facility where the utility applies the provisions of 49 CFR § 192.917 (e)(3) or (e)(4), any increases above the maximum operating pressure must be reported. Also, for low-pressure systems (i.e., inches of water column pressure), all pressure increases above MAOP must be reported. Increases in pressure above MAOP resulting from planned, designed, testing, or other intentional operations performed per procedures or process established by the utility are exempted from this requirement. For purposes of reporting, "events" includes each occurrence of overpressurization that develops between overpressurization being noted and maintenance being performed.
- e) The amount of time it takes for changes, repairs, or new facilities to be finalized and updated, per the utility's procedures, to the utility's facilities maps. The provided information shall show the number of facilities mapped segregated into the following time intervals:
 - 1. Less than 14 days;
 - 2. More than 14 days, but less than 30 days;
 - 3. More than 30 days, but less than 90 days;
 - 4. More than 90 days, but less than 180 days;
 - 5. More than 180 days, but less than 360 days;
 - 6. More than 360 days.

- f) The number of employees, by operating Division, District, Region, or Other (i.e., an employee of a mobile workforce not assigned to Division, District, or Region) evaluated, and those disqualified after evaluations, performed by the utility per 49 CFR§ 192.805 (d) or (e).
- g) The 32 metrics required to be tracked per 49 CFR § 192.945(a) and ASME B31.8S, Chapter 9, Table 9.
- h) Excavation Damage Prevention Related Data
 - 1. Number of excavation damages and related costs involving homeowners;
 - 2. Number of damages and related costs involving agencies (i.e., Caltrans, non-pressurized sewer, etc.) excluded per California Government Code 4216 (GC4216);
 - 3. Number of person-days, along with total costs, devoted to: i) excavation field meetings (per GC4216); and ii) stand-by activities for preventing damage to subsurface facilities during an excavation;
 - 4. Number of person-days, along with total costs, devoted to: i) mark and locate activities (per GC 4216); and ii) all other subsurface damage prevention activities excluding those from paragraph 3 above.
- i) Lost and Unaccounted For Gas (LUAF Gas)
 - 1. A listing of the different causes of LUAF Gas that the utility tracks as part of its operations; and
 - 2. An accounting of the contribution by each of the different causes of LUAF Gas, actual and/or estimated values, which factor into the aggregated LUAF Gas value provided by the utility on all reports submitted pursuant to subsection 123.1. An utility must provide details on how each estimated value is derived.
- j) Public Liaison Activities
 - 1. The number of public liaison activities scheduled by the utility and the number of public liaison activities actually performed along with details to explain what caused the difference between the scheduled and performed liaison activities.
 - 2. A summary of public agencies (by county and agency name) to which the utility provided notice of, and made available for participation, its annual liaison sessions during each of the five calendar years preceding the reporting year. The summary must also denote which agencies were able to have representation at the session.
 - 3. In an effort to provide a convenient resource for the public to use towards confirming that utilities and first responders continue to work together in better coordinating responses to emergencies, each utility shall make the same information provided per paragraph 2 above available on its website with a link to the same information provided on

the CPUC website. Attendance of agencies at liaison sessions is voluntary and may be dependent on agencies having to allocate resources to emergencies that occur when sessions are scheduled.

k) Gas Safety Plan

1. Each utility must submit a Gas Safety Plan, as codified by Pub. Util. Code §§ 961 and 963, and as ordered by the Commission in D.12-04-010.
2. Each utility must make any modifications to its Gas Safety Plan identified by the Commission's Safety and Enforcement Division, or its successor.

123.3 All information submitted by an utility pursuant to paragraph 123.2 shall be submitted with verification, under penalty of perjury, from a senior officer of the utility, at the level of Vice-President or above, stating that the facts contained in the information are true and correct to the best knowledge of that senior officer.

124 REPORTING SAFETY-RELATED CONDITIONS

124.1 The requirements of 49 CFR, Part 191, §§191.1, 191.7, 191.23, and 191.25, to report specified safety-related conditions, are incorporated by references as part of these rules. Copies of all reports submitted to the DOT pursuant to the foregoing requirements shall be submitted to the Commission concurrently.

125 PROPOSED INSTALLATION REPORT

125.1 This section applies to the construction of a new pipeline, or the reconstruction or reconditioning of an existing pipeline. In addition to the requirements of this section, copies of all reports submitted to the DOT pursuant to the requirements of 49 CFR, Part 191, §191.22(c)(1) shall be submitted to the Commission concurrently.

125.2 The proposed installation reports required by this section shall be filed based on the following:

- (a) For utilities with less than 50,000 services in the state of California according to the Annual DOT Report, Form PHMSA F 7100.1-1 that is required by 49 CFR §191.11, the Proposed Installation Report shall be submitted to the Commission for any installation that is estimated to cost \$1,400,000 or more. The Annual DOT Report referenced above shall be the report filed by the utility for the year previous to that of the proposed installation; or
- (b) For utilities with 50,000 services or more in the state of California according to the Annual DOT Report, Form PHMSA F 7100.1-1 required by 49 CFR §191.11, the Proposed Installation Report shall be submitted to the Commission for any installation that is estimated to cost \$3,500,000 or more. The Annual DOT Report referenced above shall be the report filed by the utility for the year previous to that of the proposed installation.

125.3 Definitions:

- (a) "Construction of a new pipeline" means the installation of pipeline that will serve as a loop or extension to an existing pipeline or as an independent or stand-alone pipeline, any of which will be placed in service for the first time by an utility who filed a Form PHMSA F-7100.1-1 for the calendar year preceding the year in which construction takes place. An utility commencing service for the first time shall file a Proposed Installation Report with the Commission after receiving any necessary Certificate of Public Convenience and Necessity (CPCN) approval from the Commission and prior to the start of construction of the approved project. A CPCN is not required for an extension within a city, county, city and county, or territory within which an utility already lawfully provides service.
- (b) "Reconstruction of an existing pipeline" means the installation of pipeline that will replace an existing pipeline or pipeline segment due to alignment interference, deteriorating or aging conditions, pressure/capacity enhancement, or other reason.
- (c) "Reconditioning of an existing pipeline" is defined as the work associated with repairing, structurally reinforcing, the replacement of fittings or short segments of pipe, or for the removal and reapplication of pipe coating. The term does not include altering or retrofitting a pipeline or its appurtenances to allow for the passage of internal inspection devices.

125.4 At least 60 days prior to the construction of a new pipeline, reconstruction, or reconditioning of an existing pipeline, a report shall be filed with the Commission setting forth the proposed route and general specifications for such pipeline. The specifications shall include but not be limited to the following items:

- (a) Description and purpose of the proposed pipeline.
- (b) Specifications covering the pipe selected for installation, route map segregating incorporated areas, class locations and design factors, terrain profile sketches indicating maximum and minimum elevations for each test section of pipeline, and, when applicable, reasons for use of casing or bridging where the minimum cover will be less than specified in §192.327.
- (c) Maximum allowable operating pressure for which the line is being constructed.
- (d) Test medium and pressure to be used during strength testing.
- (e) Protection of pipeline from hazards as indicated in §192.317 and §192.319.
- (f) Protection of pipeline from external corrosion.
- (g) Estimated cost with supporting detail.

125.5 In cases of reconditioning projects that do not result in relocating pipeline from the general location it occupies prior to the project, the information stated in Section 125.4 (b) does not need to be provided within the report filed per Section 125.4.

125.6 In cases of projects necessary on an emergency basis, the report required by Section 125.4 shall be filed with the Commission as far in advance of the project as practicable, but no later than 5 business days after the project has been initiated. Reports filed for emergency projects, in addition to other information required per Section 125.4, must also detail reasons that necessitated the project being performed on an emergency basis.

125.7 During strength testing of a pipeline to be operated at hoop stresses of 20 percent or more of the specified minimum yield strength of the pipe used, any failure shall be reported on appropriate forms established by the Commission.

126 CHANGE IN MAXIMUM ALLOWABLE OPERATING PRESSURE

126.1 Except as provided in **(126.2)** below, at least 30 days prior to an increase in the maximum allowable operating pressure of a pipeline, a report shall be filed with the Commission for:

- a) A pipeline operating at or to be operated at a hoop stress of 20 percent or more of the specified minimum yield strength of the pipe being up rated.
- b) 2,500 feet or more of distribution main which is to be up rated from a MAOP less than or equal to 60 psig to a MAOP greater than 60 psig.
- c) The conversion of 5,000 feet or more of low pressure distribution main to high pressure distribution main.

The report shall include:

- i) the new maximum allowable operating pressure
- ii) the reasons for the change
- iii) the steps taken to determine the capability of the pipeline to withstand such an increase

126.2 The requirements of **(126.1)** above do not apply to the up rating or conversion of low pressure distribution mains serving less than 300 customers accomplished by connecting the service lines individually to a higher pressure main.

SUBPART C - CONSTRUCTION & SAFETY STANDARDS

141 GENERAL

141.1 Each Operator shall comply with the requirements of 49 CFR Part 192 Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards. This section of the General Order addresses specific construction, testing, and safety standards in addition to those included in 49 CFR Part 192. These rules do not supersede the Federal Pipeline Safety Regulations, but are supplements to them.

142 PLASTIC PIPE

142.1 Plastic Pipe Storage - At the time of installation, plastic pipe to be used for gas transportation, shall not have been subjected to unprotected outdoor exposure longer than the time recommended by the manufacturer, the time period specified in the Operator's operations and maintenance plan, or 4 years for medium density and 10 years for high density polyethylene pipe, whichever is least. The Operator must maintain documentation from the manufacturer to support all frequencies applied by the Operator for unprotected outdoor exposure.

143 DISTRIBUTION AND TRANSMISSION SYSTEMS

143.1 Leakage Surveys and Procedures

- (a) A gas leak survey, using leak detecting equipment, must be conducted in business districts and in the vicinity of schools, hospitals and churches, including tests of the atmosphere in gas, electric, telephone, sewer and water system manholes, at cracks in pavement, and sidewalks, and at other locations providing an opportunity for finding gas leaks, at intervals not exceeding 15 months, but at least once each calendar year.
- (b) A gas leakage survey of transmission pipelines, using leak detecting equipment must be conducted at least twice each year and at intervals not exceeding 7 ½ months.

143.2 Leak classification and action criteria – Grade – Definition – Priority of leak repair -

- (a) A "Grade 1 leak" is a leak that represents an existing or probable hazard to persons or property and requiring prompt action, immediate repair, or continuous action until the conditions are no longer hazardous.
 - (1) Prompt action in response to a Grade 1 leak may require one or more of the following:
 - (i) Implementation of the gas pipeline company's emergency plan pursuant 49 CFR § 192.615;

- (ii) Evacuating the premises;
- (iii) Blocking off an area;
- (iv) Rerouting traffic;
- (v) Eliminating sources of ignition;
- (vi) Venting the area;
- (vii) Stopping the flow of gas by closing valves or other means; or
- (viii) Notifying police and fire departments.

(2) Examples of Grade 1 leaks requiring prompt action include, but are not limited to:

- (i) Any leak, which in the judgment of the Operator personnel at the scene, is regarded as an immediate hazard;
- (ii) Escaping gas that has ignited unintentionally;
- (iii) Any indication of gas that has migrated into or under a building or tunnel;
- (iv) Any reading at the outside wall of a building or where the gas could potentially migrate to the outside wall of a building;
- (v) Any reading of eighty percent of the gas' lower explosive limit (LEL) or greater in an enclosed space;
- (vi) Any reading of eighty percent of LEL or greater in small substructures not associated with gas facilities where the gas could potentially migrate to the outside wall of a building; or
- (vii) Any leak that can be seen, heard, or felt and which is in a location that may endanger the general public or property.

(b) A "Grade 2 leak" is a leak that is recognized as being not hazardous at the time of detection but justifies scheduled repair based on the potential for creating a future hazard.

(1) Except as required by Section 143.2(d), each Operator must repair or clear Grade 2 leaks within fifteen months from the date the leak is reported. If a Grade 2 leak occurs in a segment of pipeline that is under consideration for replacement, an additional six months may be added to the fifteen months maximum time for repair provided above. In determining the repair priority, each Operator must consider the following criteria:

- (i) Amount and migration of gas;
- (ii) Proximity of gas to buildings and subsurface structures;
- (iii) Extent of pavement; and
- (iv) Soil type and conditions, such as frost cap, moisture and natural venting.

- (2) Each Operator must reevaluate Grade 2 leaks at least once every six months until cleared. The frequency of reevaluation should be determined by the location and magnitude of the leakage condition.
 - (3) Grade 2 leaks vary greatly in degree of potential hazard. Some Grade 2 leaks, when evaluated by the criteria, will require prompt scheduled repair within the next five working days. Other Grade 2 leaks may require repair within thirty days. The Operator must bring these situations to the attention of the individual responsible for scheduling leakage repair at the end of the working day. Many Grade 2 leaks, because of their location and magnitude, can be scheduled for repair on a normal routine basis with periodic reevaluation as necessary.
 - (4) When evaluating Grade 2 leaks, each Operator must consider leaks requiring action ahead of ground freezing or other adverse changes in venting conditions, and any leak that could potentially migrate to the outside wall of a building, under frozen or other adverse soil conditions.
 - (5) Examples of Grade 2 leaks requiring action within six months include, but are not limited to:
 - (i) Any reading of forty percent LEL or greater under a sidewalk in a wall-to-wall paved area that does not qualify as a Grade 1 leak and where gas could potentially migrate to the outside wall of a building;
 - (ii) Any reading of one hundred percent LEL or greater under a street in a wall-to-wall paved area that does not qualify as a Grade 1 leak and where gas could potentially migrate to the outside wall of a building;
 - (iii) Any reading less than eighty percent LEL in small substructures not associated with gas facilities and where gas could potentially migrate creating a probable future hazard;
 - (iv) Any reading between twenty percent LEL and eighty percent LEL in an enclosed space;
 - (v) Any reading on a pipeline operating at thirty percent of the specified minimum yield strength or greater in Class 3 or 4 locations that does not qualify as a Grade 1 leak; or
 - (vi) Any leak that in the judgment of the Operator personnel at the scene is of sufficient magnitude to justify scheduled repair.
- (c) A "Grade 3 leak" is a leak that is not hazardous at the time of detection and can reasonably be expected to remain not hazardous.
- (1) Each Operator must reevaluate Grade 3 leaks during the next scheduled survey, or within fifteen months of the reporting date, whichever occurs first. Thereafter, the leak must be reevaluated every calendar year, not to exceed 15 months until the leak is repaired, regraded or no longer results in a reading.

(2) Examples of Grade 3 leaks requiring reevaluation at periodic intervals include, but are not limited to:

- (i) Any reading of less than eighty percent LEL in small gas associated substructures, such as small meter boxes or gas valve boxes; or
 - (ii) Any reading under a street in areas without wall-to-wall paving where it is unlikely the gas could migrate to the outside wall of a building.
- (d) Any grade of leaks above Grade 3 can only be downgraded once to a Grade 3 leak without a physical repair. After a leak has been downgraded to Grade 3, the leak must be reevaluated every calendar year not to exceed 15 months. If the Grade 3 leak is upgraded at any time to a higher grade, the leak must be reevaluated and repaired per the Operator's procedures for the higher grade to which the leak is upgraded and may not be downgraded again to Grade 3.
- (e) All underground leaks on transmission lines classified as Grade 2 or 3, or any subcategories of grades an Operator may establish between Grade 2 or 3, must be repaired by the Operator either upon discovery or within one year after discovery.

143.3 Valve Maintenance - Each valve, the use of which may be necessary for the safe operation of a distribution system, must be inspected, serviced, lubricated (where required) and partially operated at intervals not exceeding 15 months, but at least once each calendar year.

143.4 Operator Qualification - The equipment and facilities used by an Operator for training and qualification of employees must be identical, or very similar in operation to the equipment and facilities which the employee will use, or on which the employee will perform the covered task.

143.5 Encroachments – With the exception of gas pipeline facilities related to installations in gas meter rooms or other specially designed indoor locations where an outdoor meter installation is not possible or practical, a utility transporting LNG, natural gas or other gas shall not construct any part of a LNG, natural gas or other gas pipeline system under a building. In addition, the utility shall not allow a building or other encroachments to be constructed on to its pipeline right-of-way that would hinder maintenance activities on the pipeline or cause a lengthy delay in accessing its pipeline facilities during an emergency. If the utility finds a building or other encroachment built over a pipeline facility after the effective date of this section, then the utility may require the party causing the encroachment to remove the building or other encroachment from over the pipeline facility or to reimburse the utility for its costs associated with relocating the pipeline system.

The utility shall determine, within 90 days after discovering the encroachment, whether the encroachment can be resolved within 180 days. If the utility determines that the encroachment cannot be resolved within 180 days, the utility shall, within 90 days of discovery of the encroachment, submit to the CPUC a written plan to resolve the encroachment within a period longer than 180 days. The CPUC may then extend the 180-day requirement in order to allow the party causing the encroachment and the utility to implement the written plan to resolve the encroachment. If the utility does not submit a written plan, and the encroachment is not resolved within 180 days of discovery, the utility shall isolate and discontinue service to the section of pipeline on which the encroachment exists. The utility must provide written notice of any imminent service discontinuance per this section to the Commission 30 days prior to discontinuing service.

143.6 Compatible Emergency Response Standard – In establishing emergency response procedures, all gas utilities shall use, at a minimum, the Incident Command Systems (ICS) as a framework for responding to and managing emergencies and disasters involving multiple jurisdictions or multiple agency responses. The ICS used by utilities must be compatible with the ICS used by the first responder community within the State of California, and as detailed in California Government Code Section 8607(a), All gas utilities must have the ICS in place to be activated when necessary to the types of emergency events listed and detailed within the written emergency plans gas utilities are required to maintain per 49 CFR Part 192, §192.615.

144 TEST REQUIREMENTS FOR PIPELINES TO OPERATE BELOW 100 p.s.i.g.

144.1 Except for service lines and plastic pipelines, each segment of a pipeline that is to be operated below 100 p.s.i.g. must be leak tested in accordance with 49 CFR §192.509 and the following:

- (a) Each main that is to be operated at less than 1 p.s.i.g. must be tested to at least 10 p.s.i.g.
- (b) Each main to be operated at or above 1 p.s.i.g. but less than 60 p.s.i.g. must be tested to at least 90 p.s.i.g.
- (c) Each main to be operated at or above 60 p.s.i.g. but less than 100 p.s.i.g. must be tested to a minimum of 1.5 times the proposed MAOP

144.2 Service lines and plastic pipelines must be leak tested in accordance with 49 CFR §192.511 or §192.513, respectively. In addition to these requirements:

- (a) Each new service line (other than plastic) intended to be operated at a pressure less than 1 p.s.i.g, must be tested to a minimum pressure of 10 p.s.i.g, for a minimum duration of 5 minutes.
- (b) Tie-in connections for pipeline used to repair existing service lines must be pressure tested at the operating pressure.

144.3 Clearance between gas pipelines and other subsurface structures:

- (a) All natural gas transmission pipelines must be installed in conformance with the requirements of 49 CFR, Part 192, §192.325.
- (b) All natural gas distribution pipelines (main and service) must be installed in conformance with the requirements of 49 CFR, Part 192, §192.325 and the following:
 - (1) Independently Installed: Gas pipelines, when independently installed, shall be separated, where practicable from electrical supply systems, water, oil, communication, or other pipe systems or other foreign substructures, by a clearance of at least 12 inches when paralleling and by at least 6 inches when crossing. New gas pipelines inserted within, and utilizing as conduit, pipeline facilities installed prior to the effective date of this rule are exempt from the paralleling requirements of this paragraph but not the requirements related to crossings.
 - (2) Concurrently Installed: Gas pipeline, when concurrently installed with electrical supply systems, water, oil, communication, other pipe systems, or other foreign substructures, shall be installed with the separation required by paragraph 1 of this section, except that by mutual agreement between all of the parties involved there may be less separation for duct systems for supply cables of 0 - 750 volts. (For additional information, please consult Commission General Order 128, Rule 31.4.)
- (c) In all instances where the required separations cannot be maintained, it is the responsibility of the party last installing facilities to confer with the utility and ensure that the reduced separations do not adversely impact the integrity of the gas pipeline facilities, which includes any cathodic protection that may be applied to the gas pipeline facilities.

145 TRANSMISSION LINES: RECORDKEEPING

145.1 In addition to the other recordkeeping requirements of these rules, each Operator shall maintain the following records for transmission lines for the periods specified:

- (a) The date, location, and description of each repair made to pipe (including pipe-to-pipe connections) must be retained for as long as the pipeline remains in service or there is no longer pipe within the system of the same manufacturer, size and/or vintage as the pipeline on which repairs are made, whichever, is longer.
- (b) The date, location, and description of each repair made to parts of the pipeline system other than pipe must be retained for at least 75 years. However, repairs, or findings of easement encroachments, generated by patrols, surveys, inspections, or tests required by subparts L and M of 49

CFR Part 192 must be retained in accordance with paragraph (c) of this section.

- (c) A record of each patrol, survey, inspection, and test required by subparts L and M of this part must be retained for at least 75 years or until the next patrol, survey, inspection, or test is completed, whichever is longer.

SUBPART D - LNG

161 GENERAL

161.1 Each Operator shall comply with the requirements of 49 CFR Part 193 - Liquefied Natural Gas Facilities: Federal Safety Standards. This section of the General Order addresses specific standards for the design, construction, testing, operation, and maintenance of liquefied natural gas facilities in addition to those included in 49 CFR Part 193. These rules do not supersede the Federal Pipeline Safety Regulations, but are supplements to them.

162 LIQUEFIED NATURAL GAS FACILITIES

162.1 Except for a pipeline facility in operation or under construction before January 1, 1973, no Operator may store, treat, or transfer liquefied natural gas in a pipeline facility unless that pipeline facility meets the applicable requirements of this part and of NFPA Standard No. 59A.

162.2 No Operator may store, treat, or transfer liquefied natural gas in a pipeline facility in operation or under construction before January 1, 1973, unless

- (a) The facility is operated in accordance with the applicable operating requirements of this part and of NFPA Standard 59A; and
- (b) Each modification or repair made to the facility after December 31, 1972, conforms to the applicable requirements of this part and NFPA Standard 59A, insofar as is practicable.

162.3 The Operator, who is planning to build a LNG facility in the state of California, shall notify the Gas Safety and Reliability Branch 90 days prior to commencing construction on that LNG facility. In addition to the requirements of this section, copies of all reports submitted to the DOT pursuant to the requirements of 49 CFR, Part 191, §191.22(c)(1) shall be submitted to the Commission concurrently.

162.4 All Operators must include mobile LNG equipment within the written operations and maintenance plans required by 49 CFR, Part 192, §192.605, to the extent that they own, operate, or utilize mobile LNG equipment. Such Operators must provide written, detailed procedures for the operation and maintenance of their mobile LNG units which conform to the requirements of 49 CFR, Part 193, §193.2019(a). Moreover, these procedures must include a requirement to perform operational tests of mobile LNG equipment, after any modifications are performed to the equipment (including computer equipment and software) that could affect equipment operation, before using modified equipment for actual field use.

SUBPART E - GAS HOLDERS

181 GENERAL

181.1 Each Operator shall comply with the requirements of 49 CFR Part 192 Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards. This section of the General Order addresses specific standards for the design, construction, testing, operation, and maintenance of gas holders in addition to those included in 49 CFR Part 192. These rules do not supersede the Federal Pipeline Safety Regulations, but are supplements to them.

182 PIPE-TYPE AND BOTTLE-TYPE HOLDERS: DESIGN AND CONSTRUCTION

182.1 All holders shall comply with the requirements of 49 CFR §§192.175 and 192.177.

182.2 Electrical equipment and wiring installed at holders must conform to the National Electrical Code, NFPA-70, so far as that Code is applicable.

182.3 Any holder designed and constructed in accordance with the requirements for location class 1 or 2, but not 3, shall be installed at least 75 feet from a flammable building or adjoining property that may have a flammable building constructed thereon in the future, or from the nearest rail or a track on a railroad private right-of-way. Also, no utility shall construct or install a flammable building within fifty feet of a holder. (A flammable building shall be understood to be a building, roof or siding of which consist of wood or other readily combustible material.)

182.4 Each vent line that exhausts gas from a pressure relief valve or blowdown valve must extend to a location where the gas may be discharged without hazard.

182.5 A device which will maintain a continuous pressure record shall be installed at the inlet or outlet of each holder, except that where a group of holders are jointly connected and are all filled from the same gas source and all empty into a common line or system, only one device will be required. A pressure indicating device shall be installed on each container in the holder.

182.6 Each holder facility must have adequate fire-protection facilities.

182.7 Holders shall be provided with overpressure protection systems complying with the requirements of 49 CFR, §192.195.

182.8 When a holder is constructed adjacent to any existing electric transmission line normally carrying voltages in excess of 50,000 volts, the holder shall be located no nearer to the lines than the height of the poles carrying them.

183 PIPE-TYPE AND BOTTLE-TYPE HOLDERS: PLAN FOR INSPECTION AND TESTING

183.1 All leaks of any consequence in gas pipeline, valves and equipment in the vicinity of a holder must be promptly repaired upon discovery, or as soon as practicable. All hazardous leaks must be remedied at once.

183.2 In addition to other inspections required by this Part, after a high pressure holder has been in service for a period of ten years, and at intervals not exceeding ten years thereafter, a complete and thorough internal and external inspection shall be made and reported upon by competent inspectors who are selected by the utility and are agreeable to the Commission. A copy of the report shall be provided to the Commission.

183.3 In lieu of an internal inspection, when it is not practical to enter the holder, a sufficient number of plugs shall be cut from, or holes bored in, the shell at points believed most subject to internal corrosion, to enable examination for corrosion. The interior of at least one container of a holder constructed entirely of pipe and fittings shall be inspected by removing the end closures and entering the container.

183.4 As an alternative to the above requirements to enter the container, or to cut plugs or bore holes in the holder, a nondestructive test procedure such as ultrasonic testing may be used. The test instrument must be calibrated to measure the wall thickness of the steel plates so that the error of indication shall not vary more than plus or minus two thousandths (± 0.002) of an inch.

183.5 When such inspections determine that the holders are in a defective and hazardous condition, they shall be taken out of service until repaired and placed in a safe workable condition. All others in the same group shall immediately be inspected and repaired if found defective. If any portion of the shell of a high pressure holder is located underground and exposed to the soil, inspection of its exterior for corrosion and leaks shall be made by suitable representative excavations at the time of the inspection.

SUBPART F - PETROLEUM GAS VESSEL STATIONS

201 GENERAL

Each Operator shall comply with the requirements of 49 CFR Part 192 -Transportation of Natural and Other Gas by Pipeline: Minimum Federal Safety Standards. This section of the General Order addresses specific standards for the design, construction, testing, operation, and maintenance of petroleum gas vessel stations in addition to those included in 49 CFR Part 192. These rules do not supersede the Federal Pipeline Safety Regulations, but are supplements to them.

202 PETROLEUM GAS VESSEL STATIONS

202.1 For the purpose of this section, vessel shall refer to any structure with a capacity of two hundred gallons or more used for the storage of petroleum gas, but shall not refer to those vessels used for transporting purposes.

202.2 Each Operator having a vessel station shall establish a plan for the systematic routine inspection and testing of these facilities in accordance with Appendix A -Petroleum Gas Vessel Stations: Operation, Maintenance, and Inspection, and shall provide for:

- (a) Effective training of all personnel associated with the maintenance and operation of the facilities.
- (b) Specification of appropriate safe work practices and assurance that those practices are followed.
- (c) Effective liaison with local fire departments and other emergency response agencies to assure that these agencies are familiar with the operating facilities to the extent necessary to assure that any required response from them in an emergency is effective, and to assure that the Operator of the facilities is adequately informed of the services that those agencies will provide.

SUBPART G – WHISTLEBLOWER PROTECTIONS

301 General

301.1 Each utility shall post in a prominent physical location, as well as an electronic notice on its website where its employees are likely to see it, a notice containing the following information:

Report unsafe conditions to the Public Utilities Commission by calling the whistleblower hotline at 1(800) 649-7570 or by e-mail to safetyhotline@cpuc.ca.gov.

Under sections 451 of the California Public Utilities Code, every public utility shall furnish and maintain such service, instrumentalities, equipment, and facilities, as are necessary to promote the safety, health, comfort, and convenience of its patrons, employees and the public. Further, under section 963(b)(3) of the California Public Utilities Code, it is the policy of this State that California natural gas utilities and the Commission's regulation of natural gas utilities place safety of the public and the natural gas utilities' employees as the top priority consistent with the principle of just and reasonable cost-based rates. In addition, under section 961(e) of the California Public Utilities Code, the Commission and natural gas utilities must provide meaningful and ongoing opportunities for the utilities' workforce to participate in the utilities' development of a plan for the safe and reliable operations of their pipeline facilities and to contribute to developing an industry wide culture of safety. In view of the above, any employee of the natural gas utility or of an independent contractor working under contract with a natural gas utility, who in good faith, believes that unsafe conditions, services or facilities of the utility threaten the health or safety of its patrons, the employees or the public, has a right to report the conditions to the California Public Utilities Commission. The employee can report the conditions by calling the Commission's Whistleblower Hotline at 1(800) 649-7570, either anonymously or by giving the employee's name, or by sending an e-mail with the pertinent facts and/or documentation to safetyhotline@cpuc.ca.gov. This requirement shall be in addition to any right the employee has to contact any other State or Federal agency, if the employee has reasonable cause to believe that the information discloses a violation of a state or federal statute, or a violation or noncompliance with a state or federal rule or regulation.

302 The Utility Has No Right to Retaliate Against an Employee For Notifying the California Public Utilities Commission

302.1 In addition to other statutes, which provide remedies for retaliation against Whistleblowers (e.g., the California Whistleblower Act, California Labor Code § 1102.5), or any other remedy an employee may have in a court, the Commission prohibits California natural gas utilities from retaliating against any employee, who reports, in good faith, unsafe conditions to the Commission. For purposes of this regulation, the Commission retains the option to impose penalties and any other

remedies provided under the California Public Utilities Code for any natural gas utility, which the Commission finds violates this regulation.

APPENDIX A

PETROLEUM GAS VESSEL STATIONS: OPERATION, MAINTENANCE AND INSPECTION

I. Operation and Maintenance

1. Before work which might bring about admission of air is performed on any Petroleum Gas vessel, such as removing the vessel from service for internal inspection, internal repairs or dismantling, all inlet and outlet gas connections, except those opening to the atmosphere, shall be physically removed and the vessel shall be purged with inert gases. The closing of inlet and outlet valves or the blanking off of inlet and outlet flanges shall not be considered sufficient precaution against the formation of an explosive mixture while the vessel is out of service.

Before work which might bring about the admittance of air is performed on a petroleum gas vessel, all possible liquid shall be drained there from before purging is begun. A sufficient quantity of steam shall be used to supplement the inert gases used for purging in order to assure the removal of all petroleum gas before the admittance of air. Before workmen are allowed to enter a vessel removed from service and purged with inert gases, the inert gases shall be purged with air, or in lieu thereof, the workmen entering the vessel shall be equipped with self-contained breathing apparatus meeting the requirements of NFPA 19B and maintained in accordance with manufacturer's recommendations.

When the interior of a vessel that has been removed from service and purged of flammable vapors is scraped, brushed, sprayed, painted, or otherwise worked on in a manner that might bring about the formation of an explosive mixture, an adequate and continuous circulation of outside air through the vessel by means of fans or other devices is required.

The circulation of air shall continue until there is no reasonable probability of the formation of an explosive mixture. While engaged in such work, workers must be provided with a safe supply of air to breathe. If conditions warrant, they shall be provided with appropriate respiratory protection.

Upon returning a purged vessel to service, the air shall be purged from the vessel with inert gases before gas or liquid is allowed to reenter the vessel.

All tests to determine the presence of an explosive mixture in connection with the purging of a vessel with inert gases or air, shall be conducted by competent Operators by means of adequate specifications and gas analysis apparatus. When gas detection equipment is used, the Operator shall calibrate and verify it is in good working order.

Except as herein otherwise provided, it is recommended that all operations set forth in this paragraph, including gas analyses, be performed in accordance with

the latest procedure recommended by the American Gas Association Publication, "Purging Principles and Practice."

2. Whenever a vessel is painted, all seams on that portion of the vessel being painted, which are subject to gas pressure, shall be inspected for leaks.
3. Except as herein otherwise provided, all vessels of this type shall be maintained and operated in accordance with the Unfired Pressure Vessel Safety Orders, issued by the Division of Industrial Safety, Department of Industrial Relations of the State of California, and in effect at the time; however, no reconstruction of vessels is required in order to comply with said Unfired Pressure Vessel Safety Orders, if the vessels were acquired prior to April 1, 1940.
4. All valves, fittings, regulators, and pressure relief devices shall be kept in working order and reasonably protected from trespass.
5. The maximum safe operating pressure of the vessel shall be known to the Operator. This pressure can be determined from the inspection reports of the State Division of Industrial Safety or other qualified inspectors.
6. All drips and drain lines shall be kept free of obstruction and in proper working order at all times.
7. In order to provide for liquid expansion with temperature, Petroleum Gas storage vessels shall not be filled to a greater fraction of their volumes than is permitted by said Unfired Pressure Vessel Safety Orders, in effect at the time.
8. At stations where equipment is employed for vaporizing the gas, the vaporizer shall be located outside of buildings, unless those buildings are devoted exclusively to Petroleum Gas and distribution operations, are of approved fireproof construction, and are well ventilated from points near the floor and roof.

Any device supplying the necessary artificial heat for producing the steam, hot water, or other heating medium for the gas vaporizers shall be equipped with a full safety shutoff control.

When such devices are located under a common roof with the gas vaporizers, they shall be located in a separate compartment or room, which shall be separated from compartments or rooms containing liquefied petroleum gas vaporizers, pumps, or central gas mixing devices by a fire wall containing no openings through which free vapors might flow. Vaporizers employing artificial heat shall be provided with a safety relief valve of adequate capacity at or near the outlet of the vaporizer. Direct-fired Petroleum Gas vaporizers and heaters shall only be allowed after special authorization has been granted by the Commission.

II. Inspection Procedures

1. Each utility shall employ a standard set of inspection forms prescribed by the Commission for recording data obtained at the time inspections are made.

2. The annual inspection reports for all vessels shall contain a general summary of the operating condition of the vessel and indicate any changes, repairs, or improvements that appear advisable.
3. The annual general inspection report of each vessel shall include a description and typical analysis of the gas or gases stored therein during the past year. Analyses shall particularly indicate the content of hydrogen sulfide, carbon dioxide, oxygen, and other corrosive impurities.
4. Whenever the internal inspection of a vessel is contemplated, it shall first be removed from service and entered in accordance with the provisions of I. 1.
5. The following minimum inspections shall be made and recorded.

Annual General Inspection:

General inspection of aboveground vessels for condition, indications of corrosion, and need of painting. Check yard for cleanliness and fencing.

The exposed piping, valves, and fittings of buried vessels shall be examined for general condition, undue strain caused by settlement, and need of painting. All exposed connections, manholes and fittings on vessels, as well as mechanical joints in all exposed piping within fifty feet of any vessel, shall be tested for leaks. All leaks and their disposition shall be shown on the report form. Known or suspected leaks on buried vessels, connections, and fittings shall be uncovered and repaired as soon as practicable. Hazardous leaks shall be repaired at once.

Examination shall be made of foundations and supports for all above ground vessels to ascertain if all saddles and piers are fully supporting the vessel. Any settlement which will produce uneven and excessive strain shall be corrected as soon as practicable to minimize risk to the health and safety of the public.

Check accuracy of liquid gauging equipment. Check operation of vaporizer relief devices. Inspect condition and operation of safety shutoff control on vaporization heating equipment.

Inspection of Underground Vessels for External Corrosion:

Where a storage vessel is underground and exposed to the soil, inspection of its exterior for soil corrosion and leaks shall be made by suitable representative excavations at least once each ten years.

Additional Inspections:

Except as hereinafter provided, after a Petroleum Gas vessel has been in service for a period of twenty years, and at intervals not exceeding twenty years thereafter, a complete and thorough internal and external inspection shall be made and reported upon by qualified inspectors, who are selected by the utility and are agreeable to the Commission. For groups of two or more vessels, of the same type of materials and design, built at the same time and subjected during the interval to identical service conditions, no less than twenty percent, nor less than one of the vessels in any such group shall receive the internal inspection after each twenty years of service. If the utility uses the above exception, the vessel or vessels inspected shall be regularly rotated in order that eventually all vessels will have been examined.

When the vessel is buried and/or cannot be entered for an internal inspection, a sufficient number of plugs shall be cut from, or holes bored into, the shell at points believed most subject to internal and/or external corrosion, to enable examination for corrosion.

As an alternative to entering the vessel or to cutting plugs or boring holes in the vessel, a nondestructive test procedure such as ultrasonic testing may be used. The test instrument must be calibrated to measure the wall thickness of the steel plates so that the error of indication shall not vary more than plus or minus two thousandths (± 0.002) of an inch.

Any vessels found to be in a defective and hazardous condition shall be taken out of service until repaired and placed in a safe workable condition, and any other vessels in the same group shall immediately be inspected and repaired if found necessary.

In the years that the inspections described above are made, the utility will not be required to make the regular annual general inspection.

APPENDIX B
CALIFORNIA PUBLIC UTILITIES COMMISSION
 Report of Gas Leak or Interruption*
 CPUC File No. 420

Part I: CPUC CONTACT INFORMATION

Operator: _____	CPUC Contact: Name _____	Recorder <input type="checkbox"/>	FAX <input type="checkbox"/>

Foreword

November 12, 2019

To: Applicants Filing Proponent’s Environmental Assessments for Energy Infrastructure Projects at the California Public Utilities Commission (CPUC or Commission)

From: Merideth Sterkel (Program Manager, Infrastructure Planning and Permitting) and Mary Jo Borak and Lon Maier, Supervisors, Infrastructure Permitting and California Environmental Quality Act, Energy Division, CPUC

Subject: Introducing revisions to the Pre-filing Guidelines for Energy Infrastructure Projects and a Unified and Updated Electric and Gas PEA Checklist

We are pleased to release a 2019 revision to the California Environmental Quality Act (CEQA) Proponent’s Environmental Assessments (PEA) Checklist. This substantially revised document is now entitled “Guidelines for Energy Project Applications Requiring CEQA Compliance: Pre-filing and Proponent’s Environmental Assessments” (Guidelines). Future updates to this document will be made as determined necessary. The CPUC’s Rules of Practice and Procedure Sections 2.4 provide that all applications to the CPUC for authority to undertake projects that are not statutorily or categorically exempt from CEQA requirements shall include an Applicant-prepared PEA.

Updates Overview

Prior versions of the Working Draft PEA Checklist were published in 2008 and 2012. For this 2019 update, extensive revisions were made to all sections based on our experience with the prior checklist versions. All electric and natural gas projects are now addressed in a single PEA Checklist, and the following updates were made:

- **CEQA Statute and Guidelines 2019 Updates:** The PEA Checklist is updated pursuant to the 2019 CEQA Statutes and Guidelines, including new energy and wildfire resource areas.
- **Pre-filing Consultation Guidelines:** Pre-filing guidelines are now provided since the pre-filing and PEA development processes are intertwined.
- **Unified PEA Checklist for Energy Projects:** All electric and natural gas projects are now addressed in a single PEA Checklist.
- **Additional CEQA Impact Questions:** Questions are included for the following PEA Checklist sections: 5.4, Biological Resources; 5.6, Energy; 5.9, Hazards, Hazardous Materials, and Public Safety; 5.16, Recreation; 5.17, Transportation; and 5.19, Utilities and Service Systems.
- **CPUC Draft Environmental Measures:** Draft measures are provided in PEA Checklist Attachment 4 for Aesthetics, Air Quality, Cultural Resources, Greenhouse Gas Emissions, Utilities and Service Systems and Wildfire.

Purpose of the Guidelines Document

The purpose and objective of the PEA Checklist included within this Guidelines document has not changed, which is to provide project Proponents (Applicants) with detailed guidance about information our CEQA Unit Staff expect in sufficient PEAs. The document details the information Applicants must provide the CPUC to complete environmental reviews that satisfy CEQA requirements. Specifically, the Pre-filing Consultation Guidelines and PEA Checklist, together, are intended to achieve the following objectives:

1. Provide useful guidance to Applicants, CPUC staff, and outside consultants regarding the type and detail of information needed to quickly and efficiently deem an application complete;

2. Ensure PEAs provide reviewers with a detailed project description and associated information sufficient to deem an application complete, avoid lengthy review periods and numerous data requests for the purpose of augmenting a PEA, and avoid unnecessary PEA production costs;
3. Increase the level of consistency between PEAs submitted and provide for more consistent review by CPUC CEQA Unit Staff and outside consultants; and
4. Promote transparency and reduce the potential for conflicts between utility and CPUC Staff about the types, scope, and thoroughness of data expected for data adequacy purposes.

The Guidelines document provides detailed instructions to Applicants for use during the Pre-filing process and PEA development. The document is intended to fully inform Applicants and focus the role of outside consultants, thus, enabling Applicants to submit more complete, useful, and immediately data-adequate PEAs.

Benefits of High Quality and Complete PEAs

CPUC CEQA Unit Staff seek to complete the environmental review process required under CEQA as quickly and efficiently as possible. Table 1 shows the average duration in months of CPUC applications that require CEQA documents. While there are tensions between speed and quality in all project management, the achievement of expeditious environmental reviews can result in lower project costs to ratepayers. Our staff have reviewed the timelines for 108 past CPUC applications that required review pursuant to CEQA and determined that the average length of time from application filing to PEA deemed complete is four months, regardless of the type of CEQA document. The goal for our agency is to deem PEAs complete within 30 days. The faster PEAs are deemed complete, the sooner staff can prepare the CEQA document. With each delay to PEA completeness, the fundamental project purpose and need and baseline circumstances may shift, requiring refreshing of the data. The Guidelines document will improve the initial accuracy of PEAs and reduce the time required to deem PEAs complete. Once an application is formally filed, the Applicant will receive a notification letter from CPUC CEQA Unit Staff when the PEA is deemed complete.

Table 1. Average Duration in Months of CPUC Applications that Require CEQA Documents (1996–2019)

	I: Application Filed to PEA Deemed Complete	II: PEA Deemed Complete to Draft Environmental Document Circulated	III: Draft Environmental Document to Final Released	IV: Final Released to Proposed Decision	V: Proposed Decision to Final Decision (with Certification of CEQA Document)	I-V: Overall Duration ⁽¹⁾
Environmental Impact Report (EIR; n=49)	5	13	7	5	2	29
Initial Study/ Mitigated Negative Declaration (IS/MND; n=56)	4	8	3	4	1	19
All Document Types (n=108)	4	8	4	5	2	23
Range: All Document Types	1-9	5-18	2-10	1-7	1-2	12-38

Note:

(1) The overall duration is not a sum of the average durations for each step. The overall duration was calculated using “n,” the number of applications with data available for the date of application filing and final decision date. Not all projects had data available for each step. The data include several instances where the CEQA document was developed in conjunction with a NEPA document, e.g., an EIR/Environmental Impact Statement or IS/MND/Environmental Assessment/Finding of No Significant Impact was prepared instead of an EIR or MND, respectively. The above data is not inclusive of projects that had averages and ranges that are statistically abnormal.

Lessons Learned about the PEA Process

In the past, Applicants have filed PEAs using the checklist to ensure the correct information was provided but have not followed the format and organization of the PEA checklist and sometimes chose not to engage in Pre-filing activities with our staff. To achieve the objectives and benefits listed above, Applicants will file all future PEAs in the same organizational format as the updated checklist and adhere to the Pre-filing Consultation Guidelines in coordination with CPUC CEQA Unit Staff.

The Guidelines document describes the level effort required for the assessments necessary to not only finalize a CEQA document but ensure its legal defensibility. While final design and survey information is preferred, the PEA may incorporate preliminary design and survey data as appropriate and in consultation with CEQA Unit Staff during Pre-filing. We recognize that projects are fact specific, and deviations from the Pre-filing Consultation Guidelines and PEA Checklist are inevitable but providing concise and accurate information as soon as possible is paramount. Any deviations from these Guidelines must include clear justification and should be discussed and submitted during the Pre-filing Consultation process to avoid subsequent delays.

The PEA Checklist is written with the assumption that an Environmental Impact Report will be prepared, however, a Mitigated Negative Declaration or other form of CEQA document (e.g., exemption) may be appropriate. This determination, however, must be made in consultation with CPUC CEQA Unit Staff during Pre-filing and prior to submittal of the Draft PEA.

Future Modifications and Improvements

Like the predecessor PEA checklists, this is a working document that will be modified over time based on experience and changes to the CEQA Statute and Guidelines. To meet the above stated objectives and maintain consistency with CEQA. We expect Applicants, their consultants, CPUC consultants, and the CPUC to engage in a regular and ongoing dialogue about specific improvements to the CEQA process overall, and these Guidelines in particular.

We look forward to working with Applicants during the Pre-filing Consultation process to ensure that the level of effort that goes into preparing PEAs can be effectively and efficiently transferred into the CEQA document prepared by CPUC Staff and consultants. Applicants are invited to debrief with our staff about the efficacy of these Guidelines.

Pre-Filing Consultation Guidelines

The following Pre-filing Consultation Guidelines apply to all PEAs filed with applications to the CPUC and outline a process for Applicants to engage with CPUC CEQA Unit Staff about upcoming projects that will require environmental review pursuant to CEQA. The CPUC is typically the Lead Agency for large projects by investor-owned gas and electric utilities. The CPUC's CEQA Unit Staff are experienced with developing robust CEQA documents for long, linear energy projects. The PEA Checklist, starting in the next section, is based upon that experience.

Pre-filing Consultation Process

During Pre-filing Consultation, Applicants and CPUC Staff meet to discuss the upcoming application. Successful projects will commence Pre-filing Consultation no less than six months prior to application filing at the CPUC. When the application is formally filed at the CPUC, the Application and the PEA are submitted to the CPUC Docket Office.

1. Meetings with CPUC Staff

To initiate Pre-filing Consultation, Applicants will request and attend a meeting with CPUC CEQA Unit Staff at least six months prior to application filing.

- a. Applicants can request a Pre-Filing Consultation meeting via email or letter. Initial contact via telephone may occur, but staff request written documentation of Pre-filing Consultation commencement.
- b. For the initial meeting, Applicants will provide staff with a summary of the proposed project including maps and basic GIS data at least one week prior to the meeting.
- c. Applicants will receive initial feedback on the scope of the proposed project and PEA. Staff will work with Applicants to establish a schedule for subsequent Pre-filing meetings and milestones.

2. Consultant Resources

CPUC CEQA Unit Staff will initiate the consultant contract immediately following the initial Pre-filing Consultation meeting. CPUC's consultant contract resources will be executed prior to Applicant filing of the Draft PEA. The consultant contract is critical to the Pre-filing Consultation process. Applicants are encouraged to request updates about the status of the contract. The CPUC may use its on-call consulting resources contract for these purposes. If CEQA Unit Staff determine that their on-call consulting resources are not appropriate due to the anticipated project scope, staff may initiate a request for proposals process to engage consulting resources, and the resulting contracting process will be completed and consultant contract in place prior to Draft PEA filing.

3. Draft PEA Provided Prior to PEA Filing

A complete Draft PEA will be filed at least three months prior to application filing. CPUC CEQA Unit Staff and the CPUC consultant team will review and provide comments on the Draft PEA to the Applicant early in the three-month period to allow time for Applicant revisions to the PEA.

4. Project Site Visits

One or more site visits will be scheduled with CPUC CEQA Unit Staff and their consultant at the time of Draft PEA filing (or prior). Appropriate federal, state, and local agencies will also be engaged at this time.

5. Consultation with Public Agencies

The Applicant and CPUC CEQA Unit Staff will jointly reach out and conduct consultation meetings with public agencies and other interested parties in the project area. CPUC CEQA Unit Staff may also choose to conduct separate consultation meetings if needed.

If a federal agency will be a co-lead pursuant to the National Environmental Policy Act and coordinating with the CPUC during the environmental review process, the Applicant and CPUC CEQA Unit Staff will ensure that the agency has the opportunity to comment on the Draft PEA and participate jointly with the CPUC throughout the application review process. Applicant and Commission CEQA Unit Staff coordination with the federal agency (if applicable) will likely need to occur more than six months in advance of application filing.

6. Alternatives Development

PEAs will be drafted with the assumption that an Environmental Impact Report (EIR) will be prepared. Applicants will include a reasonable range of alternatives in the PEA (even though a Mitigated Negative Declaration [MND] may ultimately be prepared), including sufficient information about each alternative. In some situations, CPUC CEQA Unit Staff and project Applicants may agree during Pre-filing Consultation that an MND is likely and a reasonable range of alternatives is not required for the PEA. This determination, however, must be made in consultation with CEQA Unit Staff during Pre-filing and is not final. The type of document to be prepared may change based on public scoping results and other findings during the environmental review process.

CEQA Unit Staff will provide feedback on the range of alternatives prior to Draft PEA filing (if possible) based on their review of the Draft PEA. It is critical that Applicants receive feedback from CEQA Unit Staff about the range of alternatives prior to filing the PEA. Applicants will ensure that each alternative is described and evaluated in the PEA with an equal level of detail as the proposed project unless otherwise instructed in writing by CEQA Unit Staff.

7. Format of PEA Submittal

Each PEA submittal will include the completed PEA Checklist tables. Each PEA submittal will be formatted and organized as shown in the Example PEA Table of Contents provided in the PEA Checklist unless otherwise directed by CPUC CEQA Unit Staff in writing prior to application filing. The example PEA Table of Contents is modeled after typical CPUC EIRs.

8. Transmission and Distribution System Information

A key component of CEQA projects analyzed during CPUC environmental reviews is the context of the project within the larger transmission and distribution system. Detailed descriptions of the regional transmission system, including GIS data, to which the proposed project would interconnect are required. The required level of detail about interconnecting systems is project specific and will be specified by CEQA Unit Staff in writing during Pre-filing Consultation. Detailed distribution system information may also be required.

9. Data and Technical Adequacy

Applicants will focus PEA development efforts on providing thorough, up-to-date data and technical reports required for CPUC CEQA Unit Staff to complete the environmental document and alternatives analysis.

The Applicant-drafted PEA Executive Summary, Introduction, Project Description, Description of Alternatives, and other chapters typically found in past CPUC EIRs and Initial Study/MNDs will be *thorough*—emulate the level of detail provided in typical CPUC EIRs. The setting sections provided for

PEA Chapter 5, Environmental Analysis, will also be thorough. Applicants will ensure that the PEA text, graphics, and file formats can be efficiently converted into CPUC's CEQA document with minimal revision, reformatting, and redevelopment by CPUC Staff and consultants.

The impact analyses and determinations provided for Chapter 5, Environmental Analysis, and Chapter 6, Comparison of Alternatives, need not be as thorough as those to be prepared by the CPUC for its CEQA document. These two sections are expected to be revised and redeveloped by CPUC Staff and consultants. Other sections of the CEQA document will only be revised and redeveloped by CPUC Staff and consultants if determined to be necessary after PEA filing.

10. Applicant Proposed Measures

The Pre-filing Consultation process can support the development Applicant Proposed Measures (APMs); measures that Applicants incorporate into the PEA project description to avoid or reduce what otherwise may be considered significant impacts. APMs that use phrases, such as, "as practicable," "as needed," or other conditional language will be superseded by Mitigation Measures if required to avoid or reduce a potentially significant impact. CPUC CEQA Unit Staff and their consultant team may review and provide comments on the Draft PEA APMs during Pre-filing Consultation.

Applicants will carefully consider each CPUC Draft Environmental Measure identified in Chapter 5 of this PEA Checklist. The measures may be applied to the proposed project if appropriate and may be subject to modification by the CPUC during its environmental review.¹

11. PEA Checklist Deviations

CPUC CEQA Unit Staff understand that the PEA Checklist requires Applicants to develop a significant quantity of information. There are times when it is appropriate to deviate from the PEA Checklist. Deviations to the Pre-Filing Consultation Guidelines or the PEA Checklist contents may be approved by the CPUC's CEQA Unit Staff. Staff approval will be in writing and will occur prior to Applicant filing of the Draft PEA. Note that any deviations approved in writing by staff during the Pre-filing period may be reversed or modified after application and PEA filing and at any time throughout the environmental review period at the discretion of CPUC CEQA Unit Staff.

12. Submittal of Confidential Information

CPUC Staff are available during Pre-filing Consultation to discuss concerns that Applicants may have about confidentiality. However, the CEQA process requires public disclosure about projects, and such disclosure can often appear to conflict with Applicant requests for confidentiality. CPUC CEQA Unit Staff will rely on CPUC adopted confidentiality procedures to resolve confidentiality concerns. Applicants that expect aspects of a PEA filing to be confidential must follow CPUC confidentiality procedures. Applicants may mark information as confidential if allowed pursuant to General Order 66 or latest applicable Commission rule (e.g., see Public Records Act Proceeding Rulemaking (R.14-11-001)).

13. Additional CEQA Impact Questions

Additional CEQA Impact Questions that are specific to the types of projects evaluated by the Commission's CEQA Unit are identified in the PEA Checklist to be considered in addition to the checklist items in CEQA Guidelines Appendix G.

The next section of this Guidelines document provides the PEA Checklist for all energy project applications that require CEQA compliance.

¹ At this time, the CPUC environmental measures are in draft format, see PEA Checklist Attachment 4. They may be formally incorporated into Chapter 5 of future versions of the PEA Checklist.

Proponent's Environmental Assessment (PEA) Checklist

The PEA Checklist provides project Applicants (e.g., projects involving electric transmission lines, electric substations or switching stations, natural gas transmission pipelines, and underground natural gas storage facilities) with detailed guidance regarding the level of detail CPUC CEQA Unit Staff expect to deem PEAs complete. Applicants will prepare their PEAs using the same section headers and numbering as provided in the PEA Checklist. Applicants will also provide supporting data that is specific to each item within the PEA Checklist. As noted in the Pre-Filing Consultation Guidelines, the PEA Checklist is written with the assumption that an EIR will be prepared. PEA contents may not need to support the development of an EIR, but this determination can only be made in consultation with CPUC CEQA Unit Staff as described in the Pre-Filing Consultation Guidelines.

Formatting and Basic PEA Data Needs, Including GIS Data

1. Provide **editable and fully functional source files** in electronic format for all PDF files, hardcopies, maps, images, and diagrams. Files will be provided in their original file format as well as the output file format. All Excel and other spreadsheet files or modeling files will include all underlying formulas/modeling details. All modeling files must be fully functional.
2. Details about the types of **GIS data and maps** to be submitted are provided in Attachment 1. GIS data not specified in this checklist may also be requested depending on the Proposed Project and alternatives.
3. The Applicant is responsible for ensuring that all project features, including project components and temporary and permanent work areas, are included within all **survey boundaries** (e.g., biological and cultural resources).
4. Excel spreadsheets with **emissions calculations** will be provided that are complete with all project assumptions, values, and formulas used to prepare emissions calculations in the PEA. Accompanying PDF files with the same information will be provided as Appendix B to the PEA (see List of Appendices below).
5. Applicants will provide in an Excel spreadsheet a comprehensive **mailing list** that includes the names and addresses of all affected landowners and residents, including unit numbers for multi-unit properties for both the proposed project and alternatives.
 - a. An affected resident or landowner is defined as one whose place of residence or property is:
 - i. Crossed by or abuts any component of the proposed project or an alternative including any permanent or temporary disturbance area (either above or below ground) and any extra work area (e.g., staging or parking area); or
 - ii. Located within approximately 1,000 feet² of the edge of any construction work area.
 - b. Include in the following information for each resident in a spreadsheet, at minimum: parcel APN number, owner name and mailing address, and parcel physical address. If individual occupant names, facility names, or business names are available, also provide these names and addresses in the spreadsheet. A sample mailing list format is provided in Table 2.

² Notice to all property owners within 300 feet of a Proposed Project is required at the time of application filing under GO 131-D. Commission notices of CEQA document preparation may be mailed to residents and property owners greater than 300 feet from a Proposed Project to ensure adequate notification (e.g., 1,000 feet) and the extent of notification will be determined on a project specific basis. Appropriate notice expectations will be discussed during Pre-filing (e.g., with respect to visual impact areas and other types of impacts specific to the Proposed Project and its study area).

Table 2. Sample Project Mailing List

Category	Company/ Agency	Name	Mailing Address	Phone Number	Email	APN	Source
State Agency	California Resources Agency	John Doe	1234 California Street City, CA 98765	(333) 456-7899	john DOE@email.com	123-456-789	County Assessor
Individual	n/a	Jane Doe	222 Main Street City, CA 97531	(909) 876-5432	jane DOE@email.com	101-202-303	Public meeting on Month, Day 2019

6. **PEA Organization:** This PEA Checklist is organized to include each of the chapters and sections found in typical CPUC EIRs. The following sections will serve as the outline for all Draft PEAs submitted during Pre-filing and all PEAs filed with the CPUC Docket Office. PEAs will include each chapter and section identified (in matching numerical order) unless otherwise directed by CPUC CEQA Unit Staff in writing prior to filing.

Cover

A single sheet with the following information:	Applicant Notes, Comments
Title "Proponent's Environmental Assessment" and filing date	
Proponent Name (the Applicant)	
Name of the proposed project ³	
Technical subheading summarizing the type of project and its major components, in one sentence or about 40 words, for example: A new 1,120 MVA, 500/115kV substation, 10 miles of new singled-circuit 500kV transmission lines, 25 miles of new and replaced double-circuit 115kV power lines, and upgrades at three existing substations are proposed.	
Location of the proposed project (all counties and municipalities or map figure for the cover that shows the areas crossed)	
Proceeding for which the PEA was prepared and CPUC Docket number (if known) or simply leave a blank where the Docket number would go	
Primary Contact's name, address, telephone number, and email address for both the project Applicant(s) and entities that prepared the PEA	
See example PEA cover in Figure 1.	

³ If approved by the California Independent System Operator (CAISO), the project name listed will match the name specified in the CAISO approval. If multiple names apply, list all versions.

Figure 1. Example PEA Cover

Proponent's Environmental Assessment for California Utility Company's Evergreen Electric Substation and Transmission Line Project

May 1, 2019 (PEA filing date)

A new 230 kV substation, 10 miles of new single-circuit 230kV transmission lines, and upgrades at two existing substations are proposed.

The Proposed Project would be located primarily in __ County but would also cross __ and __ counties and areas within the City of __.

Table of Contents

Sections

Order	The format of the PEA will be organized as follows:	Applicant Notes, Comments
--	Cover	
--	Table of Contents, List of Tables, List of Figures, List of Appendices	
1	Executive Summary	
2	Introduction	
3	Proposed Project Description	
4	Description of Alternatives	
5	Environmental Analysis	
5.1	Aesthetics	
5.2	Agriculture and Forestry	
5.3	Air Quality	
5.4	Biological Resources	
5.5	Cultural Resources	
5.6	Energy	
5.7	Geology, Soils, and Paleontological Resources	
5.8	Greenhouse Gas Emissions	
5.9	Hazards, Hazardous Materials, and Public Safety	
5.10	Hydrology and Water Quality	
5.11	Land Use and Planning	
5.12	Mineral Resources	
5.13	Noise	
5.14	Population and Housing	
5.15	Public Services	
5.16	Recreation	
5.17	Transportation	
5.18	Tribal Cultural Resources	
5.19	Utilities and Service Systems	
5.20	Wildfire	
5.21	Mandatory Findings of Significance	
6	Comparison of Alternatives	

7	Cumulative Impacts and Other CEQA Considerations	
8	List of Preparers	
9	References ⁴	
--	Appendices	

Required PEA Appendices and Supporting Materials

Order	Title	Applicant Notes, Comments
Appendix A	Detailed Maps and Design Drawings	
Appendix B	Emissions Calculations	
Appendix C	Biological Resources Technical Reports (see Attachment 2)	
Appendix D	Cultural Resources Studies (see Attachment 3)	
Appendix E	Detailed Tribal Consultation Report ⁵	
Appendix F	Environmental Data Resources Report, Phase I Environmental Site Assessment, or similar hazardous materials report	
Appendix G	Agency Consultation and Public Outreach Report and Records of Correspondence	
Appendix H	Construction Fire Prevention Plan ⁶	

Potentially Required⁷ Appendices and Supporting Materials

Order	Title	Applicant Notes, Comments
Appendix I	Noise Technical Studies	
Appendix J	Traffic Studies	
Appendix K	Geotechnical Investigations (may preliminary at time of PEA filing)	
Appendix L	Hazardous Substance Control and Emergency Response Plan / Hazardous Waste and Spill Prevention Plan	

⁴ References will be organized by section but contained in a single chapter called, "References."

⁵ Include summary and timing of all correspondence to and from any Tribes and the State Historic Preservation Office/Native American Heritage Commission, including Sacred Lands File search results, and full description of any issues identified by Tribes in their interactions with the Applicant.

⁶ The Construction Fire Prevention Plan will be provided to federal, state, and local fire agencies for review and comment as applicable to where components of the proposed project would be located. CPUC will approve the final Construction Fire Prevention Plan. Record of the request for review and comment and any comments received from these agencies will be provided to CPUC CEQA Unit Staff.

⁷ Anticipated Appendix and study requirements should be discussed with CPUC CEQA Unit Staff during Pre-filing.

Appendix M	Erosion and Sedimentation Control Best Management Practice Plan / Draft Storm Water Pollution Prevention Plan (may be preliminary at time of PEA filing)	
Appendix N	FAA Notice and Criteria Tool Results	
Appendix O	Revegetation or Site Restoration Plan	
Appendix P	Health and Safety Plan	
Appendix Q	Existing Easements ⁸	
Appendix R	Blasting Plan (may be preliminary at time of PEA filing)	
Appendix S	Traffic Control/Management Plan (may be preliminary at time of PEA filing)	
Appendix T	Worker Environmental Awareness Program (may preliminary at time of PEA filing)	
Appendix U	Helicopter Use and Safety Plan (may be preliminary at time of PEA filing)	
Appendix V	Electric and Magnetic Fields Management Plan (may be part of the Application rather than the PEA)	

⁸ Easements should be provided military lands, conservation easements, or other lands where the real estate agreement specifies the range of activities that can be conducted

1 Executive Summary

This section will include, but is not limited to, the following:	PEA Section and Page Number ⁹	Applicant Notes, Comments
1.1: Proposed Project Summary. Provide a summary of the proposed project and its underlying purpose and basic objectives.		
1.2: Land Ownership and Right-of-Way Requirements. Provide a summary of the existing and proposed land ownership and rights-of-way for the proposed project.		
1.3: Areas of Controversy. Identify areas of anticipated controversy and public concern regarding the project.		
1.4: Summary of Impacts <ul style="list-style-type: none"> a) Identify all impacts expected by the Applicant to be potentially significant. Identify and discuss Applicant Proposed Measures here and provide a reference to the full listing of Applicant Proposed Measures provided in the table described in Section 3.11 of this PEA Checklist. b) Identify any significant and unavoidable impacts that may occur. 		
1.5: Summary of Alternatives. Summarize alternatives that were considered by the Applicant and the process and criteria that were used to select the proposed project.		
1.6: Pre-filing Consultation and Public Outreach Summary. Briefly summarize Pre-filing consultation and public outreach efforts that occurred and identify any significant outcomes that were incorporated into the proposed project.		
1.7: Conclusions. Provide a summary of the major PEA conclusions.		
1.8: Remaining Issues. Describe any major issues that must still be resolved.		

⁹ The *PEA Section and Page Number* column and *Applicant Notes, Comments* column are intended to be filled out and provided with PEA submittals. The PEA Checklist is provided in Word to all Applicants to allow column resizing as appropriate to reduce PEA checklist length when completed for submittal. Landscape formatting may also be appropriate for completed PEA Checklist tables.

2 Introduction

2.1 Project Background

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>2.1.1: Purpose and Need</p> <ul style="list-style-type: none"> a) Explain why the proposed project is needed. b) Describe localities the proposed project would serve and how the project would fit into the local and regional utility system. c) If the proposed project was identified by the California Independent System Operator (CAISO), thoroughly describe the CAISO's consideration of the proposed project and provide the following information: <ul style="list-style-type: none"> i. Include references to all CAISO Transmission Planning Processes that considered the proposed project. ii. Explain if the proposed project is considered an economic, reliability, or policy-driven project or a combination thereof. iii. Identify whether and how the Participating Transmission Owner recommended the project in response to a CAISO identified need, if applicable. iv. Identify if the CAISO approved the original scope of the project or an alternative and the rationale for their approval either for the original scope or an alternative. v. Identify how and whether the proposed project would exceed, combine, or modify in any way the CAISO identified project need. vi. If the Applicant was selected as part of a competitive bid process, identify the factors that contributed to the selection and CAISO's requirements for in-service date. d) If the project was not considered by the CAISO, explain why. 		
<p>(Natural Gas Storage Only)</p> <ul style="list-style-type: none"> e) Provide storage capacity or storage capacity increase in billion cubic feet. If the project does not increase capacity, make this statement. f) Describe how existing storage facilities will work in conjunction with the proposed project. Describe the purchasing process (injection, etc.) and transportation arrangements this facility will have with its customers. 		
<p>2.1.2: Project Objectives</p> <ul style="list-style-type: none"> a) Identify and describe the basic project objectives.¹⁰ The objectives will include reasons for constructing the project based on its 		

¹⁰ Tangential project goals should not be included as basic project objectives, such as, minimizing environmental impacts, using existing ROWs and disturbed land to the maximum extent feasible, ensuring safety during construction and operation, building on property already controlled by the Applicant/existing site control. Goals of this type do not describe the underlying purpose or basic objectives but, rather, are good general practices for all projects.

<p>purpose and need (i.e., address a specific reliability issue). The description of the project objectives will be sufficiently detailed to permit CPUC to independently evaluate the project need and benefits to accurately consider them in light of the potential environmental impacts. The basic project objectives will be used to guide the alternatives screening process, when applicable.</p> <p>b) Explain how implementing the project will achieve the basic project objectives and underlying purpose and need.</p> <p>c) Discuss the reasons why attainment of each basic objective is necessary or desirable.</p>		
<p>2.1.3: Project Applicant(s). Identify the project Applicant(s) and ownership of each component of the proposed project. Describe each Applicant’s utility services and their local and regional service territories.</p>		

2.2 Pre-filing Consultation and Public Outreach¹¹

<p>This section will include, but is not limited to, the following:</p>	<p>PEA Section and Page Number</p>	<p>Applicant Notes, Comments</p>
<p>2.2.1: Pre-filing Consultation and Public Outreach</p> <p>a) Describe all Pre-filing consultation and public outreach that occurred, such as, but not limited to:</p> <ul style="list-style-type: none"> i. CAISO ii. Public agencies with jurisdiction over project areas or resources that may occur in the project area iii. Native American tribes affiliated with the project area iv. Private landowners and homeowner associations v. Developers for large housing or commercial projects near the project area vi. Other utility owners and operators vii. Federal, state, and local fire management agencies <p>b) Provide meeting dates, attendees, and discussion summaries, including any preliminary concerns and how they were addressed and any project alternatives that were suggested.</p> <p>c) Clearly identify any significant outcomes of consultation that were incorporated into the proposed project.</p> <p>d) Clearly identify any developments that could coincide or conflict with project activities (i.e., developments within or adjacent to a proposed ROW).</p>		
<p>2.2.2: Records of Consultation and Public Outreach. Provide contact information, notification materials, meeting dates and materials, meeting notes, and records of communication organized by entity as an Appendix to the PEA (Appendix G).</p>		

¹¹ CPUC CEQA Unit Staff request that consultation and public outreach that occurs during the Pre-filing period and throughout environmental review include the assigned CPUC Staff person and CPUC consultant.

2.3 Environmental Review Process

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
2.3.1: Environmental Review Process. Provide a summary of the anticipated environmental review process and schedule.		
2.3.2: CEQA Review a) Explain why CPUC is the appropriate CEQA Lead agency. b) Identify other state agencies and any federal agencies that may have discretionary permitting authority over any aspect of the proposed project. c) Identify all potential involvement by federal, state, and local agencies not expected to have discretionary permitting authority (i.e., ministerial actions). d) Summarize the results of any preliminary outreach with these agencies as well as future plans for outreach.		
2.3.3: NEPA Review (if applicable). If review according to the National Environmental Policy Act (NEPA) is expected, explain the portions of the project that will require the NEPA review process. Discuss which agency is anticipated to be the NEPA Lead agency if discretionary approval by more than one federal agency is required.		
2.3.4: Pre-filing CEQA and NEPA Coordination. Describe the results of Pre-filing coordination with CEQA and NEPA review agencies (refer to CPUC’s Pre-Filing Consultation Guidelines). Identify major outcomes of the Pre-filing coordination process and how the information was incorporated into the PEA, including suggestions on the type of environmental documents and joint or separate processes based on discussions with agency staff.		

2.4 Document Organization

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
2.4: PEA Organization. Summarize the contents of the PEA and provide an annotated list of its sections.		

3 Proposed Project Description¹²

3.1 Project Overview

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.1: Project Overview</p> <ul style="list-style-type: none"> a) Provide a concise summary of the proposed project and components in a few paragraphs. b) Described the geographical location of the proposed project (i.e., county, city, etc.). c) Provide an overview map of the proposed project location. 		

3.2 Existing and Proposed System

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.2.1: Existing System</p> <ul style="list-style-type: none"> a) Identify and describe the existing utility system that would be modified by the proposed project, including connected facilities to provide context. Include detailed information about substations, transmission lines, distribution lines, compressor stations, metering stations, valve stations, nearby renewable generation and energy storage facilities, telecommunications facilities, control systems, SCADA systems, etc. b) Provide information on users and the area served by the existing system features. c) Explain how the proposed project would fit into the existing local and regional systems. d) Provide a schematic diagram of the existing system features. e) Provide detailed maps and associated GIS data for existing facilities that would be modified by the proposed project. 		
<p>3.2.2: Proposed Project System</p> <ul style="list-style-type: none"> a) Describe the whole of the proposed project by component, including all new facilities and any modifications, upgrades, or expansions to existing facilities and any interrelated activities that are part of the whole of the action. b) Clearly identify system features that would be added, modified, removed, disconnected and left in place, etc. c) Identify the expected capacities of the proposed facilities, highlighting any changes from the existing system. If the project would not change existing capacities, make this statement. For electrical projects, provide the anticipated capacity increase in amps or megawatts or in the typical units for the types of facilities proposed. For gas projects, provide the total volume of gas to be 		

¹² Applicant review of the Administrative Draft Project Description or sections of the Administrative Draft Project Description prepared for the CEQA document may be requested by CPUC CEQA Unit Staff to ensure technical accuracy.

<p>delivered by the proposed facilities, anticipated system capacity increase (typically in million cubic feet per day), expected customers, delivery points and corresponding volumes, and the anticipated maximum allowable operating pressure(s).</p> <p>d) Describe the initial buildout and eventual full buildout of the proposed project facilities. For example, if an electrical substation or gas compressor station would be installed to accommodate additional demand in the future, then include the designs for both the initial construction based on current demand and the design for all infrastructure that could ultimately be installed within the planned footprint of an electric substation or compressor station.</p> <p>e) Explain whether the electric line or gas pipeline will create a second system tie or loop for reliability.</p> <p>f) Provide information on users and the area served by the proposed system features, highlighting any differences from the existing system.</p> <p>g) Provide a schematic diagram of the proposed system features.</p> <p>h) Provide detailed maps and associated GIS data for proposed facilities that would be installed, modified, or relocated by the proposed project.</p>		
<p>3.2.3: System Reliability. Explain whether the electric line or gas pipeline will create a second system tie or loop for reliability. Clearly explain and show how the proposed project relates to and supports the existing utility systems.</p>		
<p>3.2.4: Planning Area. Describe the system planning area served or to be served by the project. Clearly define the Applicant’s term for the planning area (e.g., Electrical Needs Area or Distribution Planning Area).</p>		

3.3 Project Components

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
Required for all Project Types		
3.3.1: Preliminary Design and Engineering		
<p>a) Provide preliminary design and engineering information for all above-ground and below-ground facilities for the proposed project. The approximate locations, maximum dimensions of facilities, and limits of areas that would be needed to construction and operate the facilities should be clearly defined.¹³</p> <p>b) Provide preliminary design drawings for project features and explain the level of completeness (i.e., percentage).</p> <p>c) Provide detailed project maps (approximately 1:3,000 scale) and associated GIS data of all facility locations and boundaries with attributes and spatial geometry that corresponds to information in the Project Description.</p>		

¹³ Refer to Attachment 1 for mapping and GIS data requirements for the project layout and design.

<p>3.3.2: Segments, Components, and Phases</p> <ul style="list-style-type: none"> a) Define all project segments, components, and phases for the proposed project. b) Provide the length/area of each segment or component, and the timing of each development phase. c) Provide an overview map showing each segment and provide associated GIS data (may be combined with other mapping efforts). 		
<p>3.3.3: Existing Facilities</p> <ul style="list-style-type: none"> a) Identify the types of existing facilities that would be removed or modified by the proposed project (i.e., conductor/cable, poles/towers, substations, switching stations, gas storage facilities, gas pipelines, service buildings, communication systems, etc.). b) Describe the existing facilities by project segment and/or component, and provide information regarding existing dimensions, areas/footprints, quantities, locations, spans, etc. c) Distinguish between above-ground and below-ground facilities and provide both depth and height ranges for each type of facility. For poles/towers, provide the installation method (i.e., foundation type or direct bury), and maximum above-ground heights and below-ground depths. d) Explain what would happen to the existing facilities. Would they be replaced, completely removed, modified, or abandoned? Explain why. e) Identify the names, types, materials, and capacity/volumes ranges (i.e., minimum and maximum) of existing facilities that would be installed or modified by the proposed project. f) Provide diagrams with dimensions representing existing facilities to provide context on how the proposed facilities would be different. g) Briefly describe the surface colors, textures, light reflectivity, and any lighting of existing facilities. 		
<p>3.3.4: Proposed Facilities</p> <ul style="list-style-type: none"> a) Identify the types of proposed facilities to be installed or modified by the proposed project (e.g., conductor/cable, poles/towers, substations, switching stations, gas storage facilities, gas pipelines, service buildings, communication systems). b) Describe the proposed facilities by project segment and/or component, and provide information regarding maximum dimensions, areas/footprints, quantities, locations, spans, etc. c) Distinguish between above-ground and below-ground facilities and provide both depth and height ranges for each type of facility. For poles/towers, provide the installation method (i.e., foundation type or direct bury), and maximum above-ground heights and below-ground depths. 		

<ul style="list-style-type: none"> d) Identify where facilities would be different (e.g., where unique or larger poles would be located, large guy supports or snub poles). e) Provide details about civil engineering requirements (i.e., permanent roads, foundations, pads, drainage systems, detention basins, spill containment, etc.). f) Distinguish between permanent facilities and any temporary facilities (i.e., poles, shoo-fly lines, mobile substations, mobile compressors, transformers, capacitors, switch racks, compressors, valves, driveways, and lighting). g) Identify the names, types, materials, and capacity/volumes ranges (i.e., minimum and maximum) of proposed facilities that would be installed or modified by the proposed project. h) Provide diagrams with dimensions representing existing facilities. i) Briefly describe the surface colors, textures, light reflectivity, and any lighting of proposed facilities. 		
3.3.5: Other Potentially Required Facilities		
<ul style="list-style-type: none"> a) Identify and describe in detail any other actions or facilities that may be required to complete the project. For example, consider the following questions: <ul style="list-style-type: none"> i. Could the project require the relocation (temporary or permanent), modification, or replacement of unconnected utilities or other types of infrastructure by the Applicant or any other entity? ii. Could the project require aviation lighting and/or marking? iii. Could the project require additional civil engineering requirements to address site conditions or slope stabilization issues, such as pads and retaining walls, etc.? b) Provide the location of each facility and a description of the facility. 		
3.3.6: Future Expansions and Equipment Lifespans		
<ul style="list-style-type: none"> a) Provide detailed information about the current and reasonably foreseeable plans for expansion and future phases of development. b) Provide the expected usable life of all facilities. c) Describe all reasonably foreseeable consequences of the proposed project (e.g., future ability to upgrade gas compressor station to match added pipeline capacity). 		
Required for Certain Project Types		
3.3.7: Below-ground Conductor/Cable Installations (as Applicable)		
<ul style="list-style-type: none"> a) Describe the type of line to be installed (e.g., single circuit cross-linked polyethylene-insulated solid-dielectric, copper-conductor cables). b) Describe the type of casing the cable would be installed in (e.g., concrete-encased duct bank system) and provide the dimensions of the casing. 		

<p>c) Describe the types of infrastructure would likely be installed within the duct bank (e.g., transmission, fiber optics, etc.).</p>		
<p>3.3.8: Electric Substations and Switching Stations (as Applicable)</p> <p>a) Provide the number of transformer banks that will be added at initial and full buildout of the substation. Identify the transformer voltage and number of each transformer type.</p> <p>b) Identify any gas insulated switchgear that will be installed within the substation.</p> <p>c) Describe any operation and maintenance facilities, telecommunications equipment, and SCADA equipment that would be installed within the substation.</p>		
<p>3.3.9: Gas Pipelines (as Applicable). For each segment:</p> <p>a) Identify pipe diameter, number and length of exposed sections, classes and types of pipe to be installed, pressure of pipe, and cathodic protection for each linear segment.</p> <p>b) Describe new and existing inspection facilities (e.g., pig launcher sites).</p> <p>c) Describe system cross ties and laterals/taps.</p> <p>d) Identify the spacing between each valve station.</p> <p>e) Describe the compressor station, if needed, for any new or existing pipeline.</p> <p>f) Describe all pipelines and interconnections with existing and proposed facilities:</p> <ul style="list-style-type: none"> i. Number of interconnections and locations and sizes; ii. All below-ground and above-ground installations; and iii. All remote facility locations for metering, telemetry, control. 		
<p>3.3.10: Gas Storage Facilities – Background and Resource Information (as Applicable)</p> <p>a) Provide detailed background information on the natural gas formation contributing to the existing or proposed natural gas facility, including the following:</p> <ul style="list-style-type: none"> i. Description of overlying stratigraphy, especially caps ii. Description of production, injection, and intervening strata iii. Types of rock iv. Description of types of rocks in formation, including permeability or fractures v. Thickness of strata <p>b) Provide a graphic and/or table showing formation thicknesses.</p> <p>c) Identify and describe any potential gas migration pathways, such as faults, permeable contacts, abandoned wells, underground water or other pipelines.</p> <p>d) Provide a summary and detailed cross-section diagrams of the geologic formations and structures of the oil/gas field or area.</p> <p>e) Provide the first well drilling and production history, abandonment procedures, inspections, etc.</p> <p>f) Describe production zones, including depth, types of formations, and characteristics of field/area.</p>		

<p>g) Describe the existing and proposed storage capacity and limiting factors, such as injection or withdrawal capacities.</p> <p>h) Describe existing simulation studies that were used to predict the reservoir pressure response under gas injection and withdrawal operations, and simulation studies for how the system would change as proposed. Provide the studies as a PEA Appendix.</p> <p>i) Provide the history of the oil/gas field or area.</p>		
<p>3.3.11: Gas Storage Facilities – Well-Head Sites (as Applicable). Describe the location, depth, size and completion information for all existing, abandoned, proposed production and injection, monitoring, and test wells.</p>		
<p>3.3.12: Gas Storage Facilities – Production and Injection (as Applicable)</p> <p>a) Provide the proposed storage capacity of production and injection wells.</p> <p>b) Provide production and injection pressures, depths, and rates.</p> <p>c) Provide production and injection cycles by day, week, and year.</p> <p>d) Describe existing and proposed withdrawal/production wells (i.e., size, depth, formations, etc.).</p> <p>e) Describe existing and proposed cushion gas requirements.</p> <p>f) Describe any cushion gas injection—formation the well is completed in (cushion gas formation), and injection information.</p>		
<p>3.3.13: Gas Storage Facilities – Electrical Energy (as Applicable). Describe all existing and proposed electric lines, telecommunications facilities, and other utilities/facilities (e.g., administrative offices, service buildings, and non-hazardous storage), and chemical storage associated with the proposed project.</p>		
<p>3.3.14: Telecommunication Lines (as Applicable)</p> <p>a) Identify the type of cable that is proposed and length in linear miles by segment.</p> <p>b) Identify any antenna and node facilities that are part of the project.</p> <p>c) For below-ground telecommunication lines, provide the depth of cable and type of conduit.</p> <p>d) For above-ground telecommunication lines, provide:</p> <ul style="list-style-type: none"> i. Types of poles that will be installed (if new poles are required) ii. Where existing poles will be used iii. Any additional infrastructure (e.g., guy wires) or pole changes required to support the additional cable on existing poles 		

3.4 Land Ownership, Rights-of-Way, and Easements

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
3.4.1: Land Ownership. Describe existing land ownership where each project component would be located. State whether the proposed		

project would be located on property(ies) owned by the Applicant or if additional property would be required.		
<p>3.4.2: Existing Rights-of-Way or Easements</p> <p>a) Identify and describe existing rights-of-way (ROWs) or easements where project components would be located. Provide the approximately lengths and widths in each project area.</p> <p>b) Clearly state if project facilities would be replaced, modified, or relocated within existing ROWs or easements.</p>		
<p>3.4.3: New or Modified Rights-of-Way or Easements</p> <p>a) Describe new permanent or modified ROWs or easements that would be required. Provide the approximately lengths and widths in each project area.</p> <p>b) Describe how any new permanent or modified ROWs or easements would be acquired.</p> <p>c) Provide site plans identifying all properties/parcels and partial properties/parcels that may require acquisition and the anticipated ROWs or easements. Provide associated GIS data.</p> <p>d) Describe any development restrictions within new ROWs or easements, e.g., building clearances and height restrictions, etc.</p> <p>e) Describe any relocation or demolition of commercial or residential property/structures that may be necessary.</p>		
<p>3.4.4: Temporary Rights-of-Way or Easements</p> <p>f) Describe temporary ROWs or easements that would be required to access project areas, including ROWs or easements for temporary construction areas (i.e., staging areas or landing zones).</p> <p>g) Explain where temporary construction areas would be located with existing ROWs or easements for the project or otherwise available to the Applicant without a temporary ROW or easement.</p> <p>h) Describe how any temporary ROWs or easements would be acquired.</p>		

3.5 Construction

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
3.5.1 Construction Access (All Projects)		
<p>3.5.1.1: Existing Access Roads</p> <p>a) Provide the lengths, widths, ownership details (both public and private roads), and surface characteristics (i.e., paved, graveled, bare soil) of existing access roads that would be used during construction. Provide the area of existing roads that would be used (see example in Table 3 below).</p> <p>b) Describe any road modifications or stabilization that would be required prior to construction, including on the adjacent road</p>		

shoulders or slopes. Identify any roads that would be expanded and provide the proposed width increases. c) Describe any procedures to address incidental road damage cause by project activities following construction. d) Provide detailed maps and associated GIS data for all existing access roads.		
---	--	--

Table 3. Access Roads

Type of Road	Description	Area Proposed Project
Existing Dirt Road	Typically double track. May have been graded previously. No other preparation required, although a few sections may need to be re-graded and crushed rock applied in very limited areas for traction.	_____ acres
New Permanent	Would be xx feet wide, bladed. No other preparation required although crushed rock may need to be applied in very limited areas for traction.	_____ acres
Overland Access	No preparation required. Typically grassy areas that are relatively flat. No restoration would be necessary.	_____ acres

<p>3.5.1.2: New Access Roads</p> a) Identify any new access roads that would be developed for project construction purposes, such as where any blading, grading, or gravel placement could occur to provide equipment access outside of a designated workspace. ¹⁴ b) Provide lengths, widths, and development methods for new access roads. c) Identify any temporary or permanent gates that would be installed. d) Clearly identify any roads that would be temporary and fully restored following construction. Otherwise it will be assumed the new access road is a permanent feature. e) Provide detailed maps and associated GIS data for all new access roads.		
<p>3.5.1.3: Overland Access Routes</p> a) Identify any overland access routes that would be used during construction, such as where vehicles and equipment would travel over existing vegetation and where blading, grading, or gravel placement would occur. b) Provide lengths and widths for new access roads. c) Provide detailed maps and associated GIS data for all overland access routes.		
<p>3.5.1.4: Watercourse Crossings</p> a) Identify all temporary watercourse crossings that would be required during construction. Provide specific methods and procedures for temporary watercourse crossings.		

¹⁴ Temporary roads that would not require these activities should be considered an overland route.

<ul style="list-style-type: none"> b) Describe any bridges or culverts that replacement or installation of would be required for construction access. c) Provide details about the location, design and construction methods. 		
<p>3.5.1.5: Helicopter Access. If helicopters would be used during construction:</p> <ul style="list-style-type: none"> a) Describe the types and quantities of helicopters that would be used during construction (e.g., light, medium, heavy, or sky crane), and a description of the activities that each helicopter would be used for. b) Identify areas for helicopter takeoff and landing. c) Describe helicopter refueling procedures and locations. d) Describe flight paths, payloads, and expected hours and durations of helicopter operation. e) Describe any safety procedures or requirements unique to helicopter operations, such as but not limited to obtaining a Congested Area Plan from the Federal Aviation Administration (FAA). 		
<p>3.5.2 Staging Areas (All Projects)</p>		
<p>3.5.2.1: Staging Area Locations</p> <ul style="list-style-type: none"> a) Identify the locations of all staging area(s). Provide a map and GIS data for each.¹⁵ b) Provide the size (in acres) for each staging area and the total staging area requirements for the project. 		
<p>3.5.2.2: Staging Area Preparation</p> <ul style="list-style-type: none"> a) Describe any site preparation required, if known, or generally describe what might be required (i.e., vegetation removal, new access road, installation of rock base, etc.). b) Describe what the staging area would be used for (i.e., material and equipment storage, field office, reporting location for workers, parking area for vehicles and equipment, etc.). c) Describe how the staging area would be secured. Would a fence be installed? If so, describe the type and extent of the fencing. d) Describe how power to the site would be provided if required (i.e., tap into existing distribution, use of diesel generators, etc.). e) Describe any temporary lightning facilities for the site. f) Describe any grading activities and/or slope stabilization issues. 		

¹⁵ While not all potential local site staging areas will be known prior to selection of a contractor, it is expected that approximate area and likely locations of staging areas be disclosed. The identification of extra or optional staging areas should be considered to reduce the risk of changes after project approval that could necessitate further CEQA review.

3.5.3 Construction Work Areas (All Projects)		
3.5.3.1: Construction Work Areas		
<p>a) Describe known work areas that may be required for specific construction activities (e.g., pole assembly, hillside construction)¹⁶</p> <p>b) Describe the types of activities that would be performed at each work area. Work areas may include but are not necessarily limited to:</p> <ul style="list-style-type: none"> i. Helicopter landing zones and touchdown areas ii. Vehicle and equipment parking, passing, or turnaround areas iii. Railroad, bridge, or watercourse crossings iv. Temporary work pads for facility installation, modification, or removal v. Excavations and associated equipment work areas vi. Temporary guard structures vii. Pull-and-tension/stringing sites viii. Jack and bore pits, drilling areas and pull-back areas for horizontal directional drills ix. Retaining walls 		
3.5.3.2 Work Area Disturbance		
<p>a) Provide the dimensions of each work area including the maximum area that would be disturbed during construction (e.g., 100 feet by 200 feet) (see example in Table 4 below).</p> <p>b) Provide a table with temporary and permanent disturbance at each work area (in square feet or acres), and the total area of temporary and permanent disturbance for the entire project (in acres).</p>		
3.5.3.3: Temporary Power. Identify how power would be provided at work area (i.e., tap into existing distribution, use of diesel generators, etc.). Provide the disturbance area for any temporary power lines.		
3.5.4 Site Preparation (All Projects)		
3.5.4.1: Surveying and Staking. Describe initial surveying and staking procedures for site preparation and access.		
3.5.4.2: Utilities		
<p>a) Describe the process for identifying any underground utilities prior to construction (i.e., underground service alerts, etc.).</p> <p>b) Describe the process for relocating any existing overhead or underground utilities that aren't directly connected to the project system.</p> <p>c) Describe the process for installing any temporary power or other utility lines for construction.</p>		

¹⁶ Understanding that each specific work area may not be determined until the final work plan is submitted by the construction contractor, estimate total area likely to be disturbed.

Table 4. Work Areas

Proposed Project (approximate metrics)	
Pole Diameter:	
• Wood	_____ inches
• Self-Supporting Steel	_____ inches
Lattice Tower Base Dimension:	
• Self-Supporting Lattice Structure	_____ feet
Auger Hole Depth:	
• Wood	_____ to _____ feet
• Self-Supporting Steel	_____ to _____ feet
Permanent Footprint per Pole/Tower:	
• Wood	_____ sq. feet
• Self-Supporting Steel	_____ sq. feet
• Self-Supporting Steel Tower	_____ sq. feet
Number of Poles/Towers:	
• Wood	_____
• Self-Supporting Steel	_____
• Self-Supporting Steel Tower	_____
Average Work Area around Pole/Towers (e.g., for old pole removal and new pole installation):	
• Tangent structure work areas	_____ sq. feet
• Dead End / Angle structure work areas	_____ sq. feet
Total Permanent Footprint for Poles/Towers	
Approximately _____ acres	

<p>3.5.4.3: Vegetation Clearing</p> <p>a) Describe what types of vegetation clearing may be required (e.g., tree removal, brush removal, flammable fuels removal) and why (e.g., to provide access, etc.).</p> <p>b) Provide calculations of temporary and permanent disturbance of each vegetation community and include all areas of vegetation removal in the GIS database. Distinguish between disturbance that would occur in previously developed areas (i.e., paved, graveled, or otherwise urbanized), and naturally vegetated areas.</p> <p>c) Describe how each type of vegetation removal would be accomplished.</p> <p>d) Describe the types of equipment that would be used for vegetation removal.</p>		
<p>3.5.4.4: Tree Trimming Removal</p> <p>a) For electrical projects, distinguish between tree trimming as required under CPUC General Order 95-D and tree removal.</p> <p>b) Identify the types, locations, approximate numbers, and sizes of trees that may need to be removed or trimmed substantially.</p> <p>c) Identify potentially protected trees that may be removed or substantially trimmed, such as but not limited to riparian trees, oaks trees, Joshua trees, or palm trees.</p>		

<p>d) Describe the types of equipment that would typically be used for tree removal.</p>		
<p>3.5.4.5: Work Area Stabilization. Describe the processes to stabilize temporary work areas and access roads including the materials that would be used (e.g., gravel).</p>		
<p>3.5.4.6: Grading</p> <p>a) Describe any earth moving or substantial grading activities (i.e., grading below a 6-inch depth) that would be required and identify locations where it would occur.</p> <p>b) Provide estimated volumes of grading (in cubic yards) including total cut, total fill, cut that would be reused, cut that would be hauled away, and clean fill that would be hauled to the site.</p>		
<p>3.5.5 Transmission Line Construction (Above Ground)</p>		
<p>3.5.5.1: Poles/Towers</p> <p>a) Describe the process and equipment for removing poles, towers, and associated foundations for the proposed project (where applicable). Describe how they would be disconnected, demolished, and removed from the site. Describe backfilling procedures and where the material would be obtained.</p> <p>b) Describe the process and equipment for installing or otherwise modifying poles and towers for the proposed project. Describe how they would be put into place and connected to the system. Identify any special construction methods (e.g., helicopter installation) at specific locations or specific types of poles/towers.</p> <p>c) Describe how foundations, if any, would be installed. Provide a description of the construction method(s), approximate average depth and diameter of excavation, approximate volume of soil to be excavated, approximate volume of concrete or other backfill required, etc. for foundations. Describe what would be done with soil removed from a hole/foundation site.</p> <p>d) Describe how the poles/towers and associated hardware would be delivered to the site and assembled.</p> <p>e) Describe any pole topping procedures that would occur, identify specific locations and reasons, and describe how each facility would be modified. Describe any special methods that would be required to top poles that may be difficult to access.</p>		
<p>3.5.5.2: Aboveground and Underground Conductor/Cable</p> <p>a) Provide a process-based description of how new conductor/cable would be installed and how old conductor/cable would be removed, if applicable.</p> <p>b) Identify where conductor/cable stringing/installation activities would occur.</p> <p>c) Provide a diagram of the general sequencing and equipment that would be used.</p> <p>d) Describe the conductor/cable splicing process.</p>		

<p>e) Provide the general or average distance between pull-and-tension sites. Describe the approximate dimensions and where pull-and-tension sites would generally be required (as indicated by the designated work areas), such as the approximate distance to pole/tower height ratio, at set distances, or at significant direction changes. Describe the equipment that would be required at these sites.</p> <p>f) For underground conductor/cable installations, describe all specialized construction methods that would be used for installing underground conductor or cable. If vaults are required, provide their dimensions and location/spacing along the alignment. Provide a detailed description for how the vaults would be delivered to the site and installed.</p> <p>g) Describe any safety precautions or areas where special methodology would be required (e.g., crossing roadways, stream crossing).</p>		
<p>3.5.5.3: Telecommunications. Identify the procedures for installation of proposed telecommunication cables and associated infrastructure.</p>		
<p>3.5.5.4: Guard Structures. Identify the types of guard structures that would be used at crossings of utility lines, roads, railroads, highways, etc. Describe the different types of guard structures or methods that may be used (i.e., buried poles and netting, poles secured to a weighted object, bucket trucks, etc.). Describe any pole installation and removal procedures associated with guard structures. Describe guard structure installation and removal process and duration that guard structures would remain in place.</p>		
<p>3.5.5.5: Blasting</p> <p>a) Describe any blasting that may be required to construct the project.</p> <p>b) If blasting may be required, provide a Blasting Plan that identifies the blasting locations; types and amounts of blasting agent to be used at each location; estimated impact radii; and, noise estimates. The Blasting Plan should be provided as an Appendix to the PEA.</p> <p>c) Provide a map identifying the locations where blasting may be required with estimated impact radii. Provide associated GIS data.</p>		
<p>3.5.6 Transmission Line Construction (Below Ground)</p>		
<p>3.5.6.1: Trenching</p> <p>a) Describe the approximate dimensions of the trench (e.g., depth, width).</p> <p>b) Provide the total approximate volume of material to be removed from the trench, the amount to be used as backfill, and any amount to subsequently be removed/disposed of offsite in cubic yards.</p> <p>c) Describe the methods used for making the trench (e.g., saw cutter to cut the pavement, backhoe to remove, etc.).</p> <p>d) Provide off-site disposal location, if known, or describe possible option(s).</p> <p>e) Describe if dewatering would be anticipated and if so, how the trench would be dewatered, the anticipated flows of the water,</p>		

<p>whether there would be treatment, and how the water would be disposed of.</p> <ul style="list-style-type: none"> f) Describe the process for testing excavated soil or groundwater for the presence of pre-existing environmental contaminants that could be exposed from trenching operations. g) If a pre-existing hazardous waste were encountered, describe the process of removal and disposal. h) Describe the state of the ground surface after backfilling the trench. i) Describe standard Best Management Practices to be implemented. 		
<p>3.5.6.2: Trenchless Techniques (Microtunnel, Jack and Bore, Horizontal Directional Drilling)</p>		
<ul style="list-style-type: none"> a) Identify any locations/features for which the Applicant expects to use a trenchless (i.e., microtunneling, jack and bore, horizontal directional drilling) crossing method and which method is planned for each crossing. b) Describe the methodology of the trenchless technique. c) Provide the approximate location and dimensions of the sending and receiving pits. d) Describe the methodology of excavating and shoring the pits. e) Provide the total volume of material to be removed from the pits, the amount to be used as backfill, and the amount subsequently to be removed/disposed of offsite in cubic yards. f) Describe process for safe handling of drilling mud and bore lubricants. g) Describe the process for detecting and avoiding “fracturing-out” during horizontal directional drilling operations. h) Describe the process for avoiding contact between drilling mud/lubricants and stream beds. i) If engineered fill would be used as backfill, indicate the type of engineered backfill and the amount that would be typically used (e.g., the top 2 feet would be filled with thermal-select backfill). j) Describe if dewatering is anticipated and, if so, how the pits would be dewatered, the anticipated flows of the water, whether there would there be treatment, and how the water would be disposed of. k) Describe the process for testing excavated soil or groundwater for the presence of pre-existing environmental contaminants. Describe the process of disposing of any pre-existing hazardous waste that is encountered during excavation. l) Describe any standard BMPs that would be implemented for trenchless construction. 		
<p>3.5.7 Substation, Switching Stations, Gas Compressor Stations</p>		
<p>3.5.7.1: Installation or Facility Modification. Describe the process and equipment for removing, installing, or modifying any substations, switching stations, or compressor stations including:</p> <ul style="list-style-type: none"> a) Transformers/ electric components b) Gas components c) Control and operation buildings d) Driveways 		

<ul style="list-style-type: none"> e) Fences f) Gates g) Communication systems (SCADA) h) Grounding systems 		
<p>3.5.7.2: Civil Works. Describe the process and equipment required to construct any slope stabilization, drainage, retention basins, and spill containment required for the facility.</p>		
<p>3.5.8 Gas Pipelines</p>		
<p>3.5.8.1: Gas Pipeline Construction. Describe the process for proposed pipeline construction including site development, trenching and trenchless techniques, pipe installation, and backfilling.</p>		
<p>3.5.8.2: Water Crossings. Describe water feature crossings that will occur during trenching, the method of trenching through stream crossings, and the process for avoiding impacts to the water features required for pipeline construction. Identify all locations where the pipeline will cross water features. Cite to any associated geotechnical or hydrological investigations completed and provide a full copy of each report as an Appendix to the PEA.¹⁷</p>		
<p>3.5.8.3: Gas Pipeline Other Requirements</p> <ul style="list-style-type: none"> a) Describe hydrostatic testing process including pressures, timing, source of flushing water, discharge of water. b) Describe energy dissipation basin, and the size and length of segments to be tested. c) Describe pig launching locations and any inline inspection techniques used during or immediately post construction. 		
<p>3.5.9 Gas Storage Facilities</p>		
<p>3.5.9.1: Gas Storage Construction</p> <ul style="list-style-type: none"> a) Describe the process for constructing the gas storage facility including constructing well pads and drilling wells. b) Describe the specific construction equipment that would be used, such as the type of drill rig (i.e., size, diesel, electric, etc.), depth of drilling, well-drilling schedule and equipment. 		
<p>3.5.9.2: Drilling Muds and Fluids. Describe the use of any drilling muds, fluids, and other drilling materials. Provided estimated types and quantities.</p>		
<p>3.5.10 Public Safety and Traffic Control (All Projects)</p>		
<p>3.5.10.1: Public Safety</p> <ul style="list-style-type: none"> a) Describe specific public safety considerations during construction and best management practices to appropriately manage public safety. Clearly state when and where they each safety measure would be applied. 		

¹⁷ If a geotechnical study is not available at the time of PEA filing, provide the best information available.

<p>b) Identify procedures for managing work sites in urban areas, covering open excavations securely, installing barriers, installing guard structures, etc.</p> <p>c) Identify specific project areas where public access may be restricted for safety purposes and provide the approximate durations and timing of restricted access at each location.</p>		
3.5.10.2: Traffic Control		
<p>a) Describe traffic control procedures that would be implemented during construction.</p> <p>b) Identify the locations, process, and timing for closing any sidewalks, lanes, roads, trails, paths, or driveways to manage public access.</p> <p>c) Identify temporary detour routes and locations.</p> <p>d) Provide a preliminary Traffic Control Plan(s) for the project.</p>		
<p>3.5.10.3: Security. Describe any security measures, such as fencing, lighting, alarms, etc. that may be required. State if security personnel will be stationed at project areas and anticipated duration of security.</p>		
<p>3.5.10.4: Livestock. Describe any livestock fencing or guards that may be necessary to prevent livestock from entering project areas. State if the fencing would be electrified and if so, how it would be powered.</p>		
3.5.11 Dust, Erosion, and Runoff Controls (All Projects)		
<p>3.5.11.1: Dust. Describe specific best management practices that would be implemented to manage fugitive dust.</p>		
<p>3.5.11.2: Erosion. Describe specific best management practices that would be implemented to manage erosion.</p>		
<p>3.5.11.3: Runoff. Describe specific best management practices that would be implemented to manage stormwater runoff and sediment.</p>		
3.5.12 Water Use and Dewatering (All Projects)		
<p>3.5.12.1: Water Use. Describe the estimated volumes of water that would be used by construction activity (e.g., dust control, compaction, etc.). State if recycled or reclaimed water would be used and provide estimated volumes. Identify the anticipated sources where the water would be acquired or purchased. Identify if the source of water is groundwater and the quantity of groundwater that could be used.</p>		
<p>3.5.12.2: Dewatering</p> <p>a) Describe dewatering procedures during construction, including pumping, storing, testing, permitted discharging, and disposal requirements that would be followed.</p> <p>b) Describe the types of equipment and workspace considerations to be used to dewater, store, transport, or discharge extracted water.</p>		
3.5.13 Hazardous Materials and Management (All Projects)		
3.5.13.1: Hazardous Materials		
<p>a) Describe the types, uses, and volumes of all hazardous materials that would be used during construction.</p> <p>b) State if herbicides or pesticides may be used during construction.</p>		

<p>c) If a pre-existing hazardous waste were encountered, describe the process of removal and disposal.</p>		
<p>3.5.13.2: Hazardous Materials Management</p>		
<p>a) Identify specific best management practices that would be followed for transporting, storing, and handling hazardous materials. b) Identify specific best management practices that would be followed in the event of an incidental leak or spill of hazardous materials. c) Provide a Hazardous Substance Control and Emergency Response Plan / Hazardous Waste and Spill Prevention Plan as an Appendix to the PEA, if appropriate.</p>		
<p>3.5.14 Waste Generation and Management (All Projects)</p>		
<p>3.5.14.1: Solid Waste</p>		
<p>a) Describe solid waste streams from existing and proposed facilities during construction. b) Identify procedures to be implemented to manage solid waste, including collection, containment, storage, treatment, and disposal. c) Provide estimated total volumes of solid waste by construction activity or project component. d) Describe the recycling potential of solid waste materials and provide estimated volumes of recyclable materials by construction activity or project component. e) Identify the locations of appropriate disposal and recycling facilities where solid wastes would be transported.</p>		
<p>3.5.14.2: Liquid Waste</p>		
<p>a) Describe liquid waste streams during construction (i.e., sanitary waste, drilling fluids, contaminated water, etc.) b) Describe procedures to be implemented to manage liquid waste, including collection, containment, storage, treatment, and disposal. c) Provide estimated volumes of liquid waste generated by construction activity or project component. d) Identify the locations of appropriate disposal facilities where liquid wastes would be transported.</p>		
<p>3.5.14.3: Hazardous Waste</p>		
<p>a) Describe potentially hazardous waste streams during construction and procedures to be implemented to manage hazardous wastes, including collection, containment, storage, treatment, and disposal. b) If large volumes of hazardous waste are anticipated, such as from a pre-existing contaminant in the soil that must be collected and disposed of, provide estimated volumes of hazardous waste that would be generated by construction activity or project component. c) Identify the locations of appropriate disposal facilities where hazardous wastes would be transported.</p>		
<p>3.5.15 Fire Prevention and Response (All Projects)</p>		
<p>3.5.15.1: Fire Prevention and Response Procedures. Describe fire prevention and response procedures that would be implemented during</p>		

construction. Provide a Construction Fire Prevention Plan or specific procedures as an Appendix to the PEA.		
3.5.15.2: Fire Breaks. Identify any fire breaks (i.e., vegetation clearance) requirements around specific project activities (i.e., hot work). Ensure that such clearance buffers are included in the limits of the defined work areas, and the vegetation removal in that area is attributed to Fire Prevention and Response (refer to 3.5.4.3: Vegetation Clearing).		

3.6 Construction Workforce, Equipment, Traffic, and Schedule

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.6.1: Construction Workforce</p> <p>a) Provide the estimated number of construction crew members. In the absence of project-specific data, provide estimates based on past projects of a similar size and type.</p> <p>b) Describe the crew deployment. Would crews work concurrently (i.e., multiple crews at different sites); would they be phased? How many crews could be working at the same time and where?</p> <p>c) Describe the different types of activities to be undertaken during construction, the number of crew members for each activity (i.e. trenching, grading, etc.), and number and types of equipment expected to be used for the activity. Include a written description of the activity. See example in Table 5.</p>		
<p>3.6.2: Construction Equipment. Provide a tabular list of the types of equipment expected to be used during construction of the proposed project including the horsepower. Define the equipment that would be used by each phase as shown in the example table below (Table 5).</p>		

Table 5. Construction Equipment and Workforce

Work Activity				Activity Production				
Equipment Description	Estimated Horse-power	Probable Fuel Type	Equipment Quantity	Estimated Workforce	Estimated Start Date	Estimated End Date	Duration of Use (Hrs./Day)	Estimated Production
Survey				4	January 2020	December 2020		358 Miles
1-Ton Truck, 4x4	300	Diesel	2		January 2020	December 2020	10	1 Mile/Day
Staging Yards				5	DOP			
1-Ton Truck, 4x4	300	Diesel	1		Duration of Project		4	
R/T Forklift	350	Diesel	1				5	
Boom/Crane Truck	350	Diesel	1				5	
Water Truck	300	Diesel	2				10	
Jet A Fuel Truck	300	Diesel	1				4	
Truck, Semi-Tractor	500	Diesel	1				6	
Road Work				6	January 2020	March 2020		426 Miles
1-Ton Truck, 4x4	300	Diesel	2		January 2020	March 2020	5	
Backhoe/Front Loader	350	Diesel	1		January 2020	March 2020	7	
Track Type Dozer	350	Diesel	1		January 2020	March 2020	7	
Motor Grader	350	Diesel	1		January 2020	March 2020	5	
Water Truck	300	Diesel	2		January 2020	March 2020	10	
Drum Type Compactor	250	Diesel	1		January 2020	March 2020	5	
Excavator	300	Diesel	1		January 2020	February 2020	7	
Lowboy Truck/Trailer	500	Diesel	1		January 2020	February 2020	4	

<p>3.6.3: Construction Traffic</p> <p>a) Describe how the construction crews and their equipment would be transported to and from the proposed project site.</p> <p>b) Provide vehicle type, number of vehicles, and estimated hours of operation per day, week, and month for each construction activity and phase.</p> <p>c) Provide estimated vehicle trips and vehicles miles traveled (VMT) for each construction activity and phase. Provide separate values for construction crews commuting, haul trips, and other types of construction traffic.</p>		
<p>3.6.4: Construction Schedule</p> <p>a) Provide the proposed construction schedule (e.g., month and year) for each segment or project component, and for each construction activity and phase.</p> <p>b) Provide and explain the sequencing of construction activities, and if they would or would not occur concurrently.</p> <p>c) Provide the total duration of each construction activity and phase in days or weeks.</p> <p>d) Identify seasonal considerations that may affect the construction schedule, such as weather or anticipated wildlife restrictions, etc. The proposed construction should account for such factors.</p>		
<p>3.6.5: Work Schedule</p> <p>a) Describe the anticipated work schedule, including the days of the week and hours of the day when work would occur. Clearly state if work would occur at night or on weekends and identify when and where this could occur.</p> <p>b) Provide the estimated number of days or weeks that construction activities would occur at each type of work area. For example, construction at a stationary facility or staging area may occur for the entire duration of construction, but construction at individual work areas along a linear project would be limited to a few hours, days or weeks, and only a fraction of the total construction period.</p>		

3.7 Post-Construction

<p>This section will include, but is not limited to, the following:</p>	<p>PEA Section and Page Number</p>	<p>Applicant Notes, Comments</p>
<p>3.7.1: Configuring and Testing. Describe the process and duration for post-construction configuring and testing of facilities. Describe the number of personnel and types of equipment that would be involved.</p>		
<p>3.7.2: Landscaping. Describe any landscaping that would be installed. Provide a conceptual landscape plan that identifies the locations and types of plantings that will be used. Identify whether plantings will include container plants or seeds. Include any water required for landscaping in the description of water use above.</p>		

3.7.3 Demobilization and Site Restoration		
3.7.3.1: Demobilization. Describe the process for demobilization after construction activities, but prior to leaving the work site. For example, describe final processes for removing stationary equipment and materials, etc.		
3.7.3.2: Site Restoration. Describe how cleanup and post-construction restoration would be performed (i.e., personnel, equipment, and methods) on all project ROWs, sites, and extra work areas. Things to consider include, but are not limited to, restoration of the following: a) Restoring natural drainage patterns b) Recontouring disturbed soil c) Removing construction debris d) Vegetation e) Permanent and semi-permanent erosion control measures f) Restoration of all disturbed areas and access roads, including restoration of any public trails that are used as access, as well as any damaged sidewalks, agricultural infrastructure, or landscaping, etc. g) Road repaving and striping, including proposed timing of road restoration for underground construction within public roadways		

3.8 Operation and Maintenance

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
3.8.1: Regulations and Standards a) Identify and describe all regulations and standards applicable to operation and maintenance of project facilities. b) Provide a copy of any applicable Wildfire Management Plan and describe any special procedures for wildfire management.		
3.8.2: System Controls and Operation Staff a) Describe the systems and methods that the Applicant would use for monitoring and control of project facilities (e.g., on-site control rooms, remote facilities, standard monitoring and protection equipment, pressure sensors, automatic shut-off valves, and site and equipment specific for monitoring and control such as at natural gas well pads). b) If new full-time staff would be required for operation and/or maintenance, provide the number of positions and purpose.		
3.8.3: Inspection Programs a) Describe the existing and proposed inspection programs for each project component, including the type, frequency, and timing of scheduled inspections (i.e., aerial inspection, ground inspection, pipeline inline inspections). b) Describe any enhanced inspections, such as within any High Fire Threat Districts consistent with applicable Wildfire Management Plan requirements.		

<p>c) Describe the inspection processes, such as the methods, number of crew members, and how access would occur (i.e., walk, vehicle, all-terrain vehicle, helicopter, drone, etc.). If new access would be required, describe any restoration that would be provided for the access roads.</p>		
<p>3.8.4: Maintenance Programs</p> <p>a) Describe the existing and proposed maintenance programs for each project component.</p> <p>b) Describe scheduled maintenance or facility replacement after the designated lifespan of the equipment.</p> <p>c) Identify typical parts and materials that require regular maintenance and describe the repair procedures.</p> <p>d) Describe any access road maintenance that would occur.</p> <p>e) Describe maintenance for surface or color treatment.</p> <p>f) Describe cathodic protection maintenance that would occur.</p> <p>g) Describe ongoing landscaping maintenance that would occur.</p>		
<p>3.8.5: Vegetation Management Programs</p> <p>a) Describe vegetation management programs within and surrounding project facilities. Distinguish between any different types of vegetation management.</p> <p>b) Describe any enhanced vegetation management, such as within any High Fire Threat Districts consistent with any applicable Wildfire Management Plan requirements. Identify the areas where enhanced vegetation management would be conducted.</p>		

3.9 Decommissioning

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.9.1: Decommissioning. Provide detailed information about the current and reasonably foreseeable plans for the disposal, recycling, or future abandonment of all project facilities.</p>		

3.10 Anticipated Permits and Approvals

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.10.1: Anticipated Permits and Approvals. Identify all necessary federal, state, regional, and local permits that may be required for the project. For each permit, list the responsible agency and district/office representative with contact information, type of permit or approval, and status of each permit with date filed or planned to file. For example:</p> <p>a) Federal Permits and Approvals</p> <ul style="list-style-type: none"> i. U.S. Fish and Wildlife Service ii. U.S. Army Corps of Engineers iii. Federal Aviation Administration iv. U.S. Forest Service 		

<ul style="list-style-type: none"> v. U.S. Department of Transportation – Office of Pipeline Safety vi. U.S. Environmental Protection Agency (Resource Conservation and Recovery Act; Comprehensive Environmental Response, Compensation, and Liability Act) <p>b) State and Regional Permits</p> <ul style="list-style-type: none"> i. California Department of Fish and Wildlife ii. California Department of Transportation iii. California State Lands Commission iv. California Coastal Commission v. State Historic Preservation Office, Native American Heritage Commission vi. State Water Resources Control Board vii. California Division of Oil, Gas and Geothermal Resources viii. Regional Air Quality Management District ix. Regional Water Quality Control Board (National Pollutant Discharge Elimination System General Industrial Storm Water Discharge Permit) x. Habitat Conservation Plan Authority (if applicable) <p>See also Table 6 of example permitting requirements and processes.</p>		
<p>3.10.2: Rights-of-Way or Easement Applications. Demonstrate that applications for ROWs or other proposed land use have been or soon will be filed with federal, state, or other land-managing agencies that have jurisdiction over land that would be affected by the project (if any). Discuss permitting plans and timeframes and provide the contact information at the federal agency(ies) approached.</p>		

3.11 Applicant Proposed Measures

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.11 Applicant Proposed Measures</p> <ul style="list-style-type: none"> a) Provide a table with the full text of any Applicant Proposed Measure. Where applicable, provide a copy of Applicant procedures, plans, and standards referenced in the Applicant Proposed Measures. b) Within Chapter 5, describe the basis for selecting a particular Applicant Proposed Measure and how the Applicant Proposed Measure would reduce the impacts of the project.¹⁸ c) Carefully consider each CPUC Draft Environmental Measure identified in Chapter 5 of this PEA Checklist. The CPUC Draft Environmental Measures will be applied to the proposed project where applicable. 		

¹⁸ Applicant Proposed Measures that use phrases, such as, “as practicable” or other conditional language are not acceptable and will be superseded by Mitigation Measures if required to avoid or reduce a potentially significant impact.

Table 6. Example Permitting Requirements and Processes

Note: In addition to the CPCN or PTC, the applicant may also be required to secure resource agency permits for the project.

Disclaimer: Below is a general list of permits required for transmission projects. Permit requirements for individual projects may vary slightly depending on project conditions.

Agency	Permit	Regulation	Protected Resource	Trigger	Application Process	Timing
<i>Federal</i>						
Army Corps of Engineers	404 Permit	Clean Water Act	Waters of the United States (including wetlands)	Placement of dredge or fill material into waters of the U.S., including wetlands. If project impacts less than 0.5 acres a nationalwide permit (NWP) is typically issued	NWP: prepare a preconstruction notification (PCN) along with the draft Corps's application (Engineer Form 4345). Information in the PCN includes, but is not limited to: results of wetland delineation including areas of waters of the U.S.; temporary and permanent impacts to waters of the U.S. and discussion of avoidance; construction techniques, timeline, and equipment that would be used; special status species that potentially occur in the project area, and discussion of mitigation (if applicable) to replace wetlands	NWP: takes approximately nine months from the date of application submittal (depending on level of impacts and level of consultation required by other agencies). Initial review is 30 days after which application is deemed complete or additional information is requested.
				If project would impact more than 0.5 acres a regional or individual permit may be required.	Regional or Individual Permit: Same requirements as NWP as well as preparation and submittal of 404(b)(1) Alternatives analysis which identifies the Least Environmentally Damaging Practicable Alternative (LEDPA). Public notice also required	Regional or Individual Permit: An additional three to six months may be required on top of the nine months expected for an NWP. A 30 day public notice is also required to inform the public about the project before the Corps issues the permit.
USFWS	Section 7 Consultation	Federal Endangered Species Act	Federally Listed Species	Potential impact to a federally listed threatened or endangered species	Biological Assessment (BA) prepared and submitted to Corps. BA contains information on each species and describes potential for "take" of species and/or habitat.	The timeline for processing and receiving a formal Biological Opinion (BO) from USFWS can be six months to a year from when the Corps has initiated consultation and depending on the level of impact to listed species. The typical timeline for issuance of a BO is no less than 135 days after acceptance of the BA as complete.
US Department of Agriculture, Forest Service	Special Use Authorization	National Forest Management Act/NEPA	National Forest lands	Use of federal lands managed by the USDA Forest Service for a transmission line. Typically constitutes a Major Federal Action which in turn triggers NEPA analysis.	Special Use Authorization Application: prepare a special use application for consideration by the Forest Service. Prior to submitting a proposal, applicant is required to arrange a preapplication meeting at the local Forest Service office. Application typically includes project plan, operating plans, liability insurance, licenses/registrations and other documents. If it is determined that NEPA is required either an EA or EIS would be prepared. The NEPA document may be prepared jointly with the CEQA document.	Review of Special Use Authorization applications is often dependent upon what level of NEPA analysis is required. An EA is typically 9-12 months, and EIS is generally 18 months. NEPA process may occur concurrently with CEQA process.
US Department of the Interior, Bureau of Land Management	Right-of-Way Grant	Federal Land Policy and Management Act/NEPA	Federal Lands	Use of federal lands managed by the BLM for a transmission line. Typically constitutes a Major Federal Action which in turn triggers NEPA analysis.	Right-of-Way Application: Contact the BLM office with management responsibility. Obtain an application form "Application for Transportation and Utility Systems and Facilities on Federal Lands". Arrange a pre-application meeting with a BLM Realty Specialist or appropriate staff member. Submit completed application to the appropriate BLM office. If it is determined that NEPA is required either an EA or EIS would be prepared. The NEPA document may be prepared jointly with the CEQA document.	BLM attempts to review completed applications within 60 days of submittal. Full timing is often dependent upon what level of NEPA analysis is required. An EA is typically 9-12 months, and EIS is generally 18 months. NEPA process may occur concurrently with CEQA process.

Guidelines for Energy Project Applications Requiring CEQA Compliance: Pre-filing and PEAs
November 12, 2019

Agency	Permit	Regulation	Protected Resource	Trigger	Application Process	Timing
<i>State (continued)</i>						
State Historic Preservation Officer (SHPO)	Section 106 National Historic Preservation Act (NHPA)	National Historic Preservation Act	Cultural and/or historical resources	Required if there are potential impacts to cultural and/or historical resources that are listed or eligible for listing on the National Register of Historic Places.	Information on cultural and historical resources gathered during the draft CEQA document preparation is included in a 106 Technical Report and submitted to the Corps along with the Area of Potential Effect (APE) map. The information is then evaluated by the Corps' cultural resources evaluator for potential adverse effects within the APE. Depending upon the level of potential adverse effect, the Corps then forwards its finding to SHPO for concurrence or begins the process for a Memorandum of Agreement (MOA). Native American consultation is also mandatory for the 106 process but can begin during preparation of the environmental document. All letters and correspondence for the Native American consultation must be provided to the Corps. Consultation with federally-recognized tribes may require a more extensive consultation.	Once SHPO has received the Corps' determination, it has approximately 60 days to agree or request additional information. However, SHPO has recently become more involved in projects and this timeframe is only an estimate and if a potential adverse effect to cultural or historical resources could occur, the SHPO process can take up to a year or more. Depending on the level of impacts to cultural resources, the Corps may determine no effect and issue the permit before receiving concurrence from SHPO.
California State Lands Commission (CSLC)	Right of Way Lease Agreement	Division 6 of the California Public Resources Code	California Sovereign Lands	May be triggered if the transmission line crosses state lands under the jurisdiction of the CSLC, which includes the beds of 1) more than 120 rivers, streams and sloughs; 2) nearly 40 non-tidal navigable lakes, such as Lake Tahoe and Clear Lake; 3) the tidal navigable bays and lagoons; and 4) the tide and submerged lands adjacent to the entire coast and offshore islands of the State from the mean high tide line to three nautical miles offshore.	Leases or permits may be issued to qualified applicants and the Commission shall have broad discretion in all aspects of leasing including category of lease or permit and which use, method or amount of rental is most appropriate, whether competitive bidding should be used in awarding a lease, what term should apply, how rental should be adjusted during the term, whether bonding and insurance should be required and in what amounts, whether an applicant is qualified based on what it deems to be in the best interest of the State.	Most coordination should be done concurrently with the CEQA process to ensure that any CSLC-required issues are addressed under CEQA. Once a final route/alternative is selected, the lease process may take two to three months for final Commission approval.
<i>Local / Other</i>						
Air Quality Management District or Air Pollution Control District	Permit to Construct	Federal Clean Air Act	Air Quality	Depends on the air district involved; may not be required for most transmission projects. Some air districts have a trigger level based on disturbed acreage.	Application forms need to be prepared and submitted to the local AQMD or APCD	Typically 30 to 90 days after submittal of a complete application.

19

¹⁹ Permitting is project specific. This table is provided for discussion purposes.

3.12 Project Description Graphics, Mapbook, and GIS Requirements

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>3.12.1: Graphics. Provide diagrams of the following as applicable:</p> <ul style="list-style-type: none"> a) All pole, tower, pipe, vault, conduit, and retaining wall types b) For poles, provide typical drawings with approximate diameter at the base and tip; for towers, estimate the width at base and top. c) A typical detail for any proposed underground duct banks and vaults d) All substation, switchyard, building, and facility layouts e) Trenching, drilling, pole installation, pipe installation, vault installation, roadway construction, facility removal, helicopter uses, conductor installation, traffic control, and other construction activities where a diagram would assist the reader in visualizing the work area and construction approach f) Typical profile views of proposed aboveground facilities and existing facilities to be modified within the existing and proposed ROW (e.g., typical cross-section of existing and proposed facilities by project segment). g) Photos of representative existing and proposed structures 		
<p>3.12.2: Mapbook. Provide a detailed mapbook on an aerial imagery basemap at a scale between 1:3000 and 1:6000 (or as appropriate and legible) that show mileposts, roadways, and all project components and work areas including:</p> <ul style="list-style-type: none"> a) All proposed above-ground and underground structure/facility locations (e.g., poles, conductor, substations, compressor stations, telecommunication lines, vaults, duct bank, lighting, markers, etc.) b) All existing structures/facilities that would be modified or removed c) Identify by milepost where existing ROW will be used and where new ROW or land acquisition will be required. d) All permanent work areas including permanent facility access e) All access roads including, existing, temporary, and new permanent access f) All temporary work areas including staging, material storage, field offices, material laydown, temporary work areas for above ground (e.g., pole installation) and underground facility construction (e.g., trenching and duct banks), helicopter landing zones, pull and tension sites, guard structures, shoo flies etc. g) Areas where special construction methods (e.g., jack and bore, HDD, blasting, retaining walls etc.) may need to be employed 		

<ul style="list-style-type: none"> h) Areas where vegetation removal may occur i) Areas to be heavily graded and where slope stabilization measures would be employed including any retaining walls 		
<p>3.12.3: GIS Data. Provide GIS data for all features and ROW shown on the detailed mapbook.</p>		
<p>3.12.4: GIS Requirements. Provide the following information for each pole/tower that would be installed and for each pole/tower that would be removed:</p> <ul style="list-style-type: none"> a) Unique ID number and type of pole (e.g., wood, steel, etc.) or tower (e.g., self-supporting lattice) both in a table and in the attributes of the GIS data provided b) Identify pole/tower heights and conductor sizes in the attributes of the GIS data provided. 		
<p>3.12.5: Natural Gas Facilities GIS Data. For natural gas facilities, provide GIS data for system cross ties and all laterals/taps, valve stations, and new and existing inspection facilities (e.g., pig launcher sites).</p>		

4 Description of Alternatives

All Applicants will assume that alternatives will be required for the environmental analysis and that an EIR will be prepared unless otherwise instructed by CPUC CEQA Unit Staff in writing prior to application filing. See PEA Requirements at the beginning of this checklist document. The consideration and discussion of alternatives will adhere to CEQA Guidelines Section 15126.6. The description of alternatives will be provided in this chapter of the PEA, and the comparison of each alternative to the proposed project is provided in PEA Chapter 6. The amount of detail required for the description of various alternatives to the proposed project and what may be considered a reasonable range of alternatives will be discussed with CPUC during Pre-filing.

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>4.1 Alternatives Considered. Identify alternatives to the proposed project.²⁰ Include the following:</p> <ul style="list-style-type: none"> a) All alternatives to the proposed project that were suggested, considered, or studied by the CAISO or by CAISO stakeholders b) Alternatives suggested by the public or agencies during public outreach efforts conducted by the Applicant c) Reduced footprint alternatives, including, e.g., smaller diameter pipelines and space for fewer electric transformers d) Project phasing options (e.g., evaluate the full build out for environmental clearance but consider an initial, smaller buildout that would only be expanded [in phases] if needed) e) Alternative facility and construction activity sites (e.g., substation, compressor station, drilling sites, well-head sites, staging areas) f) Renewable, energy conservation, energy efficiency, demand response, distributed energy resources, and energy storage alternatives g) Alternatives that would avoid or limit the construction of new transmission-voltage facilities or new gas transmission pipelines h) Other technological alternatives (e.g., conductor type) i) Route alternatives and route variations j) Alternative engineering or technological approaches (e.g., alternative types of facilities, or materials, or configurations) k) Assign an identification label and brief, descriptive title to each alternative described in this PEA chapter (e.g., Alternative A: No Project; Alternative B: Reduced Footprint 500/115-kV Substation; Alternative C: Ringo Hills 16-inch Pipeline Alignment; Alternative D1: Lincoln Street Route Variation; etc.). Each alternative will be easily identifiable by reading the brief title. <p>Provide a description of each alternative. The description of each alternative will discuss to what extent it would be potentially feasible,</p>		

²⁰ Reduced footprint alternatives; siting alternatives; renewable, energy conservation, energy efficiency, demand response, distributed energy resources, and energy storage alternatives; and non-wires alternatives (electric projects only) are typically required. For linear projects, route alternatives and route variations are typically required as well.

<p>meet the project’s underlying purpose, meet most of the basic project objectives, and avoid or reduce one or more potentially significant impacts. If the Applicant believes that an alternative is infeasible or the implementation is remote and speculative (CEQA Guidelines Section 15126.6(f)(3), clearly explain why.</p> <p>If significant environmental effects are possible without mitigation, alternatives will be provided in the PEA that are capable of avoiding or reducing any potentially significant environmental effects, even if the alternative(s) substantially impede the attainment of some project objectives or are costlier.²¹</p>		
<p>4.2 No Project Alternative. Include a thorough description of the No Project Alternative. The No Project Alternative needs to describe the range of actions that are reasonably foreseeable if the proposed project is not approved. The No Project Alternative will be described to meet the requirements of CEQA Guidelines Section 15126.6(e).</p>		
<p>4.3 Rejected Alternatives. Provide a detailed discussion of all alternatives considered by the Applicant that were not selected by the Applicant for a full description in the PEA and analysis in PEA Chapter 5. The detailed discussion will include the following:</p> <ul style="list-style-type: none"> a) Description of the alternative and its components b) Map of any alternative sites or routes c) Discussion about the extent to which the alternative would meet the underlying purpose of the project and its basic objectives d) Discussion about the feasibility of implementing the alternative e) Discussion of whether the alternative would reduce or avoid any significant environmental impacts of the proposed project f) Discussion of any new significant impacts that could occur from implementation of the alternative g) Description of why the alternative was rejected h) Any comments from the public or agencies about the alternative during PEA preparation 		
<p>For Natural Gas Storage Projects:</p>		
<p>4.4 Natural Gas Storage Alternatives. In addition to the requirements included above, alternatives to be considered for proposed natural gas storage projects include the following, where applicable:</p> <ul style="list-style-type: none"> a) Alternative reservoir locations considered for gas storage including other field locations and other potential storage areas b) Alternative pipelines, road, and utility siting c) Alternative suction gas requirements, and injection/withdrawal options 		

²¹ CPUC CEQA Unit Staff will determine whether an alternative could *substantially* reduce one or more potentially significant impacts of the proposed project (CEQA Guidelines Section 15125.5). Applicants are strongly advised to provide more rather than less alternatives for CPUC’s consideration or as determined during Pre-filing.

5 Environmental Analysis

Include a description of the environmental setting, regulatory setting, and impact analysis for each resource area. The resource areas addressed will include each environmental factor (resource area) identified in the most recent adopted version of the CEQA Guidelines Appendix G checklist and any additional relevant resource areas and impact questions that are defined in this PEA checklist.

1. Environmental Setting
 - a. For each resource area, the PEA will include a detailed description of the natural and built environment in the vicinity of the proposed project area (e.g., topography, land use patterns, biological environment, etc.) as applicable to the resource area. Both regional and local environmental setting information will be provided.
 - b. All setting information provided will relate in some way to the impacts of the proposed project discussed in the PEA's impacts analysis, however CPUC's impacts analysis may be more thorough, which may necessitate additional setting information than the Applicant might otherwise provide.
2. Regulatory Setting
 - a. Organized by federal, State, regional, and local sections
 - b. Describe the policy or regulation and briefly explain why it is applicable to the proposed project.
 - i. Identify in the setting all laws, regulations, and policies that would be applicable for CPUC's exclusive jurisdiction over the siting and design of electric and gas facilities. Public utilities under CPUC's jurisdiction are expected to consult with local agencies regarding land use matters. Local laws, regulations, and policies will be considered for the consideration of potential impacts during CPUC's CEQA review (e.g., encroachment, grading, erosion control, scenic corridors, overhead line undergrounding, tree removal, fire protection, permanent and temporary noise limits, zoning requirements, general plan polices, and all local and regional laws, regulations, and policies).
3. Impact Questions
 - a. Includes all impact questions in the current version of CEQA Guidelines, Appendix G.
 - b. Additional impact questions that are frequently relevant to utility projects are provided in Attachment 4, CPUC Draft Environmental Measures.
4. Impact Analyses
 - a. Discussion organized by CEQA Guidelines, Appendix G impact items and any Additional CEQA Impact Questions in the PEA Checklist. Assess all potential environmental impacts and make determinations, such as, No Impact, Less than Significant, Less than Significant with Mitigation, Significant and Unavoidable, or Beneficial Impact with respect to construction, operations, and maintenance activities.
 - b. The impact analyses provided in PEA Chapter 5, Environmental Analysis, need not be as thorough as those to be prepared by CPUC for the CEQA environmental document. A preliminary determination will be provided but with only brief justification unless otherwise directed by CPUC Staff in writing during Pre-filing.
5. CPUC Draft Environmental Measures
 - a. CPUC Draft Environmental Measures are provided for some of the resource areas in Attachment 4, CPUC Draft Environmental Measures. The measures may be applied to the proposed project as written or modified by the CPUC during its environmental review if the measure would avoid or reduce a potentially significant impact.

- b. The CPUC Draft Environmental Measures should be discussed with the CPUC’s CEQA Unit Staff during Pre-filing, especially with respect to the development of Applicant Proposed Measures.
- c. In general, impact avoidance is preferred to the reduction of potentially significant impacts.

Additional requirements specific to each resource area are identified in the following sections.

5.1 Aesthetics

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.1.1 Environmental Setting		
5.1.1.1: Landscape Setting. Briefly described the regional and local landscape setting.		
5.1.1.2: Scenic Resources. Identify and describe any vistas, scenic highways, national scenic areas, or other scenic resources within and surrounding the project area (approximately 5-mile buffer but may be greater if necessary). Scenic resources may also include but are not limited to historic structures, trees, or other resources that contribute to the scenic values where the project would be located.		
<p>5.1.1.3: Viewshed Analysis</p> <ul style="list-style-type: none"> a) Conduct a viewshed analysis for the project area (approximately 5-mile buffer but may be greater if necessary). b) Describe the project viewshed, including important visibility characteristics for the project site, such as viewing distance, viewing angle, and intervening topography, vegetation, or structures. c) Provide a supporting map (or maps) showing project area, landscape units, topography (i.e., hillshade), and the results of the viewshed analysis. Provide associated GIS data. 		
5.1.1.4: Landscape Units. Identify and describe landscape units (geographic zones) within and surrounding the project area (approximately 5-mile buffer but may be greater if necessary) that categorizes different landscape types and visual characteristics, with consideration to topography, vegetation, and existing land uses. Landscape units should be developed based on the existing landscape characteristics rather than the project’s features or segments.		
5.1.1.5: Viewers and Viewer Sensitivity. Identify and described the types of viewers expected within the viewshed and landscape units. Describe visual sensitivity to general visual change based on viewing conditions, use of the area, feedback from the public about the project, and landscape characteristics.		

<p>5.1.1.6: Representative Viewpoints</p> <p>a) Identify representative viewpoints from publicly accessible locations (up to approximately 5-mile buffer but may be greater if appropriate). The number and location of the viewpoints must represent a range of views of the project site from major roads, highways, trails, parks, vistas, landmarks, and other scenic resources near the project site. Multiple viewpoints should be included where the project site would be visible from sensitive scenic resources to provide context on different viewing distances, perspectives, and directions.</p> <p>b) Provide the following information for each viewpoint:</p> <ul style="list-style-type: none"> i. Number, title, and brief description of the location ii. Types of viewers iii. Viewing direction(s) and distance(s) to the nearest proposed project features iv. Description of the existing visual conditions and visibility of the project site as seen from the viewpoint and shown in the representative photographs <p>c) Provide a supporting map (or maps) showing project features and representative viewpoints with arrows indicating the viewing direction(s). Provide associated GIS data (may be combined with GIS data request below for representative photographs).</p>		
<p>5.1.1.7: Representative Photographs</p> <p>a) Provide high resolution photographs taken from the representative viewpoints in the directions of all proposed project features.²² Multiple photographs should be provided where project features may be visible in different viewing directions from the same location.</p> <p>b) Provide the following information for each photograph:</p> <ul style="list-style-type: none"> i. Capture time and date ii. Camera body and lens model iii. Lens focal length and camera height when taken <p>c) Provide GIS data associated with each photograph location that includes coordinates (<1 meter resolution), elevations, and viewing directions, as well as the associated viewpoint.</p>		
<p>5.1.1.8: Visual Resource Management Areas</p> <p>a) Identify any visual resource management areas within and surrounding the project area (approximately 5-mile buffer).</p> <p>b) Describe any project areas within visual resource management areas.</p>		

²² All representative photographs should be taken using a digital single-lens reflex camera with standard 50-millimeter lens equivalent, which represents an approximately 40-degree horizontal view angle. The precise photograph coordinates and elevations should be collected using a high accuracy GPS unit.

c) Provide a supporting map (or maps) showing project features and visual resource management areas. Provide associated GIS data.		
5.1.2 Regulatory Setting		
5.1.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding aesthetics and visual resource management.		
5.1.3 Impact Questions		
5.1.3.1: Impact Questions. The impact questions include all aesthetic impact questions in the current version of CEQA Guidelines, Appendix G.		
5.1.3.2: Additional CEQA Impact Questions: None.		
5.1.4 Impact Analysis		
5.1.4.1: Visual Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
The following information will be included in the PEA or a technical Appendix to support the aesthetic impact analysis:		
5.1.4.2: Analysis of Selected Viewpoints. Identify the methodology and assumptions that were applied in selecting key observation points for visual simulation. It is recommended that viewpoints are selected where viewers may be sensitive to visual change (public views) and in areas that are visually sensitive, or heavily trafficked or visited. ²³		
<p>5.1.4.3: Visual Simulation</p> <p>a) Identify methodology and assumptions for completing the visual simulations. The simulations should include photorealistic 3-D models of project features and any land changes within the KOP view. The visual simulations should depict conditions:</p> <ul style="list-style-type: none"> i. Immediately following construction, and ii. After vegetation establishment in all areas of temporary impact to illustrate the visual impact from vegetation removal. <p>b) Provide high resolution images for the visual simulations.</p>		
<p>5.1.4.4: Analysis of Visual Change</p> <p>a) Identify the methodology and assumptions for completing the visual change analysis.²⁴ The methodology should be consistent with applicable visual resource management criteria.</p> <p>b) Provide a description of the visual change for each selected viewpoint. Describe any conditions that would change over time, such as vegetation growth.</p>		

²³ The KOP selection process should be discussed with CPUC during Pre-filing

²⁴ The visual impact assessment methodology should be discussed with CPUC during Pre-filing

c) Describe the effects of visual change that would result in the entire project area, as indicated by the selected viewpoints that were simulated and analyzed.		
5.1.4.5: Lighting and Marking. Identify all new sources of permanent lighting. Identify any proposed structures or lines that could require FAA notification. Identify any structures or line segments that could require lighting and marking based on flight patterns and FAA or military requirements. Provide supporting documentation in an Appendix (e.g., FAA notice and criteria tool results).		
5.1.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.2 Agriculture and Forestry Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.2.1 Environmental Setting		
5.2.1.1: Agricultural Resources and GIS		
a) Identify all agricultural resources that occur within the project area including: <ul style="list-style-type: none"> i. Areas designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance ii. Areas under Williamson Act contracts and provide information on the status of the Williamson Act contract iii. Any areas zoned for agricultural use in local plans iv. Areas subject to active agricultural use b) Provide GIS data for agricultural resources within the proposed project area.		
5.2.1.2: Forestry Resources and GIS		
a) Identify all forestry resources within the project area including: <ul style="list-style-type: none"> i. Forest land as defined in Public Resources Code 12220(g)25 ii. Timberland as defined in Public Resource Code section 4526 iii. Timberland zoned Timberland Production as defined in Government Code section 51104(g) b) Provide GIS data for all forestry resources within the proposed project area.		
5.2.2 Regulatory Setting		
5.2.2: Agriculture and Forestry Regulations. Identify all federal, state, and local policies for protection of agricultural and forestry resources that apply to the proposed project.		

²⁵ Forest land is defined in Public Resources Code as, “land that can support 10 percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.”

5.2.3 Impact Questions		
5.2.3.1: Agriculture and Forestry Impact Questions. The impact questions include all agriculture and forestry impact questions in the current version of CEQA Guidelines, Appendix G.		
5.2.3.2: Additional CEQA Impact Questions: None.		
5.2.4 Impact Analyses		
5.2.4.1: Agriculture and Forestry Impacts. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
Incorporate the following discussions into the analysis of impacts:		
5.2.4.2: Prime Farmland Soil Impacts. Calculate the acreage of Prime Farmland soils that would be affected by construction and operation and maintenance.		
5.2.4.3. Williamson Act Impacts. Describe the approach to resolve potential conflicts with Williamson Act contract (if applicable)		
5.2.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.3 Air Quality

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.3.1 Environmental Setting		
5.3.1.1: Air Quality Plans Identify and describe all applicable air quality plans and attainment areas. Identify the air basin(s) for the project area. If the project is located in more than one attainment area and/or air basin, provide the extent in each attainment area and air basin.		
5.3.1.2: Air Quality. Describe existing air quality in the project area. a) Identify existing air quality exceedance of National Ambient Air Quality Standards and California Ambient Air Quality Standards in the air basin. b) Provide the number of days that air quality in the area exceeds state and federal air standards for each criteria pollutant that where air quality standards are exceeded. c) Provide air quality data from the nearest representative air monitoring station(s).		
5.3.1.3: Sensitive Receptor Locations. Identify the location and types of each sensitive receptor locations ²⁶ within 1,000 feet of the project area. Provide GIS data for sensitive receptor locations.		

²⁶ Sensitive Receptor locations may include hospitals, schools, and day care centers, and such other locations as the air district board or California Air Resources Board may determine (California Health and Safety Code § 42705.5(a)(5)).

5.3.2 Regulatory Setting		
5.3.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding aesthetics and visual resource management.		
5.3.2.2: Air Permits. Identify and list all necessary air permits.		
5.3.3 Impact Questions		
5.3.3.1: Impact Questions. The impact questions include all air quality impact questions in the current version of CEQA Guidelines, Appendix G.		
5.3.3.2: Additional CEQA Impact Questions: None.		
5.3.4 Impact Analysis		
5.3.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
The following information will be presented in the PEA or a technical Appendix to support the air quality impact analysis:		
5.3.4.2: Air Quality Emissions Modeling. Model project emissions using the most recent version of CalEEMod and/or a current version of other applicable modeling program. Provide all model input and output data sheets in Microsoft Excel format to allow CPUC to evaluate whether project data was entered into the modeling program accurately. The assumptions used in the air quality modeling must be consistent with all PEA information about the project’s schedule, workforce, and equipment. The following information will be addressed in the emissions modeling, Air Quality Appendix, and PEA:		
<ul style="list-style-type: none"> a) Quantify the expected emissions of criteria pollutants from all project-related sources. Quantify emissions for both construction and operation (e.g., compressor equipment). b) Identify manufacturer’s specifications for all proposed new emission sources. For proposed new, additional, or modified compressor units, include the horsepower, type, and energy source. c) Describe any emission control systems that are included in the air quality analysis (e.g., installation of filters, use of EPA Tier II, III, or IV equipment, use of electric engines, etc.). d) When multiple air basins may be affected by the project, model air emissions within each air basin and provide a narrative (supported by calculations) that clearly describes the assumptions around the project activities considered for each air basin. Provide modeled emissions by attainment area or air basin (supported by calculations). 		

5.3.4.3: Air Quality Emissions Summary. Provide a table summarizing the air quality emissions for the project and applicable thresholds for each applicable attainment area. Include a summary of uncontrolled emissions (prior to application of any APMs) and controlled emissions (after application of APMs). Clearly identify the assumptions that were applied in the controlled emissions estimates.		
5.3.4.4: Health Risk Assessment. Complete a Health Risk Assessment when air quality emissions have the potential to lead to human health impacts ²⁷ . If health impacts are not anticipated from project emissions, the analysis should clearly describe why emissions would not lead to health impacts.		
5.3.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.4 Biological Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.4.1 Environmental Setting		
5.4.1.1: Biological Resources Technical Report. Provide a Biological Resources Technical Report as an Appendix to the PEA that includes all information specified in Attachment 2.		
The following biological resources information will be presented in the PEA:		
5.4.1.2: Survey Area (Local Setting). Identify and describe the biological resources survey area as documented in the Biological Resources Technical Report. All temporary and permanent project areas must be within the survey area.		
5.4.1.3: Vegetation Communities and Land Cover		
<ul style="list-style-type: none"> a) Identify, describe, and quantify vegetation communities and land cover types within the biological resources survey area. b) Clearly identify any sensitive natural vegetation communities that meet the definition of a biological resource under CEQA (i.e., rare, designated, or otherwise protected), such as, but not limited to, riparian habitat. c) Provide a supporting map (or maps) showing project features and vegetation communities and land cover type. 		

²⁷ Refer to Office of Environmental Health Hazard Assessment (OEHHA) most recent guidance for preparation of Health Risk Assessments to determine whether a Health Risk Assessment is required for the project. The need for an HRA should also be discussed with CPUC during Pre-filing.

<p>5.4.1.4: Aquatic Features</p> <ul style="list-style-type: none"> a) Identify, describe, and quantify aquatic features within the biological resources survey area that may provide potentially suitable aquatic habitat for rare and special-status species. b) Identify and quantify potentially jurisdictional aquatic features and delineated wetlands, according to the Wetland Delineation Report and Biological Resources Technical Report. c) Provide a supporting map (or maps) showing project features and aquatic resources. 		
<p>5.4.1.5: Habitat Assessment. Identify rare and special-status species with potential to occur in the project region (approximately a 5-mile buffer but may be larger if necessary). For each species, provide the following information:</p> <ul style="list-style-type: none"> a) Common and scientific name b) Status and/or rank c) Habitat characteristics (i.e., vegetation communities, elevations, seasonal changes, etc.) d) Blooming characteristics for plants e) Breeding and other dispersal (range) behavior for wildlife f) Potential to occur within the survey area (i.e., Present, High Potential, Moderate Potential, Low Potential, or Not Expected), with justification based on the results of the records search, survey findings, and presence of potentially suitable habitat g) Specific types and locations of potentially suitable habitat that correspond to the vegetation communities and land cover and aquatic features 		
<p>5.4.1.6: Critical Habitat</p> <ul style="list-style-type: none"> a) Identify and describe any critical habitat for rare or special-status species within and surrounding the project area (approximately a 5-mile buffer). b) Provide a supporting map (or maps) showing project features and critical habitat. 		
<p>5.4.1.7: Native Wildlife Corridors and Nursery Sites</p> <ul style="list-style-type: none"> a) Identify and describe regional and local wildlife corridors within and surrounding the project area (approximately a 5-mile buffer), including but not limited to, landscape and aquatic features that connect suitable habitat in regions otherwise fragmented by terrain, changes in vegetation, or human development. b) Identify and describe regional and local native wildlife nursery sites within and surrounding the project area (approximately a 5-mile buffer), as identified through the records search, surveys, and habitat assessment. 		

c) Provide a supporting map (or maps) showing project features, native wildlife corridors, and native nursery sites.		
5.4.1.8: Biological Resource Management Areas		
<p>a) Identify any biological resource management areas (i.e., conservation or mitigation areas, HCP or NCCP boundaries, etc.) within and surrounding the project area (approximately 5-mile buffer).</p> <p>b) Identify and quantify any project areas within biological resource management areas.</p> <p>c) Provide a supporting map (or maps) showing project features and biological resource management areas.</p>		
5.4.2 Regulatory Setting		
5.4.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding biological resources.		
5.4.2.2: Habitat Conservation Plan. Provide a copy of any relevant Habitat Conservation Plan.		
5.4.3 Impact Questions		
<p>5.4.3.1: Impact Questions. The impact questions include all biological resource impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.4.3.2: Additional CEQA Impact Question:</p> <p>Would the project create a substantial collision or electrocution risk for birds or bats?</p>		
5.4.4 Impact Analysis		
5.4.4.1: Impact Analysis Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for Biological Resources and any additional impact questions listed above.		
The following information will be included in the impact analysis:		
<p>5.4.4.2: Quantify Habitat Impacts. Provide the area of impact in acres by each habitat type. Quantify temporary and permanent impacts. For all temporary impacts provide the following:</p> <p>a) Description of the restoration and revegetation approach</p> <p>b) Vegetation species that would be planted within the area of temporary disturbance</p> <p>c) Procedures to reduce invasive weed encroachment within areas of temporary disturbance</p> <p>d) Expected timeframe for restoration of the site</p>		
5.4.4.3: Special-Status Species Impacts. Identify anticipated impacts on special-status species. Identify any take permits that are anticipated for the project. If an existing habitat conservation plan (HCP) or natural communities conservation plan (NCCP) would be used for the project, provide current accounting of take coverage included in the HCP/NCCP		

to demonstrate that there is sufficient habitat coverage remaining under the existing permit.		
<p>5.4.4.4: Wetland Impacts. Quantify the area (in acres) of temporary and permanent impacts on wetlands. Include the following details:</p> <ul style="list-style-type: none"> a) Provide a table identifying all wetlands, by milepost and length, crossed by the project and the total acreage of each wetland type that would be affected by construction. b) Discuss construction and restoration methods proposed for crossing wetlands. c) If wetlands would be filled or permanently lost, describe proposed measures to compensate for permanent wetland losses. d) If forested wetlands would be affected, describe proposed measures to restore forested wetlands following construction. 		
<p>5.4.4.5: Avian Impacts. Describe avian obstructions and risk of electrocution from the project. Describe any standards that will be implemented as part of the project to reduce the risk of collision and electrocution.</p>		
5.4.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.5 Cultural Resources²⁸

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.5.1 Environmental Setting		
<p>5.5.1.1: Cultural Resource Reports. Provide a cultural resource inventory and evaluation report that addresses the technical requirement provided in Attachment 3.</p>		
<p>5.5.1.2: Cultural Resources Summary. Summarize cultural resource survey and inventory results and survey methods. Do not provide any confidential cultural resource information within the PEA chapter.</p>		
<p>5.5.1.3: Cultural Resource Survey Boundaries. Provide a map with mileposts showing the boundaries of all survey areas in the report. Provide the GIS data for the survey area. Provide confidential GIS data for the resource locations and boundaries separately under confidential cover.</p>		
5.5.2 Regulatory Setting		
<p>5.5.2.1: Regulatory Setting. Identify applicable federal and state regulations for protection of cultural resources.</p>		

²⁸ For a description and evaluation of cultural resources specific to Tribes, see Section 5.18, Tribal Cultural Resources.

5.5.3 Impact Questions		
5.5.3.1: Impact Questions. The impact questions include all cultural resource impact questions in the current version of CEQA Guidelines, Appendix G.		
5.5.3.2: Additional CEQA Impact Questions: None.		
5.5.4 Impact Analysis		
5.5.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis		
5.5.4.2: Human Remains. Describe the potential for encountering human remains or grave goods during the trenching or any other phase of construction. Describe the procedures that would be used if human remains are encountered.		
5.5.4.3: Resource Avoidance. Describe avoidance procedures that would be implemented to avoid known resources.		
5.5.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.6 Energy

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.6.1 Environmental Setting		
5.6.1.1: Existing Energy Use. Identify energy use of existing infrastructure if the proposed project would replace or upgrade an existing facility.		
5.6.2 Regulatory Setting		
5.6.2.1: Regulatory Setting. Identify applicable federal, state, or local regulations or policies applicable to energy use for the proposed project.		
5.6.3 Impact Questions		
5.6.3.1: Impact Questions: The impact questions include all energy impact questions in the current version of CEQA Guidelines, Appendix G.		
5.6.3.2: Additional CEQA Impact Question: Would the project add capacity for the purpose of serving a non-renewable energy resource?		

5.6.4 Impact Analysis		
5.6.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.6.4.2: Nonrenewable Energy. Identify renewable and non-renewable energy projects that may interconnected to or be supplied by the proposed project.		
5.6.4.3: Fuels and Energy Use a) Provide an estimation of the amount of fuels (gasoline, diesel, helicopter fuel, etc.) that would be used during construction and operation and maintenance of the project. Fuel estimates should be consistent with Air Quality calculations supporting the PEA. b) Provide the following information on energy use: i. Total energy requirements of the project by fuel type and end use ii. Energy conservation equipment and design features iii. Identification of energy supplies that would serve the project		
5.6.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.7 Geology, Soils, and Paleontological Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.7.1 Environmental Setting		
5.7.1.1: Regional and Local Geologic Setting. Briefly describe the regional and local physiography, topography, and geologic setting in the project area.		
5.7.1.2: Seismic Hazards a) Provide the following information on potential seismic hazards in the project area: i. Identify and describe regional and local seismic risk including any active faults within and surrounding the project area (will be a 10-mile buffer unless otherwise instructed in writing by CEQA Unit Staff during Pre-filing) ii. Identify any areas that are prone to seismic-induced landslides iii. Provide the liquefaction potential for the project area b) Provide a supporting map (or maps) showing project features and major faults, areas of landslide risk, and areas at high risk of liquefaction. Provide GIS data for all faults, landslides, and areas of high liquefaction potential.		

<p>5.7.1.3: Geologic Units. Identify and describe the types of geologic units in the project area. Include the following information for each geologic unit:</p> <ul style="list-style-type: none"> a) Summarize the geologic units within the project area. b) Identify any previous landslides in the area and any areas that are at risk of landslide. c) Identify any unstable geologic units. d) Provide a supporting map (or maps) showing project features and geologic units. Clearly identify any areas with potentially hazardous geologic conditions. Provide associated GIS data. 		
<p>5.7.1.4: Soils. Identify and describe the types of soils in the project area.</p> <ul style="list-style-type: none"> a) Summarize the soils within the project area. b) Clearly identify any soils types that could be unstable (e.g., at risk of lateral spreading, subsidence, liquefaction, or collapse). c) Provide information on erosion susceptibility for each soil type that occurs in the project area. d) Provide a supporting map (or maps) showing project features and soils. Provide associated GIS data. 		
<p>5.7.1.5: Paleontological Report. Provide a paleontological report that includes the following:</p> <ul style="list-style-type: none"> a) Information on any documented fossil collection localities within the project area and a 500-foot buffer. b) A paleontological resource sensitivity analysis based on published geological mapping and the resource sensitivity of each rock type. c) Supporting maps and GIS data. 		
<p>5.7.2 Regulatory Setting</p>		
<p>5.7.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding geology, soils, and paleontological resources.</p>		
<p>5.7.3 Impact Questions</p>		
<p>5.7.3.1: Impact Questions. The impact questions include all geology, soils, and paleontological resource impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.7.3.2: Additional CEQA Impact Questions: None.</p>		
<p>5.7.4 Impact Analysis</p>		
<p>5.7.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.</p>		
<p>Include the following information in the impact analysis:</p>		

5.7.4.2: Geotechnical Requirements. Identify any geotechnical requirements that would be implemented to address effects from unstable geologic units or soils. Describe how the recommendation would be applied (i.e., when and where).		
5.7.4.3: Paleontological Resources. Identify the potential to disturb paleontological resources based on the depth of proposed excavation and paleontological sensitivity of geologic units within the project area.		
5.7.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.8 Greenhouse Gas Emissions

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.8.1 Environmental Setting		
5.8.1.1: GHG Setting. Provide a description of the setting for greenhouse gases (GHGs). The setting should consider any GHG emissions from existing infrastructure that would be upgraded or replaced by the proposed project.		
5.8.2 Regulatory Setting		
5.8.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for greenhouse gases.		
5.8.3 Impact Questions		
5.8.3.1 Impact Questions. The impact questions include all greenhouse gas impact questions in the current version of CEQA Guidelines, Appendix G.		
5.8.3.2: Additional CEQA Impact Questions: None.		
5.8.4 Impact Analysis		
5.8.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.8.4.2: GHG Emissions. Provide a quantitative assessment of GHG emissions for construction and operation and maintenance of the proposed project. Provide model results and all model files. Modeling will be conducted using the latest version of the emissions model at the time of application filing (e.g., most recent version of CalEEMod). GHG emissions will be provided for the following conditions: <ul style="list-style-type: none"> a) Uncontrolled emissions (before APMs are applied) b) Controlled emissions considering application of APMs <ul style="list-style-type: none"> i. Based on the modeled GHG emissions, quantify the project’s contribution to and analyze the project’s effect on 		

<p>climate change. Identify and provide justification for the timeframe considered in the analysis.</p> <p>ii. Discuss any programs already in place to reduce GHG emissions on a system-wide level. This includes the Applicant’s voluntary compliance with the EPA SF6 reduction program, reductions from energy efficiency, demand response, LTPP, etc.</p> <p>iii. For any significant impacts, identify potential strategies that could be employed by the project to reduce GHGs during construction or operation and maintenance consistent with OPR Advisory on CEQA and Climate Change.</p>		
Natural Gas Storage		
5.8.4.3: Natural Gas Storage Accident Conditions. In addition to the requirements above, identify the potential GHG emissions that could result in the event of a gas leak.		
5.8.4.4: Monitoring and Contingency Plan. Provide a comprehensive monitoring plan that would be implemented during project operation to monitor for gas leaks. The plan should identify a monitoring schedule, description of monitoring activities, and actions to be implemented if gas leaks are observed.		
5.8.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.9 Hazards, Hazardous Materials, and Public Safety²⁹

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.9.1 Environmental Setting		
5.9.1.1: Hazardous Materials Report. Provide a Phase I Environmental Site Assessment or similar hazards report for the proposed project area. Describe any known hazardous materials locations within the project area and the status of the site.		
5.9.1.2: Airport Land Use Plan. Identify any airport land use plan(s) within the project area.		
5.9.1.3: Fire Hazard. Identify if the project occurs within federal, state, or local fire responsibility areas and identify the fire hazard severity rating for all project areas, including temporary work areas and access roads.		
5.9.1.4: Metallic Objects. For electrical projects, identify any metallic pipelines or cables within 25 feet of the project.		

²⁹ For fire risk specific to state responsibility areas or lands classified as very high fire hazard severity zones, see Section 5.20, Wildfire.

<p>5.9.1.5: Pipeline History (for Natural Gas Projects). Provide a narrative describing the history of the pipeline system(s) to which the project would connect, list of previous owner and operators, and detailed summary of the pipeline systems’ safety and inspection history.</p>		
<p>5.9.2 Regulatory Setting</p>		
<p>5.9.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for hazards, hazardous materials, and public safety.</p>		
<p>5.9.2.2: Touch Thresholds. Identify applicable standards for protection of workers and the public from shock hazards.</p>		
<p>5.9.3 Impact Questions</p>		
<p>5.9.3.1: Impact Questions. The impact questions include all hazards and hazardous materials impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.9.3.2: Additional CEQA Impact Questions:</p> <ul style="list-style-type: none"> a) Would the project create a significant hazard to air traffic from the installation of new power lines and structures? b) Would the project create a significant hazard to the public or environment through the transport of heavy materials using helicopters? c) Would the project expose people to a significant risk of injury or death involving unexploded ordnance? d) Would the project expose workers or the public to excessive shock hazards? 		
<p>5.9.4 Impact Analysis</p>		
<p>5.9.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines Appendix G for this resource area and any additional impact questions listed above.</p>		
<p>Include the following information in the impact analysis:</p>		
<p>5.9.4.2: Hazardous Materials. Identify the hazardous materials (i.e., chemicals, solvents, lubricants, and fuels) that would be used during construction and operation of the project. Estimate the quantity of each hazardous material that would be stored on site during construction and operation.</p>		
<p>5.9.4.3: Air Traffic Hazards. If the project involves construction of above-ground structures (including structure replacement) within the airport land use plan area, provide a discussion of how the project would or would not conflict with height restrictions identified in the airport land use plan and how the project would comply with any FAA or military requirements for the above ground facilities.</p>		
<p>5.9.4.4: Accident or Upset Conditions. Describe how the project facilities would be designed, constructed, operated, and maintained to</p>		

minimize potential hazard to the public from the failure of project components as a result of accidents or natural catastrophes.		
5.9.4.5: Shock Hazard. For electricity projects, identify infrastructure that may be susceptible to induced current from the proposed project. Describe strategies (e.g., cathodic protection) that the project would employ to reduce shock hazards and avoid electrocution of workers or the public.		
For Natural Gas and Gas Storage:		
5.9.4.6: Health and Safety Plan. Include in the Health and Safety Plan, plans for addressing gas leaks, fires, etc. Identify sensitive receptors, methods of evacuation, and protection measures. The Plan will be provided as an Appendix to the PEA.		
5.9.4.7: Health Risk Assessment. Provide a Health Risk Assessment including risk from potential gas leaks, fires, etc. Identify sensitive receptors that would be affected and potential impacts on them if there is a gas release. ³⁰		
5.9.4.8: Gas Migration. Describe potential for and effects of gas migration through natural and manmade pathways. a) Provide Applicant Proposed Measures for avoiding gas emissions at the surface from gas migration pathways. b) Provide Applicant Proposed Measures for avoiding emissions of mercaptan and/or other odorizing agents.		
5.9.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.10 Hydrology and Water Quality

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.10.1 Environmental Setting		
5.10.1.1: Waterbodies. Identify by milepost all ephemeral, intermittent, and perennial surface waterbodies crossed by the project. For each, list its water quality classification, if applicable.		
5.10.1.2: Water Quality. Identify any downstream waters that are on the state 303(d) list and identify whether a total maximum daily load (TMDL) has been adopted or the date for adoption of a TMDL. Identify existing sources of impairment for downstream waters. Describe any management plans that are in place for downstream waters.		
5.10.1.3: Groundwater Basin. Identify all known EPA and state groundwater basins and aquifers crossed by the project.		

³⁰Refer to the requirements for Health Risk Assessments in Section 5.3.4.4.

<p>5.10.1.4: Groundwater Wells and Springs. Identify the locations of all known public and private groundwater supply wells and springs within 150 feet of the project area.</p>		
<p>5.10.1.5: Groundwater Management. Identify the groundwater management status of any groundwater resources in the project area and any groundwater resources that may be used by the project. Describe if groundwater resources in the basin have been adjudicated. Identify any sustainable groundwater management plan that has been adopted for groundwater resources in the project area or describe the status of groundwater management planning in the area.</p>		
<p>5.10.2 Regulatory Setting</p>		
<p>5.10.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding hydrologic and water quality.</p>		
<p>5.10.3 Impact Questions</p>		
<p>5.10.3.1: Impact Questions. The impact questions include all hydrology and water quality impact questions in the current version of CEQA Guidelines, Appendix G.</p> <p>5.10.3.2: Additional CEQA Impact Questions: None.</p>		
<p>5.10.4 Impact Analysis</p>		
<p>5.10.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in the current version of CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.</p>		
<p>Include the following information in the impact analysis:</p>		
<p>5.10.4.2: Hydrostatic Testing. Identify all potential sources of hydrostatic test water, quantity of water required, withdrawal methods, treatment of discharge, and any waste products generated.</p>		
<p>5.10.4.3: Water Quality Impacts. Describe impacts to surface water quality, including the potential for accelerated soil erosion, downstream sedimentation, and reduced surface water quality.</p>		
<p>5.10.4.4: Impermeable Surfaces. Describe increased run-off and impacts on groundwater recharge due to construction of impermeable surfaces. Provide the acreage of new impermeable surfaces that will be created as a result of the project.</p>		
<p>5.10.4.5: Waterbody Crossings. Identify by milepost all waterbody crossings. Provide the following information for crossing:</p> <ul style="list-style-type: none"> a) Identify whether the waterbody has contaminated waters or sediments. b) Describe the waterbody crossing method and any approaches to avoid the waterbody. c) Describe typical additional work area and staging area requirements at waterbody and wetland crossings. 		

d) Describe any dewatering or water diversion that will be required during construction near the waterbody. Identify treatment methods for any dewatering.		
e) Describe any proposed restoration methods for work near or within the waterbody.		
5.10.4.6: Groundwater Impacts. If water would be obtained from groundwater supplies, evaluate the project’s consistency with any applicable sustainable groundwater management plan.		
5.10.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.11 Land Use and Planning

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.11.1 Environmental Setting		
5.11.1.1: Land Use. Provide a description of land uses within the area traversed by the project route as designated in the local General Plan (e.g., residential, commercial, agricultural, open space, etc.).		
5.11.1.2: Special Land Uses. Identify by milepost and segment all special land uses within the project area including: a) All land administered by federal, state, or local agencies, or private conservation organizations b) Any designated coastal zone management areas c) Any designated or proposed candidate National or State Wild and Scenic Rivers crossed by the project d) Any national landmarks		
5.11.1.3: Habitat Conservation Plan. Provide a copy of any Habitat Conservation Plan applicable to the project area or proposed project. Also required for Section 5.4, Biological Resources.		
5.11.2 Regulatory Setting		
5.11.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for land use and planning.		
5.11.3 Impact Questions		
5.11.3.1: Impact Questions. The impact questions include all land use questions in the current version of CEQA Guidelines, Appendix G.		
5.11.3.2: Additional CEQA Impact Questions: None.		
5.11.4 Impact Analysis		
5.11.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		

5.11.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.12 Mineral Resources

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.12.1 Environmental Setting		
5.12.1.1: Mineral Resources. Provide information on the following mineral resources within 0.5 mile of the proposed project area: a) Known mineral resources b) Active mining claims c) Active mines d) Resource recovery sites		
5.12.2 Regulatory Setting		
5.12.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for minerals.		
5.12.3 Impact Questions		
5.12.3.1: Impact Questions. The impact questions include all mineral resource impact questions in the current version of CEQA Guidelines, Appendix G. 5.12.3.2: Additional CEQA Impact Questions: None.		
5.12.4 Impact Analysis		
5.12.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
5.12.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.13 Noise

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.13.1 Environmental Setting		
5.13.1.1: Noise Sensitive Land Uses. Identify all noise sensitive land uses within 1,000 feet of the proposed project. Provide GIS data for sensitive receptors within 1,000 feet of the project.		
5.13.1.2: Noise Setting. Provide the existing noise levels (Lmax, Lmin, Leq, and Ldn sound level and other applicable noise parameters) at noise sensitive areas near the proposed project. All noise measurement data and the methodology for collecting the data will be provided in a noise study as an Appendix to the PEA.		

5.13.2 Regulatory Setting		
5.13.2.1: Regulatory Setting. Identify applicable state, and local laws, policies, and standards for noise.		
5.13.3 Impact Questions		
5.13.3.1 Impact Questions. The impact questions include all noise questions in the current version of CEQA Guidelines, Appendix G.		
5.13.3.2: Additional CEQA Impact Questions: None.		
5.13.4 Impact Analysis		
5.13.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.13.4.2: Noise Levels		
<ul style="list-style-type: none"> a) Identify noise levels for each piece of equipment that could be used during construction. b) Provide a table that identifies each phase of construction, the equipment used in each construction phase, and the length of each phase at any single location (see example in Table 7 below). c) Estimate cumulative equipment noise levels for each phase of construction. d) Include phases of operation if noise levels during operation have the potential to frequently exceed pre-project existing conditions. e) Identify manufacturer’s specifications for equipment and describe approaches to reduce impacts from noise. 		

Table 7. Construction Noise Levels

Equipment Required	Equipment Noise Levels (Leq; 50 feet)	Phase Noise Level (Leq; 50 feet)	Phase Duration at Each Location	Receptor Nearest to Construction Phase	Noise Level at Nearest Receptor (Leq)	Exceeds Noise Standard at Nearest Receptor?	Distance to Not Exceed Standard
Site Preparation/Grading							
Dozer	78 dBA	82 dBA	5 days	Residence on Main Street; 100 feet from Substation Site	76 dBA	Yes	112 feet
Gradall	79 dBA						
Dump Truck	73 dBA						
Construct Tower Foundation							
Auger Rig	77 dBA	82 dBA	11 days	School on Education Avenue; 130 feet from Tower A12	73 dBA	No	N/A
Dump Truck	73 dBA						
Excavator	77 dBA						
Concrete Truck	75 dBA						

For Natural Gas:		
5.13.4.3: Compressor Station Noise. Provide site plans of compressor stations or other noisy, permanent equipment, showing the location of the nearest noise sensitive areas within 1 mile of the proposed ROW. If new compressor station sites are proposed, measure or estimate the existing ambient sound environment based on current land uses and		

activities. For existing compressor stations (operated at full load), include the results of a sound level survey at the site property line and nearby noise-sensitive areas. Include a plot plan that identifies the locations and duration of noise measurements.		
5.13.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.14 Population and Housing

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.14.1 Environmental Setting		
5.14.1.1: Population Estimates. Identify population trends for the areas (county, city, town, census designated place) where the project would take place.		
5.14.1.2: Housing Estimates. Identify housing estimates and projections in areas where the project would take place.		
5.14.1.3: Approved Housing Developments a) Provide the following information for all housing development projects within 1 mile of the proposed project that have been recently approved or may be approved around the PEA and application filing date: <ul style="list-style-type: none"> i. Project name ii. Location iii. Number of units and estimated population increase iv. Approval date and construction status v. Contact information for developer (provided in the public outreach Appendix) b) Ensure that the project information provided above is consistent with the PEA analysis of cumulative project impacts.		
5.14.2 Regulatory Setting		
5.14.2.1: Regulatory Setting. Identify any applicable federal, state or local laws or regulations that apply to the project.		
5.14.3 Impact Questions		
5.14.3.1: Impact Questions. The impact questions include all population and housing impact questions in the current version of CEQA Guidelines, Appendix G.		
5.14.3.2: Additional CEQA Impact Questions: None.		
5.14.4 Impact Analysis		
5.14.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		

Include the following information in the impact analysis:		
5.14.4.2: Impacts to Housing. Identify if any existing or proposed homes occur within the footprint of any proposed project elements or right-of-way. Describe housing impacts (e.g., demolition and relocation of residents) that may occur as a result of the proposed project.		
5.14.4.3: Workforce Impacts. Describe on-site manpower requirements, including the number of construction personnel who currently reside within the impact area, who would commute daily to the site from outside the impact area or would relocate temporarily within the impact area. Chapter 4 of this document can be referenced as applicable. Identify any permanent employment opportunities that would be create by the project and the workforce conditions in the area that the jobs would be created.		
5.14.4.4: Population Growth Inducing. Provide information on the project’s growth inducing impacts, if any. The information will include, but is not necessarily limited to, the following: a) Any economic or population growth in the surrounding environment that will directly or indirectly result from the project b) Any obstacles to population growth that the project would remove c) Any other activities directly or indirectly encouraged or facilitated by the project that would cause population growth leading to a significant effect on the environment, either individually or cumulatively		
5.14.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.15 Public Services

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.15.1 Environmental Setting		
5.15.1.1 Service Providers a) Identify the following service providers that serve the project area and provide a map showing the service facilities that could serve the project: i. Police ii. Fire (identify service providers within local and state responsibility areas) iii. Schools iv. Parks v. Hospitals		

b) Provide the documented performance objectives and data on existing emergency response times for service providers in the area (e.g., police or fire department response times).		
5.15.2 Regulatory Setting		
5.15.2.1 Regulatory Setting. Identify any applicable federal, state or local laws or regulations for public services that apply to the project.		
5.15.3 Impact Questions		
5.15.3.1: Impact Questions. The impact questions include all public services impact questions in the current version of CEQA Guidelines, Appendix G.		
5.15.3.2: Additional CEQA Impact Questions: None.		
5.15.4 Impact Analysis		
5.15.4.1 Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.15.4.2: Emergency Response Times		
<ul style="list-style-type: none"> a) Describe whether the project would impede ingress and egress of emergency vehicles during construction and operation. b) Include an analysis of impacts on emergency response times during project construction and operation, including impacts during any temporary road closures. Describe approaches to address impacts on emergency response times. 		
5.15.4.3: Displaced Population. If the project would create permanent employment or displace people, evaluate the impact of the new employment or relocated people on governmental facilities and services and describe plans to reduce the impact on public services.		
5.15.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.16 Recreation

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.16.1 Environmental Setting		
5.16.1.1: Recreational Setting		
<ul style="list-style-type: none"> a) Describe the regional and local recreation setting in the project area including: <ul style="list-style-type: none"> i. Any recreational facilities or areas within and surrounding the project area (approximately 0.5-mile buffer) including the recreational uses of each facility or area 		

<ul style="list-style-type: none"> ii. Any available data on use of the recreational facilities including volume of use b) Provide a map (or maps) showing project features and recreational facilities and provide associated GIS data. 		
5.16.2 Regulatory Setting		
5.16.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding recreation.		
5.16.3 Impact Questions		
5.16.3.1: Impact Questions. The impact questions include all recreation impact questions in the current version of CEQA Guidelines, Appendix G.		
5.16.3.2: Additional CEQA Impact Questions: <ul style="list-style-type: none"> a) Would the project reduce or prevent access to a designated recreation facility or area? b) Would the project substantially change the character of a recreational area by reducing the scenic, biological, cultural, geologic, or other important characteristics that contribute to the value of recreational facilities or areas? c) Would the project damage recreational trails or facilities? 		
5.16.4 Impact Analysis		
5.16.4.1: Impact Analysis: Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
5.16.4.2: Impact Details. Clearly identify the maximum extent of each impact, and when and where the impacts would or would not occur. Organize the impact assessment by project phase, project component, and/or geographic area, as necessary.		
5.16.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.17 Transportation

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.17.1 Environmental Setting		
5.17.1.1: Circulation System. Briefly describe the regional and local circulation system in the project area, including modes of transportation, types of roadways, and other facilities that contribute to the circulation system.		
5.17.1.2: Existing Roadways and Circulation <ul style="list-style-type: none"> a) Identify and describe existing roadways that may be used to access the project site and transport materials during 		

<p>construction or are otherwise adjacent to or crossed by linear project features. Provide the following information for each road:</p> <ul style="list-style-type: none"> i. Name of the road ii. Jurisdiction or ownership (i.e., State, County, City, private, etc.) iii. Number of lanes in both directions of travel iv. Existing traffic volume (if publicly available data is unavailable or significantly outdated, then it may be necessary to collect existing traffic counts for road segments where large volumes of construction traffic would be routed or where lane or road closures would occur) v. Closest project feature name and distance <p>b) Provide a supporting map (or maps) showing project features and the existing roadway network identifying each road described above. Provide associated GIS data. The GIS data should include all connected road segments within at least 5 miles of the project.</p>		
<p>5.17.1.3: Transit and Rail Services</p> <ul style="list-style-type: none"> a) Identify and describe transit and rail service providers in the region. b) Identify any rail or transit lines within 1,000 feet of the project area. c) Identify specific transit stops, and stations within 0.5 mile of the project. Provide the frequency of transit service. d) Provide a supporting map (or maps) showing project features and transit and rail services within 0.5 mile of the project area. Provide associated GIS data. 		
<p>5.17.1.4: Bicycle Facilities</p> <ul style="list-style-type: none"> a) Identify and describe any bicycle plans for the region. b) Identify specific bicycle facilities within 1,000 feet of the project area. c) Provide a supporting map (or maps) showing project features and bicycle facilities. Provide associated GIS data. 		
<p>5.17.1.5: Pedestrian Facilities</p> <ul style="list-style-type: none"> a) Identify and describe important pedestrian facilities near the project area that contribute to the circulation system, such as important walkways. b) Identify specific pedestrian facilities that would be near the project, including on the road segments identified per 5.17.1.2. c) Provide a supporting map (or maps) showing project features and important pedestrian facilities. Provide associated GIS data. 		

5.17.1.6: Vehicle Miles Traveled (VMT). Provide the average VMT for the county(s) where the project is located.		
5.17.2 Regulatory Setting		
5.17.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards regarding transportation.		
5.17.3 Impact Questions		
5.17.3.1: Impact Questions. All impact questions for this resource area in the current version of CEQA Guidelines, Appendix G.		
5.17.3.2: Additional CEQA Impact Questions: a) Would the project create potentially hazardous conditions for people walking, bicycling, or driving or for public transit operations? b) Would the project interfere with walking or bicycling accessibility? c) Would the project substantially delay public transit?		
5.17.4 Impact Analysis		
5.17.4.1: Impact Analysis. Provide an impact analysis for each significance criteria identified in Appendix G of the CEQA Guidelines for transportation and any additional impact questions listed above ³¹ .		
Include the following information in the impact analysis:		
5.17.4.2: Vehicle Miles Traveled (VMT) a) Identify whether the project is within 0.5 mile of a major transit stop or a high-quality transit corridor. b) Identify the number of vehicle daily trips that would be generated by the project during construction and operation by light duty (e.g., worker vehicles) and heavy-duty vehicles (e.g., trucks). Provide the frequency of trip generation during operation. c) Quantify VMT generation for both project construction and operation. d) Provide an excel file with the VMT assumptions and model calculations, including all formulas and values. e) Evaluate the project VMT relative to the average VMT for the area in which the project is located.		
5.17.4.3: Traffic Impact Analysis. Provide a traffic impact study. The traffic impact study should be prepared in accordance with guidance from the relevant local jurisdiction or Caltrans, where appropriate.		
5.17.4.4: Hazards. Identify any traffic hazards that could result from construction and operation of the project. Identify any lane closures and traffic management that would be required to construct the project.		

³¹ Discuss with CPUC during Pre-filing whether a traffic study is needed.

5.17.4.5: Accessibility. Identify any closures of bicycle lanes, pedestrian walkways, or transit stops during construction or operation of the project.		
5.17.4.6: Transit Delay. Identify any transit lines that could be delayed by construction and operation of the project. Provide the maximum extent of the delay in minutes and the duration of the delay.		
5.17.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.18 Tribal Cultural Resources³²

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.18.1 Environmental Setting		
5.18.1.1: Outreach to Tribes. Provide a list of all tribes that are on the Native American Heritage Commission (NAHC) list of tribes that are affiliated with the project area. Provide a discussion of outreach to Native American tribes, including tribes notified, responses received from tribes, and information of potential tribal cultural resources provided by tribes. Any information of potential locations of tribal cultural resources should be submitted in an Appendix under clearly marked confidential cover. Provide copies of all correspondence with tribes in an Appendix.		
5.18.1.2: Tribal Cultural Resources. Describe tribal cultural resources (TCRs) that are within the project area. a) Summarize the results of attempts to identify possible TCRs using publicly available documentary resources. The identification of TCRs using documentary sources should include review of archaeological site records and should begin during the preparation of the records search report (see Attachment 3). During the inventory phase, a formal site record would be prepared for any resource identified unless tribes object. b) Summarize attempts to identify TCRs by speaking directly with tribal representatives.		
5.18.1.3: Ethnographic Study. The ethnographic study should document the history of Native American use of the area and oral history of the area.		
5.18.2 Regulatory Setting		
5.18.2.1: Regulatory Setting. Identify any applicable federal, state or local laws or regulations for tribal cultural resources that apply to the project.		

³² For a description of historical resources and requirements for cultural resources that are not tribal cultural resources, refer to Section 5.5 Cultural Resources.

5.18.3 Impact Questions		
5.18.3.1: Impact Questions. The impact questions include all tribal cultural resources impact questions in the current version of CEQA Guidelines, Appendix G.		
5.18.3.2: Additional CEQA Impact Questions: None.		
5.18.4 Impact Analysis		
5.18.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.18.4.2: Information Provided by Tribes. Include an analysis of any impacts that were identified by the tribes during the Applicant’s outreach.		
5.18.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.19 Utilities and Service Systems

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.19.1 Environmental Setting		
5.19.1.1: Utility Providers. Identify existing utility providers and the associated infrastructure that serves the project area.		
5.19.1.2: Utility Lines. Describe existing utility infrastructure (e.g., water, gas, sewer, electrical, stormwater, telecommunications, etc.) that occurs in the project ROW. Provide GIS data and/or as-built engineering drawings to support the description of existing utilities and their locations.		
5.19.1.3: Approved Utility Projects. Identify utility projects that have been approved for construction within the project ROW but that have not yet been constructed. ³³		
5.19.1.4: Water Supplies. Identify water suppliers and the water source (e.g., aqueduct, well, recycled water, etc.). For each potential water supplier, provide data on the existing water capacity, supply, and demand.		
5.19.1.5: Landfills and Recycling. Identify local landfills that can accept construction waste and may service the project. Provide documentation of landfill capacity and estimated closure date. Identify any recycling centers in the area and opportunities for construction and demolition waste recycling.		

³³ Note that this project information should be consistent with the cumulative project description included in Chapter 7.

5.19.2 Regulatory Setting		
5.19.2.1: Regulatory Setting. Identify any applicable federal, state or local laws or regulations for utilities that apply to the project.		
5.19.3 Impact Questions		
5.19.3.1: Impact Questions. All impact questions for this resource area in the current version of CEQA Guidelines, Appendix G.		
5.19.3.2: Additional CEQA Impact Question: Would the project increase the rate of corrosion of adjacent utility lines as a result of alternating current impacts?		
5.19.4 Impact Analysis		
5.19.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.19.4.2: Utility Relocation. Identify any project conflicts with existing utility lines. If the project may require relocation of existing utilities, identify potential relocation areas and analyze the impacts of relocating the utilities. Provide a map showing the relocated utility lines and GIS data for all relocations.		
5.19.4.3: Waste <ul style="list-style-type: none"> a) Identify the waste generated by construction, operation, and demolition of the project. b) Describe how treated wood poles would be disposed of after removal, if applicable. c) Provide estimates for the total amount of waste materials to be generated by waste type and how much of it would be disposed of, reused, or recycled. 		
5.19.4.4: Water Supply <ul style="list-style-type: none"> a) Estimate the amount of water required for project construction and operation. Provide the potential water supply source(s). b) Evaluate the ability of the water supplier to meet the project demand under a multiple dry year scenario. c) Provide a discussion as to whether the proposed project meets the criteria for consideration as a project subject to Water Supply Assessment Requirements under Water Code Section 10912. d) If determined to be necessary under Water Code Section 10912, submit a Water Supply Assessment to support conclusions that the proposed water source can meet the project’s anticipated water demand, even in multiple dry year scenarios. Water Supply Assessments should be approved by 		

the water supplier and consider normal, single-dry, and multiple-dry year conditions.		
5.19.4.5: Cathodic Protection. Analyze the potential for existing utilities to experience corrosion due to proximity to the proposed project. Identify cathodic protection measures that could be implemented to reduce corrosion issues and where the measures may be applied.		
5.19.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.20 Wildfire

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
5.20.1 Environmental Setting		
5.20.1.1: High Fire Risk Areas and State Responsibility Areas a) Identify areas of high fire risk or State Responsibility Areas (SRAs) within the project area. Provide GIS data for the Wildland Urban Interface (WUI) and Fire Hazard Severity Zones (FHSZ) mapping along the project alignment. Include areas mapped by CPUC as moderate and high fire threat districts as well as areas mapped by CalFire. b) Identify any areas the utility has independently identified as High FHSZ known to occur within the proposed project vicinity.		
5.20.1.2: Fire Occurrence. Identify all recent (within the last 10 years) large fires that have occurred within the project vicinity. For each fire, identify the following: a) Name of the fire b) Location of fire c) Ignition source and location of ignition d) Amount of land burned e) Boundary of fire area in GIS		
5.20.1.3: Fire Risk. Provide the following information for assessment of baseline fire risk in the area: a) Provide fuel modeling using Scott Burgan fuel models, or other model of similar quality. b) Provide values of wind direction and speed, relative humidity, and temperature for representative weather stations along the alignment for the previous 10 years, gathered hourly. c) Digital elevation models for the topography in the project region showing the relationship between terrain and wind patterns, as well as localized topography to show the effects of terrain on wind flow, and on a more local area to show effect of slope on fire spread.		

d) Describe vegetation fuels within the project vicinity and provide data in map format for the project vicinity. USDA Fire Effects Information System or similar data source should be consulted to determine high-risk vegetation types. Provide the mapped vegetation fuels data in GIS format.		
5.20.1.4: Values at Risk. Identify values at risk along the proposed alignment. Values at risk may include: Structures, improvements, rare habitat, other values at risk, (including utility-owned infrastructure) within 1000 feet of the project. Provide some indication as to its vulnerability (wood structures vs. all steel features). Communities and/or populations near the project should be identified with their proximity to the project defined.		
5.20.1.5: Evacuation Routes. Identify all evacuation routes that are adjacent to or within the project area. Identify any roads that lack a secondary point of access or exit (e.g., cul-de-sacs).		
5.20.2 Regulatory Setting		
5.20.2.1: Regulatory Setting. Identify applicable federal, state, and local laws, policies, and standards for wildfire.		
5.20.2.2: CPUC Standards. Identify any CPUC standards that apply to wildfire management of the new facilities.		
5.20.3 Impact Questions		
5.20.3.1: Impact Questions. All impact questions for this resource area in the current version of CEQA Guidelines, Appendix G.		
5.20.3.2: Additional CEQA Impact Questions: None.		
5.20.4 Impact Analysis		
5.20.4.1: Impact Analysis. Provide an impact analysis for each checklist item identified in CEQA Guidelines, Appendix G for this resource area and any additional impact questions listed above.		
Include the following information in the impact analysis:		
5.20.4.2: Fire Behavior Modeling. For any new electrical lines, provide modeling to support the analysis of wildfire risk.		
5.20.4.3: Wildfire Management. Describe approaches that would be implemented during operation and maintenance to manage wildfire risk in the area. Provide a copy of any Wildfire Management Plan.		
5.20.5 CPUC Draft Environmental Measures		
Refer to Attachment 4, CPUC Draft Environmental Measures.		

5.21 Mandatory Findings of Significance³⁴

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>5.21.1: Impact Assessment for Mandatory Findings of Significance. Provide an impact analysis for each of the mandatory findings of significance provided in Appendix G of the CEQA Guidelines. The impact analysis can reference relevant information and conclusion from the biological resources, cultural resources, air quality, hazards, and cumulative sections of the PEA, where applicable.</p>		

6 Comparison of Alternatives

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
<p>6.1: Alternatives Comparison</p> <p>a) Compare the ability of each alternative described in Chapter 4 against the proposed project in terms of its ability to avoid or reduce a potentially significant impact. The alternatives addressed in this section will each be:</p> <ul style="list-style-type: none"> i. Potentially feasible ii. Meet the underlying purpose of the proposed project iii. Meet most of the basic project objectives, and iv. Avoid or reduce one or more potentially significant impacts. <p>b) The relative effect of the various potentially significant impacts may be compared using the following or similar descriptors and an accompanying analysis:</p> <ul style="list-style-type: none"> i. Short-term versus long-term impacts ii. Localized versus widespread impacts iii. Ability to fully mitigate impacts <p>c) Impacts that the Applicant believes would be less than significant with mitigation may also be included in the analysis, but only if the steps listed above fail to distinguish among the remaining few alternatives.</p>		
<p>6.2: Alternatives Ranking. Provide a detailed table that summarizes the Applicant's comparison results and ranks the alternatives in order of environmental superiority.³⁵</p>		

³⁴ PEAs need only include a Mandatory Findings of Significance section if CPUC CEQA Unit Staff determine that a Mitigated Negative Declaration may be the appropriate type of document to prepare for the project, as determined through Pre-filing consultation. If no such determination has been made, then a Mandatory Findings of Significance section and the requirements below are not required.

³⁵ If the proposed project does not rank #1 on the list, the Applicant should provide the rationale for selecting the proposed project.

7 Cumulative and Other CEQA Considerations

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
7.1 Cumulative Impacts		
<p>7.1.1: List of Cumulative Projects</p> <p>a) Provide a detailed table listing past, present, and reasonably foreseeable future projects within and surrounding the project area (approximately 2-mile buffer)³⁶. The following information should be provided for each project in the table:</p> <ul style="list-style-type: none"> i. Project name and type ii. Brief description of the project location(s) and associated actions iii. Distance to and name of the nearest project component iv. Project status and anticipated construction schedule v. Source of the project information and date last checked (for each individual project), including links to any public websites where the information was obtained so it can be reviewed and updated (the project information should be current when the PEA is filed) <p>b) Provide a supporting map (or maps) showing project features and cumulative project locations and/or linear features. Provide associated GIS data.</p>		
<p>7.1.2: Geographic Scope. Define the geographic scope of analysis for each resource topic. The geographic scope of analysis for each resource topic should consider the extent to which impacts can be cumulative. For example, the geographic scope for cumulative noise impacts would be more limited in scale than the geographic scope for biological resource impacts because noise attenuates rapidly with distance. Explain why the geographic scope is appropriate for each resource.</p>		
<p>7.1.3: Cumulative Impact Analysis. Provide an analysis of cumulative impacts for each resource topic included in Chapter 5. Evaluate whether the proposed project impacts are cumulatively considerable³⁷ for any significant cumulative impacts.</p>		
7.2 Growth-Inducing Impacts		
<p>7.2.1: Growth-Inducing Impacts. Provide an evaluation of the following potential growth-inducing impacts:</p>		

³⁶ Information on cumulative projects may be obtained from federal, state, and local agencies with jurisdiction over planning, transportation, and/or resource management in the area. Other projects the Applicant is involved in or aware of in the area should be included.

³⁷ "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.

<ul style="list-style-type: none"> a) Would the proposed project foster any economic or population growth, either directly or indirectly, in the surrounding environment? b) Would the proposed project cause any increase in population that could further tax existing community service facilities (i.e., schools, hospitals, fire, police, etc.)? c) Would the proposed project remove any obstacles to population growth? d) Would the proposed project encourage and facilitate other activities that would cause population growth that could significantly affect the environment, either individually or cumulatively? 		
---	--	--

8 List of Preparers

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
8.1: List of Preparers. Provide a list of persons, their organizations, and their qualifications for all authors and reviewers of each section of the PEA.		

9 References

This section will include, but is not limited to, the following:	PEA Section and Page Number	Applicant Notes, Comments
9.1: Reference List <ul style="list-style-type: none"> a) Organize all references cited in the PEA by section within a single chapter called "References." b) Within the References chapter, organize all of the Chapter 5 references under subheadings for each resource area section. 		
9.2: Electronic References <ul style="list-style-type: none"> a) Provide complete electronic copies of all references cited in the PEA that cannot be readily obtained for free on the Internet. This includes any company-specific documentation (e.g., standards, policies, and other documents). b) If the reference can be obtained on the Internet, the Internet address will be provided. 		

PEA Checklist Attachments

Attachment 1: GIS Data Requirements

This Attachment includes specific requirements and format of GIS data that is intended to be applicable to all PEAs. The specific GIS data requirements may be updated on a project-specific basis during Pre-filing coordination with CPUC's CEQA Unit Staff.

1. GIS data will be provided in an appropriate format (i.e., point, line, polygon, raster) and scale to adequately verify assumptions in the PEA and supporting materials and determine the level of environmental impacts. At a minimum, all GIS data layers will include the following metadata properties:
 - a. The source (e.g., report reference), date, title, and preparer (name or company)
 - b. Description of the contents and any limitations of the data
 - c. Reference scale and accuracy of the data
 - d. Complete attributes that correspond to the detailed mapbook, project description, and figures presented in the PEA and/or supporting application materials, including unique IDs, labels, geometry, and other appropriate project details
2. Where precise boundaries of project features may change (e.g., staging areas and temporary construction work areas), the Applicant will provide GIS data layers with representative boundaries to evaluate potential environmental impacts as a worst-case scenario.
3. Provide GIS data for:
 - a. All proposed and alternative project facilities including but not limited to existing and proposed/alternative ROWs; substations and switching stations; pole/tower locations; conduit; vaults, pipelines; valves; compressor stations; metering stations; valve stations, gas wellheads; other project buildings, facilities, and components (both temporary and permanent); telecommunication and distribution lines modifications or upgrades related to the project; marker ball and lighting locations; and mileposts, facility perimeters, and other demarcations or segments as applicable
 - b. All proposed areas required for construction and construction planning, including all proposed and alternative disturbance areas (both permanent and temporary); access roads; geotechnical work areas; extra work areas (e.g., staging areas, parking areas, lay-down areas, work areas at and around specific pole/tower sites, pull and tension sites, helicopter landing areas); airport landing areas; underground installation areas (e.g. trenches, vaults, underground work areas); horizontal directional drilling, jack and bore, or tunnel areas; blasting areas; and any areas where special construction methods may need to be employed
 - c. Within the PEA checklist there are also specific requirements for environmental resources within Chapter 5. All environmental resource GIS data must meet the minimum mapping standards specified in this Attachment.

Attachment 2: Biological Resource Technical Report Standards

Definitions

The following biological resources will be considered within the scope of the PEA and the Biological Resources Technical Report:

Sensitive Vegetation Communities and Habitats

- a) Sensitive vegetation communities/habitats identified in local or regional plans, policies, or regulations, or designated by CDFW³⁸ or USFWS
- b) Areas that provide habitat for locally unique biotic species/communities (e.g., oak woodlands, grasslands, and forests)
- c) Habitat that contains or supports rare, endangered, or threatened wildlife or plant species as defined by CDFW and USFWS
- d) Habitat that supports CDFW Species of Special Concern
- e) Areas that provide habitat for rare or endangered species and that meet the definition in CEQA Guidelines Section 15380
- f) Existing game and wildlife refuges and reserves
- g) Lakes, wetlands, estuaries, lagoons, streams, and rivers
- h) Riparian corridors

Special-Status Species

- a) Species listed or proposed for listing as threatened or endangered under the federal Endangered Species Act (ESA) (50 CFR § 17.12 [listed plants], 17.11 [listed animals] and various notices in the Federal Register [proposed species])
- b) Species that are candidates for possible future listing as threatened or endangered under the federal ESA (61 FR § 40, February 28, 1996)
- c) Species listed or proposed for listing by the State of California as threatened or endangered under the California ESA (14 CCR § 670.5)
- d) Plants listed as rare or endangered under the California Native Plant Protection Act (California Fish and Game Code, Section 1900 et seq.)
- e) Species that meet the definitions of rare and endangered under CEQA. CEQA Guidelines Section 15380 provides that a plant or animal species may be treated as “rare or endangered” even if not on one of the official lists.
- f) Plants considered by the California Native Plant Society (CNPS) to be “rare, threatened or endangered in California” (California Rare Plant Rank 1A, 1B, 2A, and 2B) as well as California Rare Plant Rank 3 and 4 plant species
- g) Species designated by CDFW as Fully Protected or as a Species of Special Concern
- h) Species protected under the Federal Bald and Golden Eagle Protection Act
- i) Birds of Conservation Concern or Watch List species
- j) Bats considered by the Western Bat Working Group to be “high” or “medium” priority (Western Bat Working Group 2015)

³⁸ CDFW’s Rarity Ranking follows NatureServe’s Heritage Methodology (Faber-Langendoen, et al. 2016) in which communities are given a G (global) and S (state) rank based on their degree of imperilment (as measured by rarity, trends, and threats). Communities with a Rarity Ranking of S1 (critically imperiled), S2 (imperiled), or S3 (vulnerable) are considered sensitive by CDFW.

Biological Resource Technical Report Minimum Requirements

Report Contents

The Biological Resource Technical Report will include the following information at a minimum.

- a) **Preliminary Agency Consultation.** Describe any pre-survey contact with agencies. Describe any agency approvals that were required for biologists or agency protocols that were applied to the survey effort. Provide copies of correspondence and meeting notes with the names and contact information for agency staff and the dates of consultation as an appendix to the Biological Resources Technical Report.
- b) **Records Search.** Provide the results of all database and literature searches for biological resources within and surrounding the project area. Identify all sources reviewed (e.g., CNDDDB, CNPS, USFWS, etc.).
- c) **Biological Resource Survey Method.** Identify agency survey requirements and protocols applicable to each biological survey that was conducted. Identify the areas where each survey occurred. Identify any limitations for the surveys (e.g., survey timing or climatic conditions) that could affect the survey results.
- d) **Vegetation Communities and Land Cover.** Identify all vegetation communities or land cover types (e.g., disturbed or developed) within the biological survey area. The biological survey area should include a 1,000-foot buffer from project facilities to support CPUC's evaluation of indirect effects.
- e) **Aquatic Resources.** Identify any wetlands, streams, lakes, reservoirs, estuarine, or other aquatic resources within the biological survey area. Provide a wetland delineation and all data sheets including National Wetlands Inventory maps (or the appropriate state wetland maps, if National Wetlands Inventory maps are not available) that show all proposed facilities and include milepost locations for proposed pipeline routes. Provide a copy of agency verification of the wetland delineation if the delineation has been verified by the U.S. Army Corps of Engineers or CDFW. If the delineation has not been verified, describe the process and timing for obtaining agency verification.
- f) **Habitat Assessments.** Evaluate the potential for suitable habitat in the biological survey area for each species identified in the database and literature search.
- g) **Native Wildlife Corridors and Nursery Sites.** Identify any wildlife corridors or nursery sites that occur within the biological survey area.
- h) **Survey Results.** Describe all survey results and include a copy of any focused (e.g., rare plant, protocol special-status wildlife) biological resources survey reports.

Mapping and GIS Data

Provide detailed maps (at approximately 1:3,000 scale or similar), and all associated GIS data for the Biological Resources Technical Report and any supporting biological survey reports, including:

- a) Biological survey area for each survey that was conducted
- b) Vegetation communities and land cover types
- c) Aquatic resource delineation
- d) Special-status plant locations
- e) Special-status wildlife locations
- f) Avian point count locations
- g) Critical habitat
- h) California Coastal Commission or Bay Conservation and Development Commission jurisdictional areas

Attachment 3: Cultural Resource Technical Report Standards

Cultural Resource Inventory Report

Provide a cultural resource inventory report that includes archaeological, unique archaeological, and built-environment resources within all areas that could be affected by the proposed project including areas of indirect effect. The inventory report will include the results of both a literature search and pedestrian survey. The contents will address the requirements in *Archaeological Resource Management Reports: Recommended Contents and Guidelines*. The methodology and results of the inventory should be sufficient to provide the reader with an understanding of the nature, character, and composition of newly discovered and previously identified cultural resources so that the required recommendations about the resource(s) CRHR eligibility are clearly understood. No information regarding the location of the cultural resources will be included in these descriptions. The required Department of Parks and Recreation (DPR) 523 forms, including location information and photographs of the resources, are to be included in a removable confidential appendix to the report.³⁹

The inventory report will meet the following requirements:

- a) The report should clearly discuss the methods used to identify unique archaeological resources (e.g., how the determination was made about the resources' eligibility).
- b) The report should identify large resources such as districts and landscapes where resources indicate their presence, even if federal agencies disagree. It is understood that often only a few contributing elements may be in the project area, and that the boundaries of the large resource may need to be revisited as part of future projects. It is acknowledged that boundaries of districts and landscapes can be difficult to define and there is not always good recorded data on these resources.
- c) In the case of archaeological resources, the report should discuss whether each one is also a unique archaeological resource and explain why or why not.
- d) Descriptions of resources should include spatial relationships to other nearby resources, raw materials sources, and natural features such as water sources and mountains.
- e) The evidence that indicates a particular function or age for a resource should be explicitly described with a clear explanation, not simply asserted.

Cultural Resource Evaluation Report

Provide a cultural resource evaluation report. The report contents required by the state of California are outlined in the *Archaeological Resource Management Reports: Recommended Contents and Guidelines*. The evaluation report should also include:

- a) Resource descriptions and evaluations together, and not in separate volumes or report sections. This will facilitate understanding of each resource.
- b) An evaluation of each potential or eligible California Register of Historical Resources (CRHR) resource within the public archaeology laboratory (PAL) for all seven aspects of integrity⁴⁰ using specific examples for each resource. This evaluation needs to be included in the evaluation

³⁹ Any aspect of the PEA and associated data that Applicants believe to be confidential will be provided in full but may be marked confidential if allowed pursuant to General Order 66 or latest applicable Commission rule (e.g., see Public Records Act Proceeding R.14-11-001).

⁴⁰ The seven aspects of integrity are location, design, setting, materials, workmanship, feeling, and association, as defined in “*Types of Historical Resources and Criteria for Listing in the California Register of Historical Resources*” [14 CCR 4852(c)].

- report for all resources that could be affected by the project even if the resources were not previously evaluated. Previous evaluations should be reviewed to address change over time.
- c) An evaluation of each potential or eligible CRHR resource within the PAL under all four criteria using specific examples for each resource. This evaluation needs to be included in the evaluation report for all resources that could be affected by the project even if the resources were not previously evaluated. The cultural resources professional should make their own recommendation regarding eligibility, which does not need to agree with previous recommendations for CRHR or NRHP, as long as it is clearly explained.
 - d) For **prehistoric archaeological resources**, Criteria 1, 2 and 341 should be explicitly considered. Research efforts to search for important events and persons related to the resource must be described. This evaluation needs to be included in the evaluation report for all resources that could be affected by the project even if the resources were not previously evaluated. The cultural resources professional should make their own recommendation, which does not need to agree with previous recommendations for CRHR or NRHP eligibility, as long as it is clearly explained.
 - e) While **potential unique archaeological resources** could be identified in the records search report or inventory report, the justification for each individual resource to be considered a resource under CEQA should be presented in this report.
 - f) If surface information collected during survey is sufficient to make an eligibility recommendation, this reasoning should be outlined explicitly for each resource. This is particularly the case for resources that are believed to have buried subsurface components.
 - g) If archaeological testing or additional historical research was required in order to evaluate a resource, the evaluation report will be explicit about why the work was required, the results for each resource, and the subsequent eligibility recommendation.
 - h) For large projects with multiple similar resources where the eligibility justifications for similar resources are essentially identical, it is acceptable to discuss these resources as a group. However, eligibility justifications for each individual resource is preferred, so if the grouping strategy is used, the criteria used to group resources must be clearly justified.
 - i) Large resources such as districts and landscapes may be challenging to fully evaluate in the context of a single project. CPUC encourages the identification and evaluation of these resources with the understanding that often only a few contributing elements may be located within the project area, and that the boundaries of the large resource may need to be revisited as part of future projects. It is understood that a full evaluation of the resource may be beyond the scope of one project. Regardless, the potential for the project to affect any resources within a district or landscape must be defined.

⁴¹ Criteria for Designation on the California Register are as follows (defined in http://ohp.parks.ca.gov/?page_id=21238):

- Criterion 1: Associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
- Criterion 2: Associated with the lives of persons important to local, California or national history.
- Criterion 3: Embodies the distinctive characteristics of a type, period, region or method of construction or represents the work of a master or possesses high artistic values.
- Criterion 4: Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

Attachment 4: CPUC Draft Environmental Measures

About this Attachment: The following CPUC Draft Environmental Measures are provided for consideration during PEA development. They should be discussed with the CPUC's CEQA Unit Staff during Pre-filing, especially with respect to the development of Applicant Proposed Measures. The CPUC Draft Environmental Measures may form the basis for mitigation measures in the CEQA document if appropriate to the analysis of potentially significant impacts. These and other CPUC Draft Environmental Measures may be formally incorporated into Chapter 5 of future versions of the PEA Checklist.

5.1 Aesthetics

Aesthetics Impact Reduction During Construction

All project sites will be maintained in a clean and orderly state. Construction staging areas will be sited away from public view where possible. Nighttime lighting will be directed away from residential areas and have shields to prevent light spillover effects. Upon completion of project construction, project staging and temporary work areas will be returned to pre-project conditions, including re-grading of the site and re-vegetation or re-paving of disturbed areas to match pre-existing contours and conditions.

5.3 Air Quality

Dust Control During Construction

The Applicant shall implement measures to control fugitive dust in compliance with all local air district(s) standards. Dust control measures shall include the following at a minimum:

- All exposed surfaces with the potential of dust-generating shall be watered or covered with coarse rock to reduce the potential for airborne dust from leaving the site.
- The simultaneous occurrence of more than two ground disturbing construction phases on the same area at any one time shall be limited. Activities shall be phased to reduce the amount of disturbed surfaces at any one time.
- Cover all haul trucks entering/leaving the site and trim their loads as necessary.
- Use wet power vacuum street sweepers to sweep all paved access road, parking areas, staging areas, and public roads adjacent to project sites on a daily basis (at minimum) during construction. The use of dry power sweeping is prohibited.
- All trucks and equipment, including their tires, shall be washed off prior to leaving project sites.
- Apply gravel or non-toxic soil stabilizers on all unpaved access roads, parking areas, and staging areas at project sites.
- Water and/or cover soil stockpiles daily.
- Vegetative ground cover shall be planted in disturbed areas as soon as possible and watered appropriately until vegetation is established.
- All vehicle speeds shall be limited to fifteen (15) miles per hour or less on unpaved areas.
- Implement dust monitoring in compliance with the standards of the local air district.
- Halt construction during any periods when wind speeds are in excess of 50 mph.

5.5 Cultural Resources

Human Remains (Construction and Maintenance)

Avoidance and protection of inadvertent discoveries that contain human remains shall be the preferred protection strategy with complete avoidance of such resources ensured by redesigning the project. If human remains are discovered during construction or maintenance activities, all work shall be diverted from the area of the discovery, and the CPUC shall be informed immediately. The Applicant shall contact the County Coroner to determine whether or not the remains are Native American. If the remains are determined to be Native American, the Coroner will contact the Native American Heritage Commission (NAHC). The NAHC will then identify the person or persons it believes to be the most likely descendant of the deceased Native American, who in turn would make recommendations for the appropriate means of treating the human remains and any associated funerary objects.

If the remains are on federal land, the remains shall be treated in accordance with the Native American Graves Protection and Repatriation Act (NAGPRA). If the remains are not on federal land, the remains shall be treated in accordance with Health and Safety Code Section 7050.5, CEQA Section 15064.5(e), and Public Resources Code Section 5097.98.

5.8 Greenhouse Gas Emissions

Greenhouse Gas Emissions Reduction During Construction

The following measures shall be implemented to minimize greenhouse gas emissions from all construction sites:

- If suitable park-and-ride facilities are available in the project vicinity, construction workers shall be encouraged to carpool to the job site.
- The Applicant shall develop a carpool program to the job site.
- On road and off-road vehicle tire pressures shall be maintained to manufacturer specifications. Tires shall be checked and re-inflated at regular intervals.
- Demolition debris shall be recycled for reuse to the extent feasible.
- The contractor shall use line power instead of diesel generators at all construction sites where line power is available.
- The contractor shall maintain construction equipment per manufacturing specifications.

5.19 Utilities and Service Systems

Notify Utilities with Facilities Above and Below Ground

The Applicant shall notify all utility companies with utilities located within or crossing the project ROW to locate and mark existing underground utilities along the entire length of the project at least 14 days prior to construction. No subsurface work shall be conducted that would conflict with (i.e., directly impact or compromise the integrity of) a buried utility. In the event of a conflict, areas of subsurface excavation or pole installation shall be realigned vertically and/or horizontally, as appropriate, to avoid other utilities and provide adequate operational and safety buffering. In instances where separation between third-party utilities and underground excavations is less than 5 feet, the Applicant shall submit the intended construction methodology to the owner of the third-party utility for review and approval at least 30 days prior to construction. Construction methods shall be adjusted as necessary to assure that the integrity of existing utility lines is not compromised.

5.20 Wildfire

Construction Fire Prevention Plan

A project-specific Construction Fire Prevention Plan for both construction and operation of the project shall be submitted for review prior to initiation of construction. A draft copy of the Plan shall be provided to the CPUC and state and local fire agencies at least 90 days before the start of any construction activities in areas designated as Very High or High Fire Hazard Severity Zones. Plan reviewers shall also include

federal, state, or local agencies with jurisdiction over areas where the project is located. The final Plan shall be approved by the CPUC at least 30 days prior to the initiation of construction activities. The Plan shall be fully implemented throughout the construction period and include the following at a minimum:

- The purpose and applicability of the Plan
- Responsibilities and duties
- Preparedness training and drills
- Procedures for fire reporting, response, and prevention that include:
 - Identification of daily site-specific risk conditions
 - The tools and equipment needed on vehicles and to be on hand at sites
 - Reiteration of fire prevention and safety considerations during tailboard meetings
 - Daily monitoring of the red-flag warning system with appropriate restrictions on types and levels of permissible activity
- Coordination procedures with federal and local fire officials
- Crew training, including fire safety practices and restrictions
- Method(s) for verifying that all Plan protocols and requirements are being followed

A project Fire Marshal or similar qualified position shall be established to enforce all provisions of the Construction Fire Prevention Plan as well as perform other duties related to fire detection, prevention, and suppression for the project. Construction activities shall be monitored to ensure implementation and effectiveness of the Plan.

Fire Prevention Practices (Construction and Maintenance)

The Applicant shall implement ongoing fire patrols during the fire season as defined each year by local, state, and federal fire agencies. These dates vary from year to year, generally occurring from late spring through dry winter periods. During Red Flag Warning events, as issued daily by the National Weather Service, all construction/maintenance activities shall cease, with an exception for transmission line testing, repairs, unfinished work, or other specific activities which may be allowed if the facility/equipment poses a greater fire risk if left in its current state.

All construction/maintenance crews and inspectors shall be provided with radio and cellular telephone access that is operational in all work areas and access routes to allow for immediate reporting of fires. Communication pathways and equipment shall be tested and confirmed operational each day prior to initiating construction/maintenance activities at each work site. All fires shall be reported to the fire agencies with jurisdiction in the area immediately upon discovery of the ignition.

All construction/maintenance personnel shall be trained in fire-safe actions, initial attack firefighting, and fire reporting. All construction/maintenance personnel shall be trained and equipped to extinguish small fires in order to prevent them from growing into more serious threats. All construction/maintenance personnel shall carry at all times a laminated card and be provided a hard hat sticker that list pertinent telephone numbers for reporting fires and defining immediate steps to take if a fire starts. Information on laminated contact cards and hard hat stickers shall be updated and redistributed to all construction/maintenance personnel and outdated cards and hard hat stickers shall be destroyed prior to the initiation of construction/maintenance activities on the day the information change goes into effect.

Construction/maintenance personnel shall have fire suppression equipment on all construction vehicles. Construction/maintenance personnel shall be required to park vehicles away from dry vegetation. Water tanks and/or water trucks shall be sited or available at active project sites for fire protection during construction. The Applicant shall coordinate with applicable local fire departments prior to construction/maintenance activities to determine the appropriate amounts of fire equipment to be carried on vehicles and, should a fire occur, to coordinate fire suppression activities.

Gas Safety and Reliability Branch

Ensuring that intra-state natural gas and liquid petroleum gas pipeline systems are designed, constructed, operated, and maintained according to safety standards.

MISSION STATEMENT

The Gas Safety and Reliability Branch (GSRB) ensures that intra-state natural gas and liquid petroleum gas (LPG) pipeline systems are designed, constructed, operated, and maintained according to safety standards set by the CPUC and the federal government. GSRB gas safety engineers are trained and qualified by the federal government. GSRB enforces natural gas and LPG safety regulations; inspects construction, operation, and maintenance activities; and makes necessary amendments to regulations to protect and promote the safety of the public, the utility employees that work on the gas pipeline systems, and the environment.

GSRB endorses the system safety approach embodied in the federal government's regulation of Pipeline and Hazardous Materials Safety Administration. State and federal regulators are tasked with ensuring that pipeline and hazardous materials operators have risk management programs in place, that those programs are designed in conformance with state and federal laws and regulations, that the programs are effective in enhancing public safety, the operator's employees safety, environmental safety, and that the safety of the entire system and operation continues to improve.

GSRB conducts operation and maintenance compliance inspections, accident investigations, reviews utilities' reports and records, conducts construction inspections, conducts special studies, and takes action in response to complaints and inquiries from the public on issues regarding gas pipeline safety.

GSRB also conducts [audits and inspections](#) of gas facilities owned and operated by mobile home parks, and conducts inspections of propane gas pipeline distributions systems.

Intra-state hazardous liquid pipelines are regulated by the [Office of the State Fire Marshall \(OSFM\)](#). Interstate pipelines are regulated by the [Pipeline and Hazardous Materials Safety Administration \(PHMSA\)](#).

Gas Utilities

GSRB oversees the operation and safety of the five major investor-owned utilities who serve natural gas and LPG to the bulk of California residents and businesses: Pacific Gas and Electric Company (PG&E), Southern California Gas Company (SoCalGas), San Diego Gas & Electric (SDG&E), Southwest Gas Corporation, and Southern California Edison (Avalon LPG).

GSRB is taking numerous steps to ensure public safety in the immediate and longer-term. GSRB regularly performs field and headquarter inspections and audits of practices and procedures developed by these gas utilities. The utilities also perform audits and report to the CPUC on an ongoing basis their practices, procedures, and progress on a variety of issues.

Mobile Home Parks and Small LPG Operators

GSRB enforces pipeline safety regulations for master-metered natural gas distribution systems in mobile home parks, and small liquid petroleum gas (propane) distribution systems in California. More information can be found on the [MHP webpage](#).

Within CPUC, the GSRB administers the Mobile Home Park Utility Conversion Program (MHP-UCP), which allows Gas Utility Companies and Electric Utility Companies to construct new gas and electric systems within mobile home parks (MHPs) to replace risky and ill-maintained master-meter systems, and recover cost through general rate cases. For more information about the program, including applications, please visit the [Mobilehome Park Utility Conversion Program](#) page.

Pipeline Operator Safety Seminars

GSRB, in conjunction with the United States DOT Pipeline and Hazardous Materials Safety Administration, conducts regular seminars for Gas Pipeline Operators. This seminar is designed to help operators understand state and federal gas pipelines safety regulations and better prepare for CPUC inspections. Information about past seminars, including slide decks and recorded presentations can be found on the [Pipeline Operator Safety Seminars Page](#).

Damage Prevention Information

The CPUC urges consumers and contractors to call 8-1-1 to have gas pipeline utilities locate and mark the gas pipeline facilities before beginning any work that involves excavation or digging in the ground.

A letter to the American public: What you need to know about call priority

A common complaint officers hear from citizens is, 'What took you so long?'

Jun 11, 2020

The following is excerpted from my new book, "[Expert Witness: A Civilian's Guide to Effective Crime Reporting](#)," which introduces civilians to what happens behind the scenes when police answer calls for service.

This is probably one of the most common grievances that members of the community share with officers when they arrive on a scene: "What took you so long to get here?"

Trust me, officers want to make it to your scene quickly to help you in any way they can if they are able. The problem is that many police departments across the nation are understaffed, and yet there is no shortage of calls.

EXPERT

WITNESS

A CIVILIAN'S GUIDE TO
EFFECTIVE CRIME REPORTING

XAVIER WELLS

arrive on-scene quickly to administer aid. Officers can also be pulled from lower-priority calls to respond to Priority 1 incidents.

Priority 2: This is the third priority level, which covers most non-emergency situations. These are incidents where there is no immediate threat to human life or safety and all involved parties are still on scene. Officers responding to these calls often are not allowed to run code and must obey the traffic laws of the area. Additionally, officers can be reassigned from Priority 2 calls to higher ones, like Priority 1 or Priority 0.

Priority 3: These are the lowest-priority calls that a department will respond to, and they will have the longest wait times, sometimes in excess of five hours. Priority 3 calls are those where life or property is not at risk and an immediate police response will not likely prevent further injury or loss of property and will likely not adversely impact an investigation. These calls can include welfare checks, noise calls, financial disputes and lost property.

Understanding that police response is in direct correlation to what priority a call is assigned, you can begin to see why, in some cases, it takes officers a while to arrive. Understanding when to call 911 and how important the information you give to the call-taker is can have a direct impact on police response to your emergency. It is important to understand that if your call doesn't meet the above criteria for a high-priority call, then it may be a little while before an officer can make it out to you. This isn't because they don't want to take your call or that it isn't important; it is far more likely that there is, unfortunately, a heavy call load with higher-priority calls than yours. As I stated before, officers headed to a lower-priority call can and will be pulled from that call and reassigned to a new higher-priority one, which will have a noticeable effect on response times.

About the author

Xavier Wells is the founder of [Cadet, Rookie, Cop, LLC](#), created to fill training gaps for new officers. He is an active Texas peace officer, disabled veteran and author of four books: "The Rookie Handbook," "Applicant to Police Cadet," "Graduating with Honors" and "Expert Witness." He holds a bachelor's degree in criminal justice and a master's degree in public administration from Liberty University. Currently, Xavier works patrol and serves as an adjunct defensive tactics instructor for his department.

Standard for the Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Volunteer Fire Departments

This standard specifies requirements for effective and efficient organization and deployment of fire suppression operations, emergency medical operations, and special operations to the public by volunteer and combination fire departments to protect citizens and the occupational safety and health of fire department employees.

Please note: This Standard is no longer accepting Public Input due to the Emergency Response and Responder Safety Document Consolidation Plan ([consolidation plan](#)) as approved by the NFPA Standards Council. As part of the consolidation plan, this Standard is slipping cycle and being combined into a new consolidated draft. Once the new draft is available and open for Public Input, this notice will be updated with a link to the applicable document information page.

General FAQs

1. [What is PHMSA?](#)
2. [What does PHMSA do?](#)
3. [How is PHMSA organized?](#)
4. [Who is the chief executive of PHMSA?](#)

1. What is PHMSA?

The Pipeline and Hazardous Materials Safety Administration, or PHMSA, is a U.S. Department of Transportation agency. It was created under the Norman Y. Mineta Research and Special Programs Improvement Act (P.L. 108-426) of 2004.

2. What does PHMSA do?

PHMSA develops and enforces regulations for the safe, reliable, and environmentally sound operation of the nation's 2.6 million mile pipeline transportation system and the nearly 1 million daily shipments of hazardous materials by land, sea, and air.

3. How is PHMSA organized?

PHMSA comprises two safety offices, the Office of Pipeline Safety and the Office of Hazardous Materials Safety. PHMSA is located in five regions across the country and headquartered in Washington, D.C. The Training Center is centrally-located in Oklahoma City.

4. Who is the chief executive of PHMSA?

The Administrator is the Agency's chief executive, who appointed by the President and confirmed by the United States Senate. The PHMSA Administrator provides direction to nearly 500 employees within the agency's Washington, DC Headquarters and Regions. PHMSA's administrator is supported by a [senior leadership team](#) comprised of a Deputy Administrator, Chief Safety Officer, Chief Counsel, Associate Administrators for Pipeline and Hazardous Materials Safety, Chief Financial Officer, and Directors for Public Affairs and Civil Rights.

Office of Pipeline Safety

About the Office

PHMSA's Office of Pipeline Safety is responsible for carrying out a national program to ensure the safe, reliable, and environmentally-sound operation of the nation's natural gas and hazardous liquid pipeline transportation system.

Office of Pipeline Safety Divisions

Policy and Programs

The Office of the Deputy Associate Administrator for Policy and Programs supports PHMSA's mission through developing, proposing, and implementing regulatory policy initiatives and regulations governing the safe operation of the nation's hazardous liquid and natural gas pipeline transportation system. The office also directs education and outreach efforts to promote the adoption and increased use of safety programs and activities by state and local governments, pipeline operators, and the general public in their efforts to enhance safety.

Field Operations

The Office of the Deputy Associate Administrator for Field Operations supports PHMSA's mission through administering a national pipeline safety inspection and enforcement program to support compliance of Federal pipeline safety regulations. The office is responsible for providing executive direction, policy, and national coordination for regional operations, emergency support and security, and drug and alcohol programs for pipeline operators.

PHMSA's Mission

The Pipeline and Hazardous Materials Safety Administration (PHMSA) operates in a dynamic and challenging environment. The scope and complexity of our safety mission will continue to grow, requiring that we fundamentally rethink how we will use data, information, and technology to achieve our safety goals.

In this context, PHMSA's leadership team has updated the agency's strategic framework. As part of this work, we have developed bold new vision and mission statements that better reflect our focus on innovation, and how essential PHMSA's safety mission is to the daily lives of Americans - allowing for the safe transportation of energy that heats our homes and powers our mobile devices.

Mission

PHMSA's mission is to protect people and the environment by advancing the safe transportation of energy and other hazardous materials that are essential to our daily lives. To do this, the agency establishes national policy, sets and enforces standards, educates, and conducts research to prevent incidents. We also prepare the public and first responders to reduce consequences if an incident does occur.

Executive Summary

SoCalGas^{®1} operates an integrated energy delivery system composed of pipelines, compressor stations, storage fields, and regulator stations, designed to provide safe and reliable service to its customers. SoCalGas relies on this as part of a network to deliver energy to residential, business, industrial, and agricultural customers throughout Southern California. Notably, the integrated energy system's reliance on the reliability and resiliency attributes of the gas system, including to meet the peak ramping demands of dispatchable electric generation when renewables are otherwise unavailable, is expected to increase even though overall gas throughput may decline. The gas system similarly provides an existing mechanism capable of transporting increasingly cleaner gaseous fuels in alignment with decarbonization goals. SoCalGas also emphasizes that activities necessary to maintain and enhance safety cannot be compromised. SoCalGas' core mission is to provide safe and reliable gas service. Safety is at the foundation of its operational activities, which are grounded in federal and state law as well as CPUC decisions. The planned project, as further described below, is necessary to support the safe operation of the gas system and provision of reliable gas service that is essential to customers.

The Ventura Compressor Station, located at 1555 North Olive Street in the City of Ventura, is one of these critical components, which has safely and reliably operated to meet local demand within Ventura and the Central Coast, as well as to supply the La Goleta Storage Field. The California Public Utilities Commission (CPUC), which has primary regulatory authority over SoCalGas' integrated natural gas system, has recognized the critical importance of storage to maintaining a reliable energy system, including providing fuel for electric generation and meeting the needs of residential customers, especially during winter months (Abdelaziz et al. 2021).

The existing compression equipment was installed in the 1980s, and a compressor station has been in use since at least 1923. Due to the decreased functionality and reliability of the existing 40-year-old equipment, coupled with changes in system operations related to decreasing local supply and the need to support storage of natural gas, SoCalGas has proposed to modernize the Ventura Compressor Station. The planned Ventura Compressor Station Modernization Project (planned project), which was first contemplated in 2013, would replace three existing natural gas compressors with four new natural gas compressors to maintain the same annual supply flowing through the compressor station, and construct a new compressor building and other associated improvements at the current compressor station site.

In August of 2021, the CPUC requested that SoCalGas prepare a feasibility study of the planned project that: (1) fully analyzes all options considered for the compressor station upgrade; (2) provides the basis for rejecting any alternatives that were considered, including but not limited to electric compressors for all or part of the planned project (3) discusses all alternative sites that were considered but rejected and provides SoCalGas' reasons for rejecting them; and (4) provides an explanation of how the planned project factors into both local and statewide safe and reliable service and the state's decarbonization goals. SoCalGas continues to collaborate with the CPUC and stakeholders on California's energy transition in a comprehensive and transparent manner.

Through extensive stakeholder engagement with the local community, including public meetings, community canvassing, stakeholder briefings, station tours for local officials,

¹ SoCalGas is a wholly owned subsidiary of Sempra Energy.

informational newsletters, and social media posts and dedicated project website updates, SoCalGas requested input and identified seventeen (17) potential alternatives as part of this feasibility study. Of these alternatives, seven (7) were dismissed from further consideration for failing to meet the purpose, need and objectives of the planned project or for failing to meet essential site criteria, which are criteria that must be met to construct and operate a compressor station. The potential alternatives are shown in Table ES-1 below.

The ten (10) remaining alternatives were evaluated based on operational considerations; environmental considerations; project cost; operational cost; and schedule duration. In order to assess each potential alternative option according to the same criteria, a scoring rubric was developed. These alternatives were assessed based on a desktop level analysis with cost estimates developed to a Class 5² and schedule estimates to a Level 1.³ Given the relatively high-level assessment that was performed on the 10 alternatives, please note the potential for wide accuracy ranges with respect to cost and schedule. The schedule for each alternative was determined using industry standards and consulting with industry experts to determine durations for engineering, procurement, and construction. Without engaging in preliminary negotiations with the landowners, a common 24-month period was used for the land and/or right-of-way acquisition duration for each alternate location other than for the current site, which SoCalGas already owns. The duration for the alternative site locations could easily be extended due to lengthy negotiations if a voluntary transfer cannot be agreed upon or the property is currently under use by the owner(s). A duration extending beyond 24 months would impact the schedule and delay the progress of the engineering, procurement of long-lead-time equipment, and construction. These delays could add years to the estimated schedules.

The environmental analysis was performed by Dudek, a third-party environmental consulting firm, and their analysis is included in Appendix A. The criteria within the environmental rubric address topic areas that the CPUC examined in data requests as well as some other categories that are typically evaluated in a California Environmental Quality Act (CEQA) environmental impact report (EIR).⁴ The scoring rubric for all five considerations – operational, environmental, project cost, operational cost, and schedule – is included in Appendix B.

Table ES-1. Ventura Compressor Modernization Project Potential Alternatives

Alternative	Identified By	Location
No Project	Community	Current site – Maintain existing site configuration and operational profile
Compressor Station Removal	Community	Current site – Remove compressor station and do not replace compression

² In accordance with AACE RP 87R-14 (AACE 2020), a Class 5 cost estimates is "generally prepared based on very limited information, and subsequently have wide accuracy ranges. Class 5 estimates are generally based on unclarified contingent resources..."

³ In accordance with AACE RP 91R-16 (AACE 2020), a Level 1 schedule is "a high-level schedule that reflects key milestones and summary activities by major phase, stage or project being executed. Level 1 schedules provide high-level information that assist in the decision making process (go/no go prioritization and criticality of projects)."

⁴ There is no discretionary permit required for the planned modernization project and consequently, environmental review under CEQA is not required. Environmental considerations evaluated by Dudek include topic areas such as, but not limited to, land use, air quality, traffic, and wildfire, which are topic areas in CEQA Guidelines Appendix G, Environmental Checklist Form.

Table ES-1. Ventura Compressor Modernization Project Potential Alternatives

Alternative	Identified By	Location
3/1 Hybrid	SoCalGas	Install a hybrid equipment configuration consisting of three electric compressors and one natural gas compressor at current site or other alternative sites
All Electric Compression	CPUC	Install an all-electric equipment configuration consisting of four new electric compressors at current site or other alternative sites
Goleta Storage Field	SoCalGas	Remove the existing horsepower from the compressor station and replace with new compression equipment at the La Goleta Storage Field approximately 40 miles north within the County of Santa Barbara
Petrochem	SoCalGas	Approximately 15-acre industrial site designated and zoned for industrial uses located approximately 13,500 feet northwest of the compressor station on the west side of State Route (SR) 33 within the County of Ventura
Petrochem – Hybrid	SoCalGas	
Planned Project	SoCalGas	Current site – Approximately 8-acre parcel located on land designated and zoned for industrial uses on the west side of City of Ventura
Current Site – Hybrid	SoCalGas	
Avocado Site – Natural Gas	Community	Approximately 15-acre agricultural site designated for open space uses and zoned for agriculture located approximately 3,000 feet west of the compressor station within the County of Ventura
Avocado Site – Hybrid	Community	
Ventura Steel – Natural Gas	SoCalGas	Approximately 10-acre industrial site with oil extraction infrastructure designated and zoned for industrial uses located approximately 8,000 feet north of the compressor station within the County of Ventura
Ventura Steel – Hybrid	SoCalGas	
Devil’s Canyon Road – Natural Gas	Community	Approximately 12.88-acre oil extraction site located approximately 6,000 feet to the north of the compressor station on west side of SR-33 within the County of Ventura
Devil’s Canyon Road – Hybrid	Community	
County Line – Natural Gas	SoCalGas	Approximately 12.33-acre vacant parcel of land designated and zoned for agriculture located within County of Ventura at the county line between Santa Barbara/Ventura counties approximately 12 miles northwest of the existing compressor station
County Line – Hybrid	SoCalGas	

The top three alternatives for each of the five categories are shown in Table ES-2: Results of Evaluation, below.

Table ES-2. Results of Evaluation

Ranking Order	Operational Considerations	Environmental Considerations	Project Cost	Operational Cost	Schedule
1	1A Planned Project	4B Devil’s Canyon Road – Hybrid	1A Planned Project	1A Planned Project	1A Planned Project
2	3A Ventura Steel – Natural Gas	1B Current Site – Hybrid	1B Current Site – Hybrid	3A Ventura Steel – Natural Gas	1B Current Site – Hybrid
3	1B Current Site – Hybrid	3B Ventura Steel – Hybrid	4A Devil’s Canyon Road – Natural Gas	4A Devil’s Canyon Road – Natural Gas	4A Devil’s Canyon Road – Natural Gas

Based on the analysis, Alternative 1.A: Planned Project received the highest rankings in the most categories. However, SoCalGas has selected Alternative 1.B: Current Site – Hybrid, which received the second highest rankings in the most categories, as the preferred alternative. The Devil’s Canyon Road – Hybrid alternative received the highest score in the environmental considerations. However, it did so with less than 1 percent difference between it and the current site when equipped with hybrid compression technology. Further, it does not achieve high rankings in the other four categories.

SoCalGas determined that the Current Site – Hybrid alternative (1) provides greater reliability benefits due to project duration as compared to the alternative site locations; (2) provides greater oxides of nitrogen (NO_x) emissions reductions as compared to an all-gas option; and (3) reduces the project cost burden to our customers as compared to the alternative site locations.

1 Introduction

SoCalGas®⁵ operates an integrated energy delivery system composed of pipelines, compressor stations, storage fields, and regulator stations, designed to provide safe and reliable service to its customers. SoCalGas relies on this network to deliver energy to residential, business, industrial, and agricultural customers throughout Southern California. As the nation's largest natural gas distribution utility, SoCalGas serves 21.8 million consumers through 5.9 million meters in more than 500 communities within its 24,000-square-mile service territory.

The Ventura Compressor Station, located at 1555 North Olive Street in the City of Ventura, has safely and reliably operated to meet local distribution needs within Ventura and the Central Coast, as well as to supply the La Goleta Storage Field. Figure 1 shows an overview of the site's location in SoCalGas' service area. However, the existing compression equipment was installed in the 1980s, and the compressor station has been in use since at least 1923. As discussed further herein, due to changes to the operating environment of SoCalGas' integrated natural gas transmission system, the functionality of the existing 40-year-old equipment, the ability to maintain system reliability, and the critical importance of maintaining adequate inventory in the La Goleta storage field, SoCalGas has proposed to modernize the compressor station, by replacing three existing natural gas compressors with four new natural gas compressors within a new compressor building and other associated improvements (planned project). The California Public Utilities Commission (CPUC) has recognized the role of compressor stations in maintaining the operational reliability and safety of the gas transmission system (CPUC 2019).

Figure 1. Regional Overview

The CPUC, which has primary regulatory authority over SoCalGas' integrated natural gas transmission system, requested⁶ that SoCalGas prepare a feasibility study that: (1) fully

⁵ SoCalGas is a wholly owned subsidiary of Sempra Energy.

⁶ California Public Utility Commission letters dated August 5, 2021, and August 20, 2021 (CPUC 2021a, 2021b).

analyzes all options considered for the compressor station upgrade; (2) provides the basis for rejecting any alternatives that were considered, including but not limited to electric compressors for all or part of the planned project (3) discusses all alternative sites that were considered but rejected and provides SoCalGas' reasons for rejecting them; and (4) provides an explanation of how the planned project factors into both local and statewide safe and reliable service and the state's decarbonization goals.

This feasibility study for the Ventura Compressor Station analyzes potential project alternatives to determine if they meet the purpose and need of the planned project and most of the project objectives; determine if they meet essential site criteria; assess operational and environmental criteria; and finally, assess cost and schedule. In order to assess each potential alternative option according to the same criteria, a scoring rubric was developed for operational, environmental and schedule considerations. The rubric assigns point values from 0 to 9. Cost was evaluated based on the lowest to highest cost.

The criteria within the rubric address several topic areas that the CPUC examined in multiple data requests⁷ regarding the Ventura Compressor Modernization Project as well as categories typically evaluated in a CEQA EIR or topic areas relevant to operational needs.⁸ Operational considerations include topic areas such as safety and resiliency, electrification and power requirements, control systems, system maintenance and gas releases, and siting considerations. Environmental considerations include topic areas such as, but not limited to, air quality, greenhouse gas emissions, traffic, noise, aesthetics/visual resources, land use designation, and wildfire. Additional topic areas were added to expand the environmental evaluation to address cultural resources, natural resources, and CalEnviroScreen pollution burden.

Dudek was retained by SoCalGas to prepare an environmental evaluation as part of this feasibility study (see Appendix A). Dudek is a 700-person national, multidisciplinary environmental and engineering firm founded in 1980 and is ranked as one of the top 120 U.S. Environmental Firms (Engineering News-Record 2021). Additional technical support for SoCalGas' feasibility study analysis was provided by Burns and McDonnell (BMCD) and SPEC Services. BMCD is a 7,500-person family of companies consisting of engineers, construction professionals, architects, planners, technologists, and scientists to design and build infrastructure. SPEC Services is an engineering firm that includes over 200 people covering a broad range of disciplines, including process, mechanical, electrical, controls, civil/ structural, and pipeline engineering and design,

⁷ CPUC Data Requests/SoCalGas Responses include:

- CPUC–Energy Division Data Request 1, RE: Ventura Compressor Station, Date Requested: May 12, 2021; Date Responded: May 14, 2021 (SoCalGas 2021a)
- CPUC–Energy Division Data Request 2, RE: Ventura Compressor Station, Date Requested: May 17, 2021; Date Responded: May 24, 2021 (SoCalGas 2021b)
- CPUC–Energy Division Data Request 3, RE: Ventura Compressor Station, Date Requested: June 1, 2021; Date Responded: June 4, 2021 (SoCalGas 2021c)
- CPUC–Energy Division Data Request 4, RE: Ventura Compressor Station, Date Requested: June 23, 2021; Date Responded: July 7, 2021 (SoCalGas 2021d)
- CPUC–Energy Division Data Request 5, RE: Ventura Compressor Station, Date Requested: July 23, 2021; Date Responded: August 6, 2021 (SoCalGas 2021e)
- CPUC–Safety and Enforcement Division Data Request 1, RE: Ventura Compressor Station, Date Requested: August 19, 2021; Date Responded: August 19, 2021 (SoCalGas 2021f)

⁸ There is no discretionary permit required for the planned modernization project and consequently, environmental review under CEQA is not required. Environmental considerations evaluated by Dudek include topic areas such as but not limited to land use, air quality, traffic, and wildfire, which are topic areas in CEQA Guidelines Appendix G, Environmental Checklist Form.

procurement, construction management, project controls, survey, and land services, and permits.

As discussed more fully herein, the natural gas system and the planned project are integrally related to local and statewide safe and reliable energy service and the state’s decarbonization goals.

1.1 System Overview, Safety, Reliability, and Decarbonization Goals

This section provides an overview of SoCalGas’ natural gas system, system safety, Ventura Compressor Station safety and reliability and provides an explanation of how the planned project factors into both local and statewide safe and reliable service and the state’s decarbonization goals, as requested by the CPUC in letters dated August 5, 2021, and August 20, 2021.

1.1.1 Gas System Overview

SoCalGas’ service territory encompasses approximately 24,000 square miles throughout Central and Southern California, from Visalia to the Mexican border. Most of the natural gas used in California—more than 90 percent—is produced out of state including from basins in Texas and New Mexico. Transmission pipelines transport natural gas supplies from the California/Arizona border and other receipt points in Central and Southern California to areas throughout SoCalGas’ service territories. Nine compressor stations located along the transmission pipelines, including the Ventura Compressor Station, provide the pressurization needed to move the gas through the pipelines.⁹ Natural gas may be moved into four underground storage fields within the SoCalGas system.¹⁰ Since out-of-state supplies of natural gas may not be enough to meet customers’ needs, gas from the storage facilities is used to make up the difference. Storage fields play a critical role in providing gas supplies during colder months for heating and warmer months to support electricity generation. Natural gas may be withdrawn from storage fields and moved into transmission pipelines and then into smaller, lower-pressure distribution mains that transport the natural gas around the region and directly to commercial and industrial customers. The natural gas is then moved into even smaller and lower-pressure pipelines for delivery to homes and businesses throughout SoCalGas’ service territory.

1.1.2 System Safety

At SoCalGas, the safety of our customers, employees, contractors, and the communities we serve has been, and will remain, our core value. Our tradition of safety spans more than 150 years and is the foundation of our business. As the nation’s largest natural gas utility, we take our safety commitment very seriously. Our longstanding commitment to safety focuses on three primary areas – employee and contractor safety, customer and public safety, and the safety of

⁹ As noted by the U.S. Energy Information Administration, “The U.S. interstate natural gas pipeline network relies on more than 1,200 natural gas compressor stations to maintain the continuous flow of natural gas between supply area and consumers. Compressor stations are ‘pumping’ facilities that advance the flow of natural gas. They are usually situated between 50 and 100 miles apart along the length of a natural gas pipeline system and are designed to operate on a nonstop basis” (USEIA 2007).

¹⁰ The four natural gas storage fields are Aliso Canyon (northern San Fernando Valley near Porter Ranch), Honor Rancho (Santa Clarita near the State Route 126 and Interstate 5 interchange), La Goleta (Goleta south of University of California, Santa Barbara), and Playa del Rey (north of Los Angeles International Airport).

our gas system. This safety focus is embedded in all we do and is the foundation for who we are – from initial employee training, to the installation, operation and maintenance of our utility infrastructure, and to our commitment to provide safe and reliable service to our customers. We strive to continuously improve and strengthen our safety performance by setting clear measurable goals, assessing our safety performance, reviewing and questioning approaches and assumptions, integrating people and activities to promote a common approach to safety, and learning from and sharing best practices and lessons learned with our stakeholders, including our peers. This safety commitment has guided SoCalGas’ past and current practice and will continue to guide our future direction. SoCalGas’ overarching safety program is called the Safety Management System (SMS).

Safety Features

Natural gas energy providers, such as SoCalGas, are regulated, monitored, and inspected by a number of government agencies. Pipeline operators must comply with the Code of Federal Regulations requirements, Department of Transportation Pipeline and Hazardous Materials Safety Administration requirements (PHMSA 2018), National Code Standard requirements, and CPUC General Orders and regulations when engineering, designing, and constructing compressor stations. SoCalGas also incorporates best available technology and safety systems when retrofitting or redesigning its facilities and equipment to provide multiple layers of redundancy when it comes to system safety and reliability. Figure 2 presents a overview of the components of the SoCalGas pipeline system.

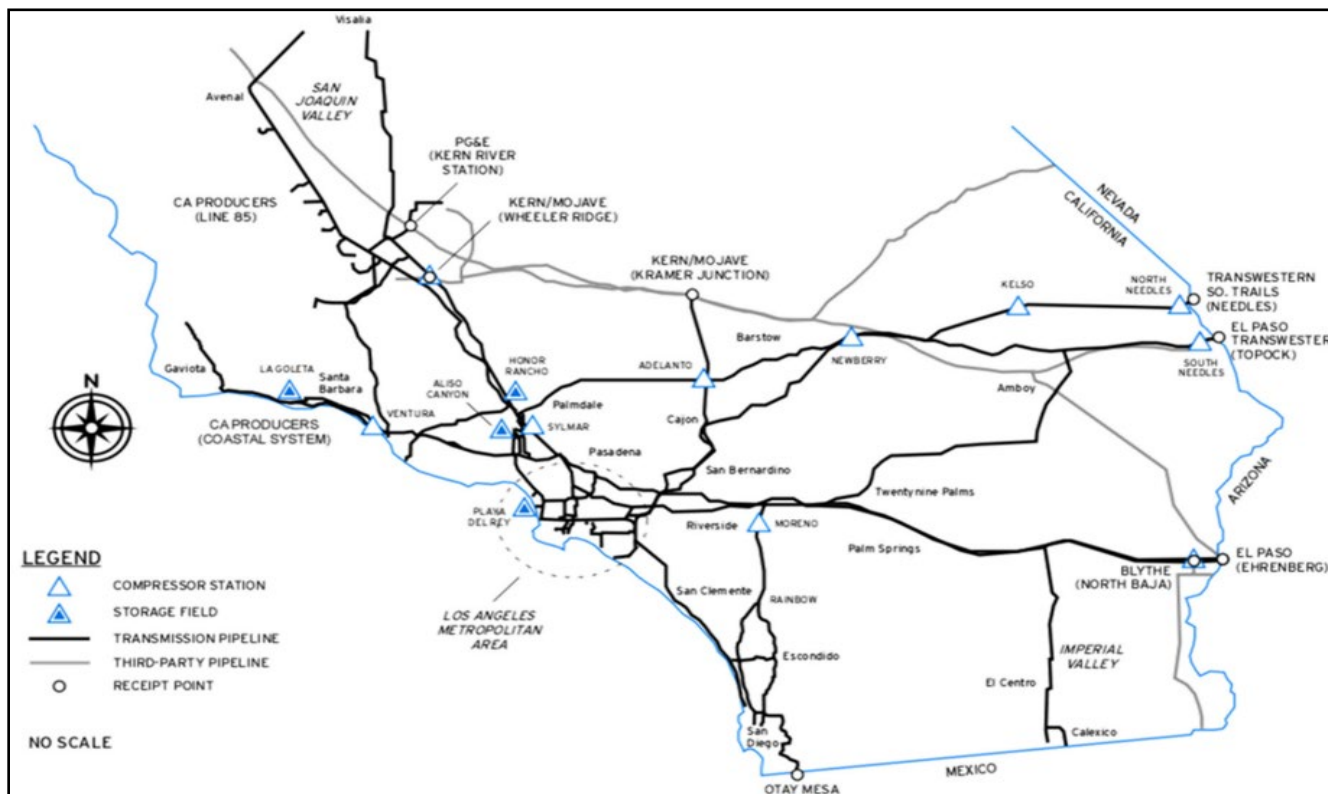

Figure 2. Gas Transmission System

The integrity of the pipeline systems that bring natural gas to homes and businesses is also under careful and routine surveillance. SoCalGas has approximately 5,000 trained employees

to respond quickly to incidents throughout the service territory. Additional safety measures include the following:

- **Leak Surveys:** SoCalGas conducts regular leak surveys by trained and qualified individuals of its pipelines and compressor stations, typically using sensitive natural gas detection equipment, and addresses leak indications found as a result of a leak survey.
- **Pipeline Patrols:** Pipeline patrols are performed by trained and qualified individuals within structured scheduled times that meet or exceed federal and state requirements to look for indications of any abnormal conditions, such as missing pipeline markers, construction activity, potential gas leaks, and other factors that can affect the safety and operation of the pipeline.
- **Corrosion Control:** In order to protect pipelines from external corrosion, SoCalGas uses pipeline coating and cathodic protection. SoCalGas also manages the quality of the natural gas in its system and manages the system’s operation to prevent internal corrosion.
- **Valve Inspection:** Valves utilized for isolating pipeline segments are inspected once each year and serviced for valve casing leak detection, proper valve identification, adequate lubrication, and valve operation. There are approximately 8,500 of these valves in the transmission pipeline system.
- **Underground Vaults:** Once a year, SoCalGas performs routine maintenance and inspection on all underground vaults within its service area, which typically contain pressure-regulating or pressure-limiting equipment. Maintenance and inspection include proper operation of ventilation equipment, inspection of structural conditions, correction of water presence, and removal of trash or other foreign substances.

1.1.3 Ventura Compressor Station Safety and Reliability

SoCalGas’ SMS encompasses all aspects of safety relevant to SoCalGas’ business, including employee safety, contractor safety, customer safety, public safety, and system safety. It applies to all SoCalGas assets and operations as well as to all employees, from senior management to those on the frontline. Our staff at the Ventura Compressor Station work and live in the Ventura community and impart the value of safety in every task.

Safety

The Ventura Compressor Station meets all applicable federal and state requirements for safety. SoCalGas performs specific testing and inspections at the Ventura Compressor Station as required by the Code of Federal Regulations, California Air Resources Board (CARB) and CPUC General Order 112-E and other relevant local regulations (e.g., Ventura County Air Pollution Control District [VCAPCD]). The station, including its piping, safety, and fire equipment, is equipped with continuous remote/onsite monitoring equipment, and is also subject to in-person testing and inspection, as further described below. SoCalGas also is in regular communication with first responders, including the Ventura City Fire Department (VCFD), which is the primary emergency response agency for an emergency natural-gas-related incident at the Ventura Compressor Station. The VCFD also reviews and approves the facility’s hazardous materials business plan and spill prevention, control, and countermeasure plan. In advance of routine maintenance activities, SoCalGas contacts the VCFD to maintain open communication. Additionally, SoCalGas’ Emergency Services Department conducts annual briefings with first

responders in Ventura and across its service territory so that they are educated about how to respond to a natural gas incident.

The Ventura Compressor Station is among the many SoCalGas facilities subject to the statewide California Air Resources Board (CARB) Oil and Gas Methane Regulation, per California Code of Regulations, Title 17, Division 3, Chapter 1, Subchapter 10: Climate Change, Article 4, Subarticle 13: Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities, which has been in effect since January 1, 2018. This regulation includes quarterly third-party leak detection and repair (LDAR) inspections. The purpose of this regulation is to establish greenhouse gas emission standards for natural gas facilities and serve the purposes of the California Global Warming Solutions Act, Assembly Bill 32, as codified in Sections 38500–38599 of the California Health and Safety Code. The rule is intended to minimize methane leakage associated with gas storage, processing, and transmission. The rule also includes time frames for conducting timely repairs and re-inspections should a component be found to be leaking methane.

There are a multitude of regular tests and inspections that occur at the Ventura Compressor Station, which include the following:

- **Daily:** Facility rounds/remote monitoring
- **Weekly:** Hazardous materials storage area audio-visual inspections
- **Monthly:** Fire and safety equipment inspection; preventive maintenance and inspections per original equipment manufacturer’s (OEM) specifications; spill prevention, control, and countermeasure inspections
- **Quarterly:** Fire and gas detector testing and inspections; emission testing; third-party leak inspections per CARB’s statewide Oil and Gas Methane Regulation; preventive maintenance and inspections per OEM specifications
- **Semi-annual:** Structural support integrity inspections; preventive maintenance and inspections per OEM specifications; internal environmental compliance audits and inspections
- **Annual:** Third-party fire equipment inspections, servicing, and testing; emergency shutdown (ESD) system testing and inspections; third-party emission testing; preventive maintenance and inspections per OEM specifications; valve maintenance and inspections; relief valve and transmitter inspections and testing; internal leak inspections
- **Other as needed:** Stormwater compliance evaluations every rain event

When performing system testing, natural gas is released into onsite piping that feeds into SoCalGas’ local distribution system. When a compressor or onsite pipeline is taken out of service for scheduled maintenance SoCalGas uses state of the art technology to reduce/eliminate the venting of natural gas to atmosphere. Releases are accounted for in SoCalGas’ greenhouse gas annual emission report.

Reliability

The Ventura Compressor Station is situated to support the Central Coast and meet reliability needs. It is the last compressor station on SoCalGas’ Coastal System and the main feed to customers in Ventura and on the Central Coast. A compressor station has been in use at the planned project site since 1923 and the current equipment has been onsite since the 1980s. Customer demand on the Coastal System has been relatively stable over the last 10 years;

however, locally produced gas supplies have decreased significantly over the same period.¹¹ With the loss of local supply and performance constraints due to aging equipment, the compressor station has had to run more frequently in order to meet customer demand and maintain gas storage supply in the La Goleta Storage Field. SoCalGas has made use of natural gas supply from Pacific Gas and Electric Company (PG&E) that is delivered to the distribution system at Morro Bay to supplement the local demand, thereby facilitating injection at the La Goleta Storage Field. However, these operational modifications are not sufficient to address the long-term changes, such as the loss of local production, to the system. Gas supplies transported through the Ventura Compressor Station are now the primary source of supply for the La Goleta Storage Field because local supplies no longer meet injection needs. For these reasons, SoCalGas sought CPUC authorization for compressor station modernization in the 2016 and 2019 General Rate Case (GRC).¹²

1.1.4 Decarbonization Goals

Reducing carbon intensity across all economic sectors is foundational to achieving California's net zero GHG emission goals. It requires energy efficiency, renewable electricity, renewable gases, long duration storage, carbon management, and other technologies to be viable at scale. A successful energy transition requires leadership, innovation, effective policy, and broad collaboration. SoCalGas set a goal to achieve net zero greenhouse emissions in its operations and the energy it delivers by 2045. These steps are in alignment with the State of California.

The State is working on many decarbonization efforts with the goal of achieving carbon neutrality by 2045. The Ventura Compressor Station Modernization Project, along with the others recognized by Commission Decision D.19-09-051 on SoCalGas' integrated gas transmission system, will support both local and statewide decarbonization efforts. Furthermore, SoCalGas continues to integrate electric equipment across its infrastructure to create hybrid operating systems that further reduce potential emissions.

The reliability services and capabilities provided by the gas grid are increasingly being called upon to support decarbonization goals and complement renewable resource deployment. For example, "renewable natural gas (RNG) is produced from food waste, farms, landfills, and even sewer systems. It can rapidly cut greenhouse gas emissions because it takes more climate

¹¹ Over time, locally produced gas supplies on SoCalGas' transmission system downstream of the Ventura Compressor Station have dropped from approximately 15,029,633 million cubic feet in 2011 to 1,534,807 million cubic feet in 2020 (SoCalGas 2021a).

¹² As noted in Commission Decision D.19-09-051 on SoCalGas' 2019 GRC application, the CPUC authorized the planned compressor modernization project and the necessary funding, recognizing the importance of maintaining operational reliability and safety of the gas transmission system, and finding that: "With respect to the requested amounts for this GRC, we note that other largescale projects are being planned specifically for the Ventura Compressor Station and the Honor Rancho Compressor Station (and the Moreno Compressor station for SDG&E [San Diego Gas & Electric®]). Because we recognize the importance of the proposed projects and the role of compressor stations in maintaining operational reliability and safety of the gas transmission system, we find that it is prudent and reasonable to authorize the proposed projects and for SoCalGas to have the necessary funding to conduct these projects (and Moreno Compressor station for SDG&E). At this point, we do not find it necessary to deviate from current GRC practice and authorize funding only for specific projects because of the large scope covered in the GRC and because of the many challenges associated with planning and executing multiple and large projects within a specified timeframe. We do however encourage SoCalGas to place a high priority on critical projects under this category as most of its compressors are over 50 years old and because of key risks that need to be mitigated in this area. Therefore, we find that the requested amounts for Compressor Stations should be authorized" (D.19-09-051 at pp. 116-117).

pollution out of the air” (Kovaleski 2019). The CPUC recently issued Decision 22-02-025 on biomethane standards to implement Senate Bill 1440 Biomethane Procurement Program which sets “biomethane (i.e., renewable natural gas and/or bio-synthetic natural gas) procurement targets to reduce short-lived climate pollutant emissions ... establish a cost-effective means of procurement and adopt provisions to achieve additional co-benefits, as well as timetables for each investor-owned utility providing gas service in California to achieve specified procurement targets” (CPUC 2022). California’s Low-Carbon Fuel Standard, which requires companies that sell transportation fuels in the state to lower their products’ carbon intensity, is causing increased interest in dairy renewable natural gas to address the emissions linked to climate change (Dvorak 2022). Biogas from cow manure, which is around 60% methane, is piped to a processing facility that collects gas and purifies it for injection into the pipeline (Dvorak 2022). Calgren Dairy Fuels completed a dairy renewable natural gas facility in Pixley, California, the first of its kind in the state. The biogas captured by the facility is processed and piped into the SoCalGas system. As noted by Walt Dwelle, principal owner of Calgren Renewable Fuels: “This facility alone will eventually capture methane produced from the manure of more than 75,000 cows, preventing about 130,000 tons of greenhouse gas from entering the atmosphere each year, the equivalent of taking more than 25,000 passenger cars off the road for a year” (Kovaleski 2019).

SoCalGas is integrating green hydrogen into the pipeline network to support hard to electrify industries – like dispatchable electric generation, high heat industries and heavy-duty trucks. There’s a growing consensus among academics, industry leaders, community stakeholders and regulators that solar, wind and batteries alone cannot achieve California’s target of carbon neutrality by 2045 – a goal SoCalGas shares for its own operations.

The California Energy Commission (CEC) observed that the gas system is integral to the electric grid because the gas system is “being used to integrate renewables” by “meet[ing] peak and net peak demand.”¹³ Advancement of renewable resources has changed the way electricity is generated and driven increased “inter-dependencies between gas and electric systems.”¹⁴ As noted by Katherine Blunt in the Wall Street Journal, “grid operators around the country have recently raised concerns that the intermittence of some electricity sources is making it harder for them to balance supply and demand, and could result in more shortages” (Blunt 2022). As the electric grid incorporates an increasing amount of renewable resources, it is likely less natural gas will be used for electric generation on an annualized basis. Despite this, the gas system will be called upon to fill gaps when renewable resources cannot meet demand due to intermittent supply, increased levels of end-use electrification, increases in extreme weather events, and wildfires such as the 2018 Thomas Fire that affected both Ventura and Santa Barbara Counties.

As such, deliveries of just-in-time natural gas are increasing for thermal generation, albeit overall generation is decreasing. In recent years due to changes in regulations related to cooling systems for natural gas electric generation, in-state gas fired generation has decreased by almost 13,000 megawatts (MW).¹⁵ Despite this decline in gas generation capacity, gas throughput on SoCalGas’ integrated transmission system has risen largely to support

¹³ See CEC, “Overview of California Gas Reliability Issues,” presented at the Integrated Energy Policy Report Joint Agency Workshop on Summer 2021 Reliability, Session 3: Gas Reliability Issues and Polar Vortex, held on July 9, 2021. Available at: <https://www.energy.ca.gov/event/workshop/2021-07/iepr-joint-agency-workshop-summer-2021-electric-and-natural-gas-0>.

¹⁴ Ibid.

¹⁵ See 2021 Draft IEPR, Volume II, p. 33.

dispatchable generation.¹⁶ For example, in 2020, in significant measure most peak hour gas deliveries from SoCalGas' system were to serve dispatchable electric generators and electric system ramping needs more so than to serve peak hour core customer thermal load. For example, of the 77 hours in 2020 when deliveries to either core customers or dispatchable electric generators exceeded 100,000 Dekatherms/hour (Dths/hr) (equivalent to ~ 2.4 billion cubic feet/day (Bcf/d) of capacity), 62 hours were to serve dispatchable electric generators while 15 hours served core customers. This requires consistent and reliable compression of gas in the pipelines to be able to move high quantities of gas quickly.

1.2 Feasibility Study Methodology

SoCalGas appreciates the collaboration with the community and CPUC on the Ventura Compressor Station Project. We understand the public's concern for safety at this facility and all SoCalGas facilities. SoCalGas is committed to clear, open, transparent, and frequent communication to work collaboratively with the communities and local municipalities in which our facilities are located and with regulatory agencies with oversight of our facilities. This feasibility study represents SoCalGas' diligent and earnest assessment of the Ventura Compressor Station and the feasibility of potential alternative site locations and equipment configurations.

There is no prescriptive format or template for a feasibility study. As such, SoCalGas developed this study based on the foundational purpose, need and objectives of the project, essential site criteria and five core considerations – operational, environmental, project cost, operational cost, and schedule – described herein.

1.2.1 Purpose, Need, and Objectives of the Project

SoCalGas considered project alternatives based on safety, reliability, resiliency, environmental, and community considerations; ratepayer impacts; and cost and schedule in relationship to the planned project's objectives. The purpose of the planned Ventura Compressor Modernization Project is to:

1. Continue providing reliable compression to supply residential, business, industrial, and agricultural customers with gas in Ventura and along the Central Coast of California;
2. Enhance reliability by modernizing aging infrastructure; and
3. Support gas deliveries to the La Goleta Storage Field, a critical part of the region's energy infrastructure.

The need for the planned project is driven by changes to the operating environment of SoCalGas' integrated gas transmission system, the functionality of the existing 40-year-old equipment, the ability to maintain sufficient pressure in the existing pipelines, and the critical importance of maintaining adequate inventory in the La Goleta Storage Field.

The objectives of the planned project are to:

- Replace compression infrastructure installed in the 1980s with new equipment that complies with applicable Ventura County Air Pollution Control District (VCAPCD)

¹⁶ SoCalGas' internal modeling analysis.

requirements and supports California’s climate goals and SoCalGas’ climate goals to reach net zero carbon emissions by 2045.

- Meet system operational requirements, including adequate horsepower to compress gas, and address changes in the natural gas transmission system that necessitate flexibility such that the equipment can provide sufficient compression to supply the La Goleta Storage Field and customers north of the Ventura Compressor Station as well as meeting local distribution needs in Ventura.
- Safely construct and operate the compressor station by complying with safety regulations including, but not limited to, U.S. Department of Transportation (DOT) regulations.
- Maintain compatibility with local agency land use designations and zoning by utilizing existing industrial land with adequate acreage to minimize land use conflicts and minimize disturbance to undeveloped land as practicable.
- Minimize environmental impacts, such as loss of environmentally sensitive habitat, impacts to sensitive wildlife species, and impacts to historical and Native American resources.
- Minimize significant hillside grading, dust generation, and installation of retaining walls.
- Minimize the need to relocate pipelines and other infrastructure and maintain adequate separation to reduce potential landslide risk and maintain resiliency.
- Consider availability of electric infrastructure if a hybrid natural gas and electric compressor configuration is contemplated.
- Consider proximity to and the design pressure of the existing pipeline system.
- Safeguard ratepayer funds by evaluating project costs in a prudent manner and in accordance with CPUC direction.

1.2.2 Essential Site Criteria

Essential site criteria are those criteria that must be met to construct and operate a compressor station. They include the following:

1. Property acreage is at least 8 acres but ideally 10 acres or larger, especially for sites with slopes greater than an average of 15% to account for graded cut/fill slopes. The site must also be held by private property owners or SoCalGas (not a local, state, or federal agency).

SoCalGas operates nine (9) compressor stations on its integrated gas transmission system. The property acreage of these compressor stations vary in size from less than an acre to more than 100 acres, with a median size of 39 acres and an average size of roughly 40 acres. To safely operate a compressor station, adequate space within and around buildings and pipelines is necessary, which is dependent on the operational needs of the particular facility. The existing station is operating on 8 acres but given that the median compressor station size for SoCalGas’ 9 compressor stations is 39 acres and the average compressor station size is 40 acres, at least 10 acres is needed for a new compressor station to provide for operational needs and to address slopes/grading.

2. The site is compatible with Federal Aviation Administration (FAA) requirements for land use.

The FAA sets forth guidance for development near airports and land use compatibility. This guidance is typically implemented at the regional level by Airport Land Use Commissions (ALUC).¹⁷ Certain types of land uses are limited or prohibited near airports for safety reasons, such as industrial-scale land uses and utility-scale solar arrays, due to glare. The compressor station location must comply with FAA requirements.

3. The site is not within a Federal Emergency Management Agency (FEMA) mapped floodway.

FEMA regulatory floodways are defined as “the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height” (FEMA 2020). Further, “[t]he community is responsible for maintaining the floodway to mitigate flood hazards; the community must not allow any activities causing a rise in the Base Flood Elevation (BFE) in the regulatory floodway” (FEMA 2019). Development within a floodway is typically restricted and as such, placing a compressor station in a regulatory floodway would be inconsistent with FEMA flood requirements.

1.2.3 Five Core Considerations

The evaluation of alternative options accounts for operational and environmental considerations that go beyond the foundational elements of the purpose, need, and objectives of the planned project and the essential site criteria. In addition, the feasibility study evaluates project cost, operational cost, and schedule. Cost is evaluated because as stated in the California Public Utilities Code Section 701.1(a)1, “a principal goal of electric and natural gas utilities’ resource planning and investment shall be to minimize the cost to society of the reliable energy services that are provided by natural gas and electricity.” Schedule is also evaluated because as stated in the CPUC’s Decision D.19-09-051 on SoCalGas’ 2019 GRC application, “We do however encourage SoCalGas to place a high priority on critical projects under this category as most of its compressors are over 50 years old and because of key risks that need to be mitigated in this area” (D.19-09-051 at pp. 116-117). The consideration of schedule aligns with the CPUC’s input.

Operational, environmental, and schedule subcategories were rated on a scale of 0-9, with 9 being the highest score an alternative could receive and 0 being the lowest score. The point values for each subcategory were added together to come up with a separate total score for the operational, environmental, and schedule considerations. The project cost and operational cost were ranked from lowest cost to highest cost based on total dollar value.

- **Operational Considerations:** there are five subcategories: (1) auxiliary and control systems, (2) backup power requirements, (3) emergency access, (4) geotechnical engineering constraints, and (5) proximity to distribution system.

¹⁷ The California Public Utilities Code, Sections 21670 et seq., requires the County Board of Supervisors to establish an ALUC in each county with an airport operated for the benefit of the public. The Code also sets forth the range of responsibilities, duties, and powers of the ALUC. In Ventura County, the Board of Supervisors has designated the Ventura County Transportation Commission to act as the ALUC for the County (VCALUC 2000).

The operational considerations evaluation process included a team of six SoCalGas staff members with subject matter expertise in pipeline operations, mechanical engineering, and civil engineering. Each staff member evaluated each alternative and assigned a point score in accordance with the rubric (Appendix B).

- **Environmental Considerations:** there are three categories within which environmental topic areas are addressed:
 - *Operational Subcategories:* (1) air quality, (2) greenhouse gas emissions, (3) land use designation, (4) CalEnviroScreen pollution burden, (5) wildfire, (6) aesthetics/visual, and (7) noise.
 - *Onsite Construction Subcategories:* (1) slope/topography/grading, (2) traffic – construction, (3) air quality, (4) greenhouse gas emissions, (5) cultural resources, (6) natural resources, and (7) noise.
 - *Offsite Construction Subcategories:* (1) traffic – roadway construction, (2) utilities/service systems, (3) noise, (4) air quality, (5) greenhouse gas emissions, (6) natural resources, and (7) cultural resources.

Environmental considerations were evaluated by Dudek – see Appendix A – and are based on topic areas that the CPUC examined in multiple data requests as well as categories typically evaluated in a CEQA EIR.¹⁸ Dudek assigned a point score for each subcategory that was subtotaled by category (Operational, Onsite Construction, Offsite Construction) and then the total score was calculated.

- **Project Cost:** project cost estimates using American Association of Cost Engineers (AACE) accepted industry practices for two subcategories: (1) property / right-of-way acquisition and (2) engineering and procurement.

Project costs were developed by SoCalGas, with support from BMCD and SPEC Services, and in accordance with AACE Recommended Practices (RP) 10S-90 for the various alternatives. Project costs were normalized and assigned a score.

- **Operational Cost:** operational cost estimates using AACE accepted industry practices for three subcategories: (1) fuel costs; (2) annual maintenance costs, and (3) fuel modification.

Operational costs were developed by SoCalGas, with support from BMCD and SPEC Services, and in accordance with AACE RP 10S-90 for the various alternatives. Operational costs were normalized and assigned a score.

- **Schedule:** project duration to assess most timely process for three subcategories: (1) project permitting complexity; (2) property/ROW acquisition; and (3) construction duration.

Schedules were developed by SoCalGas, with technical support from BMCD and SPEC Services, for each alternative. Schedule estimates were also based on accepted industry

¹⁸ There is no discretionary permit required for the planned modernization project and as a result, environmental review under CEQA is not required.

standards using AACE RP 91R-16, “Schedule Development” (AACE 2020). Schedules were normalized and assigned a score.

1.2.4 Evaluation Process

The feasibility study identifies potential alternatives to the planned project for further evaluation, shown in Table 1: Ventura Compressor Station Modernization Project Potential Alternative Options, and on Figure 1: Potential Alternative Site Locations. These potential alternatives take into consideration direction from the CPUC and conversations with the community as a part of SoCalGas’ Town Halls hosted in October 2021.¹⁹ All alternatives suggested by the community and the CPUC were considered as part of this analysis.

In addition to the alternative options suggested by the community, SoCalGas identified potential new sites by considering the essential site criteria and purpose, need, and objectives. Because urbanized areas generally do not have 10-acre parcels (or larger acreage with the potential to subdivide into a smaller 10-acre parcel), the screening process focused on more rural areas with larger parcel sizes outside city limits. These areas tended to be west-northwest of the compressor station or southeast within the agricultural areas near the cities of Oxnard and Camarillo. Steep slopes are also a consideration for the hillsides adjacent to the City of Ventura due to grading and visibility. Several mapped FEMA flood hazard areas are associated with the Arundell Barranca, the Santa Clara River and its tributaries, and coastal marine wetlands that are southeast of the compressor station and with the Ventura River to the northwest of the compressor station (FEMA 2022). Proximity to the Oxnard, Camarillo, and Naval Air Station (NAS) Point Mugu airports also constrains land use due to compliance with FAA requirements. Finally, although not identified as essential site criteria, proximity to and the design pressure of the existing pipeline system were considered at a macro level related to constructability and cost.²⁰ Alternatives have been evaluated according to the feasibility study process shown in Exhibit 1: Feasibility Study Evaluation Flowchart.

¹⁹ As part of SoCalGas’ effort to hear from and respond to the community’s concerns, allow for feedback, and answer questions, SoCalGas convened a series of town hall meetings in October 2021 to engage with the greater Ventura area community. Four of the sessions were held in person at the Museum of Ventura County and three were held virtually on the Microsoft Teams platform. All sessions provided the presentations and questions and answers in both English and Spanish. A total of 44 individuals participated in the town hall meetings.

²⁰ Pipelines are designed to a certain maximum allowable operating pressure in accordance with federal and state requirements.

Exhibit 1. Feasibility Study Evaluation Flowchart

Source: SoCalGas.

Feasibility Study Evaluation Process

- Step 1: Potential alternative site locations and equipment configurations are identified.
- Step 2: The alternatives are analyzed to determine if they meet the purpose and need of the planned project and most (though not necessarily all) of the project objectives. If an alternative does not, it is dismissed from further consideration.
- Step 3: The remaining alternatives are analyzed to determine if they meet essential site criteria, such as minimum site acreage. If an alternative does not, it is dismissed from further consideration.
- Step 4: Those alternatives that meet the purpose, need, and most objectives and meet essential site criteria are assessed based on operational and environmental criteria and assigned a total technical score. The scoring rubric is provided in Appendix B: Feasibility Study Scoring Rubric.
- Step 5: The alternatives are then considered based on cost and schedule to implement and are assigned a total cost/schedule score according to the rubric.
- Step 6: At the conclusion of the analysis, the alternatives are ranked based on a total score and then the preferred option is identified.

The alternatives that have been developed are shown in Table 1.

Table 1. Ventura Compressor Modernization Project Potential Alternatives

Alternative	Identified By	Location/Configuration
Alternatives Considered and Dismissed		
No Project	Community	Current site – Maintain existing site configuration and operational profile

Table 1. Ventura Compressor Modernization Project Potential Alternatives

Alternative	Identified By	Location/Configuration
Compressor Station Removal	Community	Current site – Remove compressor station and do not replace compression
3/1 Hybrid	SoCalGas	Install a hybrid equipment configuration consisting of three electric compressors and one natural gas compressor at current site or other alternative sites
All Electric Compression	CPUC	Install an all-electric equipment configuration consisting of four new electric compressors at current site or other alternative sites
Goleta Storage Field	SoCalGas	Remove the existing horsepower from the compressor station and replace with new compression equipment at the La Goleta Storage Field approximately 40 miles north within the County of Santa Barbara
Petrochem	SoCalGas	Approximately 15-acre industrial site designated and zoned for industrial uses located approximately 13,500 feet northwest of the compressor station on the west side of State Route 33 within the County of Ventura
Petrochem – Hybrid	SoCalGas	
Alternatives Carried Forward for Analysis		
1.A: Planned Project	SoCalGas	Current site – Approximately 8-acre parcel located on land designated and zoned for industrial uses on the west side of City of Ventura
1.B: Current Site – Hybrid	SoCalGas	
2.A: Avocado Site – Natural Gas	Community	Approximately 15-acre agricultural site designated for open space uses and zoned for agriculture located approximately 3,000 feet west of the compressor station within the County of Ventura
2.B: Avocado Site – Hybrid	Community	
3.A: Ventura Steel – Natural Gas	SoCalGas	Approximately 10-acre industrial site with oil extraction infrastructure designated and zoned for industrial uses located approximately 8,000 feet north of the compressor station within the County of Ventura
3.B: Ventura Steel – Hybrid	SoCalGas	
4.A: Devil’s Canyon Road – Natural Gas	Community	Approximately 12.88-acre oil extraction site designated for open space uses and zoned for agriculture located approximately 6,000 feet to the north of the compressor station on west side of SR-33 within the County of Ventura
4.B: Devil’s Canyon Road – Hybrid	Community	
5.A: County Line – Natural Gas	SoCalGas	Approximately 12.33-acre vacant parcel of land designated and zoned for agriculture located within County of Ventura at the county line between Santa Barbara/Ventura counties approximately 12 miles northwest of the existing compressor station
5.B: County Line – Hybrid	SoCalGas	

*Reasons for dismissing alternatives are discussed in Section 2.

INTENTIONALLY LEFT BLANK

2 Alternatives Considered and Dismissed or Outside Scope of Analysis

This section provides an overview of alternatives to the planned project that were considered by SoCalGas but dismissed from further consideration for reasons described in greater detail in the following sections.

2.1 Alternatives Dismissed for Failing to Achieve Purpose/Need/Objectives

Certain alternatives were considered and dismissed from further evaluation because they do not meet the purpose, need, and most objectives of the planned project as identified in Step 2 of the evaluation process.

2.1.1 No Project

The No Project Alternative would result in maintaining the existing compressor station as it is currently configured (existing baseline setting). The existing compression equipment, consisting of three 1,100-horsepower (HP) compressors installed in the 1980s, would continue to be housed in the existing compressor building and would operate based on similar or reduced natural gas operational system demand.²¹ The office trailer would provide office and administrative facilities for station staff; warehousing/storage would remain in the temporary storage containers. Piping and other supporting onsite infrastructure for both the transmission system and the distribution system would remain the same.

Rationale for Dismissing Alternative

The No Project Alternative would not meet the stated purpose and need of the planned project. The existing three 1,100 HP compressors were installed in the 1980s. Over time, locally produced gas supplies on SoCalGas' transmission system downstream of the Ventura Compressor Station have dropped from approximately 15,029,633 million cubic feet in 2011 to 1,534,807 million cubic feet in 2020 (SoCalGas 2021a). The loss in local production causes the Ventura Compressor Station to operate more frequently and with greater variability to move gas north, placing greater strain on already aging equipment. Maintenance events and days per year where one or more compressors were out of service for maintenance as of May 19, 2021,

²¹ The basis for natural gas requirements and supplies in California are mandated by the California Public Utilities Commission (CPUC) in Decision 95-01-039, which defined the requirement for SoCalGas, Pacific Gas and Electric Company, San Diego Gas & Electric®, Southwest Gas Corporation, City of Long Beach Energy Resources Department, and Southern California Edison to publish the California Gas Report. The most recent edition is the 2020 California Gas Report, which forecasts natural gas usage through 2035, accounting for energy efficiency and building electrification (reach codes). The report states that "utility-driven, statewide natural gas demand is projected to decline at an average rate of 1.0 percent each year through 2035" but "Nevertheless, gas-fired generation and energy storage will continue to be primary technologies to support long-term increases in electricity usage and integrate increasing quantities of intermittent renewable electric generation into the electric grid" (CGEU 2020). See also SoCalGas' Data Request 4 (SoCalGas 2021b).

were 73 and 461, respectively (SoCalGas 2021a).²² In addition, replacement parts are becoming more difficult to obtain because of the age of the equipment. SoCalGas has already made changes to how it operates the main units in an effort to maximize the station's availability. Based on the natural gas forecast of the 2020 California Gas Report (CGEU 2020), natural gas use is anticipated to slowly decline with greater emphasis on renewable sources such as solar and wind, placing a greater emphasis on operational flexibility and the ability of equipment to ramp up and down quickly.

In 2012, SoCalGas retained a consultant to evaluate three compressor stations on SoCalGas' integrated transmission system, specifically Blythe, Moreno, and Ventura. Compression equipment at Ventura in 2012 consisted of three natural gas compressors at 1,100 HP each, the same equipment that is currently onsite. The results of the engineering analysis concluded that future operations will likely require a wide range of operating points, making flexibility for the station paramount. Additional horsepower is needed for daily fluctuations in loads, not to expand the system beyond existing levels of service. Without replacing the aging compressors and adding more horsepower, future operational needs would not be met and supplies at the La Goleta Storage Field would be affected. Storage fields play a critical role in providing gas supplies when supplies are not available from the out of state sources. The significant decrease in the local gas production and relatively stable demand has placed additional reliance on the La Goleta Storage Field to reliably provide service. Gas supplies transported through the Ventura Compressor Station (including supply from PG&E that is delivered at Morro Bay to supplement the local demand) are the primary source of supply for the La Goleta Storage Field, because local supplies no longer meet injection needs. The No Project Alternative would meet some of the stated objectives. The facility would continue to comply with safety and air quality regulations. The use of the property would remain consistent with the City of Ventura land use designation of "Industry" and zoning of "M-2 General Industrial," and the property size is sufficient for a compressor station (City of Ventura 2019, 2020). Potential environmental impacts would be minimized because there would be no construction or operational changes, and no grading would occur, because pipeline or other infrastructure relocation would be unnecessary. However, the No Project Alternative would not replace older compression infrastructure, causing potential impacts to reliability because the equipment would not meet changing system operational requirements.

As described above, the No Project Alternative would not provide sufficient compression to meet future operational needs, would not modernize aging infrastructure, would not maintain supplies to the La Goleta Storage Field, and would meet only some of the stated objectives. For these reasons, the No Project Alternative was dismissed.

2.1.2 Compressor Station Removal

The Compressor Station Removal Alternative would result in the decommissioning of the existing compressor station and removal of the onsite infrastructure, without relocating compression to

²² SoCalGas interprets a "maintenance event" as an event where operations needed to perform planned or unplanned maintenance activities on a specific compressor unit or any equipment related to a specific compressor unit or an event that may result in a reduction in the station gas throughput.

a new location. Compression from the Ventura Compressor Station to move natural gas north to Santa Barbara and San Luis Obispo counties would no longer be provided.²³

Rationale for Dismissing Alternative

The Compressor Station Removal Alternative would not meet the stated purpose and need of the planned project. SoCalGas is required to provide firm natural gas service, including to core customers (primarily residences and small businesses). As a result, SoCalGas must maintain reliable service to customers across its service territory. The Ventura Compressor Station is sited specifically to support the Central Coast, supplying natural gas to more than a quarter-million people for activities such as cooking and heating. It is the last compressor station on SoCalGas' system and is the main feed to customers in Ventura and on the Central Coast to meet reliability needs. The removal of compression would eliminate the ability to supply natural gas to customers in Ventura and along the Central Coast, would fail to modernize existing infrastructure (although the existing infrastructure would be removed), and would not enable deliveries to the La Goleta Storage Field.

The Compressor Station Removal Alternative would meet some of the stated objectives. The removal of the compressor station would be performed in accordance with all applicable safety requirements and the use of the property would remain consistent with the City of Ventura land use designation and zoning (City of Ventura 2019, 2020). However, this option would not meet the gas system's operational requirements. In addition, potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, could occur due to grading, trenching, and removal/disposal of pipeline materials and soil spoils. Additionally, future use of the property could be developed in accordance with the Ventura Municipal Code, which allows by right many industrial uses that could also cause environmental impacts (e.g., noise, lighting, glare, emissions).

As described above, the Compressor Station Removal Alternative would not provide sufficient compression to meet operational needs, would not modernize aging infrastructure, would not maintain supplies to the La Goleta Storage Field, and would meet only some of the stated objectives. For these reasons, the Compressor Station Removal Alternative was dismissed.

2.1.3 3/1 Hybrid Compression

The 3/1 Hybrid Compression option would result in the installation of three new 1,900 HP electric compressors and one 1,900 HP natural gas compressor. Electricity would be provided by the Southern California Edison (SCE) electric grid and require a new onsite substation and potentially one new circuit, with an additional circuit for redundancy. Some onsite electric generation could be provided from rooftop-mounted solar panels and electric storage could be provided by an onsite battery energy storage system (BESS). One new natural gas compressor would be installed. A new compressor building would be constructed to house the equipment. As with the

²³ M-2 General Industrial land uses allowed by Ventura Municipal Code Section 24.262.020 – Uses – Permitted include but are not limited to administrative, business, and professional services; automotive and accessories; drinking establishments; equipment rentals and sales; government services; food and fish processing; oil equipment services; recreation services; wholesaling and distribution; and major wireless telecommunication facilities. Additional land uses may be permitted under a director permit (e.g., farmer's market) or a use permit (e.g., farm employee housing, recycling services) (City of Ventura 2021).

planned project, a new office building and a new warehouse would be constructed and any structures currently onsite would be removed.

Rationale for Dismissing Alternative

The 3/1 Hybrid Compression Alternative would not meet the stated purpose and need of the planned project. As discussed in Section 2.1.2: Compressor Station Removal Alternative, SoCalGas has a mandate to provide natural gas service to customers on the Central Coast and within its entire service area. Locally, wildfire risk is an ever-present threat. The 2017/2018 Thomas Fire was started during a high wind event that caused energized SCE power lines to arc and emit molten aluminum particles on dry vegetation igniting the fire (CALFIRE/VCFPD 2019). “Unlike electric systems in Europe, distribution and transmission lines in the U.S. were typically built overhead instead of buried underground, which makes them more vulnerable to high winds and other weather” (Blunt 2022). SCE has initiated Public Safety Power Shutoffs (PSPS) events during subsequent high wind conditions. An equipment configuration with three electric compressors affected by a PSPS event or disrupted due to fire damage or destroyed power lines would leave only one compressor functional. Under most operational conditions, the customers cannot be served with only one compressor in service and this situation could jeopardize the ability for long-term storage injection. Moreover, although unlikely, if the one natural gas compressor was also out of service during a PSPS event, reliability would be further compromised and supplies to the Coastal System and customers would be affected.

Offsite and onsite design features to offset the potential risk of PSPS events were considered. Based on preliminary analysis, approximately 5 MW of electric power would be needed and may be available on SCE distribution-level service. To minimize the risk of loss of power during a PSPS event, two unique power lines of at least 12 kilovolts (kV) that interconnect to two different circuits at two different substations could be installed. The exact size and location would need to be developed in consultation with SCE. This option presents several challenges due to SCE circuit availability and need to construct additional offsite electrical infrastructure.

Onsite generation would require approximately 5 MW. Solar, battery energy storage and fuel cells were evaluated. A utility-scale solar power plant may require between 5 and 10 acres per megawatt (MW) of generating capacity (USEIA 2021). Given the baseline power needed, a minimum of 30 acres to 60 acres would be necessary, which would not be feasible on the existing or potential alternative locations. A battery energy storage system (BESS) could offer onsite generation capabilities. BESS consist of individual batteries grouped into modules that are housed in climate-controlled containers typically 20 to 40 feet in length, about 10 feet in height and 10 feet in width. Data varies for the available capacity of a container and the longevity with which a BESS system can continue to function within design parameters, but the operational lifetime of the BESS could exceed 15 years (Dubarry et al. 2021). Based on these parameters, a BESS could be incorporated for supplemental power for administrative needs (e.g., office building) and potentially to provide supplemental power to electric compressors in the event of a power failure. However, “most large-scale batteries currently use lithium-ion technology, and can discharge for about four hours at most” (Blunt 2022). The length of time that a BESS could supply power would be contingent on the size and capacity of the BESS, likely between 3 to 5 days at most. Fuel cells, which directly convert chemical energy to electricity with pure water and heat as the only byproducts (USDOEEERE 2015), also could offer redundant power supply in the event of a power failure.

Even with design features incorporated to minimize risk from loss of power of the three electric compressors, the higher potential to lose all service with one natural gas compressor would

conflict with the mandate to provide natural gas service to customers on the Central Coast and within its entire service area. As a mainline compressor station, the station's ability to continue to serve customers at a rate sufficient to avoid a widespread disruption is paramount. In the event of a PSPS or prolonged power outage, service would be dependent on the capacity of the supplemental electric sources and amount of natural gas contained in the La Goleta Storage Field at the time of the outage.

The 3/1 Hybrid Compression option would meet some of the stated objectives. Three new electric and one natural gas compressors would meet VCAPCD and safety regulations and would be capable of meeting operating requirements when not impacted by a loss of electric power. Some potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, could occur due to grading, trenching, and installation of new electric infrastructure. Consistency with the land use designation and zoning and site size would be dependent on the site selected. New or reconductored offsite electric lines would be required.

As described above, the 3/1 Hybrid Compression Alternative would not provide reliable compression in the event of a power failure, would not enhance reliability, could jeopardize supplies to the La Goleta Storage Field, and would meet only some of the stated objectives. For these reasons, the 3/1 Hybrid Compression Alternative was dismissed.

2.1.4 All-Electric Compression

The All-Electric Compression option would result in the installation of four new 1,900 HP electric compressors. Electricity would be provided by the SCE electric grid and require a new onsite substation and potentially one new circuit, with an additional circuit for redundancy. Some onsite electric generation could be provided from rooftop-mounted solar panels and electric storage could be provided by an onsite BESS that would be sufficient to support the office/administrative electric load. No natural gas compressors would remain or be installed. A new compressor building would be constructed to house the equipment. As with the planned project, a new office building and a new warehouse would be constructed and any structures currently onsite would be removed.

Rationale for Dismissing Alternative

The All-Electric Compression option would not meet the stated purpose and need of the planned project. As discussed in Section 2.1.2: Compressor Station Removal Alternative, SoCalGas has a mandate to provide natural gas service to customers on the Central Coast and within its entire service area. The reliability of the Ventura Compressor Station is critical. If SoCalGas lost electric power with an all-electric compressor option, this could impact customers due to the inability to move gas up the Central Coast to serve customer demand and to replenish the La Goleta Storage Field. With increasing frequency, PSPS on the SCE electric grid destabilize the energy delivery system and compromise reliability. Locally, wildfire risk is an ever-present threat. The Ventura community was affected by the Thomas Fire that began in December 2017, resulting in damage to more than 280,000 acres and destroying more than 1,000 buildings. Power was lost during the fire for several hours and subsequently SCE has initiated PSPS events during high wind conditions.

Additionally, the electrical load for four new electric compressors would require onsite infrastructure, such as a substation. Based on preliminary analysis, approximately 8 MW of electric power would be needed, which would require distribution-level service on two unique power lines of at least 12 kV or 16 kV each, or 8 MW of backup generation onsite. According to

the Solar Energy Industries Association, “depending on the specific technology, a utility-scale solar power plant may require between 5 and 10 acres per megawatt (MW) of generating capacity” (SEIA 2021). The existing site is only 8 acres in size and proposed new locations are roughly 15 acres in size, rendering utility-scale solar onsite infeasible. Also, as discussed above, BESS and fuel cells could provide supplemental power but the duration the power would be available is likely no longer than 5 days.

As a mainline compressor station, the station’s ability to continue to serve customers at a rate sufficient to avoid a widespread disruption is paramount. In the event of a PSPS or prolonged power outage, service would be dependent on the capacity of supplemental electric sources and the amount of natural gas contained in the La Goleta Storage Field at the time of the outage.

The All-Electric Compression Alternative would meet some of the stated objectives. New electric compressors would meet safety regulations and would be capable of meeting operating requirements when not impacted by a loss of electric power. Some environmental impacts, especially related to dust generation, noise, and visual/aesthetics, could occur due to grading, trenching, and installation of new electric infrastructure. Consistency with the land use designation and zoning and site size would be dependent on the site selected. New or reconductored offsite electric lines would be required.

As described above, the All-Electric Compression Alternative would not provide reliable compression in the event of a power failure, would not enhance reliability, could jeopardize supplies to the La Goleta Storage Field, and would meet only some of the stated objectives. For these reasons, the All-Electric Compression Alternative was dismissed.

2.1.5 La Goleta Storage Field

The La Goleta Storage Field Alternative (“Goleta Alternative”) would result in the installation of new compression equipment at the La Goleta Storage Field. The Ventura Compressor Station provides the necessary pressure to supply the Coastal System north of the Ventura Compressor Station and to support injection at the La Goleta Storage Field. Natural gas currently enters the La Goleta Storage Field at a pressure that enables the existing onsite equipment to boost pressure to overcome the differential between the storage field and pipeline. With the loss of compression at the Ventura Compression Station, new compression equipment would be installed to offset the loss of pipeline pressure currently provided by the Ventura Compressor Station and support injection.

Rationale for Dismissing Alternative

The Goleta Alternative would not meet the stated purpose and need of the planned project. The installation of new compression equipment at the La Goleta Storage Field would serve some of the essential functions of the Ventura Compressor Station but would not achieve the same operational benefits as the planned project. In general, it is less efficient and requires greater horsepower to compress at the end of a pipeline system rather than at the beginning. Additionally, the loss of pressure on the transmission lines serving the Coastal System north of the Ventura Compressor Station could impact the distribution pipeline systems north of the Ventura Compressor Station under winter demand conditions. Additional improvements to the Coastal System, such as rebuilding or replacing regulator stations and large customer meter sets or installing new pipelines, may be required. SoCalGas’ current design for the planned project would allow the station to support customer demand north of Ventura during a high-sendout condition should gas supply from the La Goleta Storage Field be unavailable, or during

milder demand conditions to preserve the inventory at the storage field for the winter heating season. Simply replacing the Ventura Compressor Station with incremental compression at the La Goleta Storage Field for injection purposes would not achieve this function; the extent of the additional improvements that would be required are unknown, but it may include new transmission pipeline between the compressors and the transmission mainline, an assessment of the capability of the existing compressors at the La Goleta Storage Field to perform this new transmission function, and a complex control system to operate the compressors in injection or transmission mode.

The Goleta Alternative would meet some of the stated objectives. The alternative would comply with applicable safety regulations, Santa Barbara County Air Pollution Control District requirements and maintain compatibility with the County of Santa Barbara land use designation and zoning as well as the County of Santa Barbara land use designation and zoning of the La Goleta Storage Field (“UT – Public Utility” and “PU – Public Utilities,” respectively) (County of Santa Barbara 2022). However, potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, could occur due to grading, trenching, and installation of new infrastructure. Environmental resource constraints, such as cultural and natural resources, that are known to be present at the La Goleta Storage Field, could be impacted by the installation of new compression equipment.

As described above, the Goleta Alternative would not provide sufficient compression to meet operational needs, would not enhance reliability, and would meet only some of the stated objectives. For these reasons, the Goleta Alternative was dismissed.

2.2 Alternatives Dismissed for Failing to Meet Essential Site Criteria

One alternative was considered and dismissed from further evaluation because it does not meet the essential site criteria as identified in Step 3 of the evaluation process. The alternative that was considered and the rationale for why it was dismissed are identified in Section 2.2.1.

2.2.1 Petrochem Site

The Petrochem Site option was developed by SoCalGas. This site is located approximately 12,000 feet north of the compressor station property to the west of State Route (SR) 33 within the jurisdiction of the County of Ventura. This site is not located on the existing transmission pipeline corridor and is privately owned; therefore, any future project would require the involvement of the landowner, either through easement acquisition, property purchase, or exercise of eminent domain. The property is approximately 15 acres on land currently developed with industrial uses, including oil extraction infrastructure, and is designated “Industrial” and zoned by the County of Ventura as “M3-10,000 sf – General Industrial, 10,000 sf minimum parcel size” (Ventura County 2020, 2021b). The slope of the property is less than 5 percent and would require onsite grading related to over-excavation and recompaction for structural foundations and grading to relocate and install pipelines. Access to the site is provided by multiple driveways off Crooked Palm Road that meet SoCalGas and emergency responder access requirements.

Transmission and distribution pipelines would need to be rerouted from the existing compressor station property to the new site location, requiring grading, trenching, and pipeline installation, and would potentially require acquisition of additional pipeline right-of-way. Given the fact that the site is developed with existing industrial uses, other utility connections for electrical, potable

water, sewer, and telecommunications are assumed to be available onsite and would require minimal upgrades. Water, sewer service, electricity, and telecommunications demand would be anticipated to be consistent with the existing compressor station.

A new office and a warehouse similar in size to the planned project structures would be constructed onsite. A perimeter block wall 8 feet in height would be required for security purposes. Cameras and lighting would also be required for operational needs and security. Landscaping, such as trees or hedges, would be installed to help screen the perimeter wall and minimize visibility of the compressor station.

Purpose and Need

The Petrochem Site option would meet the stated purpose and need for the planned project. Four new compressors (either four gas or two gas and two electric) would replace the existing aging equipment and would meet the VCAPCD air emission and DOT safety requirements. Both transmission and distribution pipelines would need to be routed to the new location, which would be feasible predicated on detailed engineering design. The proposed 7,600 HP would also maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The Petrochem Site Alternative would meet some of the stated objectives. This alternative would replace existing infrastructure with new equipment that would meet VCAPCD and safety regulations and be capable of meeting operating requirements, including during power outages. The 15-acre site is sufficient to build a new compressor station. The use of the property would be consistent with the Ventura County land use designation of “Industrial” and the zoning “M3-10,000 sf.” However, potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, would occur due to grading, trenching, and installation of new infrastructure.

As described above, the Petrochem Site Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives. For these reasons, the Petrochem Site Alternative was carried forward for consideration related to essential site criteria.

Essential Site Criteria

The Petrochem Site option does not meet all the essential site criteria, as noted below and shown on Figure 3.

- The existing property is at least 10 acres in size for a new compressor station.
- The nearest airport to the property is the Oxnard Airport, which is approximately 9.85 miles to the southeast (VCALUC 2000). The use as a compressor station is compatible with the FAA land use regulations as stated in the *Airport Comprehensive Land Use Plan for Ventura County Final Report* (VCALUC 2000).²⁴
- The site has several areas of mapped FEMA floodway (Zone AE) and areas without a base flood elevation identified (FEMA 2021b). The floodway occupies a significant portion of the site and as such, this site does not meet the essential site criteria.

²⁴ The Airport Comprehensive Land Use Plan for Ventura County Final Report addresses the Camarillo, Oxnard, Santa Paula, and NAS Point Mugu airports (VCALUC 2000).

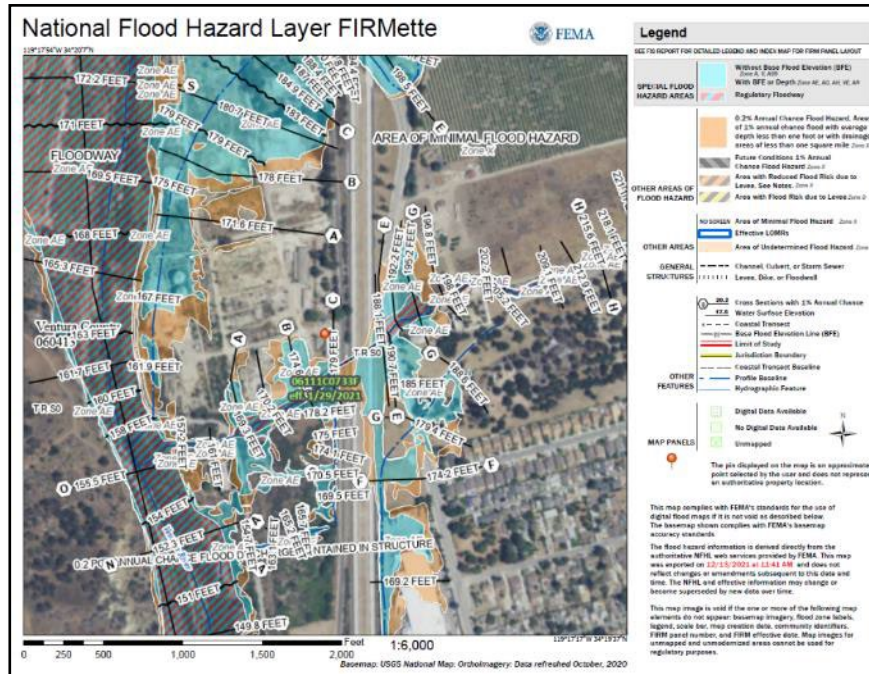

Figure 3. National Flood Hazard Layer FIRMette

Source: FEMA 2021b.

As such, the Petrochem Site option was dismissed from further consideration because of mapped FEMA floodway.

2.3 Other Alternatives Outside the Scope of the Feasibility Study

As previously noted, this feasibility study has been prepared in response to CPUC letters dated August 5, 2021, and August 20, 2021, which specifically request that SoCalGas “hold a public forum to present (1) full analysis of all options considered for the compressor station upgrade, (2) the basis for rejecting all alternatives, including but not limited to electric compressors for all or part of the project, (3) all alternative sites that were considered and SoCalGas’ reasons for rejecting them, and (4) an explanation of how this project factors into both local and statewide safe and reliable service and the state’s decarbonization efforts” (CPUC 2021). There are potential alternatives outside the scope of this feasibility study, such as relocating to non-industrial land uses farther away from the compressor station, that have not been evaluated given the focus of this analysis.

INTENTIONALLY LEFT BLANK

3 Alternatives Carried Forward for Further Analysis

This section provides a description of each alternative option, including the planned project, that was carried forward for detailed environmental and operational analysis. For the purpose of developing the alternative options, certain general construction assumptions are provided based on regulatory requirements, industry best management practices, and SoCalGas gas standards.²⁵ Specific construction assumptions for individual alternatives are described in the section for that respective alternative. For simplicity, measurements for linear distance, square footage, and grading (volume) have been rounded to the nearest hundred. Additionally, on January 6, 2022, representatives from SoCalGas' Construction Department, Gas Transmission Department, and Gas Engineering Department visited each alternative site location and viewed them from publicly accessible areas or from land with SoCalGas access rights to assess site conditions.

General Construction Assumptions

- Pipeline alignments and staging areas are conceptual and do not account for geotechnical, civil, environmental, utility, or other constraints. These factors would be addressed during preliminary engineering design.
- All quantities for linear distance, square footage, and grading are rounded to the nearest hundred.
- A hybrid compressor station would include two natural gas compressors and two electric compressors, with each unit having approximately 1,900 HP.
- A hybrid compressor station would require a 5 MW increase in the electric service capacity.
- New structures would be approximately 20,300 square feet total and the same approximate size (rounded to the nearest hundred square feet) and height for each alternative, as follows:
 - Compressor building: 10,000 square feet and 52.5 feet in height.
 - Warehouse: 5,200 square feet and 27.5 feet in height.
 - Office: 4,700 square feet and 16.5 feet in height.
 - Generator enclosure (850-kilowatt generator): 400 square feet and 16.5 feet in height.
- A perimeter block wall 8 feet in height would be required for security purposes.
- The new compressor station would require approximately 10 acres of land.
- Any new compressor station would require two suction pipelines and two discharge pipelines, consistent with the existing compressor station.
- Minimum easement width for ongoing operations (e.g., repair, maintenance, vehicular access, inspection, vegetation management) is 25 feet for one pipeline and 50 feet for two adjacent pipelines.
- A 25-foot temporary workspace easement would be required in addition to the 50-foot permanent non-exclusive easement.

²⁵ SoCalGas' gas standards, including operations and maintenance procedures, are developed to comply with federal and state pipeline safety regulations.

- A permanent exclusive easement of 50 feet by 75 feet would be required for mainline valves.
- A 50-foot by 75-foot workspace would be required for new mainline valves.
- Transmission pipeline requires a minimum trench width of 28 inches and a minimum trench depth of 64 inches.
- Pipeline spacing must be a minimum of 60 inches of horizontal separation and 24 inches of vertical separation between natural gas pipelines and electrical, water, sewer, and telecommunications pipelines/conduit.
- One staging area is required for each alternative option that would be used for pipe storage, parking, and, temporary offices, welding activities, and other such temporary activities.
- Consistent with Ventura County Fire Protection District (VCFPD) Standard 501, “Fire Apparatus Access Standard,” emergency access roads must be a minimum of 24 feet wide and not exceed a slope greater than 20 percent, with turnouts every 150 feet.
- Grading cross slopes are dependent upon soil type and generally cannot exceed a 2:1 (horizontal:vertical) ratio.
- A disturbance footprint of 3.95 acres was assumed for the primary compressor station (exclusive of other site grading and utility connections), which includes over-excavation and recompaction.
- Subsurface utility potholing would be required for any new or relocated pipeline to identify potential conflicts and to address them in the engineering design.
- All grading quantities are estimates.²⁶ Ultimately, over-excavation, recompaction, rough grading, and other earthwork would be designed and implemented based on licensed geotechnical and civil engineers’ recommendations.
- For cross-county pipeline installations, geotechnical borings will be required to validate slope stability for pipeline design and routing.
- To the extent feasible, new pipelines and infrastructure would be placed within existing SoCalGas easements/right-of-way or public right-of-way rather than private property or public land (e.g., parks, schools).
- If an alternative location is selected that is not currently owned by SoCalGas, the company would acquire in fee property on which the compressor station would be located.
- As part of any necessary site acquisition process, any prior industrial contamination and well abandonment would be addressed by the seller, not SoCalGas.²⁷ Easement and/or fee acquisition would require coordination with and concurrence of the affected landowners. Eminent domain would be used as a last resort.
- Construction equipment is addressed in Appendix A and specifically the air quality analysis and reflects the different equipment for hillside sites and for level sites.
- SCE Interconnection:

²⁶ Grading is defined by the City of Ventura as “removal of soil or deposition of fill or combination thereof, including but not limited to, overexcavation and recompaction” (City of Ventura 2017). Grading is defined by the County of Ventura as “excavation (cut), fill, or any combination of excavation and fill” (Ventura County 2016).

²⁷ It is assumed that remediation activities would be handled under the oversight of the California Department of Toxic Substances Control (DTSC 2022). Oil well abandonment may also require oversight and approval by the California Geologic Energy Management Division (CalGEM 2022).

- SCE assumptions were developed using SCE’s Southern California Edison Power Site Search Tool (SCE 2022).
- Any electrical alignment, pole placement, or electrical infrastructure requires SCE review and approval, which typically occurs after a Method of Service agreement has been established.
- Interconnection to the SCE system is assumed to occur by installing new poles to connect to the nearest existing circuit that runs from the site location to the Casitas Substation or to the Carpinteria Substation (County Line site only).
- For new poles, lightweight steel poles approximately 50 feet in height and spaced approximately every 100 to 150 feet would be required.
- Foundations would be approximately 2 feet in diameter and 7 feet in depth and require approximately 2 cubic yards of grading.
- Pole placement would be based on engineering design and field conditions but are assumed to be sited to avoid environmental resources to the extent feasible.
- Any new power pole inset is expected to require a temporary construction workspace of 50 feet by 50 feet (2,500 square feet) around each pole, which may result in temporary disturbance to ground cover.
- Vehicular access would be required to each pole location.

3.1 Alternative 1.A: Planned Project

The planned project was developed by SoCalGas at the existing Ventura Compressor Station site, located within the City of Ventura. The site is owned by SoCalGas and land use onsite consists of a compressor station, which has been present in some form since at least 1923 and has existed in its current configuration since the 1980s. The site is designated by the Ventura City General Plan as “Industry” and is zoned by the Ventura City municipal code as “M-2 General Industrial.” Industrial uses surround the site on the north, west, and south. The EP Foster Elementary School is located across Olive Street to the east of the site.

This alternative would result in the construction of a new compressor building and installation of four new natural gas engine-driven compressors (referred to throughout as “natural gas compressors”) at 1,900 HP each at the site. The existing three 1,100 HP natural gas reciprocating compressors would remain in operation until the new equipment is commissioned and in service. The existing compressors would then be decommissioned and removed and the old compressor building demolished. The existing office trailer and storage containers would be demolished/removed after a new office and a warehouse are constructed onsite. A perimeter block wall 8 feet in height would be required for security purposes. Cameras and lighting would also be required for operational needs and security. Landscaping, such as trees or hedges, would be installed to help screen the perimeter wall and minimize visibility of the compressor station. Access to the site via a driveway at least 24 feet wide is currently available and would be maintained to meet SoCalGas and emergency responder access requirements.

3.1.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 1.A: Planned Project are presented below and in Table 2.

- Other than ingress and egress to the site, construction activities would occur onsite or on an immediately adjacent eastern staging area.
- Construction of the compressor station, including pad grading, buildings, and compressors, would take approximately 24 to 36 months.

Table 2. Alternative 1.A Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	8.42 acres
Project Site – Demolition	22,000 square feet Office Trailer: 1,500 square feet Storage Containers: 1,500 square feet Compressor Building, Piping, and Equipment: 19,000 square feet
Project Site - Grading	6,375 cubic yards
Offsite – New Pipeline	0
Offsite – Roads	0
Offsite – Staging Area	2.5 acres
SCE Circuit, Substation, and System Name	Grandad Circuit 16 kilovolts Casitas Substation Santa Clara 220/66 System
Offsite – New Electrical Poles	0 Existing electrical service sufficient for natural gas option
Estimated Number of Properties Affected*	3

Note:

* Properties affected include the site, access, infrastructure, and staging areas.

3.1.2 Purpose, Need, and Objectives

The Alternative 1.A, the planned project, would meet the stated purpose and need for the planned project. The planned project would replace the existing aging equipment with four new natural gas compressors. The new equipment would meet the VCAPCD air emission requirements and safety requirements. The natural gas compressors would continue to operate even if there was a loss of power and would be available to move gas up the Central Coast and into the La Goleta Storage Field. As the overall energy delivery system in California continues to change due to the dispatching of renewable resources and electrification of buildings and vehicles, the ability of equipment to operate under variable conditions is critical. Solar and wind energy are intermittent and storage technology is not yet sufficient to store utility-scale power, which makes the resilience of the natural gas system for direct customer use and to support electric power generation imperative. The proposed combined 7,600 HP would maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The planned project would meet all stated objectives. New natural gas compressors would replace existing infrastructure with new equipment that would meet VCAPCD and safety regulations and would be capable of meeting operating requirements, including during power outages. The use of the property would remain consistent with the City of Ventura land use designation and zoning. The property is sufficient in size for the equipment configuration. Potential environmental impacts from construction would be minimized because all work would occur on the existing property.

As described above, the planned project would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet all stated objectives. For these reasons, the planned project was carried forward for consideration related to essential site criteria.

3.1.3 Essential Site Criteria

The planned Ventura Compressor Station Project site would meet all the essential site criteria.

- The existing property is 8 acres in size.
- The nearest airport to the property is the Oxnard Airport, which is approximately 9 miles to the southeast. This airport is served by Runway 7-25, which is 5,950 feet long by 100 feet wide, is aligned east-west, and has a threshold of 1,372 feet for obstacle clearance safety (VCALUC 2000). The site's use as a compressor station is compatible with the FAA land use regulations as stated in the *Airport Comprehensive Land Use Plan for Ventura County Final Report* (VCALUC 2000).²⁸
- The site is designated by FEMA as "Area with Reduced Flood Risk Due to Levee Zone X" and is not within a floodway (FEMA 2021a).

Therefore, the planned project was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4, Environmental and Operational Considerations.

3.2 Alternative 1.B: Current Site – Hybrid

The Ventura Compressor Station – Hybrid Alternative was proposed by the CPUC and would result in two new natural gas compressors at 1,900 HP each and two new electric compressors at 1,900 HP each at the existing Ventura Compressor Station property. The existing three 1,100 HP natural gas compressors would remain in operation until the new equipment is commissioned and in service. The existing compressors would then be decommissioned and removed and the old compressor building demolished. The new compressors would be installed in a new compressor building. The existing temporary office trailer and storage containers would be demolished/removed. A new office and a warehouse would be constructed onsite, similar to the planned project. New electric lines would be required to meet onsite electric demand from the new electric compressors. Based on preliminary analysis, approximately 5 MW of electric power are needed, which would require distribution-level service on one unique power line of at least 16 kV and potentially an onsite substation. It is assumed that this conduit could be placed on existing SCE poles that interconnect with the existing station.

²⁸ The Airport Comprehensive Land Use Plan for Ventura County Final Report addresses the Camarillo, Oxnard, Santa Paula, and NAS Point Mugu airports (VCALUC 2000).

3.2.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 1.B: Current Site – Hybrid are presented below and in Table 3.

- Construction of the compressor station, including pad grading, buildings, and compressors, and electrical interconnection would take approximately 30 to 36 months.

Table 3. Alternative 1.B Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	8.42 acres
Project Site – Demolition	22,000 square feet Office Trailer 1,500 square feet Storage Containers 1,500 square feet Compressor Building, Piping and Equipment: 19,000 square feet
Project Site - Grading	6,375 cubic yards
Offsite – New Pipeline	0
Offsite – Roads	0
Offsite – Staging Area	2.5 acres
Offsite – Pipeline Ground Disturbance	0
SCE Circuit, Substation, and System Name	San Nicholas Circuit 16 kilovolts Casitas Substation Santa Clara 220/66 System (SCE 2021a)
Offsite – New Electrical Poles	None required - existing electrical connection onsite assumed to be adequate to connect with San Nicholas Circuit
Estimated Number of Properties Affected*	3

Note:

* Properties affected include the site, access, infrastructure. and staging areas.

3.2.2 Purpose, Need, and Objectives

The Ventura Compressor Station – Hybrid Alternative would meet the stated purpose and need for the planned project. A hybrid compressor configuration would replace the existing aging equipment with two new natural gas compressors and two new electric compressors. The new gas compressors would meet the VCAPCD’s air emission requirements and the electric driven compressors would be non-emitting equipment and therefore would not be subject to VCAPCD’s requirements. By providing two natural gas and two electric compressors, the compressor station would have the redundancy needed in the event of a loss of electric power. The natural gas compressors would continue to operate even if the electric compressors were offline and would be available to move gas up the Central Coast and into the La Goleta Storage Field. As the overall energy delivery system in California continues to change due to the dispatching of renewable resources and electrification of buildings and vehicles, the ability of equipment to operate under variable conditions is critical. Solar and wind energy are intermittent and storage technology is not yet sufficient to store utility-scale power, which makes the resilience of the natural gas system for direct customer use and to support electric power generation imperative.

A hybrid compressor station with the proposed combined 7,600 HP would also maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The Ventura Compressor Station – Hybrid Alternative would meet most of the stated objectives. New natural gas and electric compressors would replace existing infrastructure with new equipment that would meet VCAPCD and safety requirements and be capable of meeting operating requirements, including during power outages due to the redundancy with natural gas compressors. The use of the property would remain consistent with the City of Ventura land use designation and zoning. The property is sufficient in size for a hybrid equipment configuration. Potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, could occur due to installation of new electric infrastructure.

As described above, the Ventura Compressor Station – Hybrid Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet most of the stated objectives. For these reasons, the Ventura Compressor Station – Hybrid Alternative was carried forward for consideration related to essential site criteria.

3.2.3 Essential Site Criteria

As discussed in Section 3.1.3, the Ventura Compressor Station site would meet all the essential site criteria. As such, the Ventura Compressor Station – Hybrid Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.3 Alternative 2.A. Avocado Site – Natural Gas

The Avocado Site – Natural Gas Alternative was suggested by members of the public at SoCalGas’ town hall in October 2021. This site is located approximately 3,000 feet west of the compressor station property on the existing transmission pipeline corridor within the jurisdiction of the County of Ventura. The site is privately owned; therefore, any future project would require the involvement of the landowner, either through a voluntary transfer of needed land rights or through the exercise of eminent domain.²⁹

The property is approximately 15 acres and is designated “Open Space” and zoned by the County of Ventura as “AE-40 ac – Agricultural Exclusive, 40 acres minimum parcel size” (Ventura County 2020, 2021b). The Ventura County general plan “Open Space” land use designation encompasses land or water that is essentially unimproved and devoted to an open-space use, including land for preservation of natural resources, managed production of resources, outdoor recreation, public health and safety, and to promote efficient municipal services and avoid urban sprawl (Ventura County 2020). The Ventura County zoning ordinance AE-40 zone “is to preserve and protect commercial agricultural lands as a limited and irreplaceable resource, to preserve and maintain agriculture as a major industry in Ventura County and to protect these areas from the encroachment of nonrelated uses which, by their nature, would have detrimental effects

²⁹ As a public utility, SoCalGas has the ability to condemn land through the eminent domain process. Eminent domain is the process by which a government agency or utility can take property for public benefit as long as the property owner is adequately compensated. The eminent domain process is usually exercised only as a last resort.

upon the agriculture industry” (Ventura County 2021a). Additionally, the property is within an area governed by the Save Open-Space and Agricultural Resources (SOAR) initiative.³⁰

The surrounding area is primarily developed with agricultural uses and low-density residential development (the nearest residence is approximately 0.7 miles away) and the specific site is used for agricultural purposes, including a portion of which is an avocado orchard. The slope of the property ranges from 0 percent to 70 percent and would require grading and potentially the installation of retaining walls or soil nails to create a level pad for compressor equipment and operational needs. To meet acceptable engineering design standards, a 2:1 slope is typically required, which requires a larger footprint than the actual building pad (“catch points”); given the slope of the site, significant grading to create a level site would be required.

Access to the site via a driveway at least 24 feet wide would be needed to meet SoCalGas and emergency responder access requirements. The access road would require grading and potentially retaining walls to achieve an acceptable grade suitable for fire truck access.

Distribution pipelines would need to be rerouted from the existing compressor station property to the new site location, requiring grading, trenching, pipeline installation, and potentially acquisition of additional pipeline right-of-way. Additionally, other utility connections for electricity, potable water, sewer, and telecommunications would be required. These may be able to be collocated in a utility trench if minimum separation between the utilities can be maintained. It may be feasible to locate the utility trench within the new access road. Otherwise, multiple trenches would be necessary. Electric and telecommunications lines may be located on aboveground utility poles. Water, sewer service, electricity, and telecommunications demand would be anticipated to be consistent with the existing compressor station.

Once access, site grading, and utilities are provided, four new natural gas compressors with 1,900 HP each would be installed in a new compressor building similar to the planned project. A new office and a warehouse similar in size to the planned project structures would be constructed onsite. A perimeter block wall 8 feet in height would be required for security purposes. Cameras and lighting would also be required for operational needs and security. Landscaping, such as trees or hedges, would be installed to help screen the perimeter wall and minimize visibility of the compressor station.

3.3.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 2.A: Avocado Site – Natural Gas are presented below and in Table 4.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 60 to 70 months.
- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the Avocado Site would take approximately 6 to 12 months, which would happen concurrently with the onsite work.

³⁰ Ventura County voters first approved the countywide SOAR initiative in 1998. In general, and subject to certain exceptions, SOAR requires countywide voter approval of any (1) substantive change to the General Plan’s Agricultural, Open Space, or Rural land use goals or policies and (2) re-designation of land with these General Plan land use designations. In November 2016, Ventura County voters renewed the County’s SOAR initiative and extended its provisions through 2050 (Ventura County 2020).

- Additional acreage would be added to account for required slope cutbacks. Soil nail walls would potentially be used to minimize need for slopes and onsite fill/compaction. Fill soil creates challenges for structural and equipment foundations. Soil nails would allow for a level site with fewer slopes to procure, grade, and maintain.
- Site grading and layout would be performed to integrate into the existing site contours to the extent feasible.

Table 4. Alternative 2.A Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	15.06 acres
Project Site – Demolition	0
Project Site – Grading	1.3 million cubic yards Assumes cut and fill balance onsite
Offsite – Pipeline Corridor 1	3,019 square feet
Offsite - Pipeline Corridor 2	1,563 square feet
Offsite - Water/Sewer Lines	36,945 square feet
Main Line Valve Connection 1	3,750 square feet
Main Line Valve Connection 2	3,750 square feet
Offsite – Roads	Resurface and widen 12,315 linear feet of Taylor Ranch Road to 24 feet, with assumed existing width of 12 feet
Offsite – Staging Area	5.63 acres
SCE Circuit, Substation, and System Name	Grandad Circuit 16 kilovolts Casitas Substation Santa Clara 220/66 System (SCE 2021a)
Offsite – New Electrical Poles	0 Assumes collocated utility trench because electrical demand would not be significant
Estimated Number of Properties Affected*	4

3.3.2 Purpose and Need

The Avocado Site – Natural Gas Alternative would meet the stated purpose and need for the planned project. Four new 1,900 HP natural gas compressors would replace the existing aging equipment and would meet the VCAPCD air emission and safety requirements. The proposed 7,600 HP would also maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The Avocado Site – Natural Gas Alternative would meet some of the stated objectives. New natural gas compressors would replace existing infrastructure with new equipment that would meet VCAPCD and safety regulations and would be capable of meeting operating requirements,

including during power outages. The 15-acre site is sufficient to build a new compressor station. However, the use of the property would not be consistent with the Ventura County land use designation of Open Space or the zoning AE-40 acres. Additionally, the property is within an area governed by the SOAR initiative. Potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, would occur due to grading, trenching, and installation of new infrastructure. The location is highly visible from the surrounding community because the site is on a hillside above West Ventura.

As described above, the Avocado Site – Natural Gas Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives. For these reasons, the Ventura Compressor Station – Hybrid Alternative was carried forward for consideration related to essential site criteria.

3.3.3 Essential Site Criteria

The Avocado Site would meet all the essential site criteria.

- The existing property is approximately 15 acres in size.
- The nearest airport to the property is the Oxnard Airport, which is approximately 9.5 miles to the southeast. The use as a compressor station is compatible with the FAA land use regulations as stated in the Airport Comprehensive Land Use Plan for Ventura County Final Report (VCALUC 2000).³¹
- The site is designated by FEMA as having no flood risk (FEMA 2021a).

As such, the Avocado Site – Natural Gas Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.4 Alternative 2.B: Avocado Site – Hybrid

The Avocado Site – Hybrid Alternative was proposed by SoCalGas to take into consideration feedback provided during town halls in October 2021 and CPUC input to consider electric compressors. This alternative would be identical to the Avocado Site – Natural Gas Alternative except that compression would be provided by two 1,900 HP natural gas compressors and two 1,900 HP electric compressors. Installation of electric compressors would increase the electric demand for the compressor station. Based on preliminary analysis, approximately 5 MW of electric power would be needed, which would require distribution-level service on one unique power line of at least 16 kV. An onsite substation would also be required.

3.4.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 2.B: Avocado Site – Hybrid are presented below and in Table 5.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 60 to 70 months.

³¹ The Airport Comprehensive Land Use Plan for Ventura County Final Report addresses the Camarillo, Oxnard, Santa Paula, and NAS Point Mugu airports (VCALUC 2000).

- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the Avocado site would take approximately 6 to 12 months, which would happen concurrently with the onsite work.
- Additional acreage would be added to account for required slope cutbacks. Soil nail walls would potentially be used to minimize need for slopes and onsite fill/compaction. Fill soil creates challenges for structural and equipment foundations. Soil nails would allow for a level site with fewer slopes to procure, grade, and maintain.
- Site grading and layout would be performed to integrate into the existing site contours.

Table 5. Alternative 2.B Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	15.06 acres
Project Site – Demolition	0
Project Site – Grading	1.3 million cubic yards Assumes cut and fill balance onsite
Offsite – Pipeline Corridor 1	3,019 square feet
Offsite - Pipeline Corridor 2	1,563 square feet
Offsite - Water/Sewer Lines	36,945 square feet
Main Line Valve Connection 1	3,750 square feet
Main Line Valve Connection 2	3,750 square feet
Offsite – Roads	Resurface and widen 12,315 linear feet of Taylor Ranch Road to 24 feet, with assumed existing width of 12 feet
Offsite – Staging Area	5.63 acres
SCE Circuit, Substation, and System Name	Grandad Circuit 16 kilovolts Casitas Substation Santa Clara 220/66 System (SCE 2021a)
Offsite – New Electrical Poles	30 poles
Offsite –Electric Poles – Grading	60 cubic yards
Estimated Number of Properties Affected*	4

Note:

* Properties affected include the site, access, infrastructure, and staging areas.

3.4.2 Purpose and Need

As with the Avocado Site – Natural Gas Alternative, the hybrid alternative would meet the stated purpose and need. The use of electric compressors with natural gas compressors would provide the necessary redundancy to meet operational needs. This alternative would provide sufficient compression to meet operational needs, would enhance reliability, and would maintain supplies to the La Goleta Storage Field.

As with the Avocado Site – Natural Gas Alternative, the hybrid alternative would meet some of the stated objectives. However, the use of electric compressors would increase electric demand and therefore require additional electric infrastructure to support the project, consequently requiring more grading and overhead electric conduit.

Because the Avocado Site – Hybrid Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives, this alternative was carried forward for consideration related to essential site criteria.

3.4.3 Essential Site Criteria

As noted in Section 3.3.3, the Avocado Site would meet all essential site criteria. Therefore, the Avocado Site – Hybrid Alternative was carried forward for consideration of environmental and operational criteria, as discussed in Section 4.

3.5 Alternative 3.A: Ventura Steel – Natural Gas

The Ventura Steel – Natural Gas Alternative was developed by SoCalGas. This site is located approximately 7,000 feet north of the compressor station property to the east of North Ventura Avenue within the jurisdiction of the County of Ventura. This site is not located on the existing transmission pipeline corridor and is privately owned; therefore, any future project would require the involvement of the landowner, either through a voluntary transfer of needed land rights or through the exercise of eminent domain. The property is approximately 10 acres, on land currently developed with industrial uses, including oil extraction infrastructure, and is designated “Industrial” by the Ventura County general plan and zoned by the Ventura County zoning ordinance as “M3-10,000 sf – General Industrial, 10,000 sf minimum parcel size” (Ventura County 2020. 2021b). The majority of the site is less than 10 percent slope and would require onsite grading related to over-excavation and recompaction for structural foundations and grading to relocate and install pipelines. Access to the site is provided by multiple driveways off North Ventura Avenue and East Shell Road that currently meet SoCalGas and emergency responder access requirements.

Transmission and distribution pipelines would need to be rerouted from the existing compressor station property to the new site location, requiring grading, trenching, pipeline installation, and potentially acquisition of additional pipeline right-of-way. Given the fact that the site is developed with existing industrial uses, other utility connections for electricity, potable water, sewer, and telecommunications are assumed to be available onsite and would require minimal upgrades. Water, sewer service, electricity, and telecommunications demand would be anticipated to be consistent with the existing compressor station.

Four new natural gas compressors with 1,900 HP each would be installed in a new compressor building similar to the planned project. A new office and a warehouse similar in size to the planned project structures would be constructed onsite. A perimeter block wall 8 feet in height would be required for security purposes. Cameras and lighting would also be required for operational needs and security. Landscaping, such as trees or hedges, could be installed to help screen the perimeter wall and minimize visibility of the compressor station.

3.5.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 3.A: Ventura Steel – Natural Gas are presented below and in Table 6.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 36 to 48 months.
- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the Ventura Steel site would take approximately 12 months, which would happen concurrently with the onsite work.
- Road closures Ventura Avenue would be necessary, and in order to maintain traffic flow, one lane would be closed for 6 months, then the alternate lane would be closed for 6 months, with traffic control measures in place for the duration of the work.

Table 6. Alternative 3.A Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	10 acres
Project Site – Demolition	49,850 square feet Building 1: 10,600 square feet Building 2: 11,130 square feet Building 3: 24,000 square feet Building 4: 4,200 square feet
Project Site – Grading	4,500 cubic yards
Pipeline Corridor 1	39,685 square feet
Pipeline Corridor 2	38,876 square feet
Water/Sewer Lines	0 square feet
Main Line Valve Connection	7,500 square feet
Depressurization Line	282 square feet
Offsite – Staging Area	4.69 acres
SCE Circuit, Substation, and System Name	Canet Circuit Casitas Substation Santa Clara 220/66 kilovolts (SCE 2021a)
Offsite – New Electrical Poles	0 Assumes existing electrical service is sufficient for natural gas option
Offsite – Electric Poles – Grading	0
Offsite – Roads	3,600 linear feet of new 12-foot-wide road for construction access to new pipeline corridor Assumes existing access from School Canyon Road and Crimea Street Fire Road is adequate

Table 6. Alternative 3.A Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Estimated Number of Properties Affected*	12

Note:

* Properties affected include the site, access, infrastructure, and staging areas.

3.5.2 Purpose and Need

The Ventura Steel – Natural Gas Alternative would meet the stated purpose and need for the planned project. Four new 1,900 HP natural gas compressors would replace the existing aging equipment and would meet the VCAPCD air emission requirements and safety requirements. Both transmission and distribution pipelines would need to be routed to the new location, which would be feasible predicated on detailed engineering design and availability of right-of-way. The proposed 7,600 HP would also maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The Ventura Steel – Natural Gas Alternative would meet some of the stated objectives. New natural gas compressors would replace existing infrastructure with new equipment that would meet VCAPCD and safety requirements and would be capable of meeting operating requirements, including during power outages. The 10-acre site is sufficient to build a new compressor station. The use of the property would be consistent with the Ventura County land use designation of “Industrial” and the zoning “M3-10,000 sf.” However, potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, would occur due to grading, trenching, and installation of new infrastructure.

As described above, the Ventura Steel – Natural Gas Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives. For these reasons, the Ventura Steel – Natural Gas Alternative was carried forward for consideration related to essential site criteria.

3.5.3 Essential Site Criteria

The Ventura Steel site would meet all the essential site criteria.

- The existing property is approximately 10 acres in size.
- The nearest airport to the property is the Oxnard Airport, which is approximately 8.75 miles to the southeast (VCALUC 2000). The use as a compressor station is compatible with the FAA land use regulations as stated in the *Airport Comprehensive Land Use Plan for Ventura County Final Report* (VCALUC 2000).³²
- The site is designated by FEMA as having no flood risk (FEMA 2021b).

³² The Airport Comprehensive Land Use Plan for Ventura County Final Report addresses the Camarillo, Oxnard, Santa Paula, and NAS Point Mugu airports (VCALUC 2000).

As such, the Ventura Steel – Natural Gas Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.6 Alternative 3.B: Ventura Steel – Hybrid

The Ventura Steel – Hybrid Alternative was proposed by SoCalGas to take into consideration CPUC input to consider electric compressors. This alternative would be identical to the Ventura Steel – Natural Gas Alternative except that compression would be provided by two 1,900 HP natural gas compressors and two 1,900 HP electric compressors. Installation of electric compressors would increase the electric demand for the compressor station. Based on preliminary analysis, approximately 5 MW of electric power would be needed, which would require distribution-level service on one unique power line of at least 16 kV. An onsite substation would also be required.

3.6.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 3.B: Ventura Steel – Hybrid are presented below and in Table 7.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 36 to 48 months.
- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the Ventura Steel site would take approximately 12 months, which would happen concurrently with the onsite work.

Table 7. Alternative 3.B Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	10 acres
Project Site – Demolition	49,850 square feet Building 1: 10,600 square feet Building 2: 11,130 square feet Building 3: 24,000 square feet Building 4: 4,200 square feet
Project Site – Grading	4,500 cubic yards
Pipeline Corridor 1	39,685 square feet
Pipeline Corridor 2	38,876 square feet
Water/Sewer Lines	0 square feet
Main Line Valve Connection	7,500 square feet
Depressurization Line	282 square feet
Offsite – Staging Area	4.69 acres
SCE Circuit, Substation, and System Name	San Nicholas Circuit Casitas Substation Santa Clara 220/66 kilovolts
Offsite – New Electrical Poles	2 poles Interconnect to the San Nicholas Circuit

Table 7. Alternative 3.B Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Offsite – Electric Poles – Grading	4 cubic yards
Offsite – Roads	3,600 linear feet of new 12-foot-wide road for construction access to new pipeline corridor Assumes existing access from School Canyon Road and Crimea Street Fire Road is adequate
Estimated Number of Properties Affected*	12

Note:

* Properties affected include the site, access, infrastructure, and staging areas.

3.6.2 Purpose and Need

As with the Ventura Steel – Natural Gas Alternative, the hybrid alternative would meet the stated purpose and need. The use of electric compressors with natural gas compressors would provide the necessary redundancy to meet operational needs. This alternative would provide sufficient compression to meet operational needs, would enhance reliability, and would maintain supplies to the La Goleta Storage Field.

As with the Ventura Steel – Natural Gas Alternative, the hybrid alternative would meet some of the stated objectives. However, the use of electric compressors would increase electric demand and therefore require additional electric infrastructure to support the project, consequently requiring more grading and overhead electric conduit.

Because the Ventura Steel – Hybrid Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives, this alternative was carried forward for consideration related to essential site criteria.

3.6.3 Essential Site Criteria

As noted in Section 3.5.3, the Ventura Steel site would meet all essential site criteria. Therefore, the Ventura Steel – Hybrid Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.7 Alternative 4.A: Devil’s Canyon Road – Natural Gas

The Devil’s Canyon Road – Natural Gas Alternative was suggested by members of the public at SoCalGas’ town hall in October 2021. This site is located approximately 5,300 feet northwest of the compressor station property within the jurisdiction of the County of Ventura. The site is privately owned; therefore, any future project would require the involvement of the landowner, either through a voluntary transfer of needed land rights or through the exercise of eminent domain.

The property is approximately 12.88 acres, privately owned, currently used for oil extraction, and designated by the Ventura County general plan as “Open Space” and zoned by the Ventura

County zoning ordinance as “OS-160 ac, Open Space, 160 acres minimum parcel size” with a Habitat Connectivity Corridor mapped along the Ventura River (Ventura County 2020, 2021b). The Ventura County general plan states that the Open Space land use designation encompasses land or water that is essentially unimproved and devoted to an open-space use, including land for preservation of natural resources, managed production of resources, outdoor recreation, public health and safety, and to promote efficient municipal services and avoid urban sprawl (Ventura County 2020). The Ventura County Code states that “the purpose of [the OS] zone is to provide for any of the following on parcels or areas of land or water that are essentially unimproved: ... The managed production of resources, including but not limited to: forest lands, rangeland, agricultural lands and areas of economic importance for the production of food or fiber; areas required for recharge of groundwater basins; bays, estuaries, marshes, rivers and streams which are important for the management of commercial fisheries; and, areas containing major mineral deposits, including those in short supply” (Ventura County 2021a). The area is developed with oil extraction uses. The slope of the property ranges between 0 percent and 30 percent, with the majority of the site less than 10 percent, and would require grading for over-excavation and recompaction for building foundations and utility trenching.

Access to the site is provided by multiple driveways off Shell Road that meet SoCalGas and emergency responder access requirements. Transmission and distribution pipelines would need to be rerouted from the existing compressor station property to the new site location, requiring grading, trenching, pipeline installation, and potentially acquisition of additional pipeline right-of-way. Given the fact that the site is developed with existing industrial uses, other utility connections for electricity, potable water, sewer, and telecommunications are assumed to be available onsite and would require minimal upgrades. Water, sewer service, electricity, and telecommunications demand would be anticipated to be consistent with the existing compressor station.

Once access, site grading, and utilities are provided, four new 1,900 HP natural gas compressors would be installed in a new compressor building similar to the planned project. A new office and a warehouse similar in size to the planned project structures would be constructed onsite. A perimeter block wall 8 feet in height would be required for security purposes. Cameras and lighting would also be required for operational needs and security. Landscaping, such as trees or hedges, could be installed to help screen the perimeter wall and minimize visibility of the compressor station.

3.7.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 4.A: Devil’s Canyon Road – Natural Gas are presented below and in Table 8.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 24 to 30 months.
- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the Devil’s Canyon Road site would take approximately 6 to 12 months, which would happen concurrently with the onsite work.

Table 8. Alternative 4.A Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	12.88 acres
Project Site – Demolition	156,645 square feet Piping/Equipment/Building
Project Site – Grading	4,500 cubic yards
Pipeline Route 1	23,963 square feet
Pipeline Route 2	23,963 square feet
Water/Sewer Lines	0 square feet
Main Line Valve Connection	7,500 square feet
Depressurization Line	0 square feet
Offsite – Staging Area	6.27 acres
SCE Circuit, Substation, and System Name	Circuit 00423 Casitas Substation Subtransmission 66 kilovolts
Offsite – New Electrical Poles	0 Assumes existing electrical service is sufficient for natural gas option
Offsite – Electric Poles – Grading	0 cubic yards
Offsite – Roads	1,892 linear feet Assumes existing access serving facility requires minor leveling and resurfacing
Estimated Number of Properties Affected*	5

Notes:

* Properties affected include the site, access, infrastructure, and staging areas

3.7.2 Purpose and Need

The Devil’s Canyon Road – Natural Gas Alternative would meet the stated purpose and need for the planned project. Four new 1,900 HP natural gas compressors would replace the existing aging equipment and would meet the VCAPCD air emission and safety requirements. Both transmission and distribution pipelines would need to be routed to the new location, which would be feasible predicated on detailed engineering design. The proposed 7,600 HP would also maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The Devil’s Canyon Road – Natural Gas Alternative would meet some of the stated objectives. New natural gas compressors would replace existing infrastructure with new equipment that would meet VCAPCD and safety regulations and be capable of meeting operating requirements, including during power outages. The 12.88-acre site is sufficient to build a new compressor station. The property is designated by the Ventura County general plan as “Open Space” and zoned “OS-160-acres, Open Space 160 acres minimum parcel size” with the Habitat Connectivity and Wildlife Corridors overlay zone. The use of the property would not be consistent with the intent of the Ventura County general plan OS designation or the Ventura County OS-160-acre

zoning because the intent of both the land use designation and the zoning is to preserve land or water that is essentially unimproved and devoted to an open-space use (Ventura County 2021). Potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, would occur due to grading, trenching, and installation of new infrastructure.

As described above, the Devil’s Canyon Road – Natural Gas Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives. For these reasons, the Devil’s Canyon Road – Natural Gas Alternative was carried forward for consideration related to essential site criteria.

3.7.3 Essential Site Criteria

The Devil’s Canyon Road site would meet all the essential site criteria.

- The existing property is approximately 12.88 acres in size.
- The nearest airport to the property is the Oxnard Airport, which is approximately 8.90 miles to the southeast. The use as a compressor station is compatible with the FAA land use regulations as stated in the *Airport Comprehensive Land Use Plan for Ventura County Final Report* (VCALUC 2000).³³
- The site is designated by FEMA as having no flood risk; however, the eastern property is adjacent to the Ventura River and the access road crosses the river and is mapped Zone AE, which is a regulatory floodway (FEMA 2021d).

As such, the Devil’s Canyon Road – Natural Gas Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.8 Alternative 4.B: Devil’s Canyon Road – Hybrid

The Devil’s Canyon Road – Hybrid Alternative was proposed by SoCalGas to take into consideration CPUC input to consider electric compressors. This alternative would be identical to the Devil’s Canyon Road – Natural Gas Alternative except that compression would be provided by two 1,900 HP natural gas compressors and two 1,900 HP electric compressors. Installation of electric compressors would increase the electric demand for the compressor station. Based on preliminary analysis, approximately 5 MW of electric power would be needed, which would require distribution-level service on one unique power line of at least 16 kV. An onsite substation would also be required.

3.8.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 4.B: Devil’s Canyon Road – Hybrid are presented below and in Table 9.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 24 to 30 months.

³³ The *Airport Comprehensive Land Use Plan for Ventura County Final Report* addresses the Camarillo, Oxnard, Santa Paula, and NAS Point Mugu airports (VCALUC 2000).

- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the Devil’s Canyon Road site would take approximately 6 to 12 months, which would happen concurrently with the onsite work.

Table 9. Alternative 4.B Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	12.88 acres
Project Site – Demolition	156,645 square feet Piping/Equipment/Building
Project Site – Grading	4,500 cubic yards
Pipeline Route 1	23,963 square feet
Pipeline Route 2	23,963 square feet
Water/Sewer Lines	0 square feet
Main Line Valve Connection	7,500 square feet
Depressurization Line	0 square feet
Offsite – Staging Area	6.27 acres
SCE Circuit, Substation, and System Name	Circuit 00423 Casitas Substation Subtransmission 66 kilovolts
Offsite – New Electrical Poles	40 Assumes existing electrical service is sufficient for natural gas option
Offsite –Electric Poles – Grading	80 cubic yards
Offsite – Roads	1,892 linear feet Assumes existing access serving facility requires minor leveling and resurfacing
Estimated Number of Properties Affected*	5

Notes: SCE = Southern California Edison.

* Properties affected include the site, access, infrastructure, and staging areas.

3.8.2 Purpose and Need

As with the Devil’s Canyon Road – Natural Gas Alternative, the hybrid alternative would meet the stated purpose and need. The use of electric compressors with natural gas compressors would provide the necessary redundancy to meet operational needs. This alternative would provide sufficient compression to meet operational needs, would enhance reliability, and would maintain supplies to the La Goleta Storage Field.

As with the Devil’s Canyon Road – Natural Gas Alternative, the hybrid alternative would meet some of the stated objectives. However, the use of electric compressors would increase electric demand and therefore require additional electric infrastructure to support the project, consequently requiring more grading and overhead electric conduit.

Because the Devil’s Canyon Road – Hybrid Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives, this alternative was carried forward for consideration related to essential site criteria.

3.8.3 Essential Site Criteria

As noted in Section 3.7.3, the Devil’s Canyon Road site would meet all essential site criteria; therefore, the Devil’s Canyon Road – Hybrid Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.9 Alternative 5.A: County Line – Natural Gas

The County Line – Natural Gas Alternative was developed by SoCalGas. This site is located within Ventura County at the county line between Santa Barbara and Ventura counties. It is approximately 11 miles northwest of the compressor station property, generally on the existing transmission pipeline corridor. The site is privately owned; therefore, any future project would require the involvement of the landowner, either through a voluntary transfer of needed land rights or through the exercise of eminent domain. The property is approximately 12.33 acres and vacant, although it appears to have been used for agricultural purposes historically. The property is designated by the Ventura County general plan as “Open Space” and zoned by the Ventura County zoning ordinance as “AE-40 ac – Agricultural Exclusive, 40 acres minimum parcel size” and is within the area governed by the SOAR initiative (Ventura County 2020, 2021a). The area is primarily developed with agricultural uses and low-density residential development. The slope of the property ranges from 0 percent to 70 percent, with the majority between 10 and 40 percent, and would require grading and potentially the installation of retaining walls to create a level pad for compressor equipment and operational needs. To meet acceptable engineering design standards, a 2:1 slope is typically required, which requires a larger footprint than the actual building pad (“catch points”).

Access to the site via a driveway at least 24 feet wide would be needed to meet SoCalGas and emergency responder access requirements. There is an existing access road; however, because its width varies some sections of the road would need to be widened. The access road would require minimal grading to achieve an acceptable grade suitable for fire truck access.

Distribution pipelines would need to be rerouted from the existing compressor station property to the new site location, requiring trenching and pipeline installation, and potentially acquisition of additional pipeline right-of-way. Additionally, other utility connections for electricity, potable water, sewer, and telecommunications would be required. These may be able to be collocated in a utility trench if minimum separation between the utilities can be maintained. Otherwise, multiple trenches would be necessary. Electric and telecommunications lines may be located on aboveground utility poles. Water, sewer service, electricity, and telecommunications demand would be anticipated to be consistent with the existing compressor station.

Once access, site grading, and utilities are provided, five new 1,900 HP natural gas compressors would be installed in a new compressor building similar to the planned project. An additional compressor would be required for this site to overcome a greater pressure differential due to the location being farther north than the other alternative sites (approximately 11 miles). A new office and a warehouse similar in size to the planned project structures would be constructed onsite. A perimeter block wall 8 feet in height would be required for security purposes. Cameras

and lighting would also be required for operational needs and security. Landscaping, such as trees or hedges, could be installed to help screen the perimeter wall and minimize visibility of the compressor station.

3.9.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 5.A: County Line – Natural Gas are presented below and in Table 10.

- Construction of the compressor station, including pad grading, onsite utility installations, buildings, and compressors, would take approximately 60 to 70 months.
- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the County Line site would take approximately 6 months, which would happen concurrently with the onsite work.

Table 10. Alternative 5.A: County Line – Natural Gas – Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	12.33 acres
Project Site – Demolition	0 square feet Existing agricultural field
Project Site – Grading	600,000 cubic yards Cut and fill balance onsite
Pipeline Route 1	19,973 square feet
Water/Sewer Lines	7,497 square feet
Main Line Valve Connection	7,500 square feet
Depressurization Line	3,197 square feet
Offsite – Staging Area	3.92 acres
SCE Circuit, Substation, and System Name	Circuit 01950 Carpinteria Substation Subtransmission 66 kilovolts
Offsite – New Electrical Poles	0 Assumes collocated utility trench because electrical demand would not be significant
Offsite – Electric Poles – Grading	0 cubic yards
Offsite – Roads	2,499 linear feet Assumes existing access serving site requires minor leveling and resurfacing
Estimated Number of Properties Affected*	5

Note:

* Properties affected include the site, access, infrastructure, and staging areas.

3.9.2 Purpose and Need

The County Line – Natural Gas Alternative would meet the stated purpose and need for the planned project. Five new 1,900 HP natural gas compressors would replace the existing aging equipment and would meet the VCAPCD air emission and safety requirements. The proposed 9,500 HP would also maintain sufficient pressure in the existing pipelines and adequate inventory in the La Goleta Storage Field.

The County Line – Natural Gas Alternative would meet some of the stated objectives. New natural gas compressors would replace existing infrastructure with new equipment that would meet VCAPCD and DOT safety regulations and would be capable of meeting operating requirements, including during power outages. The 12.33-acre site is sufficient to build a new compressor station. However, the use of the property would not be consistent with the Ventura County land use designation of Open Space or the zoning AE-40 acres. Additionally, the property is within an area governed by the SOAR initiative. Potential environmental impacts, especially related to dust generation, noise, and visual/aesthetics, would occur due to grading, trenching, and installation of new infrastructure. The location is visible from the surrounding community because the site is on a hillside to the southeast of SR-150.

As described above, the County Line – Natural Gas Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives. For these reasons, the County Line – Natural Gas Alternative was carried forward for consideration related to essential site criteria.

3.9.3 Essential Site Criteria

The County Line site would meet all the essential site criteria.

- The existing property is approximately 12.33 acres in size.
- The nearest airport to the property is the Oxnard Airport, which is approximately 19 miles to the southeast. The use as a compressor station is compatible with the FAA land use regulations as stated in the *Airport Comprehensive Land Use Plan for Ventura County Final Report* (VCALUC 2000).³⁴
- The site is designated by FEMA as having no flood risk; however, the northwesterly perimeter along an existing access road is mapped Zone A, a special flood hazard area without a base flood elevation (FEMA 2021c).

As such, the County Line – Natural Gas Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

3.10 Alternative 5.B: County Line – Hybrid

The County Line – Hybrid Alternative was proposed by SoCalGas to take into consideration CPUC input to consider electric compressors. This alternative would be identical to the County Line – Natural Gas Alternative except that compression would be provided by two 1,900 HP natural gas compressors and

³⁴ The Airport Comprehensive Land Use Plan for Ventura County Final Report addresses the Camarillo, Oxnard, Santa Paula, and NAS Point Mugu airports (VCALUC 2000).

three 1,900 HP electric compressors. Installation of electric compressors would increase the electric demand for the compressor station. Based on preliminary analysis, approximately 5 MW of electric power would be needed, which would require distribution-level service on one unique power line of at least 16 kV. An onsite substation would also be required.

3.10.1 Alternative-Specific Construction Assumptions

The construction assumptions for Alternative 5.B: County Line – Hybrid are presented below and in Table 11.

- Construction of the compressor station, including pad grading, access road, onsite utility installations, buildings, and compressors, would take approximately 60 to 70 months.
- Given the location of the existing transmission pipelines, installation/interconnection of the pipelines to a new compressor station at the County Line site would take approximately 6 to 12 months, which would happen concurrently with the onsite work.

Table 11. Alternative 5.B: County Line – Hybrid – Construction Assumptions/Estimates

Project Component	Assumptions and Estimates
Project Site Acreage	12.33 acres
Project Site – Demolition	0 square feet Existing agricultural field
Project Site – Grading	600,000 cubic yards Cut and fill balance onsite
Pipeline Route 1	19,973 square feet
Water/Sewer Lines	7,497 square feet
Main Line Valve Connection	7,500 square feet
Depressurization Line	3,197 square feet
Offsite – Staging Area	3.92 acres
SCE Circuit, Substation, and System Name	Circuit 01950 Carpinteria Substation Subtransmission 66 kilovolts
Offsite – New Electrical Poles	15 Assumes collocated utility trench because electrical demand would not be significant
Offsite – Electric Poles – Grading	30 cubic yards
Offsite – Roads	2,499 linear feet Assumes existing access serving site requires minor leveling and resurfacing
Estimated Number of Properties Affected*	5

Note:

* Properties affected include the site, access, infrastructure, and staging areas.

3.10.2 Purpose and Need

As with the County Line – Natural Gas Alternative, the hybrid alternative would meet the stated purpose and need. The use of electric compressors with natural gas compressors would provide the necessary redundancy to meet operational needs. This alternative would provide sufficient compression to meet operational needs, would enhance reliability, and would maintain supplies to the La Goleta Storage Field.

As with the County Line – Natural Gas Alternative, the hybrid alternative would meet some of the stated objectives. However, the use of electric compressors would increase electric demand and therefore require additional electric infrastructure to support the project, consequently requiring more grading and overhead electric conduit.

Because the County Line – Hybrid Alternative would provide sufficient compression to meet operational needs, would enhance reliability, would maintain supplies to the La Goleta Storage Field, and would meet some of the stated objectives, this alternative was carried forward for consideration related to essential site criteria.

3.10.3 Essential Site Criteria

As noted in Section 3.9.3, the County Line site would meet all essential site criteria. Therefore, the County Line – Hybrid Alternative was carried forward for consideration related to environmental and operational criteria, as discussed in Section 4.

INTENTIONALLY LEFT BLANK

4 Operational and Environmental Considerations

The evaluation of alternative options necessarily accounts for operational and environmental considerations that go beyond the foundational elements of the purpose, need, and objectives of the planned project and the essential site criteria. This section provides an evaluation of the alternatives relative to five supplemental operational criteria. Environmental considerations have been evaluated by Dudek. Their analysis is incorporated in Appendix A.

In order to assess each potential alternative option according to the same criteria, a scoring rubric was developed for both the operational and environmental considerations. The rubric assigns point values from 0 to 9. The criteria within the rubric address topic areas that the CPUC examined in multiple data requests regarding the Ventura Compressor Modernization Project. Operational considerations include topic areas such as safety and resiliency, electrification and power requirements, control systems, system maintenance and gas releases, and siting considerations. Environmental considerations include topic areas such as emissions, climate change, traffic, noise, aesthetics, land use, construction impacts, and wildfire. Additional topic areas were added to expand the environmental evaluation to address cultural resources, natural resources, and CalEnviroScreen pollution burden.

4.1 Evaluation Methodology

The operational considerations evaluation process included a team of six SoCalGas staff members with subject matter expertise in pipeline operations, mechanical engineering, and civil engineering. Each staff member evaluated each alternative and assigned a point score in accordance with the rubric (included as Appendix B) and with the specific category shown in the relevant subsection below. The evaluation was based on a desktop-level analysis that was field-verified by SoCalGas' Construction Department, Gas Transmission Department, and Gas Engineering Department on January 6, 2022. The rubric scores are the average of the scores assigned by each staff member for each line item. Please refer to Appendix B for the complete scoring rubric.

4.2 Operational Assessment

This section provides an analysis of the operational considerations and each alternative option's assigned score in accordance with the scoring rubric (Appendix B).

4.2.1 Auxiliary and Control Systems

The complexity of auxiliary and control systems relates to alternative options with one operational system instead of two. With a hybrid gas and electric station, the control panel would need to be able to interface with two unique types of unit control panels, instead of one panel with one set of command controls. It would also necessitate two control philosophies, which is the directive of how to run the station based on the system needs at that time (see Table 12).

Table 12. Auxiliary and Control Systems

	0	1-2-3	4-5-6	7-8-9
Topic Area	Hybrid option that relies on SCE power for running 50% compressors	Hybrid option that does not rely on SCE power for running 50% compressors	Non-hybrid with backup power feed from SCE to run 50% compressors	Non-hybrid option with onsite backup power generation to run 50% compressors

Note: SCE = Southern California Edison.

All Natural Gas Alternatives

The natural gas alternatives would operate with only natural gas equipment, which would require one operational system. Table 13 presents the auxiliary and control systems point assessments for the natural gas alternatives. Since each option below assumes one operational system, a total of 9 points each was assigned.

Table 13. Auxiliary and Control Systems – All Natural Gas Alternatives

Alternative	Auxiliary and Control Systems Total
1.A: Planned Project	9 points
2.A: Avocado Site – Natural Gas	9 points
3.A: Ventura Steel – Natural Gas	9 points
4.A: Devil’s Canyon Road – Natural Gas	9 points
5.A: County Line – Natural Gas	9 points

All Hybrid Alternatives

The hybrid alternatives would operate with both natural gas equipment and electric equipment, requiring two operational systems, which creates greater challenges when operating the compressor station. Table 14 presents the auxiliary and control systems point assessments for the hybrid alternatives. Since each option below assumes a hybrid operational system creating greater operating complexity, a total of 5 points each was assigned.

Table 14. Auxiliary and Control Systems – All Hybrid Alternatives

Alternative	Auxiliary and Control Systems Total
1.B: Ventura Compressor Station – Hybrid	5 points
2.B: Avocado Site – Hybrid	5 points
3.B: Ventura Steel – Hybrid	5 points
4.B: Devil’s Canyon Road – Hybrid	5 points
5.B: County Line – Hybrid	5 points

4.2.2 Backup Power Requirements

Backup power requirements relates to the ability for the compressor station to provide sufficient horsepower to move gas into the Coastal System depending on the availability of natural gas and electric infrastructure, especially in black start conditions (see Table 15). Black start is the ability to restart the electric system after a blackout/loss of power. It is used when the grid experiences a blackout and must be restarted from scratch. Black start is central to system restoration and recovery plans for system operators (NREL 2021).

Table 15. Backup Power Requirements

	0	1-2-3	4-5-6	7-8-9
Topic Area	No operation possible without SCE power in service	Black start capability and ability to provide less than 50% horsepower without SCE power in service	Black start capability and ability to provide less than 100% down to 50% horsepower without SCE in service	Black start capability and ability to provide 100% horsepower without SCE in service

Note: SCE = Southern California Edison.

All Natural Gas Alternatives

All natural gas alternatives would be only natural gas compression and have black start capability and full compression without SCE service available. Table 16 presents the backup power requirements point assessments for the natural gas alternatives. Since each option below could have black start capability from 50% to 100% capability, a total of 6 points each was assigned.

Table 16. Backup Power Requirements – All Natural Gas Alternatives

Alternative	Backup Power Requirements Total
1.A: Planned Project	6 points
2.A: Avocado Site – Natural Gas	6 points
3.A: Ventura Steel – Natural Gas	6 points
4.A: Devil’s Canyon Road – Natural Gas	6 points
5.A: County Line – Natural Gas	6 points

All Hybrid Alternatives

Hybrid alternatives would have natural gas compression and electric compression. A hybrid option would have black start capability and with backup power available could also have full compression available if power on the SCE system is lost. Table 17 presents the backup power requirements point assessments for the hybrid alternatives. Since each option below could have black start capability from 50% to 100% capability, a total of 6 points each was assigned.

Table 17. Backup Power Requirements – All Hybrid Alternatives

Alternative	Backup Power Requirements Total
1.B: Ventura Compressor Station – Hybrid	6 points
2.B: Avocado Site – Hybrid	6 points
3.B: Ventura Steel – Hybrid	6 points
4.B: Devil’s Canyon Road – Hybrid	6 points
5.B: County Line – Hybrid	6 points

4.2.3 Emergency Access

Emergency access is related to roadway access for first responders, such as the fire department. The VCFPD Standard 501 “Fire Apparatus Access Standard” requires that emergency access roads be a minimum of 24 feet wide and not exceed a slope of 20 percent, with turnouts every 150 feet (VCFPD 2019). The evaluation of alternatives considers the existing site access and the extent to which roadway improvements must occur to comply with fire department requirements (see Table 18). The availability of onsite or nearby fire water infrastructure may allow the fire department to grant limited waivers for some requirements, such as turnout spacing.

Table 18. Emergency Access

	0	1-2-3	4-5-6	7-8-9
Topic Area	Emergency access exceeds 20% grade even with engineered design (including retaining walls)	New access road required or substantial improvements to existing access road	Minor modification to existing access road	No new road improvements

Note: Assessment based on desktop analysis using Google Earth field-verified by SoCalGas staff January 6, 2022.

Alternative 1.A: Planned Project/Alternative 1.B: Ventura Compressor Station – Hybrid

The planned project and a hybrid alternative at the existing compressor station would meet all applicable emergency access and safety requirements because the existing compressor station meets all access requirements. The site has access points that connect to Olive Street. The primary entrance (and main access point) is 36 feet wide. A secondary access point is 20 feet wide. The primary entrance is sufficient for fire trucks and other emergency response vehicles that connect to Olive Street. The existing facility also has fire water infrastructure onsite that meets fire department requirements. Table 19 presents the emergency access point assessments for these alternatives. This site scored a 9 because existing access meets fire department requirements and fire water infrastructure is present.

Table 19. Emergency Access – Alternatives 1.A and 1.B: Ventura Compressor Station

Alternative	Emergency Access Total
1.A: Planned Project	9 points
1.B: Ventura Compressor Station – Hybrid	9 points

Alternative 2.A: Avocado Site – Natural Gas/Alternative 2.B: Avocado Site – Hybrid

The Avocado Site would require a new access road with at least a 24-foot width and slope not exceeding 20 percent. The site has existing agricultural roads for crop access that could be widened and improved with asphalt or other paving. Given the topography of the site, grading, and potentially retaining walls, to establish an acceptable slope would be needed. A fire hydrant may also be required, which would require a new fire water line at a minimum water pressure sufficient for firefighting (typically 20 pounds per square inch [psi]). Table 20 presents the emergency access point assessments for these alternatives. This site scored a 2 because an existing access road (Taylor Ranch Road) is available however substantial grading to establish a 20 percent slope or less and sufficient width would be required.

Table 20. Emergency Access – Alternatives 2.A and 2.B: Avocado Site

Alternative	Emergency Access Total
2.A: Avocado Site – Natural Gas	4 points
2.B: Avocado Site – Hybrid	4 points

Alternative 3.A: Ventura Steel – Natural Gas/Alternative 3.B: Ventura Steel – Hybrid

The Ventura Steel site is located on an existing industrial property and as such is assumed to meet all applicable emergency access and safety requirements. The site has two access points that are sufficient for fire trucks and other emergency response vehicles and that connect to North Ventura Avenue. A fire hydrant is located at the northeast corner of Shell Road and North Ventura Avenue, approximately 100 feet from the property boundary. Table 21 presents the emergency access point assessments for these alternatives. This site scored a 9 because existing access meets fire department requirements and fire water infrastructure is present.

Table 21. Emergency Access – Alternatives 3.A and 3.B: Ventura Steel

Alternative	Emergency Access Total
3.A: Ventura Steel – Natural Gas	9 points
3.B: Ventura Steel – Hybrid	9 points

Alternative 4.A: Devil’s Canyon Road – Natural Gas/Alternative 4.B: Devil’s Canyon Road – Hybrid

The Devil’s Canyon Road site has site access provided by an existing bridge approximately 28 feet in width that crosses the Ventura River. The bridge is sufficient in width for fire apparatus. Fire water infrastructure is located onsite. Table 22 presents the emergency access point assessments for these alternatives. This site scored a 7 because existing access meets fire department requirements however, in the event of a significant rainfall, bridge access could be affected and emergency access would have to be provided elsewhere, likely across adjacent property to the west.

Table 22. Emergency Access – Alternatives 4.A and 4.B: Devil’s Canyon Road

Alternative	Emergency Access Total
4.A: Devil’s Canyon Road – Natural Gas	7 points
4.B: Devil’s Canyon Road – Hybrid	7 points

Alternative 5.A: County Line – Natural Gas/Alternative 5.B: County Line – Hybrid

The County Line site would require a new access road with at least a 24-foot width and slope not exceeding 20 percent. The site has existing agricultural roads for crop access that could be widened and improved with asphalt or other paving. A fire hydrant may also be required, which would require a new fire water line at a minimum water pressure sufficient for firefighting (typically 20 psi). Table 23 presents the emergency access point assessments for these alternatives. This site scored a 5 because an existing access road is available and however it would require some widening along sections of the road and surface improvements.

Table 23. Emergency Access – Alternatives 5.A and 5.B: County Line

Alternative	Emergency Access Total
5.A: County Line – Natural Gas	5 points
5.B: County Line – Hybrid	5 points

4.2.4 Geotechnical Engineering Constraints

Soil stability and underlying geology can contribute to soil movement and pipeline damage. Although detailed geologic and geotechnical evaluation under the direction of a licensed geologist, geotechnical engineer, and civil engineer is outside the scope of this feasibility study, a desktop-level evaluation using the County of Ventura’s GIS-based “County View” system has been performed to determine whether known geotechnical constraints associated with high risk of faulting/seismicity, liquefaction, and subsidence are present for each alternative (Ventura

County 2021b).^{35,36} Most geotechnical constraints can be addressed by implementing measures at the recommendation of a geologist, geotechnical engineer, and/or civil engineer and following standard building code requirements, such as over-excavating and recompacting soil or installing special building foundations (e.g., piers, caissons). However, significant geotechnical constraints (see Table 24) can cause greater long-term risk to infrastructure and increase overall project cost, including for long-term maintenance. As such, siting of new pipelines and infrastructure should avoid these constraints to the extent feasible.

Table 24. Geotechnical Engineering Constraints

	0	1-2-3	4-5-6	7-8-9
Topic Area	Substantial geotechnical constraints	Moderate geotechnical constraints	Minimal geotechnical constraints	No known geotechnical constraints

Note: Assessment based on desktop analysis using County of Ventura’s GIS based “County View” system to evaluate liquefaction, faulting/seismicity, and landslide risk.

Alternative 1.A: Planned Project/Alternative 1.B: Ventura Compressor Station – Hybrid

The Ventura Compressor Station site is not mapped with any known earthquake faults, earthquake fault hazards, potential earthquake-induced landslide areas, or subsidence zones. The site is mapped with potential risk for soil liquefaction (Ventura County 2021b). Existing pipelines serving the compressor station also fall within the soil liquefaction area. However, the existing compressor station has not experienced any settling or foundation cracking associated with subsidence or liquefaction. No new natural gas pipelines would be required offsite for this location. New utility connections, such as aboveground electrical and telecommunication conduit, for a hybrid alternative could be sited and installed based on geotechnical field conditions. Table 25 presents the geotechnical engineering constraint point assessments for these two alternative options. This site scored a 6 because of mapped potential risk for soil liquefaction however, standard engineering design and compliance with building code requirements can reduce liquefaction risk. Furthermore, a compressor station has been onsite for almost 100 years with no known challenges from liquefaction.

Table 25. Geotechnical Engineering Constraints – Alternatives 1.A and 1.B: Ventura Compressor Station

Alternative	Geotechnical Engineering Constraints Total
1.A: Planned Project	6 points
1.B: Ventura Compressor Station – Hybrid	6 points

³⁵ As defined by the U.S. Geological Survey, “Liquefaction takes place when loosely packed, water-logged sediments at or near the ground surface lose their strength in response to strong ground shaking. Liquefaction occurring beneath buildings and other structures can cause major damage during earthquakes” (USGS 2021).

³⁶ As defined by the U.S. Geological Survey, “Land subsidence is a gradual settling or sudden sinking of the Earth’s surface due to removal or displacement of subsurface earth materials. The principal causes include: aquifer-system compaction associated with groundwater withdrawals; drainage of organic soils; underground mining; natural compaction or collapse, such as with sinkholes or thawing permafrost” (USGS 2019).

**Alternative 2.A: Avocado Site – Natural Gas/
Alternative 2.B: Avocado Site – Hybrid**

The Avocado Site is not mapped with any known earthquake faults, earthquake fault hazards, liquefaction risk, or subsidence zones. The site is mapped with potential earthquake-induced landslide areas. New pipeline infrastructure and new utility connections would be required within the area mapped as a potential earthquake-induced landslide area. Table 26 presents the geotechnical engineering constraint point assessments for these alternatives. This site scored a 4 because of mapped potential landslide risk from an earthquake. While engineering design and compliance with building code requirements will reduce risk, an earthquake induced landslide could cause significant damage to a compressor station.

Table 26. Geotechnical Engineering Constraints – Alternatives 2.A and 2.B: Avocado Site

Alternative	Geotechnical Engineering Constraints Total
2.A: Avocado Site – Natural Gas	4 points
2.B: Avocado Site – Hybrid	4 points

Alternative 3.A: Ventura Steel – Natural Gas/Alternative 3.B: Ventura Steel – Hybrid

The Ventura Steel site is not mapped with any known earthquake faults, earthquake fault hazards, or subsidence zones. However, there is a mapped earthquake fault to the west of SR-33/Ventura River approximately 2,500 feet from the property boundary. The site is also mapped with liquefaction risk. New pipeline infrastructure and new utility connections would be required within the area mapped with liquefaction risk. Table 27 presents the geotechnical engineering constraint point assessments for these alternatives. This site scored a 6 because of mapped potential risk for soil liquefaction however, standard engineering design and compliance with building code requirements can reduce liquefaction risk.

Table 27. Geotechnical Engineering Constraints – Alternatives 3.A and 3.B: Ventura Steel

Alternative	Geotechnical Engineering Constraints Total
3.A: Ventura Steel – Natural Gas	6 points
3.B: Ventura Steel – Hybrid	6 points

Alternative 4.A: Devil’s Canyon Road – Natural Gas/Alternative 4.B: Devil’s Canyon Road – Hybrid

The Devil’s Canyon Road site is mapped with a known earthquake fault approximately 700 feet north of the limits of ground disturbance. However, there is no mapped earthquake fault hazard zone or subsidence zone. The site is also mapped with liquefaction risk. New pipeline infrastructure and new utility connections would be required within the area mapped with liquefaction risk and could be in proximity to the fault, although engineering design could address most of the fault risk. Table 28 presents the geotechnical engineering constraint point assessments for these alternatives. This site scored a 5 because of mapped potential risk for

soil liquefaction and proximity to a known fault. Standard engineering design and compliance with building code requirements can reduce liquefaction and risk related to seismic shaking.

Table 28. Geotechnical Engineering Constraints – Alternatives 4.A and 4.B: Devil’s Canyon Road

Alternative	Geotechnical Engineering Constraints Total
4.A: Devil’s Canyon Road – Natural Gas	5 points
4.B: Devil’s Canyon Road – Hybrid	5 points

Alternative 5.A: County Line – Natural Gas/Alternative 5.B: County Line – Hybrid

The County Line site is mapped with a known earthquake fault approximately 500 feet north of the limits of ground disturbance. Two additional mapped faults are located near a tie-in point to the existing distribution system. However, there is no mapped earthquake fault hazard zone, subsidence zone, or liquefaction hazard. New pipeline infrastructure and new utility connections would be required and could be in proximity to the fault, and may actually cross the fault, although engineering design could address most of the fault risk. Table 29 presents the geotechnical engineering constraint point assessments for these alternatives. This site scored a 6 because of proximity to a known fault. Standard engineering design and compliance with building code requirements can reduce risk related to seismic shaking

Table 29. Geotechnical Engineering Constraints – Alternatives 5.A and 5.B: County Line

Alternative	Geotechnical Engineering Constraints Total
5.A: County Line – Natural Gas	6 points
5.B: County Line – Hybrid	6 points

4.2.5 Proximity to Distribution System

The ability to mitigate or eliminate emissions from a gas release to atmosphere for operations and maintenance (referred to as a “blowdown”) is heavily influenced by the type of system that is being blown down.³⁷ The operating pressure of a pipeline system is a critical factor when evaluating the ability to limit or eliminate emissions during a blowdown (see Table 30). Cross compression is a technique used to help minimize release of natural gas. Portable compression equipment is used to bring down gas pressure on an isolated pipeline segment and redirect the gas downstream of the isolated segment. Cross compression requires an adjacent pipeline with an operating pressure and capacity compatible with the existing pressure conditions of the line to be vacated (AGA 2020).

The location of the compressor station in relationship to the distribution pipeline system creates the option to engineer a system that can passively collect and redirect natural gas and route to

³⁷ Generally defined, a blowdown is the release of gas from a pipeline to the atmosphere to relieve pressure in the pipe so that maintenance, testing, or other activities can take place (MJB&A 2016).

the distribution system instead of needing to bring additional compression equipment onsite to perform cross compression.³⁸

Table 30. Proximity to Distribution System

	0	1-2-3	4-5-6	7-8-9
Topic Area	No access to distribution system without substantial pipeline installation	Distribution system greater than 0.5 miles away	Distribution system access outside of the facility and less than 0.5 miles away	Distribution system is within the facility

Alternative 1.A: Planned Project/Alternative 1.B: Ventura Compressor Station – Hybrid

The Ventura Compressor Station site is already connected to the distribution system. The planned project and a hybrid alternative at the existing site would be able to connect to the distribution system enabling passive rerouting without the need to bring cross compression equipment onsite. Table 31 presents the proximity to distribution system point assessments for these alternatives. This site scored a 9 because existing distribution lines are located within the property enabling the ability to limit or eliminate emissions during a blowdown.

Table 31. Proximity to Distribution System – Alternatives 1.A and 1.B: Ventura Compressor Station

Alternative	Proximity to Distribution System Total
1.A: Planned Project	9 points
1.B: Ventura Compressor Station – Hybrid	9 points

Alternative 2.A: Avocado Site – Natural Gas/Alternative 2.B: Avocado Site – Hybrid

The Avocado Site could not be connected to the distribution pipeline system without significant pipeline installation. The new pipeline route would connect to the south at the junction of Taylor Ranch Road/US 101. Table 32 presents the proximity to distribution system point assessments for these alternatives. This site scored a 1 because access to the existing distribution lines is more than 0.5 mile away.

Table 32. Proximity to Distribution System – Alternatives 2.A and 2.B: Avocado Site

Alternative	Proximity to Distribution System Total
2.A: Avocado Site – Natural Gas	1 point
2.B: Avocado Site – Hybrid	1 point

³⁸ In the event of an unplanned release or emergency, the emergency shutdown (ESD) system is designed to automatically evacuate natural gas rapidly, which may not enable cross-compression. At the Ventura Compressor Station, the ESD stack vents to atmosphere. As noted by the EPA, “rerouting combustible gases eliminates potential hazards in the operating area as well as reducing methane emissions” (EPA 2011).

Alternative 3.A: Ventura Steel – Natural Gas/Alternative 3.B: Ventura Steel – Hybrid

The Ventura Steel site would require a connection to existing distribution pipe within Ventura Avenue or a new distribution pipeline would be required from the existing compressor station site and north within Ventura Avenue. Table 33 presents the proximity to distribution system point assessments for these alternatives. This site scored a 5 because the distribution system access outside of the facility and less than 0.5 miles away.

Table 33. Proximity to Distribution System – Alternatives 3.A and 3.B: Ventura Steel

Alternative	Proximity to Distribution System Total
3.A: Ventura Steel –Natural Gas	5 points
3.B: Ventura Steel – Hybrid	5 points

Alternative 4.A: Devil’s Canyon Road – Natural Gas/Alternative 4.B: Devil’s Canyon Road – Hybrid

The Devil’s Canyon Road site would require a distribution system connection to the east across the Ventura River and SR-33 at the Shell Road exit. Existing infrastructure potentially could be adapted to support the distribution interconnection. Table 34 presents the proximity to distribution system point assessments for these alternatives. This site scored a 2 because the distribution system access is greater than 0.5 miles away but closer to the distribution system than the Avocado Site.

Table 34. Proximity to Distribution System – Alternatives 4.A and 4.B: Devil’s Canyon Road

Alternative	Proximity to Distribution System Total
4.A: Devil’s Canyon Road – Natural Gas	2 points
4.B: Devil’s Canyon Road – Hybrid	2 points

Alternative 5.A: County Line – Natural Gas/Alternative 5.B: County Line – Hybrid

The County Line site would require a new connection that would extend from the site north to the existing distribution pipeline system. Table 35 presents the proximity to distribution system point assessments for these alternatives. This site scored a 5 because the distribution system access is outside of the facility and less than 0.5 miles away.

INTENTIONALLY LEFT BLANK

5 Cost Estimate and Schedule Analysis

This section provides an analysis of cost and project schedule for each alternative option carried forward. Detailed information regarding cost estimates is included in Appendix C and schedule is in Appendix D.

5.1 Cost Estimate

SoCalGas uses accepted industry practices when estimating cost. The recognized expert in cost estimating and scheduling is the American Association of Cost Engineers (AACE). The AACE has established Recommended Practices (RPs) that are “intended to be the main technical foundation of ... educational, and certification products and services. The RPs are a series of documents that contain valuable reference information that has been subject to a rigorous review process and recommended for use by the [AACE] Technical Board” (AACE 2022). Cost estimating is based on characteristics that can be used to categorize project cost estimate types as outlined in AACE RP 10S-90, “Cost Engineering Terminology.” The level of project definition determines the information available to the estimating process (AACE 2021). Cost estimates are designated within a particular class from 1 to 5, based on the level of project definition available at the time of estimation. A Class 1 estimate is the closest to full project definition and maturity and a Class 5 is based on the lowest level of project definition (AACE 2021).

SoCalGas, with support from BMCD and SPEC Services, developed cost estimates in accordance with AACE RP 10S-90 for the various alternatives. Given the level of information available as of the date of this feasibility study, the planned project (Alternative 1.A) cost estimate is at Class 3 because the engineering analysis has been completed to a greater level of detail. Cost estimates for all other alternatives have been developed based on preliminary site considerations, an average site size of 15 acres, and construction assumptions outlined in Section 3 and are at Class 5.³⁹

Project development costs are related to the one-time cost to implement the alternative. These costs include, but are not limited to, compressors, piping, land and easement acquisition, building materials, site and roadway grading and retaining walls, electrical conduit, power poles, and engineering design. To normalize project cost, a standard contingency of 30 percent was applied to the estimated total cost for each option. This percent contingency may overstate the

³⁹ In accordance with AACE RP 10S-90 (AACE 2021), cost estimates are classified as follows:
3. COST ESTIMATE CLASSIFICATION SYSTEM, CLASS 3 ESTIMATE – (Typical level of project definition required: 10% to 40% of full project definition.) Class 3 estimates are generally prepared to form the basis for budget authorization, appropriation, and/or funding. Class 3 estimates are typically prepared to support full project funding requests and become the first of the project phase “control estimate” against which all actual costs and resources will be monitored for variations to the budget. They are used as the project budget until replaced by more detailed estimates. In many owner organizations, a Class 3 estimate may be the last estimate required and could well form the only basis for cost/schedule control. ...
5. COST ESTIMATE CLASSIFICATION SYSTEM, CLASS 1 ESTIMATE – (Typical level of project definition required: 65% to 100% of full project definition.) Class 1 estimates are generally prepared for discrete parts or sections of the total project rather than for the entire project. The parts of the project estimated at this level of detail will typically be used by subcontractors for bids, or by owners for check estimates. The updated estimate is often referred to as the current control estimate and becomes the new baseline for cost/schedule control of the project. Class 1 estimates may be prepared for parts of the project to comprise a fair price estimate or bid check estimate to compare against a contractor’s or vendor’s bid estimate, or to evaluate/dispute claims or change orders (AACE 2021).

planned project’s cost (Alternative 1.A) because the cost estimate is at a Class 3 and typically a lower contingency would be applied. However, this adjustment allows project cost to be evaluated consistent with other alternative options carried forward.

Operational costs are related to the ongoing annual cost incurred to operate the compressor station. A hybrid station requires more electric power; as such, SCE electricity is a greater portion of the operational cost. The County Line Alternative would require five compressors (either five natural gas [Alternative 5.A.] or two natural gas and three electric [Alternative 5.B.]), which is the reason for the greater cost differential compared to other sites with four compressors. Please refer to Appendix C for detailed cost estimate information and Table 37 below for summary costs.

Table 37. Ventura Compressor Station Alternatives – Cost Estimates

Alternative	Project Development Cost (Nonrecurring)	Operational Cost (Annual Recurring)
1.A: Planned Project	\$421MM	\$0.904MM
1.B: Current Site – Hybrid	\$464MM	\$1,778MM
2.A: Avocado Site – Natural Gas	\$677MM	\$0.949MM
2.B: Avocado Site – Hybrid	\$707MM	\$1,823MM
3.A: Ventura Steel – Natural Gas	\$607MM	\$0.909MM
3.B: Ventura Steel – Hybrid	\$635MM	\$1,783MM
4.A: Devil's Canyon Road – Natural Gas	\$566MM	\$0.919MM
4.B: Devil's Canyon Road – Hybrid	\$594MM	\$1,793MM
5.A: County Line – Natural Gas	\$593MM	\$1.124MM
5.B: County Line – Hybrid	\$622MM	\$2,522MM

Source: SCE 2019.

Notes: MM = million.

Costs are presented in 2022 dollars with escalation/inflation included.

Electric rates were based on SCE fixed tariff Schedule TOU-GS-2 (SCE 2019).

5.2 Schedule Analysis

SoCalGas, with technical support from BMCD and SPEC Services, developed schedule estimates for each alternative. Schedule estimates were also based on accepted industry standards using AACE RP 91R-16, “Schedule Development” (AACE 2020). Schedules are differentiated by the degree of detail available at the time of estimation, with the least detailed being a Level 1 schedule and the most detailed being a Level 5 schedule.⁴⁰ The schedule for the planned project

⁴⁰ In accordance with AACE RP 91R-16 (AACE 2020), schedules are classified as follows:

Level 1: A Level 1 schedule is a high-level schedule that reflects key milestones and summary activities by major phase, stage or project being executed. This schedule level may represent summary activities of an execution stage, specifically engineering, procurement, construction and start-up activities. Typically represented in Gantt format and depending upon when and how developed, a Level 1 schedule may or may not be the summary roll-up of a more detailed CPM schedule. Level 1 schedules provide high-level information that assist in the decision making process (go/no go prioritization and criticality of projects). ...

Level 3: Level 3 schedules are generally prepared to communicate the execution of the deliverables for each of the contracting parties. The schedule should reflect the interfaces between key workgroups, disciplines,

(Alternative 1.A) is a Level 3 and all other alternatives are at a Level 1. Because schedule delays can have a variety of outcomes, including increased maintenance, obsolete replacement parts, lack of staffing and/or equipment resources, and increased cost, alternatives were evaluated based on three categories reflected in the scoring rubric related to schedule. Furthermore, as noted in the CPUC's Decision D.19-09-051 on SoCalGas' 2019 GRC application, "We do however encourage SoCalGas to place a high priority on critical projects under this category as most of its compressors are over 50 years old and because of key risks that need to be mitigated in this area" (D.19-09-051 at pp. 116-117). The consideration of schedule aligns with the CPUC's input.

Permitting assumptions are preliminary and are based on the level of detail available for each alternative at this time and could change depending on the ultimate selection of the site layout and equipment. Please refer to Appendix B for the scoring rubric and Appendix D for the schedule estimates.

5.2.1 Applicability of Local Agency Permits

An important consideration related to permitting and its impact on a particular alternative's schedule is the overarching authority of the CPUC to regulate natural gas utilities. Article XII, Section 8 of the California Constitution establishes the CPUC's preemptive authority over matters which the Legislature has granted the CPUC regulatory powers:

A city, county, or other public body may not regulate matters over which the Legislature grants regulatory power to the Commission. This section does not affect power over public utilities relating to the making and enforcement of police, sanitary, and other regulations concerning municipal affairs pursuant to a city charter existing on October 10, 1911, unless that power has been revoked by the city's electors, or the right of any city to grant franchises for public utilities or other businesses on terms, conditions, and in the manner prescribed by law.

CPUC decisions,⁴¹ as well as California courts, have confirmed the CPUC's preemptory powers. As such, no local discretionary (e.g., rezone, land use) permits would be required because the CPUC has preemptive jurisdiction over the siting, construction, maintenance, and operation of natural gas facilities in California. The CPUC's authority does not preempt special districts, such as air quality management districts, other state agencies, or the federal government. Additionally, SoCalGas would still have to obtain all ministerial permits from local jurisdictions. Local agency permits are discussed for each alternative to provide awareness to the reader.

5.2.2 Alternatives Evaluation of Schedule

This section evaluates the estimated schedule for each potential alternative. As noted above, permitting assumptions are preliminary and are based on the level of detail available for each

or crafts involved in the execution of the stage. Typically presented in Gantt or CPM network format and is generally the output of CPM scheduling software. Level 3 schedules provide enough detail to identify critical activities. Level 3 schedules assist the team in identifying activities that could potentially affect the outcome of a stage or phase of work, allowing for mitigation and course correction in short course. Audiences for this type of schedule include, but are not limited to program or project managers, CMs or owner's representatives, superintendents, and general foremen (AACE 2020).

41 In D.94-06-014 (CPUC 2019), "[t]he Commission has restated its exclusive jurisdiction over the location and construction of public utility facilities in numerous decisions."

alternative at this time and could change depending on the ultimate selection of the site layout and equipment (see Table 38).

Table 38. Alternatives Evaluation of Schedule

Scheduling Component	0	1-2-3	4-5-6	7-8-9
Project Permitting Complexity	Substantial permitting complexity	Moderate permitting complexity	Minimal permitting complexity	None or negligible permitting complexity
Property/Right-of-Way Acquisition Required	Greater than 10 properties/ROW acquisition	5 to 9 properties/ ROW acquisition	1 to 4 properties/ ROW acquisition	No permanent properties/ROW acquisition, only temporary construction access
Construction Duration	Longer than 4 years	3 to 4 years	2 to 3 years	Less than 2 years

Notes: ROW = right-of-way.

Permitting complexity relates to the number of agency permits anticipated for a particular alternative.

Construction duration is assumed to begin upon issuance of permits through commissioning of equipment.

Alternative 1.A: Planned Project

A permit to construct (PTC) was filed with the VCAPCD in March 2020. Coverage under the National Pollutant Discharge Elimination System (NDPES) would be required through filing a Notice of Intent with the Los Angeles Regional Water Quality Control Board as well as implementation of a Stormwater Pollution Prevention Plan during construction, since greater than one acre would be disturbed. Ministerial permits for site construction activities, such as building permits, will be required from the City of Ventura. These types of permits are typically granted within three to six months and applications would be filed upon completion of final engineering. Temporary construction and access easements will be required for two staging areas/laydown yards from private landowners adjacent to the facility, but no other offsite easements are anticipated. Construction would begin upon issuance of applicable permits and is anticipated to take 24 months due to site preparation, pipeline and utility modifications, and building construction and equipment installation. The points assessments of the three schedule components for this alternative are presented in Table 39.

Table 39. Evaluation of Schedule – Alternative 1.A: Planned Project

Scheduling Component	Points
Project Permitting	8
Property/Right-of-Way Acquisition	8
Construction Duration	8

Alternative 1.B: Ventura Compressor Station – Hybrid

As noted above, a PTC was filed with the VCAPCD in March 2020. However, the application addresses the planned project configuration of four new natural gas compressors, whereas Alternative 1B would include two natural gas and two electric compressors. As such, the PTC

application would need to be amended to modify the proposed equipment. The VCAPCD process typically takes 6 to 18 months from application filing to issuance of a permit. Coverage under the NDPEs would be required through filing a Notice of Intent with the Los Angeles Regional Water Quality Control Board and the implementation of a Stormwater Pollution Prevention Plan during construction, since greater than one acre would be disturbed. Ministerial permits for site construction activities, such as building permits, would be required from the City of Ventura. Coordination with SCE would also be required to address any electrical upgrades, such as replacement of poles or conduit, which may require the filing of an advice letter with the CPUC in accordance with General Order 131-D.⁴² Temporary construction and access easements will be required for staging areas/laydown yards and potentially for electrical lines if SCE does not already have easements/right-of-way in place. However, based on aerial imagery and publicly accessible SCE information, electrical infrastructure is located adjacent to the site. Construction would begin upon issuance of applicable permits and is anticipated to take 30 to 36 months due to site preparation, pipeline and utility modifications, minimal SCE electrical system modifications, and building construction and equipment installation. The points assessments of the three schedule components for this alternative are presented in Table 40.

Table 40. Evaluation of Schedule – Alternative 1.B: Ventura Compressor Station – Hybrid

Scheduling Component	Points
Project Permitting	7
Property/Right-of-Way Acquisition	8
Construction Duration	6

Alternative 2.A: Avocado Site – Natural Gas

Alternative 2.A would require a PTC from the VCAPCD for the four new natural gas compressors. The VCAPCD process typically takes 6 to 18 months from application filing to issuance of a permit. The site and potential pipeline and utility corridors may impact riparian habitat associated with tributaries that flow to the Ventura River, potentially requiring a U.S. Army

⁴² General Order (GO) 131-D applies to the construction of electric power line and substation facilities designed to operate between 50 and 200 kV. Section III, Subsection B.1, exempts a utility from the CPUC’s requirement to file an application requesting authority to construct if a project meets specific conditions, such as: replacing existing power line facilities or supporting structures with equivalent facilities or structures; minor relocation of existing power facilities up to 2,000 feet in length or intersetting of additional support structures between existing support structures. When electrical improvements are exempt from GO 131-D, a utility must file an informational advice letter with the Commission Advisory and Compliance Division (CACD) and the CPUC Public Advisor in accordance with GO 96-A. GO131-D, Section III, A. requires a Certificate of Public Convenience and Necessity (CPCN) when “any new electric generating plant having in aggregate a net capacity available at the busbar in excess of 50 megawatts (MW), or of the modification, alteration, or addition to an existing electric generating plant that results in a 50 MW or more net increase in the electric generating capacity available at the busbar of the existing plant, or of major electric transmission line facilities which are designed for immediate or eventual operation at 200 kV or more... .” GO131-D, Section III, B. requires a or Permit to Construct (PTC) when “any electric power line facilities or substations which are designed for immediate or eventual operation at any voltage between 50 kV or 200 kV or new or upgraded substations with high side voltage exceeding 50 kV.”

Corps of Engineers Clean Water Act (CWA) Section 404 Nationwide Permit (404 NWP),⁴³ CWA Section 401 Water Quality Certification (401 Certification),⁴⁴ and California Department of Fish and Wildlife (CDFW) streambed alteration agreement (SAA).⁴⁵ The southerly portion of the proposed Taylor Ranch Road roadway improvements would extend into the State Coastal Zone, potentially requiring a coastal development permit issued by the County of Ventura.⁴⁶

Local agency discretionary permits would not apply, as discussed in Section 5.2.1. However, local agency permits are discussed to provide awareness to the reader. The property is zoned by the County of Ventura as “AE-40 ac – Agricultural Exclusive, 40 acres minimum parcel size” (Ventura County 2021b). Section 8105-4 – Permitted Uses in Open Space, Agricultural, Residential and Special Purpose Zones states that pipelines require a conditional use permit (CUP) subject to approval by the Planning Director and that “Public Service/Utility Facilities” that include “Public Service/Utility Offices And Service Yards, When Located On Lots Containing The Majority Of The Agency’s Facilities” are not allowed in the AE zone. Additionally, the site is within the SOAR initiative area, which in general requires countywide voter approval of (1) any substantive change to the General Plan’s Agricultural, Open Space, or Rural land use goals or policies and (2) re-designation of land with these General Plan land use designations.

Ministerial permits for site construction activities, such as building permits, will be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, such as new poles or conduit, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D.

Substantial property and access rights across adjacent properties to the nearest public right-of-way would need to be acquired. The land is currently planted with an active avocado orchard, affecting the value of the property. Temporary construction and access easements would also be required for a staging area/laydown yard and potentially for electrical lines if SCE does not already have easements/right-of-way in place. Construction would begin upon issuance of

⁴³ CWA Section 404 establishes a program to regulate the discharge of dredged or fill material into waters of the United States, including wetlands. For most discharges that will have only minimal adverse effects, a general permit may be suitable. General permits are issued on a nationwide, regional, or state basis for particular categories of activities. An NWP is a general permit that authorizes activities across the country, unless revoked by a district or division commander. NWPs authorize a wide variety of activities such as mooring buoys, residential developments, utility lines, road crossings, mining activities, wetland and stream restoration activities, and commercial shellfish aquaculture activities (EPA 2022).

⁴⁴ CWA Section 401 establishes the State Water Resources Control Board and the Regional Water Quality Control Boards’ authority to regulate discharges of dredged or fill material to waters of the state; it also establishes the Porter-Cologne Water Quality Control Act (Porter-Cologne Act). CWA Section 401 water quality certifications are issued to applicants for a federal license or permit for activities that may result in a discharge into waters of the United States, including but not limited to the discharge or dredged or fill material. Waste discharge requirements under the Porter-Cologne Act are issued for discharges of dredged or fill material to waters of the state (California Water Boards 2022).

⁴⁵ California Fish and Game Code Section 1602 requires any person, state or local governmental agency, or public utility to notify CDFW prior to beginning any activity that may do one or more of the following: divert or obstruct the natural flow of any river, stream, or lake; change the bed, channel, or bank of any river, stream, or lake; use material from any river, stream, or lake; or deposit or dispose of material into any river, stream, or lake (CDFW 2022).

⁴⁶ The California Coastal Act established the California Coastal Commission (Coastal Commission) and requires certification by the Coastal Commission of a Local Coastal Program (LCP) to govern decisions that determine the short- and long-term conservation and use of coastal resources within a local agency’s jurisdiction. After an LCP has been approved, state coastal permitting authority over most new development is transferred from the Coastal Commission to the local government, which then applies the requirements of the LCP in reviewing proposed development. Ventura County’s LCP was certified by the Coastal Commission on June 7, 2017 (Coastal Commission 2022; Ventura County 2017).

applicable permits and is anticipated to take 60 to 70 months due to roadway installation, utility installation, significant site preparation and grading due to the slope of the property (see Table 4: Alternative 2.A Construction Assumptions/Estimates), SCE electrical system improvements, and building construction and equipment installation. The points assessments of the three schedule components for this alternative are presented in Table 41.

Table 41. Evaluation of Schedule – Alternative 2.A: Avocado Site – Natural Gas

Scheduling Component	Points
Project Permitting	5
Property/Right-of-Way Acquisition	4

Alternative 2.B: Avocado Site – Hybrid

As discussed in Alternative 2.A above, a PTC from the VCAPCD would be required, however only for two natural gas compressors. All other federal and state permits noted in Alternative 2.A would be anticipated for Alternative 2.B. Local agency discretionary permits would not apply, as discussed in Section 5.2.1; however, local agency permits related to this site are discussed above in Alternative 2.A to provide awareness to the reader. Ministerial permits for site construction activities, such as building permits, would be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D. The electrical interconnection would require at least 5 MW, necessitating additional infrastructure.

Substantial property and access rights across adjacent properties to the nearest public right-of-way would need to be acquired. The land is currently planted with an active avocado orchard, affecting the value of the property. Temporary construction and access easements would also be required for a staging area/laydown yard and potentially for electrical lines if SCE does not already have easements/right-of-way in place. Construction would begin upon issuance of applicable permits and is anticipated to take 60 to 70 months due to roadway installation, utility installation, significant site preparation and grading due to the slope of the property (see Table 5: Alternative 2.B Construction Assumptions/Estimates), SCE electrical system improvements, and building construction and equipment installation. The points assessments of the three schedule components for this alternative are presented in Table 42.

Alternative 3.A: Ventura Steel – Natural Gas

Alternative 3.A would require a PTC from the VCAPCD for the four new natural gas compressors. The property is currently developed with industrial uses, including oil extraction infrastructure, and is zoned by the Ventura County zoning ordinance as “M3-10,000 sf – General Industrial, 10,000 sf minimum parcel size” (Ventura County 2020, 2021b). The site and potential pipeline and utility corridors may impact riparian habitat associated with tributaries that flow to the Ventura River, potentially requiring a 404 NWP, 401 Certification, and SAA.

Local agency discretionary permits would not apply, as discussed in Section 5.2.1. However, local agency permits are discussed to provide awareness to the reader. Section 8105-5, Permitted Uses in Commercial and Industrial Zones, states that pipelines require a CUP subject to approval by the Planning Director and a Public Utility Facility requires a Planning Director approval.

Ministerial permits for site construction activities, such as building permits, would be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D.

The property would need to be acquired from the landowner although access to the site is immediately adjacent to a public right-of-way (Ventura Avenue). To install two new transmission pipelines, significant rights-of-way would be required (anticipated to be at least 12 properties). Land is currently developed with industrial land uses, including oil extraction. Construction would begin upon completion of oil extraction activity remediation, transfer of property and issuance of applicable permits and is anticipated to take 36 to 48 months due to roadway installation, utility installation, site preparation and grading, SCE electrical system modifications, and building construction and equipment installation (see Table 6: Alternative 3.A Construction Assumptions/Estimates). The points assessments of the three schedule components for this alternative are presented in Table 43.

Table 43. Evaluation of Schedule – Alternative 3.A: Ventura Steel – Natural Gas

Scheduling Component	Points

Construction Duration	5

Alternative 3.B: Ventura Steel – Hybrid

As discussed in Alternative 3.A, a PTC from the VCAPCD would be required, however only for two new natural gas compressors. All other federal and state permits noted in Alternative 3.A would be anticipated for Alternative 3.B. Local agency discretionary permits would not apply, as discussed in Section 5.2.1; however, local agency permits related to this site are discussed in Alternative 3.A to provide awareness to the reader. Ministerial permits for site construction activities, such as building permits, would be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D. The electrical interconnection would require at least 5 MW, necessitating additional infrastructure.

Significant property would need to be acquired from the landowner although access to the site is immediately adjacent to a public right-of-way (Ventura Avenue). To install two new transmission pipelines, significant right-of-way would be required (anticipated to be at least 12 properties). The land is currently developed with industrial land uses, including oil extraction. Construction would begin upon completion of oil extraction activity remediation, transfer of property and issuance of applicable permits and is anticipated to take 36 to 48 months due to roadway installation, utility installation, site preparation and grading, SCE electrical system improvements, and building construction and equipment installation (see Table 7: Alternative 3.B Construction Assumptions/Estimates). The points assessments of the three schedule components for this alternative are presented in Table 44.

Table 44. Evaluation of Schedule – Alternative 3.B: Ventura Steel – Hybrid

Alternative 4.A: Devil’s Canyon Road – Natural Gas

Alternative 4.A would require a new application for a PTC from the VCAPCD for four new natural gas compressors. The property is currently used for oil extraction and is zoned by the Ventura County zoning ordinance as “OS-160 ac, Open Space, 160 acres minimum parcel size” with a Habitat Connectivity Corridor mapped along the Ventura River (Ventura County 2020, 2021b). The site and potential pipeline and utility corridors may impact riparian habitat associated with tributaries that flow to the Ventura River, potentially requiring a 404 NWP, 401 Certification, and SAA.

Local agency discretionary permits would not apply, as discussed in Section 5.2.1. However, local agency permits are discussed to provide awareness to the reader. Pursuant to Section 8105-4, Permitted Uses in Open Space, Agricultural, Residential and Special Purpose Zones, pipelines require a CUP subject to approval by the Planning Director and a Public Utility Facility requires a Planning Commission CUP approval. Ministerial permits for site construction activities, such as building permits, would be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D.

Significant property would need to be acquired from the landowner although access to the site is available from an existing driveway to a public right-of-way. To install new transmission pipelines, five properties are anticipated to require pipeline easements. The land is currently developed with industrial land uses, including oil extraction. Construction would begin upon completion of oil extraction activity remediation, transfer of property and issuance of applicable permits and is anticipated to take 24 to 30 months due to utility modifications, site preparation and grading, building construction, and equipment installation (see Table 8: Alternative 4.A Construction Assumptions/Estimates). The points assessments of the three schedule components for this alternative are presented in Table 45.

Table 45. Evaluation of Schedule – Alternative 4.A: Devil’s Canyon Road – Natural Gas

Alternative 4.B: Devil’s Canyon Road – Hybrid

As discussed in Alternative 4.A, a new application for a PTC from the VCAPCD would be required, however only for two new natural gas compressors. All other federal and state permits noted in Alternative 4.A would be anticipated for Alternative 4.B. Local agency discretionary permits would not apply, as discussed in Section 5.2.1; however, local agency permits related to this site are discussed in Alternative 4.A to provide awareness to the reader. Ministerial permits for site construction activities, such as building permits, would be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D. The electrical interconnection would require at least 5 MW, necessitating additional infrastructure.

Significant property would need to be acquired from the landowner although access to the site is available from an existing driveway to a public right-of-way. To install new transmission pipelines, five properties are anticipated to require pipeline easements. The land is currently developed with industrial land uses. Construction would begin upon completion of oil extraction activity remediation, transfer of property and issuance of applicable permits and is anticipated to take 24 to 30 months due to utility modifications, site preparation and grading, SCE electrical system improvements, and building construction and equipment installation (see Table 9: Alternative 4.B Construction Assumptions/Estimates). The points assessments of the three schedule components for this alternative are presented in Table 46.

Table 46. Evaluation of Schedule – Alternative 4.B: Devil’s Canyon Road – Hybrid

Scheduling Component	Points
Project Permitting	5
Property/Right-of-Way Acquisition	2
Construction Duration	5

Alternative 5.A: County Line – Natural Gas

Alternative 5.A would require a PTC from the VCAPCD for five new natural gas compressors. The site and potential pipeline and utility corridors may impact riparian habitat associated with Rincon Creek and/or tributaries that flow to Rincon Creek, potentially requiring a 404 NWP, 401 Certification, and SAA. The southerly portion of the project site and staging area may extend into the State Coastal Zone, potentially requiring a coastal development permit issued by the County of Ventura.

Local agency discretionary permits would not apply, as discussed in Section 5.2.1. However, local agency permits are discussed to provide awareness to the reader. The property is zoned by the Ventura County zoning ordinance as “AE-40 ac – Agricultural Exclusive, 40 acres minimum parcel size” and is within the area governed by SOAR initiative (Ventura County 2020, 2021a). Section 8105-4 – Permitted Uses in Open Space, Agricultural, Residential and Special Purpose Zones states that pipelines require a CUP subject to approval by the Planning Director and that “Public Service/Utility Facilities” that include “Public Service/Utility Offices And Service Yards, When Located On Lots Containing The Majority Of The Agency’s Facilities” are not allowed in the AE zone. Ministerial permits for site construction activities, such as building permits, would be required from the County of Ventura. Coordination with SCE would also be required to address any electrical upgrades, such as new poles or conduit, which may require the filing of an advice letter with the CPUC or a PTC in accordance with General Order 131-D.

Moderate property and access rights across adjacent properties to the nearest public right-of-way would need to be acquired. To install new transmission pipelines, five properties are anticipated to require pipeline easements; the subject land is currently vacant. Construction would begin upon issuance of applicable permits and is anticipated to take 60 to 70 months due to roadway installation, utility installation, significant site preparation and grading due to the slope of the property (see Table 10: Alternative 5.A Construction Assumptions/Estimates), and building construction and equipment installation. The points assessments of the three schedule components for this alternative are presented in Table 47.

6 Results of Evaluation

SoCalGas appreciates the community’s and CPUC’s collaboration regarding the Ventura Compressor Station. As discussed in Section 1.2 Feasibility Study Methodology, there is no prescriptive format or template for a feasibility study. As such, SoCalGas developed this study based on the foundational purpose, need and objectives of the project, essential site criteria and five supplemental considerations. If an alternative site or technology did not meet the foundational purpose, need and most objectives or essential site criteria, it was dismissed from further consideration. Those alternatives that were carried forward were analyzed in accordance with a scoring rubric (Appendix B) in five areas including: operational considerations, environmental considerations, project cost, operational cost, and schedule. The top three alternative options were identified in each of the five areas that were evaluated. As noted below, however, there are additional factors (such as age of facility equipment, timing, and ability to acquire alternative sites considered in this study) which are not captured by this feasibility analysis and impact the results of this evaluation. The results of the evaluation are shown in Table 49. Results of Evaluation.

Table 49. Results of Evaluation

Ranking Order	Operational Considerations	Environmental Considerations	Project Cost	Operational Cost	Schedule
1	1A Planned Project	4B Devil’s Canyon Road – Hybrid	1A Planned Project	1A Planned Project	1A Planned Project
2	3A Ventura Steel – Natural Gas	1B Current Site – Hybrid	1B Current Site – Hybrid	3A Ventura Steel – Natural Gas	1B Current Site – Hybrid
3	1B Current Site – Hybrid	3B Ventura Steel – Hybrid	4A Devil’s Canyon Road – Natural Gas	4A Devil’s Canyon Road – Natural Gas	4A Devil’s Canyon Road – Natural Gas

Note: Environmental considerations were evaluated by Dudek and the results in Table 49 reflect their analysis.

Overall, Alternative 1.A Planned Project received the highest scores in four of the five categories (operational considerations, project cost, operational cost, and schedule). Alternative 1.B Current Site- Hybrid received the second highest score in the most categories. Alternative 4.B Devil’s Canyon Road – Hybrid received the highest score in the environmental considerations.

The results indicate that the top three alternative options for environmental considerations are existing industrial sites with a hybrid compressor configuration. The top three alternative options for long-term operational costs are existing industrial sites with a natural gas compressor configuration. The remaining categories include both natural gas and hybrid options at existing industrial sites as the top three alternative options.

6.1 Preferred Alternative

Although Alternative 1.A Planned Project received the highest rankings in the most categories, SoCalGas has selected Alternative 1.B Current Site – Hybrid, which received the second highest rankings in the most categories, as the preferred alternative.

6.1.1 Greater Reliability Benefits

Based on the natural gas forecast of the 2020 California Gas Report (CGEU 2020), natural gas use is anticipated to slowly decline with greater emphasis on renewable sources such as solar and wind, placing a greater emphasis on operational flexibility and the ability of equipment to ramp up and down quickly. The Ventura Compressor Station is situated to support the Central Coast and meet reliability needs. It is the last compressor station on SoCalGas' Coastal System and the main feed to support storage injection at the La Goleta Storage Field as well as support customers on the Central Coast. Gas stored at the La Goleta Storage Field ultimately is used by customers on the Central Coast, including Ventura.

A recent study performed by the CPUC confirms the importance of maintaining gas storage to support overall gas demand.⁴⁷ This study includes modeling forecasts that are based on six scenarios developed by the CPUC that account for receipt point utilization, (the percent of the total capacity used at locations where gas enters the SoCalGas system), unplanned outages and storage withdrawal capacity (Abdelaziz et al. 2021). The results of the study reinforce the need to maintain available storage capacity, especially during winter peak demand, through at least 2030.

SoCalGas identified the need to proceed with a modernization of the 1980s facility equipment in 2013 (see SoCalGas DR- 4). Since 2016, SoCalGas has had a collective total of 73 maintenance events and cumulative total of 461 days when a compressor unit has been out of service (see SoCalGas DR-2). SoCalGas' trained maintenance staff are routinely performing inspections of the compressor equipment, but the risk of equipment failure increases the longer the aging equipment remains in use. Alternative site locations, such as those discussed in this study, would require site acquisition and pipeline easements over multiple properties, and in the event a landowner did not voluntarily sell land, SoCalGas could be forced to condemn land, which may take years and is not certain to be approved through an adjudicative process. Additionally, the condemnation process would consider whether other feasible locations not requiring condemnation are available, and given that SoCalGas currently operates a compressor station in the current location, the ability to condemn is not straight forward. Consequently, the analysis of alternative site acquisition is uncertain and beyond the scope of this feasibility study.

Given the age of the existing infrastructure, the uncertainty associated with acquiring alternative sites, and the time it would take to, permit, and construct a compressor station at a new location, constructing the modernization project at the current site would best support the fundamental purpose of the project, which is to (1) continue providing reliable compression to customers in Ventura and along the central coast, (2) enhance reliability by modernizing aging infrastructure; and (3) support gas deliveries to the La Goleta Storage Field.

⁴⁷ "Gas demand falls into three categories: (1) core (residential, commercial, industrial, municipal, and wholesale); (2) noncore, non-electric generation (commercial, industrial, refinery, and enhanced oil recovery); and (3) noncore, electric generation (EG). SoCalGas sells gas to core customers, whereas noncore customers buy their gas from other sources and SoCalGas delivers it" (Abdelaziz et al. 2021).

6.1.2 Greater Emission Reductions

SoCalGas is committed to taking measurable steps to reduce emissions and decarbonize its operations. Ventura County, where the compressor station is located, is in nonattainment with both the 2008 and 2015 federal 8-hour ozone standards. Both the all-natural gas options and the hybrid options significantly reduce permitted oxides of nitrogen (NO_x) emissions as compared to the existing facility’s permitted emissions. Moreover, a hybrid option will reduce permitted emissions beyond those of a natural gas option. Specifically, a hybrid option would result in approximately 75% reduction in permitted NO_x emissions as compared to the existing facility’s permitted NO_x emissions.

In addition, the hybrid option will decrease potential carbon dioxide equivalent (CO_{2e}) emissions by approximately 30% as compared to the all-gas option. As discussed in Section 1.1.4, reducing carbon intensity across all economic sectors is foundational to achieving California’s net zero GHG emission goals.

6.1.3 Cost

As a prudent operator, SoCalGas must consider the short-term project costs and the long-term operational costs in relationship to the associated effects on ratepayers. No additional weighting was given to operational cost in comparison to project development cost despite the fact that operational costs are recurring for the life of the project.

As discussed in Section 5.1, SoCalGas’ cost estimates for the 10 alternatives were based on the accepted AACE cost estimating practices. The top three alternatives for project development cost are shown in Table 50. Alternative 1.A Planned Project is the lowest total cost because no land acquisition for site development or ancillary infrastructure (pipelines, electric lines) is required. Furthermore, the existing pipeline infrastructure within the footprint of the existing compressor station is in place and only requires minor modification to connect to the proposed compressor building. As with 1.A, Alternative 1.B Current Site – Hybrid minimizes costs because no land acquisition for site development is required and pipeline infrastructure is already in place. The incremental \$43 million (MM) is related to the additional onsite infrastructure required for a hybrid option (substation, electric drop). The third lowest project development cost, Alternative 4.A Devil’s Canyon Road – Natural Gas, is approximately \$100MM greater in cost than 1.B and \$145MM greater in cost than 1.A.

Table 50. Ventura Compressor Station Alternatives – Project Development Cost Estimates – Top 3

Alternative	Project Development Cost (Nonrecurring)
1.A: Planned Project	\$421MM
1.B: Current Site – Hybrid	\$464MM
4.A: Devil’s Canyon Road – Natural Gas	\$566MM

Note: MM = million.

Overall, natural gas options have significantly less overall operational costs. The primary operational cost driver for all hybrid alternatives is the cost of SCE electricity. The top three alternatives for operational cost are provided in Table 51. For the hybrid alternatives, 1.B is the lowest annual operating cost and it is still \$1.685MM above 1.A. Estimates were developed by

SPEC Services and calculated the fuel/power usage required to operate the engine/motor and multiplied it by the SCE anticipated rate (SCE 2019).

Table 51. Ventura Compressor Station Alternatives – Operational Cost Estimates – Top 3

Alternative	Operational Cost (Recurring)
1.A: Planned Project	\$0.904MM
3.A: Ventura Steel – Natural Gas	\$0.909MM
4.A: Devil’s Canyon Road – Natural Gas	\$0.919MM

Note: MM = million.

Although the long-term operational costs of any hybrid option will be greater than a natural gas option, the emission reductions and overall progression towards a net zero future achieved with 1.B outweighs the lower cost of 1.A.

For the reasons noted above, SoCalGas believes that 1.B Current Site – Hybrid best achieves the project’s purpose of continuing to provide reliable service, while supporting decarbonization and reducing emissions at the lowest cost to ratepayers.

6.2 Next Steps

This feasibility study will be shared on SoCalGas’ Ventura project website accessible here: www.socalgas.com/ventura, no later than March 25, 2022. The feasibility study will be presented to the community and CPUC in March/April 2022 during Public Forum meetings. It is SoCalGas’ intention to move forward with Alternative 1.B Current Site – Hybrid and continue to place a high priority on this critical project to address the fundamental needs of SoCalGas’ transmission system and replace the aging equipment consistent with Commission Decision D.19-09-051.

INTENTIONALLY LEFT BLANK

1 Introduction

1.1 Project Background

Southern California Gas Company (SoCalGas) is the owner and operator of the existing Ventura Compressor Station, located at 1555 North Olive Street in the City of Ventura, California. SoCalGas has prepared a “Feasibility Study of Potential Alternatives – Ventura Compressor Station Modernization Project” (Feasibility Study; SoCalGas 2022), which evaluates the feasibility of potential alternative site locations and equipment configurations for the planned Ventura Compressor Station Modernization Project (Planned Project). The Feasibility Study addresses the operational needs of the integrated natural gas pipeline system. The existing Ventura Compressor Station Site (Existing Site) currently provides compression, powered by natural gas engine-driven compressors, to move natural gas within the existing pipeline system to customers both within the City of Ventura (the City) and north of the City along the Central Coast, to meet local distribution needs as well as supply the La Goleta Storage Field.

The Existing Site’s compression equipment was installed in the 1980s. Due to changes to the operating environment of SoCalGas’s integrated natural gas pipeline transmission system, the functionality of the existing 40-year-old equipment, the ability to maintain compression on existing pipelines, and the critical importance of maintaining adequate natural gas inventory in the La Goleta Storage Field, SoCalGas is proposing to modernize the Ventura Compressor Station. This modernization would include replacement of three existing natural gas compressors with four new natural gas compressors within a new compressor building and other associated improvements (i.e., the Planned Project).

1.2 Purpose of Evaluation

Dudek was retained by SoCalGas to prepare an environmental evaluation as part of the Feasibility Study of potential alternative site locations and equipment configurations to the Planned Project. Dudek is a 700-person national, multidisciplinary environmental and engineering firm founded in 1980 and is ranked as one of the top 120 U.S. Environmental Firms (Engineering News-Record 2021). This environmental evaluation is prepared in response to requests from the California Public Utility Commission (CPUC). The CPUC requested that SoCalGas prepare a feasibility study that: (1) fully analyzes all options considered for the compressor station upgrade; (2) provides the basis for rejecting any alternatives that were considered, including but not limited to electric compressors for all or part of the project; (3) discusses all alternative sites that were considered but rejected and SoCalGas’s reasons for rejecting them; and (4) provides an explanation of how the project factors into both local and statewide safe and reliable service and the state’s decarbonization goals.

The purpose of this evaluation is limited to the environmental considerations of the Planned Project, the alternative sites, and the two alternative technologies. The scoring criteria presented in Section 3.1 of this evaluation, as provided by SoCalGas, serve as the basis of the environmental evaluation. Dudek conducted a desktop environmental analysis based upon the Planned Project and alternative-related information provided by SoCalGas, which is based upon reasonable assumptions detailed within the Feasibility Study. No site visits were conducted and existing conditions at each site may vary slightly from what was analyzed. However, a good-faith effort was made to accurately assess the environmental considerations set forth in Section 3.1. SoCalGas’ Feasibility Study considers several other criteria, such as purpose, need, and objectives of the compressor modernization project, essential site criteria, and cost and schedule considerations, which are outside the scope of Dudek’s evaluation.

INTENTIONALLY LEFT BLANK

2 Alternative Options

Alternatives to the Planned Project at the Ventura Compressor Station were developed including feedback from the community as part of SoCalGas's Town Hall meetings hosted in October 2021. All alternatives suggested by the community during the Town Hall meetings and comment period were considered as part of the Feasibility Study. All proposed alternatives were screened based on the ability of an alternative to meet the foundational purpose, need, and objectives of the Planned Project, as stated by SoCalGas in their Feasibility Study (see Section 1.2, Purpose of Evaluation). If an alternative met the foundational purpose, need and objectives, the alternative was carried forward for further consideration based on its ability to comply with SoCalGas's identified essential site criteria, including property acreage requirements, Federal Aviation Administration (FAA) compatibility, and avoidance of Federal Emergency Management Agency (FEMA) mapped floodways. A total of five sites, with two technology options at each site, qualified for further evaluation. A brief discussion of technology alternatives and each of the evaluated alternative sites is provided below and discussed in SoCalGas's Feasibility Study.

2.1 Technology Options

The two technology options described below were determined to meet SoCalGas's operational needs and comply with emissions thresholds, and therefore were evaluated at each potential site.

2.1.1 Natural Gas

The existing Ventura Compressor Station uses three natural gas compressors, each of which is rated at 1,100 horsepower (HP). The Natural Gas Option includes the use of only natural gas engine-driven compressor technology at each potential alternative location, including the Existing Site.¹ The Planned Project would include replacement of the three existing 1,100 HP natural gas engine-driven compressors (referred to in this evaluation as *natural gas compressors*) with new, more efficient equipment, consisting of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. The new compressors and infrastructure would meet all applicable regulatory requirements, including those associated with environmental, engineering, and safety standards. Other planned structures on the Existing Site include a new warehouse building, new office building, and stormwater infiltration basins. The Natural Gas Option at all of the evaluated alternative sites would include development of a facility similar to that described above for the Planned Project at the Existing Site. One variation is the County Line Site, which would require one additional compressor for the Natural Gas Option when compared to the other sites.

2.1.2 Hybrid (Natural Gas and Electric)

The Hybrid Option would require construction of new infrastructure, similar to the Natural Gas Option. However, instead of installing four natural gas compressors, the Hybrid Option would include two new 1,900 HP natural gas compressors and two new 1,900 HP electric motor-driven compressors (referred to in this evaluation as *electric compressors*) installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric

¹ The natural gas compressors are the same for all alternatives; only the technology of the driver is different. Either a natural gas engine or an electric motor may drive a compressor. For ease of reference in this evaluation, we are referring to the natural gas engine-driven compressors as *natural gas compressors* and the electric motor-driven compressors as *electric compressors*.

service capacity and therefore would require an on-site electrical substation for the Hybrid Option. The new compressors and infrastructure would meet regulatory requirements, including those associated with environmental, engineering, and safety standards. Other planned structures under consideration for each alternative site would include a new warehouse building, a new office building, and stormwater infiltration basins. The Hybrid Option at all the evaluated alternative sites would include development of the same on-site facilities, with the exception of the County Line Site, which would require one additional electric compressor for the Hybrid Option when compared to the other sites.

2.2 Alternative Sites

This section provides a brief overview of the five alternative sites that are evaluated in this analysis. For each alternative site, both natural gas and hybrid technologies are described below and evaluated in accordance with the methodology outlined in Section 3.2, Evaluation Methodology. For a detailed description of site characteristics at each location, please refer to the Feasibility Study prepared by SoCalGas and dated March 2022. Table 1 provides an overview of the alternative sites.

Table 1. Ventura Compressor Modernization Project Potential Alternative Sites

Alternative	Identified by	Land Use/ Zoning	Location
Option 1A: Existing Site – Natural Gas (Planned Project)	SoCalGas	Industry/M-2	Existing site of the current Ventura Compressor Station – Approximately 8.42 ac parcel located on the west side of the City of Ventura
Option 1B: Existing Site – Hybrid			
Option 2A: Avocado Site – Natural Gas	Community	Open Space/ AE-40 ac	Approximately 15.06 ac agricultural site located approximately 3,000 ft west of the existing Ventura Compressor Station, on privately held land currently developed with an avocado orchard within the County of Ventura
Option 2B: Avocado Site – Hybrid			
Option 3A: Ventura Steel – Natural Gas	SoCalGas	Industrial/M3-10,000 sf	Approximately 10.00 ac industrial site located approximately 8,000 ft north of the existing Ventura Compressor Station within the County of Ventura
Option 3B: Ventura Steel – Hybrid			
Option 4A: Devil’s Canyon Road – Natural Gas	Community	Open Space/OS-160 ac/HCWC	Approximately 12.88 ac oil extraction site located approximately 6,000 ft to the north of the existing Ventura Compressor Station on the west side of SR-33 within the County of Ventura
Option 4B: Devil’s Canyon Road – Hybrid			

Table 1. Ventura Compressor Modernization Project Potential Alternative Sites

Alternative	Identified by	Land Use/ Zoning	Location
Option 5A: County Line - Natural Gas	SoCalGas	Open Space/AE-40 ac	Approximately 12.33 ac vacant parcel of land designated and zoned for agriculture located within County of Ventura at the Santa Barbara County line approximately 12 mi northwest of the existing Ventura Compressor Station
Option 5B: County Line - Hybrid			

Notes: ac = acre; ft = feet; sf = square feet; HCWC = Habitat Connectivity and Wildlife Corridors overlay zone; SR = State Route; mi = miles.

2.2.1 Existing Site

The Existing Site is the location of the Planned Project. The Planned Project was developed by SoCalGas and consists of the existing approximately 8.42-acre compressor station site located within the City of Ventura (Figure 1, Project Location - Existing Site). The site is zoned for industrial purposes and owned by SoCalGas. Land use on site consists of a compressor station, which has been present since at least 1923 and has existed in its current configuration since the 1980s. The site is fully graded and developed and is connected to the existing natural gas pipeline system. An approximately 2.53-acre temporary construction staging area would be located adjacent to the west side of the Existing Site.

No road improvements, pipeline extensions, or other permanent off-site infrastructure would be necessary to construct the Planned Project (the Natural Gas Option) or the Hybrid Option on the Existing Site.

2.2.2 Avocado Site

This alternative, which was suggested by members of the public, consists of an approximately 15.06-acre site located approximately 3,000 feet west of the Existing Site on the existing pipeline corridor within the jurisdiction of the County of Ventura (the County; Figure 2, Project Location - Avocado Site). The surrounding area is primarily developed with agricultural uses and oil/gas fields, and the nearest residence is approximately 0.7 miles away. The Avocado Site itself is undeveloped hillside land adjacent to an avocado orchard.

Development of this site would require the following new off-site infrastructure: (1) widening, regrading, and paving of Taylor Ranch Road to be a minimum of 24 feet wide with less than a 20% grade to meet Fire Department standards; (2) approximately 0.18 miles of a new pipeline system with two mainline valves that would tie into the existing natural gas system pipelines; and (3) subterranean utility lines beneath the existing Taylor Ranch Road that would tie into existing facilities at West Main Street. An approximately 5.63-acre temporary construction staging area would be located at the base of Taylor Ranch Road and West Main Street. For the Hybrid Option, approximately 0.83 miles (including 30 new poles) of off-site aboveground electrical utility extensions would also be required.

2.2.3 Ventura Steel Site

This alternative was developed by SoCalGas and consists of an approximately 10.00-acre site located approximately 7,000 feet north of the Existing Site, to the east of North Ventura Avenue within County jurisdiction (also within the City's sphere of influence) (Figure 3, Project Location - Ventura Steel Site). This site is relatively flat and there are existing active oil wells on site.

Development of this site would require the following new off-site infrastructure: (1) approximately 1.61 miles of subterranean pipeline system beneath the alignment of North Ventura Avenue that would tie into the existing natural gas system pipelines; (2) approximately 3.16 miles of a subterranean pipeline system through oil/gas fields and undeveloped hillsides that would tie into the existing natural gas system pipelines using two mainline valves; (3) a 121-foot depressurization line; and (4) 3,600 linear feet of a new permanent 12-foot-wide road for construction access to the new pipeline corridor. The pipelines would be constructed in a phased process within North Ventura Avenue to minimize the extent of required lane closures, ensure adequate northbound-southbound traffic flow during roadway construction, and allow for adequate space between the new pipelines and existing utility lines. An approximately 4.69-acre temporary construction staging area would be located north of the Ventura Steel Site. For the Hybrid Option, approximately 0.02 miles of off-site aboveground electrical utility extensions (including 2 new poles) would also be required.

2.2.4 Devil's Canyon Road Site

This alternative was suggested by members of the public and consists of an approximately 12.88-acre site located approximately 5,300 feet northwest of the Existing Site within County jurisdiction (Figure 4, Project Location – Devil's Canyon Road Site). The site is relatively flat. It has been previously developed with oilfield operations and is currently partially occupied by oil wells.

Development of this site would require the following new off-site infrastructure: (1) approximately 0.97 miles of a subterranean pipeline system beneath Devil's Canyon Road that would tie into the existing natural gas system pipelines using two mainline valves and (2) minor upgrades to an approximately 0.36-mile-long existing access road to accommodate the project. An approximately 6.27-acre construction staging area would be located northwest of the intersection of Shell Road and Ventura River Trail, approximately 0.25 miles from the existing access road to the Devil's Canyon Road Site. For the Hybrid Option, approximately 0.85 miles of off-site aboveground electrical utility extensions (including 40 new poles) would also be required.

2.2.5 County Line Site

This alternative was developed by SoCalGas and consists of an approximately 12.33-acre site located within Ventura County at the Santa Barbara County line. This site is approximately 11 miles northwest of the Existing Site, generally on the existing natural gas pipeline corridor (Figure 5, Project Location – County Line Site). This site is on a hillside, and it would require a large amount of grading to construct the compressor station in this hillside area.

Development of this site would require the following new off-site infrastructure: (1) approximately 1.15 miles of a subterranean pipeline system with two mainline valves that would tie into the existing natural gas system pipelines and (2) approximately 0.47 miles of improvements to the existing access road so it is a minimum of 24 feet wide with less than a 20% grade, meeting Fire Department standards. An approximately 3.92-acre staging area would be directly northwest of the County Line Site. For the Hybrid Option only, approximately 0.27 miles of off-site aboveground electrical utility extensions (including 15 new poles) would also be required. Additionally, the County Line Site would require construction of an additional compressor for both the Natural Gas Option and the Hybrid Option. This site would require five new natural gas compressors for the Natural Gas Option and would require two new natural gas compressors and three new electric compressors for the Hybrid Option.

3 Environmental Evaluation Methodology

The following section describes the methodology that was used in the environmental evaluation of the potential alternatives. The scoring and ranking of all alternatives are provided in Chapter 4, Environmental Scoring and Ranking, and a detailed discussion of each environmental topic area is provided in Chapter 5, Ranking Analysis.

3.1 Scoring Criteria

As shown in Table 2, a detailed numeric ranking system was developed for the environmental topic areas, which includes operational considerations and construction considerations (for both on-site construction and off-site construction).

Table 2. Scoring Criteria

Topic Area	Ranking			
	0	1-2-3	4-5-6	7-8-9
Operational Considerations				
Aesthetics/ Visual Resources	Substantially alters a defined scenic resource, as determined by adopted plans (e.g., scenic vistas, scenic highways, ridgelines)	Substantially alters the character of a site and/or its surroundings and is highly visible	Minimally alters the character of a site and/or its surroundings and is highly visible	Project is either not visible or does not alter the character of the surrounding community
Air Quality	NO _x emissions ≥12 tons per year	NO _x emissions ≥8 tons per year but <12 tons per year	NO _x emissions ≥4 tons per year but <8 tons per year	NO _x emissions <4 tons per year
CalEnviroScreen	91% to 100% pollution burden	61% to 90% pollution burden	31% to 60% pollution burden	1% to 30% pollution burden
Greenhouse Gas Emissions	GHG emissions ≥50,000 MT/yr CO ₂ e	GHG emissions ≥25,000 MT/yr CO ₂ e but <50,000 MT/yr CO ₂ e	GHG emissions ≥10,000 MT/yr CO ₂ e but <25,000 MT/yr CO ₂ e	GHG emissions <10,000 MT/yr CO ₂ e
Land Use Designation	Non-industrial/manufacturing zone and adjacent to sensitive receptors	Industrial/manufacturing zone and adjacent to sensitive receptors	Non-industrial/manufacturing zone and not adjacent to sensitive receptors	Industrial/manufacturing zone and not adjacent to sensitive receptors
Noise (Operations Assuming 80 dBA)	≥65 dBA at the property line, taking into account non-industrial land uses ^a	≥55 dBA but <65 dBA at the property line, taking into account non-industrial land uses ^a	≥45 dBA but <55dBA at the property line, taking into account non-industrial land uses ^a	<45 dBA at the property line, taking into account non-industrial land uses ^a
Wildfire	Within a very high fire hazard severity zone	Within a high fire hazard severity zone	Within a moderate fire hazard severity zone	Not within a fire hazard severity zone
On-Site Construction Considerations				
Air Quality	NO _x emissions ≥80,000 pounds and PM ₁₀ ≥10,000 pounds	NO _x emissions <80,000 pounds and ≥40,000 pounds and PM ₁₀ emissions <10,000 pounds and ≥6,000 pounds	NO _x emissions <40,000 pounds and ≥8,000 pounds and PM ₁₀ emissions <6,000 pounds and ≥2,000 pounds	NO _x emissions <8,000 pounds and PM ₁₀ <2,000 pounds

Table 2. Scoring Criteria

Topic Area	Ranking			
	0	1-2-3	4-5-6	7-8-9
Cultural Resources	Significant cultural resources are present and the project has the potential to impact the significance of those resources	Significant cultural resources are present and project impacts would be less than significant with minimization measures incorporated in the project, or the project is in a location that is highly sensitive for potentially significant cultural resources	Significant cultural resources are present, but project does not have the potential to impact the significance of those resources, or the project is in a location that is moderately sensitive for potentially significant cultural resources	No significant cultural resources are present based on records search results and the project is in a location that is not sensitive for potentially significant cultural resources
Greenhouse Gas Emissions	GHG emissions $\geq 20,000$ MT CO _{2e}	GHG emissions $\geq 10,000$ MT CO _{2e} but $< 20,000$ MT CO _{2e}	GHG emissions $\geq 5,000$ MT CO _{2e} but $< 10,000$ MT CO _{2e}	GHG emissions $< 5,000$ MT CO _{2e}
Natural Resources	Site contains sensitive plant or animal species and/or habitats or wetlands that would be directly impacted and require mitigation	Site is adjacent to sensitive plant or animal species and/or habitats or wetlands that would be indirectly impacted and would require mitigation	Site contains or is adjacent to plant or animal species and/or habitats that would be directly or indirectly impacted but would not require mitigation	No sensitive biological resources on site or no potential to affect sensitive biological resources
Noise (Assuming 100+ dBA at Site)	Non-industrial land uses ^a are located within 0–50 feet of site construction (≥ 90 dBA or greater)	Non-industrial land uses ^a are located within 51–100 feet of site construction (< 90 dBA to ≥ 84 dBA)	Non-industrial land uses ^a located within 101–250 feet of site construction (< 84 dBA to ≥ 75 dBA)	Non-industrial land uses ^a located greater than 251 feet from site construction (< 75 dBA)
Slope, Topography, and Grading	Average slope of property is equal to or greater than 40%; substantial over-excavation/recompaction requiring $\geq 75,000$ CY	Average slope of property is 30%–39%; moderate over-excavation/recompaction requiring $\geq 25,000$ but $< 75,000$ CY	Average slope of property is 20%–29%; minimal over-excavation/recompaction requiring $\geq 10,000$ CY but $< 25,000$ CY	Average slope of property is less than 20%; negligible/no over-excavation/recompaction requiring $< 10,000$ CY

Table 2. Scoring Criteria

Topic Area	Ranking			
	0	1-2-3	4-5-6	7-8-9
Traffic – Construction	Heavy truck traffic (i.e., import/export) through residential areas or roadway-constrained areas for 1 year or longer	Heavy truck traffic (i.e., import/export) through residential areas or roadway-constrained areas for 6 months to less than 1 year	Heavy truck traffic (i.e., import/export) through residential areas or roadway-constrained areas for less than 6 months	Heavy truck traffic (i.e., import/export) NOT occurring through residential areas or roadway-constrained areas
Off-Site Construction for Routing Utilities Considerations				
Air Quality ^b	Substantial linear construction (e.g., ≥15,000 feet)	Moderate linear construction (e.g., ≥10,000 but <15,000 feet)	Minimal linear construction (e.g., ≥5,000 and <10,000 feet)	None or negligible linear construction (e.g., <5,000 feet)
Cultural Resources	Significant cultural resource(s) are present and the project has the potential to impact the significance of those resources	Significant cultural resource(s) are present and project impacts will be less than significant with minimization measures incorporated in the project; or, the project is in a location that is highly sensitive for potentially significant cultural resources	Significant cultural resources are present, but project does not have the potential to impact the significance of that resource; or, the project is in a location that is moderately sensitive for potentially significant cultural resources	No significant cultural resources are present based on records search results and the project is in a location that is not sensitive for potentially significant cultural resources.
Greenhouse Gas Emissions	GHG emissions ≥2,000 MT CO ₂ e	GHG emissions ≥1,000 MT CO ₂ e but <2,000 MT CO ₂ e	GHG emissions ≥500 MT CO ₂ e but <1,000 MT CO ₂ e	GHG emissions <500 MT CO ₂ e
Natural Resources	Site contains sensitive plant or animal species and/or habitats or wetlands that would be directly impacted and would require mitigation	Site is adjacent to sensitive plant or animal species and/or habitats or wetlands that would be indirectly impacted and would require mitigation	Site contains or is adjacent to plant or animal species and/or habitats that would be directly impacted but would not require mitigation	No sensitive biological resources on site or no potential to affect sensitive biological resources

Table 2. Scoring Criteria

Topic Area	Ranking			
	0	1-2-3	4-5-6	7-8-9
Noise (Assuming 100+ dBA at Site)	Non-industrial land uses ^a are located within 0–50 feet of site construction (>90 dBA or greater)	Non-industrial land uses ^a are located within 51–100 feet of site construction (≤90 dBA to >84 dBA)	Non-industrial land uses ^a located within 101–250 feet of site construction (≤84 dBA to >75 dBA)	Non-industrial land uses ^a located greater than 251 feet from site construction (≤75 dBA)
Traffic – Roadway Construction	Substantial roadway construction on existing roads (e.g., lane closures of more than 5,001 feet)	Moderate roadway construction on existing roads (e.g., lane closures of 2,501 to 5,000 feet)	Minimal roadway construction on existing roads (e.g., lane closures of 501 to 2,500 feet)	None or negligible roadway construction (e.g., lane closures of less than 500 feet)
Utilities/Service Systems	Substantial off-site ground disturbance (more than 100,000 square feet)	Moderate off-site ground disturbance (99,999 to 50,000 square feet)	Minimal off-site ground disturbance (49,999 to 25,000 square feet)	Negligible off-site ground disturbance (less than 24,999 square feet)

Notes: NO_x = oxides of nitrogen; ≥ = greater than or equal to; < = less than; GHG = greenhouse gas; MT/yr = metric tons per year; CO_{2e} = carbon dioxide equivalent; FHSZ = fire hazard severity zone; dBA = A-weighted decibel; CY = cubic yard.

- ^a For noise, the scoring assessment location is where the noise level crosses the boundary of the nearest non-industrial (residential, commercial, or institutional [e.g., school] zoned property or at the location of the nearest occupied structure of an agricultural land use (e.g., inhabited house of a farm or vineyard).
- ^b As the linear distance of off-site construction increases, the emissions from heavy equipment and ground disturbance would also increase.

3.2 Evaluation Methodology

The site names used in this environmental evaluation refer to the alternative site locations for the compressor station (e.g., Avocado Site, Ventura Steel Site, County Line Site); however, additional components, such as staging areas and ancillary improvements such as off-site pipelines, mainline valve (MLV) stations, and/or roadway improvements, are also identified and evaluated, as applicable. “On site” refers to land area accommodating the compressor station and associated infrastructure, while “off site” refers to any required components or improvements not located within the boundaries of the compressor station land area. To adequately evaluate each topic area, the following methodologies were used.

3.2.1 Aesthetics/Visual Resources

Public visibility to each alternative site was assessed based on aerial maps and KML files of alternative sites and infrastructure/components. Scenic resources and vantage points including scenic highways and public trails were identified via review of adopted plans (specifically, the 2005 Ventura General Plan), the State Scenic Highway System managed by the California Department of Transportation (Caltrans), and the public database of trails maintained by the AllTrails application (alltrails.com). The severity of view alteration of/to a known scenic resource and alteration of existing visual character was determined based on assumed visual prominence of construction and operations at the analyzed site as experienced from available vantage points, as well as the approximate distance between the analyzed site and available vantage point, the estimated duration of view exposure, and the presence (or lack thereof) of comparable development and visual contrasts in the viewshed.

For the rubric determination, the following criteria were used to determine the score for each alternative:

- **Ranking 0:** Due to proposed characteristics of components (e.g., bulk, scale) or site location, the project alternative would be visible and would result in the substantial alteration (either through blockage or interruption) of a view from a defined scenic resource (e.g., scenic vista, scenic highway) or development of the project alternative would substantially alter or disturb a defined scenic landscape resource such as a ridgeline.
- **Ranking 1-2-3:** Due to proposed characteristics of components (e.g., bulk, scale), site location, or use, the project alternative would be highly visible to viewers in the surrounding area and would result in noticeable (and substantial) contrast with surrounding development, uses, or landscape elements.
- **Ranking 4-5-6:** While highly visible due to proposed characteristics of components (e.g., bulk, scale) or site location, the project alternative is overall compatible with existing uses in the surrounding area and would result in generally weak contrast with existing development and/or landscape elements.
- **Ranking 7-8-9:** Due to proposed characteristics of components (e.g., bulk, scale), site location, or intervening screening elements (e.g., vegetation, development, terrain), the project alternative is not visible (or is well screened) from public and private vantage points in the surrounding area. Alternatively, the project alternative is compatible with existing uses in the surrounding area and would result in no contrast with existing development and/or landscape elements.

3.2.2 Air Quality and Greenhouse Gas Emissions

Yorke Engineering LLC, an environmental consulting firm with expertise in air quality and greenhouse gas (GHG) matters, evaluated the air quality and GHG impacts from construction (on site and off site) as well as operational impacts of each equipment configuration at each potential alternative site location. The full air quality and GHG emissions analysis and supporting data are included as Attachment 1, Air Quality and Greenhouse Gas Emissions Analysis, of this evaluation.

3.2.2.1 Operational Considerations

Representative Data

For operational emissions for the Natural Gas Option, calculations for the four new proposed natural gas engines were taken from the Authority to Construct (ATC) application that was submitted to the Ventura County Air Pollution Control District (VCAPCD) in March 2020 for the Ventura Compressor Station Modernization Project at the Existing Site. Operational emissions for the Hybrid Option were based on only having two of the natural gas compressors operating, plus additional GHG emissions associated with the indirect electricity needed to operate two electric compressors. Operational emissions for the Natural Gas Option equipment configurations were assumed to be the same at all analyzed sites, with the exception of County Line, which would require an additional compressor. Similarly, the Hybrid Option would have similar operational emissions across all sites, with the exception of the County Line Site, which would require an additional electric compressor and therefore have additional indirect GHG emissions associated with the electricity needed to operate it. It is assumed the additional electricity required for electric compressors would not be supplied from the Southern California Edison (SCE) Green Tariff.

Emission Factors and Calculations

As noted above, operational emissions for the Natural Gas Option for the four proposed 1,900 HP engines were based on the ATC application submitted to the VCAPCD for modernization of the existing Ventura Compressor Station. These emissions calculations relied on the engine manufacturer's data, as well as standard natural gas fired combustion for the proposed engines and took into account emission reductions associated with installation of emissions control equipment to satisfy VCAPCD's best available control technology requirements. The analysis conservatively assumes that the Natural Gas Option would operate all compressors 24 hours per day, 7 days per week (i.e., 8,760 hours per unit per year). In practice, the compressors typically operate between 3,000 to 4,000 hours per unit per year; however, for ease of quantification in this analysis, a conservative assumption was made.

Operational oxides of nitrogen (NO_x) emissions for the Hybrid Option were scaled based on two, rather than four, natural gas-fired engines. The analysis conservatively assumes that the Hybrid Option would operate all compressors (both natural gas and electric) 24 hours per day, 7 days per week. As stated above, the compressors are not operated full-time; however, for ease of quantification in this analysis, a conservative assumption was made.

The Western Electricity Coordinating Council (WECC) California and Mexico subregion (CAMX) emission factor was used to estimate indirect GHG emissions for electricity use for the electric compressors under the Hybrid Option. This factor is an average of the regional power mix, accounting for renewable energy generation as well as fossil-fueled generation, to determine an average emission factor for pounds of CO_{2e} per megawatt-hour produced. The

analysis conservatively assumes that the Hybrid Option will operate all compressors (both natural gas and electric) 24 hours per day, 7 days per week.

3.2.2.2 On-Site Construction Considerations

To standardize across variations, common phases of a construction project were grouped into activity categories. Rankings of sites within the rubric are based on construction activities expected at each site:

- **Grading – Flat:** grading on a relatively flat surface, without any major elevation changes needed
- **Grading – Elevated:** grading where large amounts of earthwork may be involved, including excavation of hillsides, and typically involves more equipment than Grading – Flat
- **Power Line:** linear construction for new or upgraded electrical transmission lines; includes trenching and power pole erection as well as pulling and reconductoring of lines
- **Pipeline – Street:** linear construction for new gas pipeline under existing roadway to connect into existing main lines, and includes equipment used for trenching, backfilling, and paving
- **Pipeline – Open Space:** linear construction for new gas pipeline in undeveloped land to connect into existing main lines, and includes trenching and backfill
- **Compressor Station:** construction of the footprint of the new facility and structures housing the new compressor station equipment
- **Substation:** construction of a new substation at the compressor facility

For each alternative site, the activity-based emission factors were generated to evaluate the air quality and GHG impacts from the various construction activities given site conditions (see Table 3). These activities are based on the typical phases of a compressor station construction project and were applied to the various alternatives depending on the site-specific construction requirements. On-site construction emissions include site preparation, grading, and construction within the footprint of the future compressor station. Activity-based emission factors used for this evaluation are Grading – Flat, Grading – Elevated, Compressor Station, and Substation (where applicable). These factors represent the maximum emissions per unit of measure to provide a conservative estimate.

Representative construction equipment and schedule data from other recent, similar pipeline and compressor station modernization projects were extracted for input into the California Emissions Estimator Model (CalEEMod) to estimate construction emissions. Equipment inventories were developed based on representative project phases and consolidated to correlate to the activity categories above.

Table 3. On-Site Construction Activity-Based Emission Factors

Construction Activity	NO _x (lb/acre)	Exhaust PM ₁₀ (lb/acre)	CO _{2e} (MT/acre)
Grading – flat	1,855	495	224
Grading – elevated	5,186	675	822
Compressor station	2,678	512	395
Substation	2,081	118	466

Notes: NO_x = oxides of nitrogen; lb/acre = pounds per acre; PM₁₀ = coarse particulate matter; CO_{2e} = carbon dioxide equivalent; MT/acre = metric tons per acre.

Emission Factors and Calculations

To generate emission factors for the various construction activities, CalEEMod version 2020.4.0 was used. CalEEMod is the official statewide land use computer model designed to provide a uniform platform for estimating potential criteria pollutant and GHG emissions associated with the construction and operation of projects. The model quantifies direct emissions from construction and vehicle use, as well as indirect emissions such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. The mobile source emission factors used in the model, published by the California Air Resources Board (CARB), include the Pavley standards and Low Carbon Fuel Standards. The emissions model also identifies project design features, regulatory measures, and selectable mitigation measures to reduce criteria pollutant and GHG emissions, along with calculating the benefits achieved from the selected measures. CalEEMod was developed by the California Air Pollution Control Officers Association in collaboration with California air districts. Default land use data (e.g., emission factors, trip lengths, meteorology, source inventory) were provided by the various California air districts such as VCAPCD to account for local requirements and conditions.

Each representative equipment inventory was entered into CalEEMod, along with an average duration of equipment use and a unit measurement appropriate to the construction activity involved. For example, *per acre* was used for grading and *per mile* was used for pipeline construction. The CalEEMod simulations were run to determine the amount of pollutants that would be emitted for construction during each activity. After the selected scenarios were run, the emissions were normalized to produce the emission factors that can be applied to scale for each location based on the types and amount of activity required. Emission factors were identified as associated with either an on-site or an off-site construction activity.

On-site construction emissions included site preparation, grading, and construction within the footprint of the compressor station location being evaluated. Activity-based emission factors used for this evaluation are grading – flat, grading – elevated, compressor station, and substation (where applicable). Emission factors for these activities are shown in Table 3. These factors represent the maximum emissions per unit of measure to provide a conservative estimate.

3.2.2.3 Off-Site Construction Considerations

Off-site construction emissions include those from equipment used for pipeline, power line, and road work. Activity-based emission factors used for this evaluation are pipeline – street, pipeline – open space, and power line.

Emission factors for these activities are shown in Table 4. These factors represent the maximum emissions per unit of measure to provide a conservative estimate.

Table 4. Off-Site Construction Activity-Based Emission Factors

Construction Activity	NO _x (lb/mile)	Exhaust PM ₁₀ (lb/mile)	CO _{2e} (MT/mile)
Power line	1,308	55	166
Pipeline – street	1,815	83	186
Pipeline – open space	725	36	78
Roads	1,815	83	186

Notes: NO_x = oxides of nitrogen; lb/mile = pounds per mile; PM₁₀ = coarse particulate matter; CO_{2e} = carbon dioxide equivalent; MT/mile = metric tons per mile.

Ranking Criteria for Operations

The ranking ranges for operational NO_x emissions are as follows:

- **Ranking 0:** ≥12 tons/year
- **Ranking 1-2-3:** ≥8 tons/year but <12 tons/year
- **Ranking 4-5-6:** ≥4 tons/year but <8 tons/year
- **Ranking 7-8-9:** <4 tons/year

The ranking ranges for GHG emissions are:

- **Ranking 0:** ≥50,000 MT/yr CO_{2e}
- **Ranking 1-2-3:** ≥25,000 MT/yr CO_{2e} but <50,000 MT/yr CO_{2e}
- **Ranking 4-5-6:** ≥10,000 MT/yr CO_{2e} but <25,000 MT/yr CO_{2e}
- **Ranking 7-8-9:** <10,000 MT/yr CO_{2e}

Rubric Ranking Criteria for On-Site Construction

In the ranking rubric, air quality for the on-site construction activities is rated according to the amount of off-road construction equipment on site and duration of activity. The NO_x and coarse particulate matter (PM₁₀; particulate matter with an aerodynamic diameter of 10 microns or less) emissions were combined to provide one ranking score.

- **Ranking 0:** NO_x emissions ≥80,000 pounds and PM₁₀ emissions ≥10,000 pounds
- **Ranking 1-2-3:** NO_x emissions <80,000 pounds and ≥40,000 pounds and PM₁₀ emissions <10,000 and ≥6,000 pounds
- **Ranking 4-5-6:** NO_x emissions <40,000 pounds and ≥8,000 pounds and PM₁₀ emissions <6,000 and ≥2,000 pounds
- **Ranking 7-8-9:** emissions <8,000 pounds and PM₁₀ emissions <2,000 pounds

The GHG impact is rated according to the metric tons of CO₂e that are directly produced (from construction equipment on site) and indirectly produced (i.e., resulting from activities related to construction but not immediately on site).

- **Ranking 0:** ≥20,000 MT CO₂e
- **Ranking 1-2-3:** ≥10,000 MT CO₂e but <20,000 MT CO₂e
- **Ranking 4-5-6:** ≥5,000 MT CO₂e but <10,000 MT CO₂e
- **Ranking 7-8-9:** <5,000 MT CO₂e

Rubric Ranking Criteria for Off-Site Construction

In the ranking rubric, scoring for air quality impacts from off-site construction is based on the total length of the linear construction associated with each site and was calculated based on mapping data. As the linear distance of off-site construction increases, the emissions from heavy equipment and ground disturbance would also increase. Ranking levels were set to best differentiate the potential impacts for each site.

- **Ranking 0:** Substantial; ≥15,000 feet
- **Ranking 1-2-3:** Moderate; ≥10,000 and <15,000 feet
- **Ranking 4-5-6:** Minimal; ≥5,000 and <10,000 feet
- **Ranking 7-8-9:** Negligible; <5,000 feet

The GHG impact is rated according to the metric tons of CO₂e that are directly produced (from the types of construction equipment expected for the linear components) and indirectly produced (i.e., resulting from activities related to construction but not directly from the equipment used).

- **Ranking 0:** ≥2,000 MT CO₂e
- **Ranking 1-2-3:** ≥1,000 MT CO₂e but <2,000 MT CO₂e
- **Ranking 4-5-6:** ≥500 MT CO₂e but <1,000 MT CO₂e
- **Ranking 7-8-9:** <500 MT CO₂e

3.2.3 CalEnviroScreen

CalEnviroScreen is a mapping tool managed by the California Office of Environmental Health Hazard Assessment (OEHHA) that helps identify California communities that are most affected by many sources of pollution and where people are often especially vulnerable to pollution's effects. The CalEnviroScreen model uses environmental, health and socioeconomic information to produce scores for every census tract in the state. Scores from each census tract are compared and areas with a higher score are ones that experience a higher pollution burden than areas with low scores (OEHHA 2022a). The CalEnviroScreen data show the combined Pollution Burden scores for the Census tracts, which are made up of indicators from the Exposures and Environmental Effects components of the CalEnviroScreen model. Pollution Burden represents the potential exposures to pollutants and the adverse environmental conditions caused by pollution.

The pollution burden scores are based on Census Tract and are not site or technology specific. Therefore, the pollution burden scores would be the same for a site regardless of whether the Natural Gas or Hybrid Options are constructed.

After the percent of pollution burden has been determined using the CalEnviroScreen maps, scores were assigned based on the following criteria:

- **Ranking 0:** 100% to 91% Pollution Burden
- **Ranking 1-2-3:** 90% to 61% Pollution Burden
- **Ranking 4-5-6:** 60% to 31% Pollution Burden
- **Ranking 7-8-9:** 30% to 0% Pollution Burden

3.2.4 Cultural Resources

The primary objective of the cultural resource analysis is to determine if cultural resources exist within the boundaries of each alternative site and, if so, the extent to which the proposed project would impact any significant cultural resources. For purposes of this analysis, a “significant resource” is defined as a cultural resource, either archaeological (at or beneath the ground surface) or built (an extant structure) that has the potential to uniquely contribute to the understanding of historic or prehistoric periods.

The cultural resources analysis considered multiple sources of information to determine not only the presence of known cultural resources but the potential for yet unidentified cultural resources to exist within each alternative site and, the potential impact the proposed project might have on cultural resources. The data sources that were used to analyze the presence or potential for presence of cultural resources includes a review of SoCalGas’s database of the California Historic Resources Information System (CHRIS) archaeological site records and previously conducted cultural resource studies; state and local historic landmark and inventory lists; historic maps and aerial photographs; and various sources that provide information about the natural environment. Following is a summary of the methodology used for each data and rubric ranking criteria.

3.2.4.1 Records Search and Literature Review

The general purpose of a cultural resource database records search and literature review is to:

- Identify previously recorded cultural resources that may be located within the current study area.
- Determine whether the current study area has been subjected to previous cultural resource investigations, including pedestrian surveys, subsurface testing, information gleaned from archaeological monitoring or inadvertent discoveries.
- Ascertain what previously conducted cultural resource studies and site records for previously identified cultural resources reveal regarding the potential for unknown cultural resources to exist within the current study area.

The data gleaned from the records search is considered in concert with the study location’s site conditions, both natural and human induced, to determine whether a proposed project has the potential to impact a significant cultural resource. Additionally, the potential for yet unknown cultural resources to be impacted should be

considered, especially if the current study area has not yet been physically studied employing field methods such as a pedestrian survey and subsurface testing.

The records search conducted for this analysis employed SoCalGas's in-house database of the CHRIS records and studies, using data obtained from the Southern Central Coastal Information Center (SCCIC) and SoCalGas's internal collection of cultural reports/records. The search of the SoCalGas CHRIS database included previously recorded cultural resources and investigations within a 1-mile radius of each alternative site. The following lists were also reviewed for this study: National Register of Historic Places (NRHP), the California Register of Historic Resources (CRHR), the California Points of Historical Interest, and the California Historical Landmarks. Each site record for those cultural resources identified within a 1-mile radius were reviewed to better understand the nature of the resource. If the resource(s) were located outside of the on- or off-site locations for the project alternative, they were reviewed for traits that may reveal potential for unknown resources to exist within the project alternative boundaries. If a cultural resource had been identified within the project alternative boundaries, the site record was reviewed to determine whether the resource as described fit the aforementioned definition for a significant resource. Finally, for built cultural resources a 500-foot buffer surrounding the resource was employed to assess the potential for the project to impact the built resource. This is a conventional buffer for built environment studies as certain project conditions have the potential to indirectly impact a built resource. The records search results and analysis are summarized within each section respective to the alternative sites. Additionally, detailed records search results utilized in the analysis are provided in Attachment 2, Cultural Resources Analysis.

3.2.4.2 Archival Research, Historic Maps and Aerial Photographs

Historic topographic maps and aerial photographs were consulted through the Nationwide Environmental Title Research LLC to better understand any natural or human-made changes to the alternative site locations and surrounding properties over time. A review of all available historic aerial photographs was conducted and included the following years: 1947, 1967, 1978, 1980, 1984, 1994, 2005, 2009, 2010, 2012, 2014, 2016, and 2018 (NETR 2021a). Through careful comparative review of historic aeriels, changes to the landscape of a study area may be revealed. Disturbance to the study area is specifically important as it helps determine if soils within the study area are capable of sustaining intact archaeological deposits. Additionally, historic aeriels have the potential to reveal whether a study area was subjected to alluvial deposits by way of flooding, debris flows or mudslides, as well as placement of artificial or foreign fill soils that may have buried intact archaeological deposits. A review of available topographic maps was conducted and included the following years: 1904, 1910, 1918, 1921, 1938, 1946, 1952, 1955, 1961, 1964, 1966, 1968, 1972, 2012, 2015, and 2018 (NETR 2021b). Topographic maps depict not only elevation of the study area as well as the areas surrounding it, but they also illustrate the location of roads and some buildings. Although topographic maps are not comprehensive, they are another tool in determining whether a study area has been disturbed and sometimes to what approximate depth.

3.2.4.3 Natural Landscape Setting

A review of the current natural setting as well as historical natural settings was conducted to understand the potential for yet unknown archaeological sites within the project alternative sites. Depending on the type of site, archaeological resources tend to be located in areas with consistent natural traits including within close proximity to fresh water sources and habitats for exploitation of flora and faunal food sources and locals that are safe from natural events such as flooding, debris flows and mudslides. Additionally, similar to historic aerial photographs and topographic maps, understanding the current natural landscape in contrast to the previous landscape traits is an

excellent tool in determining potential ground disturbance. Those sources that were employed to better understand the natural environment include Chumash Ethnobotany (Timbrook 2007), California Native Plant Society Inventory of Rare and Endangered Plants (Inventory) (CNPS 2022a); Calflora's What Grows Here database (Calflora 2022); CDFW Biogeographic Information and Observation System (CDFW 2022b); CDFW California Sensitive Natural Communities (CDFW 2021); Vegetation - Ventura County GIS data layer (David Magney Environmental Consulting 2008); USFWS National Wetlands Inventory data (USFWS 2022b).

3.2.4.4 Rubric Scoring Criteria

For the rubric determination, the following criteria were used to determine the score for each alternative:

- Ranking 0:
 - Records Search and Literature Review: as a result of the records search, a significant cultural resource(s) has been identified within the project alternative boundaries (or within 500 feet for built cultural resources) and implementation of the project has the potential to impact the significance of that resource(s).
- Ranking 1-2-3:
 - Records Search and Literature Review: as a result of the records search, a significant cultural resource(s) has been identified within the project alternative boundaries (or within 500 feet for built cultural resources), but implementation of the project will incur less than significant impacts with minimization measures incorporated; or
 - Historic Maps and Aerial Photographs and Natural Landscape Setting: evidence available through review of historic aerial photographs, topographic maps, and resources capable of revealing current and previous natural landscape traits demonstrate that the project alternative is in a location that is highly sensitive for potentially significant cultural resources.
- Ranking 4-5-6:
 - Records Search and Literature Review: as a result of the records search, a significant cultural resource(s) has been identified within the project alternative boundaries (or within 500 feet for built cultural resources), but implementation of the project does not have the potential to impact the significance of that resource(s); or
 - Historic Maps and Aerial Photographs and Natural Landscape Setting: evidence available through review of historic aerial photographs, topographic maps, and resources capable of revealing current and previous natural landscape traits demonstrate that the project alternative is in a location that is moderately sensitive for potentially significant cultural resources.
- Ranking 7-8-9:
 - Records Search and Literature Review: as a result of the records search, no significant cultural resource(s) has been identified within the project alternative boundaries (or within 500 feet for built cultural resources); and
 - Historic Maps and Aerial Photographs and Natural Landscape Setting: evidence available through review of historic aerial photographs, topographic maps, and resources capable of revealing current and previous natural landscape traits demonstrate that the project alternative has been subjected to considerable ground disturbance and is in a location that is not sensitive for potentially significant cultural resources.

3.2.5 Land Use

Information contained in the land use analysis is based on site reconnaissance, satellite imagery from Esri and Google Earth, the County General Plan, the County Code of Ordinances, the County Geographic Information Systems (GIS) County View application, the City of Ventura (City) General Plan, the City Municipal Code, and GIS data prepared by Dudek and SoCalGas. Other sources consulted are listed in Section 6, References Cited.² Attachment 3, Land Use and Zoning Maps, details the General Plan Land Use Designations and Zoning Classifications for each of the five prospective sites.

In the ranking rubric, scoring for land use considers the currently applicable on-site zoning as well as the site's proximity to sensitive receptors. The four ranking levels are as follows:

- **Ranking 0:** The alternative is within a non-industrial/manufacturing zone and is adjacent to sensitive receptors.
- **Ranking 1-2-3:** The alternative is within an industrial/manufacturing zone and is adjacent to sensitive receptors.
- **Ranking 4-5-6:** The alternative is within a non-industrial/manufacturing zone and is not adjacent to sensitive receptors.
- **Ranking 7-8-9:** The alternative is within an industrial/manufacturing zone and is not adjacent to sensitive receptors.

Land Use Ranking Criteria Definitions

“...sensitive receptors”: Per California Health and Safety Code (CHSC) Section 25200.21, sensitive receptors shall include “schools, childcare facilities, residences, hospitals, elder care facilities, and other sensitive locations.”

“...within a non-industrial/manufacturing zone”: The alternative is located within a land area or parcel with a County or City of Ventura zoning designation that does not support the types of uses required for operation of a Natural Gas Option or Hybrid Option compressor station (e.g., agricultural, open space).³

“...within an industrial/manufacturing zone”: The alternative is located within a land area or parcel with a County or City of Ventura zoning designation that supports the types of uses required for operation of a Natural Gas Option or Hybrid Option compressor station (e.g., industrial, manufacturing).

² The official title for the City and County is “San Buenaventura”; however, this document refers to the jurisdictions as the City and County of “Ventura,” which is the common nomenclature.

³ CPUC has overarching authority of natural gas utilities. Article XII, Section 8 of the California Constitution establishes CPUC's preemptive authority over matters over which the Legislature has granted CPUC regulatory powers. CPUC decisions, as well as California courts, have confirmed CPUC's preemptory powers. As such, no local discretionary (e.g., rezone, land use) permits would be required because CPUC has preemptive jurisdiction over the siting, construction, maintenance, and operation of natural gas facilities in California. CPUC's authority does not preempt special districts, such as air quality management districts, other state agencies, or the federal government. Additionally, SoCalGas would still have to obtain all ministerial permits from local jurisdictions.

“...adjacent to sensitive receptors”:

The parcel(s) on which the alternative site is located share(s) a boundary or boundaries with an adjacent parcel with zoning that would suggest CHSC designated sensitive receptors are present (e.g., residential, institutional).

OR

The site is within 500 feet of a CHSC designated sensitive receptor (e.g., a school, childcare facility, residence) or is within 500 feet of a parcel with zoning that would suggest CHSC designated sensitive receptors are present (e.g., residential, institutional).

“...not adjacent to sensitive receptors”

The parcel(s) on which the alternative site is located *do(es) not* share a boundary(ies) with an adjacent parcel with zoning that would suggest CHSC designated sensitive receptors are present (e.g., residential, institutional).

OR

The site *is not* within 500 feet of a CHSC designated sensitive receptor (e.g., a school, childcare facility, residence) or within 500 feet of a parcel with zoning that would suggest CHSC designated sensitive receptors are present (e.g., residential, institutional).

In addition to the criteria described above, the rubric determination also takes into consideration the presence of active, on-site gas and oil wells. The Avocado, Ventura Steel, and Devil’s Canyon Road Sites are located either fully or partially within an active oil/gas field (e.g., Ventura Oil Field), while the Existing Site is located approximately 0.5 miles south of the oil/gas field boundary (DOC 2019, 2022). The total number of wells—if any—present on a given site will be noted in the land use analysis subsections for each alternative.

Because the ranking criteria as described would have little to no impact on the technology used for the compressor station, the same score is applied to both the Natural Gas Options and the Hybrid Options.

California Public Utility Commission Preemptory Powers

CPUC has preemptory powers as relates to discretionary permitting, which have been confirmed by California courts. As such, no local discretionary land use (e.g., rezone, land use) permits would be required on any of the site locations to the extent that CPUC’s preemptive jurisdiction applies to the siting, construction, maintenance, and operation of natural gas facilities in California. Nonetheless, this analysis uses the land use criteria to assess the compatibility of siting a compressor station at a potential site.

3.2.6 Natural Resources

The purpose of this review was to determine whether special-status plant and wildlife species are known to occur in the vicinity of or within the study area. The following data sources were reviewed to assist with the desktop assessment of biological resources and are included in Attachment 4, Natural Resources Analysis, of this evaluation:

- U.S. Fish and Wildlife Service (USFWS) Critical Habitat and Species Occurrence Data (2022a)
- USFWS National Wetlands Inventory data (USFWS 2022b)
- National Hydrography Dataset and Watershed Boundary Dataset (USGS 2022)

- California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CDFW 2022a)
- California Native Plant Society Inventory of Rare and Endangered Plants (Inventory) (CNPS 2022)
- Calflora's What Grows Here database (Calflora 2022)
- CDFW Biogeographic Information and Observation System (CDFW 2022b)
- CDFW California Sensitive Natural Communities (CDFW 2021)
- Vegetation - Ventura County GIS data layer (David Magney Environmental Consulting 2008)
- CDFW California Natural Community Conservation Plans, April 2019 (CDFW 2019)
- Google Earth desktop application (Google 2022)

The California Natural Diversity Database and California Native Plant Society Inventory were queried based on the USGS 7.5-minute topographic quadrangle map for where the alternatives are located, as well as the surrounding eight USGS 7.5-minute quadrangle maps. The results of the queries are provided in Attachment 4. The purpose of this review was to determine whether special-status plant and wildlife species are known to occur in the vicinity of or within the study area. Other literature reviewed included A Manual of California Vegetation, Online Edition (CNPS 2022b); the California Natural Community list (CDFW 2021) (provided in Attachment 4); and the CDFW Special Animals List (CDFW 2022c).

The California Natural Diversity Database and critical habitat data are illustrated in Figure NR-1, and the vegetation and National Wetlands Inventory data are illustrated in Figure NR-2 (see Attachment 4 for all NR [Natural Resources] figures).

For the rubric determination, the following criteria were used to determine the score for each alternative:

- Ranking 0 (sensitive resources would be impacted):
 - Sensitive Species (Plant/Animals): the alternative would directly impact designated critical habitat or suitable habitat of a federal/state listed species that has recent (within 50 years) records (CDFW 2022a) within 0.25 miles of the alternative.
 - Sensitive Habitats: the alternative would directly impact vegetation that is considered sensitive by CDFW (2021) that typically require compensatory mitigation.
 - Wetlands: the alternative would directly impact features that have been recorded in the National Wetlands Inventory (USFWS 2022b) that typically require compensatory mitigation.
- Ranking 1-2-3 (the lower the score the higher the probability of indirect impacts occurring to sensitive resources due to the resources proximity to the project limits):
 - Sensitive Species (Plant/Animals): the alternative is adjacent to (within 500 feet of)⁴ designated critical habitat or suitable habitat of a federal/state listed species that has recent (within 50 years) records (CDFW 2022a) within 0.25 miles of the alternative or contains suitable habitat of non-listed sensitive species within 3 miles, and avoidance and minimization measures (e.g., seasonal constraints, pre-construction surveys, noise monitoring, erosion control, etc.) cannot eliminate the potential of indirectly impacting the sensitive species.

⁴ The U.S. Fish and Wildlife Service typically uses 500 feet as the outer distance for determining potential indirect impacts for many species, including least Bell's vireo (*Vireo bellii pusillus*) and southwestern willow flycatcher (*Empidonax traillii extimus*).

- Sensitive Habitats: avoidance and minimization measures would be expected to avoid indirect impacts that require compensatory mitigation to the features.
- Wetlands: avoidance and minimization measures would be expected to avoid direct and indirect impacts that require compensatory mitigation to the features.
- Ranking 4-5-6 (the lower the score the higher the probability of indirect impacts occurring to the resource):
 - Sensitive Species (Plant/Animals): the alternative is adjacent to (i.e., within 500 feet of) designated critical habitat or suitable habitat of a federal/state listed species that has recent (within 50 years) records (CDFW 2022a) within 0.25 miles of the alternative or contains suitable habitat of non-listed sensitive species within 3 miles, and avoidance and minimization measures (e.g., seasonal constraints, pre-construction surveys, noise monitoring, erosion control) are likely to avoid or eliminate the potential of indirectly impacting the sensitive species.
 - Sensitive Habitats: avoidance and minimization measures would be expected to avoid direct and indirect impacts that require compensatory mitigation to the features.
 - Wetlands: avoidance and minimization measures would be expected to avoid direct and indirect impacts that require compensatory mitigation to the features.
- Ranking 7-8-9 (the highest score [9] indicates that the alternative is within an already developed environment, while the lesser scores indicate partially developed or heavily disturbed sites):
 - Sensitive Species (Plant/Animals): the alternative is not adjacent to (i.e., within 500 feet of) designated critical habitat or suitable habitat of a federal/state species that has recent (within 50 years) records (CDFW 2022a), does not contain suitable habitat for non-listed sensitive species, and is not adjacent to sensitive habitats or wetlands.
 - Sensitive Habitats: the alternative does not contain or is not adjacent to this sensitive resource.
 - Wetlands: the alternative does not contain or is not adjacent to this sensitive resource.

3.2.7 Noise

Noise modeling was completed to evaluate the potential operational impacts and construction impacts (on site and off site) for each of the two technology configurations at the five alternative site locations. The operation noise analysis output, depicted as noise level contours, are included within Attachment 5, Noise Modeling Output Figures, and visually display the modeled operation noise for each of the 10 scenarios.

3.2.7.1 Operational Considerations

The analysis assumes that operation of the new gas compressor station would be 24 hours per day, 7 days per week and would feature durable operations noise control and sound abatement measures incorporated into the facility design. A noise emission level of 80 A-weighted decibels (dBA) is assumed for operations, but there is no associated distance value for reference; therefore, the following detailed assumptions were made as follows:

- The 80 dBA noise emission level is a sound pressure level at a reference distance of 1 meter (3.28 feet) from the source of sound emission.

- It was assumed the facility would feature typical major noise-producing components, such as the compressor unit air intakes and combustion exhausts, the new compressor building and its ventilation system, and a gas cooling system.

The analysis assumes the layout for any of the compressor station options would be similar to what is shown in Exhibit 1, Conceptual Compressor Station for Noise Assumptions, with features differing based on the source of power to drive the compressors (either a Natural Gas Option or a Hybrid Option). For the County Line – Natural Gas alternative, however, the layout would feature an additional fifth compressor unit air intake and combustion exhaust along the same side of the building.

Exhibit 1. Conceptual Compressor Station for Noise Assumptions

NATURAL GAS OPTION

HYBRID OPTION

Note: Assumed gas compressor station facility layouts (*top*: four compressors, each powered with natural gas combustion; *bottom*: hybrid [i.e., two compressors powered by natural gas and two others within compressor building powered by electric motors]). Indicated heights are with respect to a common grade level.

For the Natural Gas Option and Hybrid Option per Exhibit 1, an outdoor noise prediction model was prepared to analyze aggregate noise emission from the operating components. These components are listed as follows:

Natural Gas Option:

- Each of the following was assigned a 91 dBA sound power level (i.e., yielding 80 dBA energy equivalent level [L_{eq}] sound pressure level at 1 meter) point-type source: compressor air intake, compressor building air ventilator, combustion exhaust, and natural gas cooling system fan cell.
- Compressor building façade (for each of four: north, east, south, west) modeled with a vertical area source having sound power level density of approximately 77.3 dBA per square meter of façade exterior surface.

Hybrid Option:

- Each of the following was assigned a 91 dBA sound power level (i.e., yielding 80 dBA L_{eq} sound pressure level at 1 meter): compressor air intake, compressor building air ventilator, combustion exhaust, natural gas cooling system fan cell, and electrical substation transformer.
- Compressor building façade (for each of four: north, east, south, west) modeled with a vertical area source having sound power level density of approximately 74.3 dBA per square meter of façade exterior surface. Note that the magnitude is less based on the assumption that there are only two natural gas compressors within the building, in contrast with four per the Natural Gas Option.

For purposes of this analysis, the added fifth operating compressor for the County Line alternative would not change the compressor building façade noise radiation—the change in aggregate noise level from four to five identical compressor units, per acoustic principles, would be less than 1 decibel (dB).

The prediction model assumed that the new compressor station buildings and feature layout, as depicted in Exhibit 1, would generally be centrally located within the boundary of the studied site alternative so that the buildings as sized and spaced apart in relation to one another would fit. By adopting this convention and using Exhibit 1 layouts (and therefore location of operational sound sources within a facility) commonly for each of the five site alternatives, the prediction model enabled an estimate of aggregate operational facility noise at the relevant property boundaries.

For noise, the scoring assessment location is where the noise level crosses the boundary of the nearest non-industrial (residential, commercial, or institutional [e.g., school] zoned property or at the location of the nearest occupied structure of an agricultural land use (e.g., inhabited house of a farm or vineyard). Consistent with the scoring rubric, assessment of facility operation noise at the property boundary (or at the nearest boundary of a non-industrial land use) would break out as follows:

- **Ranking 0:** ≥ 65 dBA at the property line, taking into account non-industrial land uses
- **Ranking 1-2-3:** ≥ 55 dBA but < 65 dBA, taking into account non-industrial land uses
- **Ranking 4-5-6:** ≥ 45 dBA but < 55 dBA, taking into account non-industrial land uses
- **Ranking 7-8-9:** < 45 dBA, taking into account non-industrial land uses

The Attachment 5 figures display predicted aggregate operational noise from the studied scenarios superimposed atop semi-transparent aerial images of the facility site surroundings, thus showing where expected decibel levels would occur and thus substantiate the scoring values.

3.2.7.2 On-Site Construction Considerations

The scoring rubric quantity ranges for on-site construction noise emission reflect the application of geometric divergence (a.k.a., the “6 dB per doubling of distance” rule of thumb for sound propagation from a point source or an area source having a dimension that is small compared to the distance to the receiver) as sound travels away from the construction site. In other words, the greater the distance between construction activity and the studied receiver, the lower the noise exposure level and thus the higher rubric scoring opportunity. Assumptions made to support the on-site construction analysis include the following:

- Since each site alternative requires site-wide disturbance (e.g., grading) and/or the erection of a perimeter solid wall (consistent with the Feasibility Study assumptions), then the site parcel boundary conservatively defines the location of construction activity (e.g., grading occurs up to the boundary line, and installation of the wall itself would—of course—be on or just within the boundary line).
- While details of the specific construction activities and involved equipment on site to install the new gas compressor station are not known, and although construction would take place throughout the whole site, it is assumed the aggregate noise emission of a set of concurrently operating construction equipment would emanate sound as if from a point source on the boundary of the property parcel. The assumed combined magnitude of concurrently operating on-site construction equipment noise propagating from this point position is 90 dBA L_{eq} at 50 feet, which would be consistent with anticipated sample reference L_{max} (at 50 feet) sound emission data from the Federal Highway Administration Roadway Construction Noise Model User’s Guide.

Based on these parameters and assumptions, this rubric was scored per the following criteria:

- **Ranking 0:** Where on-site construction noise exposure at the nearest non-industrial land use is expected to be ≥ 90 dBA L_{eq} , corresponding with a source-to-receptor distance of less than 50 feet
- **Ranking 1-2-3:** Where on-site construction noise exposure at the nearest non-industrial land use is expected to be < 90 dBA and ≥ 84 dBA L_{eq} , and when the source-to-receptor distance is between 51 and 100 feet
- **Ranking 4-5-6:** Where on-site construction noise exposure at the nearest non-industrial land use is expected to be < 84 dBA and ≥ 75 dBA L_{eq} , and when the source-to-receptor distance is between 101 and 250 feet
- **Ranking 7-8-9:** Where on-site construction noise exposure at the nearest non-industrial land use is expected to be < 75 dBA L_{eq} , and when the source-to-receptor distance is greater than 251 feet

The assessment position to determine scoring is where the predicted construction noise level from the site parcel boundary crosses the boundary of the nearest non-industrial (residential, commercial, or institutional [e.g., school] zoned property or at the location of the nearest occupied structure of an agricultural land use (e.g., inhabited house of a farm or vineyard).

3.2.7.3 Off-Site Construction Considerations

For off-site construction, the following assumption was made: an “off-site” construction activity could include new road construction or upgrading of an existing access route, installation of a new pipeline segment or electrical connection, or constructing a new mainline valve (MLV). For purposes of predictive assessment and corresponding scoring herein, the aggregate construction noise emission level from a set of concurrently operating equipment to perform such off-site activities would be the same as described for on-site activities (90 dBA L_{eq} at 50 feet) The scoring granularity for off-site construction activity is also the same as presented for on-site construction activity.

3.2.8 Slope, Topography, and Grading

The primary considerations of the slope, topography, and grading ranking criteria are: (1) to quantify and analyze the average slope of the main compressor station site; and (2) to quantify and analyze the grading requirements for the on-site construction scenario. The four ranking levels for slope, topography, and grading are as follows:

- **Ranking 0:** The average slope of the property is greater than 40% and/or substantial over-excavation/recompaction requires $\geq 75,000$ cubic yards (CY).
- **Ranking 1-2-3:** The average slope of property is 30%–39% and/or moderate over-excavation/recompaction requires $>25,000$ but $<75,000$ CY.
- **Ranking 4-5-6:** The average slope of property is 20%–29% and/or minimal over-excavation/recompaction requires $\geq 10,000$ CY but $<25,000$ CY.
- **Ranking 7-8-9:** The average slope of property is less than 20% and negligible/no over-excavation/recompaction requires $<10,000$ CY.

Slope, Topography, and Grading Criteria Definitions

“...the property”:	The land area or parcel on which the main compressor station site is located.
“...over-excavation/recompaction”	The over-excavation or recompaction (i.e., grading) of soils and/or other fill materials, often requiring import to or export from the site.
“...substantial”:	Construction of the on-site component(s) would require over-excavation/recompaction of materials $\geq 75,000$ CY.
“...moderate”:	Construction of the on-site component(s) would require over-excavation/recompaction of materials $\geq 25,000$ but $<75,000$ CY.
“...minimal”:	Construction of the on-site component(s) would require over-excavation/recompaction of materials $\geq 10,000$ CY but $<25,000$ CY.
“...negligible/no”:	Construction of the on-site component(s) would require over-excavation/recompaction of materials equivalent to $<10,000$ CY.

“...on-site component(s)” The components located within the site boundaries identified to support the Natural Gas Option or Hybrid Option compressor station.

Slope Methodology

Percent slope was calculated using Esri’s Spatial Analyst Toolset and a digital elevation model (DEM) acquired from the U.S. Geological Survey (USGS) 3D Elevation Program (3DEP). In addition to the spatial analysis, a weighted average methodology was used to better capture the ranking score criteria, which breaks down the site acreage into “classes” based on their slope. The classes were defined manually as 0%–10%, >10%–20%, >20%–30%, etc. The topography and slope maps for each of the five sites are provided in Attachment 6. Calculations were made based on the minimum, average, and maximum slope percentages within each range class (e.g., for the 0%–10% range, averages were calculated for each site at 0%, 5%, and 10% for the corresponding acreage). The average slope range calculations for each site are provided within the Slope, Topography, and Grading discussions of Chapter 5, Ranking Analysis.

Grading Methodology

The grading calculations were provided by SoCalGas and are expressed in cubic yards (CY). Determination of grading significance was informed by the County Department of Public Works’ discretionary grading permit triggers, which provide that any project where the average grade exceeds 10% and the amount of excavation or fill exceeds 10,000 CY shall be subject to discretionary review (County of Ventura 2022).

Because the on-site grading requirements and slope considerations would be the same for both the Natural Gas Option and Hybrid Option, the same ranking is given to both alternatives. Off-site grading requirements may be discussed for informational purposes but are not given significant weight in the ranking calculations, per the specified criteria (see Section 3.1, Scoring Criteria).

3.2.9 Traffic

3.2.9.1 On-Site Construction

The traffic evaluation scoring for each alternative is based on the potential length of time that heavy truck traffic would travel through residential areas or roadway-constrained areas to support on-site construction. The evaluation focuses on public roadways that could be affected by project-related congestion. While minor consideration is given to construction occurring on private access roads, for the purposes of this evaluation, private access roads are not considered to be constrained roadways, as they are not subject to commuter traffic. Dudek identified the existing roadways providing direct access to the alternative sites and reviewed the City and County roadway classifications as appropriate, the existing land uses along those roadways, and the estimated schedule of import and export activities. These criteria only evaluate construction duration involving heavy truck traffic (i.e., import/export of soils or materials via dump trucks and oversized vehicles) and location (i.e., using roadways adjacent to residential areas or roadways that are constrained due to urban/commuter traffic). Roadway-constrained areas are identified as local public roads (as opposed to major highways and arterials that are designed to accommodate heavy truck traffic). The analysis does not quantify existing traffic volumes or the number of heavy trucks traveling through an area.

The rubric ranking criteria for on-site construction are summarized below.

- **Ranking 0:** Heavy truck traffic would travel through either residential areas or roadway-constrained areas for 1 year or longer. Roadway-constrained areas are identified as local public roads (as opposed to major highways and arterials that are designed to accommodate heavy truck traffic).
- **Ranking 1-2-3:** Heavy truck traffic would travel through either residential areas or roadway-constrained areas for 6 months to less than 1 year. The lower the score the higher the potential for impacts occurring due to schedule duration, proximity of sensitive land uses, travel on a public road, or a combination of these factors.
- **Ranking 4-5-6:** Heavy truck traffic would travel through either residential areas or roadway-constrained areas for less than 6 months. The lower the score the higher the potential for impacts occurring due to schedule duration, proximity of sensitive land uses, travel on a public road, or a combination of these factors.
- **Ranking 7-8-9:** Heavy truck traffic would not likely occur through residential areas or roadway-constrained areas. The lower the score the higher the potential for impacts occurring due to schedule duration, proximity of sensitive land uses, travel on a public road, or a combination of these factors.

3.2.9.2 Off-Site Construction

The traffic evaluation for the off-site construction for routing of utilities rates each alternative on the extent of roadway construction on existing roads. Similar to the criteria above, the evaluation focuses on trenching within public roadways. While these criteria are focused on the extent of construction on existing public roads, the characteristics (e.g., urban, rural) of the existing roadways, whether public or private, are considered to provide a more refined level of evaluation.

The rubric ranking criteria for off-site construction are summarized below.

- **Ranking 0:** Off-site routing alignment and trenching requires that substantial roadway construction (e.g., lane closures greater than 5,001 feet) would occur on existing public roads.
- **Ranking 1-2-3:** Off-site routing alignment and trenching requires that moderate roadway construction (e.g., lane closures of 2,501 to 5,000 feet) would occur on existing public roads. The lower the score the higher the potential for impacts occurring due length of trenching required, number of roadway crossings, or a combination of these factors.
- **Ranking 4-5-6:** Off-site routing alignment and trenching requires that minimal roadway construction (e.g., lane closures of 501 to 2,500 feet) would occur on existing public roads. The lower the score the higher the potential for impacts occurring due length of trenching required, number of roadway crossings, or a combination of these factors.
- **Ranking 7-8-9:** Off-site routing alignment and trenching requires that no roadway construction or negligible roadway construction (e.g., construction less than 500 feet) would occur on existing public roads. The lower the score the higher the potential for impacts occurring due length of trenching required, number of roadway crossings, or a combination of these factors.

3.2.10 Utilities/Service Systems

The analysis of utilities/service systems was based primarily on the need for utility extensions and associated ground disturbance required to develop the alternative sites. Off-site ground disturbance for both the Natural Gas and Hybrid Options considered under this analysis would include the off-site construction of the following:

- The new natural gas pipeline system, including pipelines and depressurization lines, is required to connect to the existing pipeline system. For this assessment, the square footage of trenching was calculated using the linear feet of the trench width for the new pipeline system and a trench width of 28 inches.
- A new mainline valve (MLV) station would be required at each connection location where a new pipeline system would connect to the existing natural gas pipeline system. The ground disturbance was calculated assuming 50 feet by 75 feet of disturbance to accommodate the new valve station, depending on the configuration of the existing pipeline system.
- New utility infrastructure (water, sewer, and electrical) would be required to serve the on-site staff operations at the Avocado Site and County Line Alternatives. For this assessment, the square footage of trenching was calculated using the linear feet of the trench width for the new pipelines and a trench width of 3 feet.
- The Hybrid Option would also include ground disturbance for the construction of new footings for the electrical line interconnection from sites to the existing SCE system. This calculation assumes pole foundations would be 2 feet by 7 feet and spaced approximately every 100 to 150 feet.

The square footage for all ground disturbance associated with the estimated energy and utility-related construction was calculated based on the site-specific information prepared for each alternative.

The rubric scoring was determined based on the estimated total square footage of ground disturbance and the scoring rubric ranking of 0 to 9 was categorized as follows:

- **Ranking 0:** >100,000 square feet of off-site ground disturbance
- **Ranking 1-2-3:** Between 99,999 and 50,000 square feet of off-site ground disturbance
- **Ranking 4-5-6:** Between 49,999 and 25,000 square feet of off-site ground disturbance
- **Ranking 7-8-9:** <24,999 square feet of off-site ground disturbance

3.2.11 Wildfire

The purpose of the wildfire evaluation is to evaluate whether the alternative site locations—particularly for the land areas containing the compressor station—are located within fire hazard severity zones (FHSZs), as determined by the California Department of Forestry and Fire Protection (CAL FIRE).⁵ According to the Ventura County Fire Protection District, the State of California’s Strategic 2018 Fire Plan anticipates that “trends in wildland fires will continue. The effects of climate change, prolonged drought, tree mortality, and development into the wildland urban interface will continue to increase the number and severity of wildland fires” (VCFPD 2021). The typical fire season in Ventura County begins in May or June, with vegetative fuel loads reaching “critical moisture levels” in late summer and early fall (VCFPD 2021). Together with the advent of strong east winds (Santa Anas) throughout the County, this environment produces the perfect conditions for “catastrophic fire weather” (VCFPD 2021). All site alternatives under consideration are located within the Ventura or Casitas Fuel Beds, which act as an unbroken distribution of vegetative

⁵ According to the Office of the State Fire Marshall (OSFM), the FHSZ maps evaluate “hazard” as opposed to “risk.” Hazard is based on “...the *physical conditions that create a likelihood and expected fire behavior* over a 30 to 50 year period without considering short-term modifications such as fuel reduction effort” while “risk” is evaluates the “*potential damage a fire can do to the area under existing conditions, including any modifications such as fuel reduction projects, defensible space, and ignition resistant building construction*” (OSFM 2022).

fuel sources, including oak woodland, chaparral, coastal sage scrub, and grass (VCFPD 2021). The fuel beds are bordered by State Route (SR) 150 to the east and the Santa Barbara–Ventura County line to the west (VCFPD 2021). Together these fuel beds have sustained over a dozen large scale fires (e.g., more than 300 acres), the most recent being the Thomas Fire in December 2017, which burned approximately 281,893 acres (VCFPD 2021).

In the ranking rubric, scoring for wildfire considers the site’s FHSZ. The four ranking levels are as follows:

- **Ranking 0:** The alternative is within a very high fire hazard severity zone
- **Ranking 1-2-3:** The alternative is within a high fire hazard severity zone
- **Ranking 4-5-6:** The alternative is within a moderate fire hazard severity zone
- **Ranking 7-8-9:** The alternative is not within a fire hazard severity zone

3.2.11.1 Wildfire Ranking Criteria Definitions

CAL FIRE Fire Hazard Severity Zones

The FHSZ classifications are based on “a combination of how fire will behave and the probability of flames and embers threatening buildings” (OSFM 2022). The model places an emphasis on the spread of burning embers, as these embers can travel long distances in the wind and can ignite surrounding vegetation and infrastructure (OSFM 2022). A region is divided into discrete areas, which vary in size based on such factors as topography and land use (e.g., from 20-acre urban areas to larger wildland zones with a minimum of 200 acres). Each area receives a score for flame length, embers, and the likelihood of the area burning, which are then averaged over the zone area. The final zone classes for “very high,” “high,” and “moderate” fire hazard severity are based on the average area scores across the zone(s) (OSFM 2022).

The CAL FIRE FHSZ maps differentiate between State Responsibility Areas (SRAs) and Local Responsibility Areas (LRAs) (CAL FIRE 2017; OSFM 2022). According to CAL FIRE and the Office of the State Fire Marshal (OSFM), the SRA is “land where the State of California is financially responsible for the prevention and suppression of wildfires,” while the LRA denotes areas where *local* governments have financial responsibility for the prevention and suppression of wildfires (CAL FIRE 2017; OSFM 2022). Most notably, in SRAs there are three levels of fire hazard severity: moderate, high, and very high, while the LRA model only recognizes a single fire hazard severity level (very high) (OSFM 2022).

Additional Scoring Criteria

After the determination has been made for the type of FHSZ present on site, within each scoring criteria range, points were added or subtracted based on three primary factors:

- **Proximity to other FHSZs:** Considerations include whether the site is on the outskirts or far removed from a FHSZ or surrounded by a FHSZ.
- **Availability of vegetative fuel load:** While all sites are located within an identified fuel bed area, special considerations include whether the site is located in an urban area or is located in an open space area with an abundance of natural fuel (e.g., grassland, woodland, chaparral) on and/or adjacent to an open space area.
- **Reliance on electricity/electrical transmission:** Considerations include whether the an electrical interconnect is required to power the compressor station would be required, and if aboveground

transmission lines used to power the compressor station would be extensive, isolated, and/or traveling through a CPUC High Fire-Threat District. Sites (see discussion below), which would represent an increased wildfire risk to the surrounding community (CPUC 2021a, 2021b).

CPUC Fire-Threat Maps and the High Fire-Threat District

In October 2007, “devastating wildfires driven by strong Santa Ana winds burned hundreds of square miles in Southern California. Several of the worst wildfires were reportedly ignited by overhead utility power lines and aerial communication facilities near power lines” (CPUC 2021a). In response to these wildfires, the CPUC Fire-Threat Map was created.⁶ The CPUC Fire-Threat Map is a statewide map showing areas where there is a higher risk for power line fires igniting and spreading rapidly (CPUC 2021a). The Tier 2 and Tier 3 fire-threat areas on the CPUC Fire-Threat Map are integrated into the designated CPUC High Fire-Threat District (HFTD) maps, which also include Tier 1 High Hazard Zones (HHZs) from the U.S. Forest Service/CAL FIRE joint map of Tree Mortality HHZs (CPUC 2021a). Tier 1 HHZs are zones near communities, roads, and utility lines, and are a direct threat to public safety (CPUC 2021a). Tier 2 fire-threat areas outline areas where there is a higher risk (including likelihood and potential impacts on people and property) from utility related wildfires (CPUC 2021a). Tier 3 fire-threat areas outline areas where there is an extreme risk (including likelihood and potential impacts on people and property) from utility related wildfires (CPUC 2021a). Electric utilities and communication infrastructure within areas identified as CPUC “high fire threat areas” (e.g., areas within the HFTD), are required to adopt additional fire-safety regulations, as provided by CPUC Rulemaking 08-11-005 and General Order 95 (CPUC 2021a).

Because the HFTD is intended to “represent an area based upon mapping products (i.e., CPUC Fire-Threat Map) developed specifically for the purpose of scoping [electrical and communications] utility regulations,” the HFTD is incorporated into the analysis for the hybrid compressor station technology options, which, depending upon the alternative, may require additional electrical utility infrastructure, including above-ground electrical poles and associated overhead electrical conduit (CPUC 2021a).

The applicable CAL FIRE FHSZ and CPUC HFTD maps are provided in Attachment 7.

⁶ According to CPUC, “[t]he main people handling the development of the CPUC Fire-Threat Map was a group of utility mapping experts known as the Peer Development Panel (PDP), with oversight from a team of independent experts known as the Independent Review Team (IRT). The members of the IRT were selected by CAL FIRE and CAL FIRE served as the Chair of the IRT. The development of CPUC Fire-Threat Map includes input from many stakeholders, including investor-owned and publicly owned electric utilities, communications infrastructure providers, public interest groups, and local public safety agencies” (CPUC 2021a).

4 Environmental Scoring and Ranking

Table 5 summarizes the scoring of each of the environmental criteria for the five sites for both the Natural Gas and Hybrid Options, as detailed below. Scores for the operational, on-site construction, and off-site construction considerations were totaled, and an overall environmental score was calculated.

The scores in the “Operational Considerations” category were multiplied by a factor of 10. The scores were weighted because operational considerations would have long-term implications for the environment over the life of the modernization project and thus should be considered as more consequential, whereas short-term construction activities are temporary. The factor of 10 was determined to be appropriate by considering the duration of construction impacts in the context of the life of the project. The duration of site construction activities would vary according to site-specific considerations described in Chapter 2, Alternative Options, and the average length of construction activity for all 10 development scenarios would be 3.8 years. The anticipated useful lifespan of the modernization project is estimated to be 40 years. As such, increasing the numeric scoring for the “Operational Considerations” category by a factor of 10 was determined to adequately capture the environmental consequences of short-term construction vs. long-term operational impacts.

Table 5. Environmental Scoring Rubric

INTENTIONALLY LEFT BLANK

5 Ranking Analysis

5.1 Existing Site

The scoring rationale for each of the environmental topic areas for the Existing Site Alternative is described below.

5.1.1 Natural Gas Option

5.1.1.1 Operational Considerations

5.1.1.1.1 Aesthetics and Visual Resources

The Existing Site is partially screened from motorists on SR-33, an eligible State Scenic Highway (Caltrans 2022). Existing structural development to the east of the SR-33 corridor, and state route median and shoulder terrain and vegetation, routinely obstructs the Existing Site from the view of passing motorists. Eligible State Scenic Highways are routinely identified as scenic by the local jurisdiction, which has yet to adopt (or draft) a corridor protection plan that would install development controls or consideration over properties within the viewshed of the highway in question. Where visible, the duration of views to the Existing Site will be brief (lasting seconds) and the compressor building would not substantially block or interrupt available views to hills and mountains to the east of SR-33 that are identified as a major visual component of Ventura in the Final Environmental Impact Report for the City's existing General Plan (City of Ventura 2005b). Due to their assumed height of 15 feet or less, the office trailer, storage containers, and access roads are not anticipated to be visible from SR-33.

Due to distance and the presence of intervening terrain, vegetation, and development, the Existing Site is not visible from U.S. Route 101, an eligible state scenic highway. For the same reasons, potential development on the site would not be visible from U.S. Route 101 (or from Ventura Avenue, a locally designated scenic corridor; City of Ventura 2005b) and as such, would not alter the character of the community as experienced from U.S. Route 101 (or from Ventura Avenue).

Lastly, while the Existing Site is within the viewshed of elevated vantage points available at Grant Park (located approximately 0.85 miles to the southeast of the Existing Site and at an approximate elevation of 370 feet above mean sea level), potential development at the property is not anticipated to be visually prominent. The valued view available at Grant Park (a locally designated scenic corridor; City of Ventura 2005b) and more specifically, at Father Serra Cross, is generally focused to the south (toward the ocean). Views to the narrow valley to the west and east of SR-33 are available from the Father Serra Parking Lot; however, due to the elevational difference between Grant Park and the Existing Site, and the presence of existing development on the site, potential development would not result in any blockage or interruption of an identified scenic resource (such as local hillsides). For these reasons, potential development would have a nominal effect on the visual character of the community. Based on the assessment provided above, this alternative received a score of 8 points.

5.1.1.1.2 Air Quality

The Natural Gas Option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the

Air Quality and Greenhouse Gas Emissions Analysis (AQ/GHG Analysis) in Attachment 1, the natural gas-powered compressor station is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption.

Operation of the natural gas compressors is calculated to result in 11 tons/year of NO_x emissions. As such, the Natural Gas Option would fall within the ≥8 tons/year but <12 tons/year category, which would score from 1 to 3. Because 11 tons/year is closer to the upper end of the NO_x emissions range, the Natural Gas Option received a score of 1 point.

5.1.1.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Existing Site is in Census Tract 6111002300, which has a population of approximately 6,534. This tract has a total pollution burden score of 87%, which took into consideration the exposure indicator and environmental effect scores in Table 6 (OEHHA 2022b). This score means that this census tract has more pollution burden than 87% of all census tracts within California.

Table 6. Pollution Burden for Census Tract 6111002300

Exposure Indicator	Score (Percentile)
Ozone	27
Fine Particulate Matter (PM _{2.5})	29
Diesel Particulate Matter	51
Pesticides	97
Toxic Releases	18
Traffic	39
Drinking Water Contaminants	66
Lead in Housing	79
Cleanups	83
Groundwater Threats	90
Hazardous Waste	89
Impaired Water	59
Solid Waste	36
Pollution Burden	87

Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Existing Site received a score of 1 point because a pollution burden of 87% is within the 81% to 90% scoring range.

5.1.1.1.4 Greenhouse Gases

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of carbon dioxide (CO₂) equivalent (MT CO_{2e}) that are directly produced from equipment and indirectly produced as a result of activities related to

operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). Indirect GHG emissions for the operation of the natural-gas facilities were not quantified for the Natural Gas Option because anything attributable to indirect GHG emissions would be consistent across all the proposed alternative sites and would be minimal.

The estimated emissions for the Natural Gas Option were calculated to be 27,836 MT CO₂e/year, which would fall within the $\geq 25,000$ MT CO₂e/year but $< 50,000$ MT CO₂e/year category and therefore would score from 1 to 3. Since 27,836 MT CO₂e/year is closer to the lower end of the emission range, the Natural Gas Option received a score of 3 points.

5.1.1.1.5 Land Use Designation

Regional Site Location

As shown in Figure 1, the approximately 8-acre Existing Site is located within the City of Ventura on North Olive Street, slightly west of SR-33. The on-site components are located within a single Assessor's Parcel Number (APN), APN 680142030, which has the same boundaries as the existing compressor station (City of Ventura 2022a; 2022b). Adjacent APNs impacted by the temporary staging area include APN 8888159266; APN 680142020; APN 680142100; APN 680142220; APN 680142065; APN 680142070; and APN 680132015. Under existing conditions, regional access to the site is via U.S. Route 101 (City of Ventura 2022a; 2022b).

Surrounding Land Uses

The General Plan Land Use and Zoning maps in Attachment 3 show the land use and zoning on and adjacent to the Existing Site (including off-site components). Land uses adjacent to the Existing Site include the City General Plan land use designations of Industry to the north, west, and south. There is a small parcel (APN 680090340) designated Industry adjacent to the northeast corner of the Existing Site, which separates the property from North Olive Street (the site borders this parcel for approximately 190 feet). Although zoned M-2 (General Industrial Zone) and designated for industrial/manufacturing uses, according to a desktop analysis, this APN appears to include a single-family residence (Google Maps 2021; City of Ventura 2021), which would be considered a "sensitive receptor" as it applies to the land use analysis. The Existing Site is located on the west side of North Olive Street, which is approximately 60 feet wide. The land uses on the east side of North Olive Street include several sensitive receptors, including E.P. Foster Elementary School, which is a potential historic landmark (City of Ventura 2022a; 2022b), and residences to the east (City of Ventura 2005a). The adjacent land areas to the north, west, and south and the parcel adjacent to the Existing Site's northeast corner (APN 680090340) are zoned M-2, per the City of Ventura zoning ordinance (City of Ventura 2021; 2022b). The parcels adjacent to the Existing Site on the east side of North Olive Street include zoning for R-1 (Single Family Zone) and M-1 (Limited Industrial Zone). Other zoning east of the Existing Site and North Olive Street include C-2 (General Commercial Zone), RPD (Residential Planned Development), R-2 (Two-Family Zone), and R-3 (Multiple Family Zone) (City of Ventura 2020, 2021).

Project Component Land Uses

The Existing Site's operational components are located within a single APN (APN 680142030), which has the same boundaries as the compressor station. As shown on the General Plan Land Use and Zoning maps in Attachment 3, the current City of Ventura land use (Industry) and zoning (M-2) designations for the property (and staging area

located immediately adjacent to the southwest of the compressor station site) support industrial and manufacturing uses. The City’s General Plan describes the Industry land use as encouraging “intensive manufacturing, processing, warehousing and similar uses, as well as light, clean industries and support offices” (City of Ventura 2005a). Allowable uses within the M-2 zone include Utility or Equipment Substations, which are defined as “electrical substations, *natural gas pumping stations*, transmitters, or translators, and utility relay or monitoring facilities” (emphasis added; City of Ventura 2021, Section 24.115.3440 and 24.262.030).⁷ As such, selection of the Natural Gas Option or Hybrid Option is consistent with the existing land use and zoning designations. Additionally, the staging area would be located on land immediately west of the Existing Site that is also designated Industry and zoned M-2. However, the staging area would be removed once the site becomes operational and therefore it is not incorporated into the operational land use analysis.

Evaluation and Score

All operational components are located within parcels with City zoning that supports industrial and/or manufacturing uses (City of Ventura 2021; County of Ventura 2005a); however, the nearest sensitive receptor (residence) is located adjacent to the eastern property line of the Existing Site. In addition, while industrial and/or manufacturing uses are also located adjacent to the Existing Site parcel to the north, west, and south, the predominant uses on the east side of North Olive Street include a public elementary school (E.P. Foster Elementary School) and various residential uses. As such, within the ranking criteria range of 1 to 3, “Industrial/manufacturing zone and adjacent to sensitive receptors,” the Existing Site received a score of 1 point, due in large part to its proximity to sensitive receptors, which include a single-family residence adjacent to the compressor station site on APN 680090340 and a public school (E.P. Foster Elementary School) on the east side of North Olive Street.

5.1.1.1.6 Noise

The nearest non-industrial land use to the Existing Site is the adjacent single-family home in the northeast corner of the property. Based on the assessment provided in Attachment 5, Noise Modeling Output Figures, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (as defined in Section 3.2.7, Noise) of less than 55 dBA. Therefore, this alternative received a score of 4 points.

5.1.1.1.7 Wildfire

As shown on the SRA and LRA FHSZ Maps in Attachment 7, none of the operational components of the Existing Site are located within an FHSZ. The nearest very high FHSZ is located approximately 0.23 miles east of the existing compressor station site, while the nearest high FHSZ is located approximately 0.27 miles to the west on the west side of the Ventura River corridor (CAL FIRE 2022). The site is also located in a non-vegetated, urban area. Therefore, based on the ranking score range of 7 to 9 for sites not within an FHSZ, the Existing Site Alternative received a score of 8 points. The site did not receive a 9 because of its relative proximity to high and very high FHSZs to the west and east, as well as its location within a known fuel bed (Ventura Fuel Bed) that could still present a hazard (VCFPD 2021).

⁷ The “Utility or Equipment Substations” use type is permitted within the M-2 Zone subject to the provisions of Chapter 24.262 of the zoning code, and further provided that a use permit is approved pursuant to Chapter 24.520 (City of Ventura 2021).

5.1.1.2 On-Site Construction Considerations

5.1.1.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ were calculated from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station. For the purposes of the earthwork required to inform the air quality analysis, it was estimated that the site consisted of flat areas that required minimal grading. The total NO_x and PM₁₀ emissions from on-site construction of the Existing Site Alternative – Natural Gas Option are shown in Table 7.

Table 7. On-Site Construction Emissions: Existing Site - Natural Gas

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading – flat	872	233
Grading – elevated	0	0
Compressor station	10,578	2,022
Substation	0	0
Total^a	11,450	2,255

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The amount of on-site diesel equipment would be minimal, and the duration of grading activities would be limited. NO_x emissions would be in the <40,000 pounds and ≥8,000 pounds range and PM₁₀ emissions would be in the <6,000 pounds and ≥2,000 pounds range. Therefore, this alternative received a score of 6 points.

5.1.1.2.2 Cultural Resources

A total of 19 cultural resources have been previously recorded within a 1-mile radius of the Existing Site; however, no significant cultural resources have been identified on the Existing Site. One cultural resource comprising two buildings that are older than 45 years is present on site. The buildings were evaluated in 2021 and were found ineligible for listing in the NRHP or the CRHR or for designation as Historic Landmarks or Points of Interest; therefore, they are not significant resources (Sapphos 2021). The closest off-site resource is P-56-152841, a built environment resource located 0.18 miles to the southeast, that was formally evaluated and found ineligible for listing in the NRHP or the CRHR or for designation as Historic Landmarks or Points of Interest and is therefore not significant. No resources listed on any federal, state, or local registry are located within the Existing Site.

A total of 47 previously conducted studies have been undertaken within a 1-mile radius of the Existing Site between 1973 and 2021. Sapphos (2021) conducted a built environment study and evaluation of two buildings on the Existing Site. In addition, one of these studies, VN-02627, addressed the on-site portion of the Existing Site; however, it did not include a pedestrian survey or subsurface testing and no recommendations regarding existence or treatment of cultural resources were provided (King 1993).

The Existing Site has been subject to ground disturbance at least as early as 1923 when SoCalGas began installing a wide variety of compressor station equipment to upgrade an already existing gas plant site. Ground disturbance

associated with operation and maintenance of the SoCalGas facility occurs regularly on site. The Existing Site is located approximately 1,148 feet east of the Ventura River, 2.6 miles north of the Pacific Ocean, and 3.8 miles south of the Santa Ynez Mountains. It is not close to a natural landmark capable of depositing sediment, such as a river or the base of a foothill; therefore, it has a low potential for unknown archaeological material to be buried under natural sediment.

In summary, no known significant cultural resources exist within the Existing Site. Although the on-site component of the Existing Site has not been subjected to a pedestrian survey, the considerable and continual ground disturbance extending over 100 years and the lack of resources identified within close proximity suggests that the potential for yet unknown and intact cultural resources is low. Therefore, the Existing Site is in a location that is not sensitive for potentially significant cultural resources. Based on the above findings, the on-site component of the Existing Site received a score of 8 points.

5.1.1.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO₂e) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station were calculated. The total GHG emissions from on-site construction of the Existing Site Alternative are shown in Table 8.

Table 8. On-Site GHG Construction Emissions: Existing Site - Natural Gas

Activity	Total CO ₂ e Emissions (MT)
Grading - flat	105
Grading - elevated	0
Compressor station	1,560
Substation	0
Total^a	1,666

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The GHG emissions for on-site construction are anticipated to be below the 5,000 MT CO₂e threshold. Accordingly, this alternative received a score of 8 points.

5.1.1.2.4 Natural Resources

The Existing Site is fully developed and partially occupied with buildings from the existing compressor station operations. The Existing Site is surrounded by development and is not adjacent to (within 500 feet of) natural, open space habitat, as shown in Figure NR-2A in Attachment 4. No sensitive plant or animal species have been recorded on or adjacent to the Existing Site, as shown in Figure NR-1A in Attachment 4 and none are expected due to the developed conditions. As such, the Existing Site is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands on site and received a score of 9 points.

5.1.1.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (single-family residence adjacent to Existing Site) would be approximately 85 dBA at a distance of 90 feet, and thus between 50 and 100 feet from the construction activity; therefore, this alternative received a score of 3 points.

5.1.1.2.6 Slope, Topography, and Grading

The topography and slope maps in Attachment 6 show the slope for the Existing Site and surrounding area. The site is located in an urban area, which has been previously graded and improved, resulting in a subtle slope range of between 0% and 10%, for the both the compressor site and the surrounding area. Based on conceptual engineering analysis, grading for this site would entail approximately 4,500 CY of over-excavation/recompaction under the footprint of the various on-site structures. For the purposes of this analysis, 4,500 CY would be considered “negligible” as this amount, together with the average slope of the property, would not exceed the thresholds for a grading permit (County of Ventura 2022). Additionally, a slope of less than 10% indicates a high-ranking score is appropriate, as it does not exceed the 20% slope threshold defined in the scoring criteria (see Section 3.1). The average slope range calculations for the site are provided in Table 9.

Table 9. Average Slope Calculations

Class Range	% Slope Range	Acres	% Slope	Avg Avg	% Slope	Min Avg	% Slope	Max Avg
Existing Site – 8.42 Acres								
Site Classes: 0%–10%	0%–10%	8.42	5%	0.42	0%	0	10%	0.84
<i>Site Averages</i>				5%		0%		10%

As such, within the score range of 7 to 9, where the “average slope of the property is less than 20%” and “negligible/no over-excavation/recompaction is required” (see Section 3.1), the Existing Site received a score of 8 points.

5.1.1.2.7 Traffic

The Existing Site is in an industrial area, with direct access to the site from U.S. Route 101 to SR-33 to Stanley Avenue and Olive Street. Stanley Avenue and Olive Street are both classified as secondary arterials in the City of Ventura General Plan (City of Ventura 2005a), which provide access to primary arterials, other secondary arterials, and collector streets, with some access to local roads and major traffic-generating land uses. With direct access to the site provided via highways and arterials, vehicles traveling to/from the project site would not traverse through a road-constrained area. Furthermore, access to the site via a driveway at least 24 feet wide is currently available on Olive Street and would be maintained to meet SoCalGas and emergency responder access requirements.

Construction of the compressor station, including pad grading, buildings, and compressors, would take approximately 24 to 36 months. However, heavy earthwork is assumed to occur for less than 6 months because the site is already developed, and no major import/export of soils or materials via dump trucks and oversized vehicles would be needed. While industrial and/or manufacturing uses are located adjacent to the Existing Site

parcel to the north, west, and south, the predominant uses on the east side of North Olive Street include a public elementary school (E.P. Foster Elementary School) and various residential uses. Because construction would occur for less than 6 months but would occur near some residential uses and a school, this alternative received a score of 6 points.

5.1.1.3 Off-Site Construction Considerations

5.1.1.3.1 Air Quality

The Existing Site Alternative would not require any new off-site linear construction. Therefore, this alternative received a score of 9 points.

5.1.1.3.2 Cultural Resources

A total of 19 cultural resources have been previously recorded within a 1-mile radius of the off-site staging area for the Existing Site; however, no significant cultural resources have been identified within the staging area. The closest resources are two buildings on the Existing Site and P-56-000849, a prehistoric site located 0.37 miles west of the staging area. No resources listed on any federal, state, or local registry are located within the staging area.

Similar to the Existing Site, a total of 47 previously conducted studies have been undertaken within a 1-mile radius of the staging area between 1973 and 2021. Only VN-02627 addressed the off-site staging area, but it did not include a pedestrian survey or subsurface testing for resources (King 1993).

According to the historic aerial photographs and topographic maps, the staging area has been subject to ground disturbance at least as early as 1947 through at least as late as 1994, including structure and road construction, grading, installation of utilities, and pavement and demolition. The staging area is not close to a natural landmark capable of depositing sediment, such as a river or the base of a foothill; therefore, it has a low potential for unknown archaeological material to be buried under natural sediment.

In summary, although the off-site component of the Existing Site has not been subjected to a cultural resource study that specifically addressed the site, there are no known cultural resources within the off-site staging area. The property has been subject to considerable ground disturbance for at least 70 years and the staging area is not located close to a natural landmark capable of depositing sediment and burying yet unidentified cultural resources. Therefore, the potential for unknown and intact cultural resources is low and the off-site staging area is in a location that is not sensitive for potentially significant cultural resources. Based on the above findings, the staging area for the Existing Site received a score of 8 points.

5.1.1.3.3 Greenhouse Gases

This alternative would not require off-site linear construction; therefore, total GHG contribution would be zero. This alternative received a score of 9 points.

5.1.1.3.4 Natural Resources

No new off-site infrastructure pipelines, natural gas pipelines, or access roads are necessary for the Natural Gas Option.

The proposed off-site staging area is within a developed area, no sensitive plant or animal species have been recorded on it, and none are expected due to the developed conditions. However, the staging area is within 500 feet of riparian habitat associated with the Ventura River that has been designated as critical habitat for southwestern willow flycatcher (*Empidonax traillii extimus*) and southern steelhead (*Oncorhynchus mykiss* pop. 10). SR-33 is expected to provide a substantial barrier between the staging area and the Ventura River. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands in off-site areas. However, due to the proximity of the staging area to the sensitive riparian habitat, this alternative received a score of 8 points.

5.1.1.3.5 Noise

The Existing Site Alternative – Natural Gas Option would not involve any planned off-site construction activities. As such, there would be no noise exposure associated with off-site construction activity for this alternative, which therefore received a score of 9 points.

5.1.1.3.6 Traffic

Construction of the Existing Site Alternative would occur entirely on site, with no roadway construction required because there would be no required pipeline construction. The staging area is immediately adjacent to the east of the Existing Site and would not require any roadway access. Therefore, this alternative received a score of 9 points.

5.1.1.3.7 Utilities/Service Systems

The Existing Site Alternative would not require additional utilities or service systems because the infrastructure required to operate the existing compressor station would be used to operate the proposed compressor station. Therefore, this alternative received a score of 9 points.

5.1.2 Hybrid Option

5.1.2.1 Operational Considerations

5.1.2.1.1 Aesthetics and Visual Resources

There would be no difference in potential effects to aesthetics and visual resources between the Hybrid Option and the Natural Gas Option. As with the components of the Natural Gas Option, scenic views to components would generally be available from mobile vantage points and would not block scenic views to area hillsides and would not result in substantial alteration of existing visual character. For these reasons, potential development would have a nominal effect on the visual character of the community. Based on the assessment provided above, this alternative received a score of 8 points.

5.1.2.1.2 Air Quality

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, the Hybrid Option is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption. The Hybrid Option has fewer

internal combustion engines and thus fewer direct emissions than the Natural Gas Option. The replacement of two of the internal combustion engines with two electric compressors of equivalent horsepower would essentially cut the expected direct emissions in half.

Operation of the Hybrid Option was calculated to result in 5.6 tons/year of NO_x emissions. As such, the Natural Gas Option would fall within the ≥ 4 tons/year but < 8 tons/year category, which would score from 4 to 6. Because 5.6 tons/year is in the middle of the NO_x emissions range, the hybrid technology received a score of 5 points.

5.1.2.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Existing Site is in Census Tract 6111002300, which has a population of approximately 6,534. This tract has a total pollution burden score of 87%, which means that this census tract has more pollution burden than 87% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Existing Site received a score of 1 point because a pollution burden of 87% is within the 81% to 90% scoring range.

5.1.2.1.4 Greenhouse Gases

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). The total direct GHG emissions would be 13,918 MT CO₂e/year and indirect GHG emissions would be 5,500 MT CO₂e/year from operational activities at the Existing Site.

The shift from the Natural Gas Option to a Hybrid Option reduces the localized emissions of criteria pollutants and direct GHG emissions, but the increased power demand from the electric compressors would increase indirect GHG emissions depending on how the required power is generated. The estimated emissions for the hybrid technology were calculated to be 19,418 MT CO₂e/year, which would fall within the $\geq 10,000$ MT CO₂e/year but $< 25,000$ MT CO₂e/year category and would score from 4 to 6. Because 19,418 MT CO₂e/year is in the middle of the emission range, the Hybrid Option received a score of 5 points.

5.1.2.1.5 Land Use Designation

All the operational Existing Site Alternative – Hybrid Option components are located on parcels with City zoning that supports industrial and/or manufacturing uses (City of Ventura 2021). While industrial and/or manufacturing uses are also located adjacent to the Existing Site to the north, west, and south, the nearest sensitive receptor is located adjacent to the eastern property line of the Existing Site. In addition, the predominant uses on the east side of North Olive Street include a public elementary school (E.P. Foster Elementary School) and various residential uses. As such, within the ranking criteria range of 1 to 3, Industrial/manufacturing zone and adjacent to sensitive receptors, the Existing Site received a score of 1 point, due to its proximity to sensitive receptors adjacent to the site and east of North Olive Street.

5.1.2.1.6 Noise

The nearest non-industrial land use to the Existing Site is the adjacent single-family home in the northeast corner of the property. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (as defined in Section 3.2.7) of less than 55 dBA. Therefore, this alternative received a score of 4 points.

5.1.2.1.7 Wildfire

Although the Hybrid Option would have increased reliance on electrical power for the compressor station, the existing electrical utility infrastructure would be sufficient to provide power to the site. In addition, the site is within an urban area, where the immediate electrical utility infrastructure does not pass through a CPUC HFTD (CPUC 2021b) or a CAL FIRE FHSZ (CAL FIRE 2022). Based on the highest ranking score range of 7 to 9 for sites not within an FHSZ, the Existing Site Alternative received a score of 8 points. The site received a slightly reduced score due to its relative proximity to high and very high FHSZs to the west and east, which could still represent a hazard, as well as its location within a known fuel bed (i.e., Ventura Fuel Bed) (VCFPD 2021).

5.1.2.2 On-Site Construction Considerations

5.1.2.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ were calculated from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station. The total NO_x and PM₁₀ emissions from on-site construction of the Existing Site Alternative – Hybrid Option are shown in Table 10.

Table 10. On-Site Air Quality Construction Emissions: Existing Site - Hybrid

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading – flat	872	233
Grading – elevated	0	0
Compressor station	10,578	2,022
Substation	1,311	74.3
Total^a	12,761	2,329

Note: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The amount of on-site diesel equipment would be minimal, and the duration of grading activities would be limited. NO_x emissions would be in the <40,000 pounds and ≥8,000 pounds range and PM₁₀ emissions would be in the <6,000 pounds and ≥2,000 pounds range. Therefore, this alternative received a score of 6 points.

5.1.2.2.2 Cultural Resources

There are no differences in the Existing Site Alternative’s results for on-site construction considerations as it relates to cultural resources for the Hybrid Option when compared to the Natural Gas Option. Therefore, this alternative received a score of 8 points.

5.1.2.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO₂e) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station were calculated. The total GHG emissions from on-site construction of the Existing Site Alternative are shown in Table 11.

Table 11. On-Site GHG Construction Emissions: Existing Site - Hybrid

Activity	Total CO ₂ e Emissions (MT)
Grading - flat	105
Grading - elevated	0
Compressor station	1,560
Substation	294
Total^a	1,959

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The GHG emissions for on-site construction are anticipated to be well below the <5,000 MT CO₂e threshold. Accordingly, this alternative received a score of 8 points.

5.1.2.2.4 Natural Resources

The Hybrid Option would not alter any conditions related to on-site natural resources and this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands on site. Therefore, the Hybrid Option received a score of 9 points.

5.1.2.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use for the Hybrid Option for this alternative would be the same as the Natural Gas Option; therefore, the Hybrid Option received a score of 3 points.

5.1.2.2.6 Slope, Topography, and Grading

The Hybrid Option would have the same slope, topography, and grading requirements as the Natural Gas Option. As such, within the score range of 7 to 9, where the “average slope of the property is less than 20%” and “negligible/no over-excavation/recompaction is required” (see Section 3.1, Scoring Criteria), the Hybrid Option also received a score of 8 points.

5.1.2.2.7 Traffic

There would be a negligible difference between construction of the Hybrid Option and the Natural Gas Option. Construction of the compressor station, including pad grading, buildings and compressors, and electrical interconnection would take approximately 30 to 36 months, with major earthwork occurring for less than 6 months and briefly passing through residential areas. Access to the site would be the same as the Natural Gas Option. Therefore, this alternative received a score of 6 points.

5.1.2.3 Off-Site Construction Considerations

5.1.2.3.1 Air Quality

Scoring for off-site air quality impacts were based on the total amount of off-site linear construction required for the alternative. The Existing Site currently has an electrical line servicing the site and no additional off-site construction would be required. Therefore, this alternative received a score of 9 points.

5.1.2.3.2 Cultural Resources

There are no differences in results for off-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 8 points.

5.1.2.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions for off-site construction are anticipated to be 0 MT CO₂e because no off-site construction would be required. Accordingly, this alternative received a score of 9 points.

5.1.2.3.4 Natural Resources

No new off-site infrastructure is necessary for the Hybrid Option. Construction of the Hybrid Option would require the same off-site staging area to be used. Therefore, this alternative also received a score of 8 points.

5.1.2.3.5 Noise

No predicted off-site construction noise exposure would occur for this alternative; therefore, the alternative received a score of 9.

5.1.2.3.6 Traffic

Construction of the Hybrid Option would be the same as the Natural Gas Option because no roadway construction on existing roads would be required. Therefore, this alternative received a score of 9 points.

5.1.2.3.7 Utilities/Service Systems

The Existing Site Alternative would require no off-site ground disturbance because the infrastructure required to operate the existing compressor station would be used to operate the Hybrid Option. For the Hybrid Option, the

existing electrical lines on site would be used and no additional construction would be required. Therefore, this alternative received a score of 9 points.

5.2 Avocado Site

The scoring rationale for each of the environmental topic areas for the Avocado Site Alternative is described below.

5.2.1 Natural Gas Option

5.2.1.1 Operational Considerations

5.2.1.1.1 Aesthetics and Visual Resources

The Avocado Site encompasses high-elevation hillside terrain and includes a ridgeline visible from SR-33. The site is also briefly visible from Ventura Avenue and other locally designated scenic corridors, including Grant Park. While terrain adjacent to the site has been developed, such development is limited to agriculture (row crops); therefore, development of a compressor station would be highly visible and would contrast with the existing character of local hillsides and ridgelines.

Because development of the Avocado Site would be visible from identified scenic corridors and a scenic highway (Ventura Avenue, Grant Park, and SR-33) and would result in the substantial alteration of a ridgeline and a prominent visual component of the local landscape (i.e., hillsides), this alternative received a score of 0 points.

5.2.1.1.2 Air Quality

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, the natural gas-powered compressor station is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption.

Operation of the natural gas compressors is calculated to result in 11 tons/year of NO_x emissions. As such, the Natural Gas Option would fall within the ≥8 tons/year but <12 tons/year category, which would score from 1 to 3. Because 11 tons/year is closer to the upper end of the NO_x emissions range, the Natural Gas Option received a score of 1 point.

5.2.1.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Avocado Site is in Census Tract 6111001206, which has a population of approximately 778. This tract has a total pollution burden score of 79%, which took into consideration the exposure indicator and environmental effect scores in Table 12 (OEHHA 2022b). This score means that this census tract has more pollution burden than 79% of all census tracts within California.

Table 12. Pollution Burden for Census Tract 6111001206

Exposure Indicator	Score (Percentile)
Ozone	27
Fine Particulate Matter (PM _{2.5})	17
Diesel Particulate Matter	10
Pesticides	88
Toxic Releases	14
Traffic	75
Drinking Water Contaminants	45
Lead in Housing	58
Cleanups	72
Groundwater Threats	67
Hazardous Waste	76
Impaired Water	90
Solid Waste	80
Pollution Burden	79

Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Avocado Site received a score of 2 points because a pollution burden of 79% is within the 71% to 80% scoring range.

5.2.1.1.4 Greenhouse Gases

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). Indirect GHG emissions for the operation of the natural-gas facilities were not quantified for the Natural Gas Option since anything attributable to indirect GHG emissions would be consistent across all the proposed alternative sites.

The estimated emissions for the all-Natural Gas Option were calculated to be 27,836 MT CO₂e/year, which would fall within the ≥25,000 MT CO₂e/year but <50,000 MT CO₂e/year category and therefore would score from 1 to 3. Because 27,836 MT CO₂e/year is closer to the lower end of the emission range, the Natural Gas Option received a score of 3 points.

5.2.1.1.5 Land Use Designation

Regional Site Location

As shown in Figure 2, the Avocado Site is in southwest Ventura County, located slightly east of SR-33 and the City of Ventura, approximately 3,800 feet west of the Existing Site on North Olive Street. The Avocado Site lies across a

small portion of two larger APNs within Ventura County: APN 060031017 to the north (Northern Parcel) and APN 060031018 to the south (Southern Parcel). Under existing conditions, regional access to the Avocado Site is provided via U.S. Route 101 to Taylor Rancho Road; however, construction of a new compressor station at this location would require improvements to the roadway to accommodate emergency access. This roadway extent would be accessible directly from U.S. Route 101 via West Main Street. The Avocado Site would require the construction of one off-site staging area; however, because the staging area would not be required during the operational phase of the Avocado Site Alternative, this area is not discussed further in this section.

Surrounding Land Uses

As shown on the General Plan Land Use and Zoning maps in Attachment 3, the surrounding land uses of the Avocado Site are predominantly open space and agricultural, with minimum lot sizes ranging from 1 to 160 acres. These include the County General Plan (2020) land use designation of Open Space in all directions, as well as County zoning of Agricultural Exclusive (AE-40); Coastal Agricultural (CA-40) to the south; Open Space (OS-160) to the north, west, and east; Rural Agriculture (RA-1) to the east; and a Habitat Connectivity and Wildlife Corridor (HCWC) overlay zone to the east running along the Ventura River riparian corridor west of SR-33 (County of Ventura 2021). The Avocado Site is not adjacent to any sensitive receptors. The nearest sensitive receptor is a residence located approximately 0.7 miles away.

Project Component Land Uses

The General Plan Land Use and Zoning maps in Attachment 3 show that the approximately 15-acre Avocado Site, MLV stations, and the required access road are all located on privately held lands in Ventura County, the portions of which are currently developed with agricultural uses.

The northern half of the Avocado Site lies within APN 060031017 (Northern Parcel), a 557-acre parcel with a land use designation of Open Space (County of Ventura 2020; 2021). According to the Ventura County General Plan (2020) the “Open Space [General Plan land use] designation encompasses land, as defined under Section 65560 of the [California] Government Code, as any parcel or area of land or water which is essentially unimproved and devoted to an open-space use” (County of Ventura 2020). Zoning for the northern parcel is predominantly AE-40, which has a minimum lot area of 40 acres (County of Ventura 2008, Section 8103-0). The AE-40 zone is intended to preserve agricultural land and protect these areas from “nonrelated uses” that could have a negative impact on the County’s agriculture industry (County of Ventura 2008, Section 8104-1.2). Although APN 060031017 also includes a small segment of CA-40 zoning to the west and a HCWC overlay designation to the east, the northern half of the Avocado Site is entirely within land area zoned AE-40 (County of Ventura 2021).

The southern half of the Avocado Site lies within APN 060031018 (Southern Parcel), a 562.79-acre parcel that also has a Ventura County land use designation of Open Space (County of Ventura 2020; 2021). Zoning for the Southern Parcel includes primarily AE-40 on the northern half, and CA-40 on the southern half, both of which have a minimum lot area of 40 acres (County of Ventura 2008a, Section 8103-0; 2012, Section 8175-2[c]; 2021). The Southern Parcel also includes an HCWC overlay zone to the east running along the Ventura River riparian corridor; however, the southern half of the plot identified for the Avocado Site is entirely within land area zoned AE-40 (County of Ventura 2021). Required improvements to 2.37 miles of Taylor Ranch Road to provide construction access to the Avocado Site would take place within land area zoned CA-40-sdf (slope-density formula), with a slope ranging from 0% to 35% (County of Ventura 2012, Section 8175-2[c]).

Notwithstanding the CPUC's preemptory authority discussed in Section 3.2.5, Land Use, the selection of the Avocado Site would require changes to existing land use and zoning for the on-site location to facilitate the types of operational uses required by the project. Selection of the Avocado Site would also likely require a lot split, because the existing on-site parcels are each several hundred acres in size. In addition, the underlying land use of the Avocado Site is included in the County of Ventura Measure C, Save Open-Space and Agricultural Resources Initiative—2050 (SOAR), which states that "lands designated as Agricultural, Rural, or Open Space on the County of Ventura's General Plan will remain so designated until December 31, 2050 unless the land is redesignated ... by vote of the people or redesignated by the Board of Supervisors for the County of Ventura" (County of Ventura 2016). Further, the Board of Supervisors may only elect to redesignate said land uses to more "intensive" uses if "certain findings can be made, including (among other things) that the land is proven to be unsuitable for any form of utilitarian use, and redesignation is necessary to avoid an unconstitutional taking of property without just compensation" (County of Ventura 2016). While this does not explicitly impact the ranking as defined by the scoring criteria, the SOAR designation has been incorporated into the land use analysis and scoring for both the Natural Gas and Hybrid Options. The SOAR initiative was initially adopted by vote in 1998 and set to expire in December 2020; however, the initiative was extended by vote to 2050 after readoption in 2016.

Oil Wells

While the Avocado Site lies partially within the active Ventura Oil Field, there are no active wells present on site (DOC 2019, 2022).

Evaluation and Score

All Avocado Site Alternative – Natural Gas Option operational components are located within and/or adjacent to parcels with County zoning that does not support industrial and/or manufacturing uses. Additionally, the primary compressor station site is within an area governed by the SOAR initiative. No portion of the site is adjacent to any sensitive receptors. The nearest industrial land use to the Avocado Site is approximately 0.75 miles to the northeast (APN 068001001), while the nearest sensitive land use is approximately 0.76 miles to the east (APN 0680163255). Based on the above analysis and using the scoring criteria for a site which is within a Non-Industrial/manufacturing zone not adjacent to sensitive receptors (Section 3.1, Scoring Criteria), the Avocado Site Alternative – Natural Gas Option received a score of 6 points. Within the 4 to 6 point range, the score was influenced by the following factors: (1) while the primary compressor station for the Avocado Site would be located partially within the active Ventura Oil Field, there are no active wells on site, which suggests the potential for oil/gas exploration but does not create complications related to active well operations, and (2) while the Avocado Site is zoned for agricultural use and is part of active agricultural parcels, aerial views of the site show no current crop production on the main compressor station site.

5.2.1.1.6 Noise

The nearest non-industrial land use to the Avocado Site is approximately 0.7 miles to the east. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (as defined in Section 3.2.7) of less than 35 dBA. Therefore, this alternative received a score of 9 points.

5.2.1.1.7 Wildfire

All operational components of the Avocado Site are located within an SRA FHSZ within the Casitas Fuel Bed (VCFPD 2021; CAL FIRE 2022). As shown on the FHSZ Maps in Attachment 7, approximately one-third of the compressor station for the Avocado Site would be within a very high FHSZ, while the rest of the site, as well as the access road and all ancillary equipment, are within a high FHSZ. Therefore, based on the ranking score range of 1 to 3 for sites within high FHSZs, the Avocado Site Alternative – Natural Gas Option received a score of 2 points due to (1) a portion of the site being located in a very high FHSZ and (2) the presence of vegetative fuel sources in the surrounding areas, particularly the unimproved areas to the north and east (Radeloff 2010; VCFPD 2021).

5.2.1.2 On-Site Construction Considerations

5.2.1.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ were calculated from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station. For the purposes of the earthwork required to inform the air quality analysis, it was estimated that the site consisted of mostly hillside/elevated land and some flat areas that required grading. The total NO_x and PM₁₀ emissions from on-site construction of the Avocado Site Alternative are shown in Table 13.

Table 13. On-Site Construction Emissions: Avocado Site - Natural Gas

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading – flat	1,150	307
Grading – elevated	74,886	9,747
Compressor station	10,578	2,022
Substation	0	0
Total^a	86,614	12,076

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The Avocado Site is very hilly and would require a large amount of grading to be suitable for use. The Avocado Site currently has no industrial development. Emissions are greater than 80,000 pounds for NO_x and 10,000 pounds for PM₁₀; therefore, this alternative received a score of 0 points.

5.2.1.2.2 Cultural Resources

A total of 74 cultural resources have been previously recorded within a 1-mile radius of the Avocado Site; however, there are no resources within a 0.25-mile radius of the site and no cultural resources have been identified within the Avocado Site. Additionally, no resources listed on any federal, state, or local registry are located on the Avocado Site.

A total of 120 previously conducted studies have been undertaken within a 1-mile radius of the Avocado Site between 1973 and 2021. Investigations VN-519 (Singer 519) and VN-688 (Singer and Atwood 1987) included conducting pedestrian surveys in portions of the Avocado Site and provide recommendations that the general area

surrounding the Ventura River be avoided and left unaltered until further studies can be conducted, including archaeological and ethnographic analyses to determine the exact nature and scope of the potential resources. The authors also express that the general area should be considered culturally and/or scientifically significant.

According to the historic aerial photographs and topographic maps, the Avocado Site has remained undeveloped and covered in vegetation since at least 1904. The Avocado Site is located approximately 1,970 feet east of the Ventura River, 1.5 miles north of the Pacific Ocean at the southern base of the Santa Ynez Mountains. The Avocado Site is close to the base of the Santa Ynez Mountains, which are capable of having deposited alluvial sediments, likely prior to human habitation of the area, and also within a foothill area capable of having deposited colluvial sediments during human habitation of the area. Therefore, the Avocado Site has potential for unknown archaeological material to be buried under natural alluvial sediment.

In summary, the Avocado Site and the surrounding area have been subjected to multiple cultural resource studies, yet no cultural resources have been identified on site or within a 0.25-mile radius. Considering the lack of previous disturbance, potential alluvial and colluvial deposits capable of burying unidentified cultural resources, and the recommendations of two previous studies, the potential for yet unknown and intact cultural resources to exist is moderate. Therefore, the Avocado Site is in a location that is moderately sensitive for potentially significant cultural resources. Based on the above findings, the on-site components of the Avocado Site received a score of 6 points.

5.2.1.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. Acreages for grading were based on the “new disturbance” areas from the construction assumptions and the total GHG emissions from on-site construction of the Avocado Site Alternative are shown in Table 14.

Table 14. On-Site GHG Construction Emissions: Avocado Site - Natural Gas

Activity	Total CO _{2e} Emissions (MT)
Grading - flat	139
Grading - elevated	11,870
Compressor station	1,560
Substation	0
Total^a	13,569

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The GHG emissions for on-site construction are anticipated to fall within the $\geq 10,000$ MT CO_{2e} to $< 20,000$ MT CO_{2e} range. This would be due to an increase in the amount of off-road equipment usage that would be needed to properly grade the site for use. Accordingly, this alternative received a score of 2 points.

5.2.1.2.4 Natural Resources

The Avocado Site is within undeveloped open space that was previously mapped as *Salvia mellifera*–*Salvia leucophylla* association⁸ (David Magney Environmental Consulting 2008), as shown in Figure NR-2B in Attachment 4. This association is not a sensitive habitat (CDFW 2021). Based on recent aerial imagery, portions of the site have been disturbed but shrubs are still present, and there is shrub-dominated habitat to the north and west of the site and orchards to the south and east. No wetlands or riparian habitat have been previously recorded or are visible on aerial imagery. No sensitive plant or animal species have been recorded on or adjacent to the site, as shown in Figure NR-2B in Attachment 4. The 27 sensitive plant and animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur on the site. As such, the Avocado Site Alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands on site, and it received a score of 8 points due to the presence of natural vegetation within the site’s limits.

5.2.1.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which is more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; therefore, the site received a score of 9.

5.2.1.2.6 Slope, Topography, and Grading

The topography and slope maps in Attachment 6 show the slope for the Avocado Site and surrounding area. The site itself is currently being used for agriculture. The average slope range calculations for the site are provided in Table 15.

Table 15. Average Slope Calculations

Class Range	% Slope Range	Acres	% Slope	Avg Avg	% Slope	Min Avg	% Slope	Max Avg
Avocado Site – 15.06 Acres								
Site Classes: 0%–70%	0%–10%	0.08	5%	0	0%	0	10%	0.01
	>10%–20%	0.54	15%	0.08	10%	0.05	20%	0.11
	>20%–30%	1.7	25%	0.43	20%	0.34	30%	0.51
	>30%–40%	6.52	35%	2.28	30%	1.96	40%	2.61
	>40%–50%	3.75	45%	1.69	40%	1.5	50%	1.88
	>50%–60%	2.13	55%	1.17	50%	1.07	60%	1.28
	>60%–70%	0.34	65%	0.22	60%	0.2	70%	0.24
Site Averages				39%		34%		44%

As shown above, the on-site slope ranges from a low of 0% to a high of over 60%, with a site average of approximately 39%. Based on conceptual engineering analysis, grading for this site would entail approximately 1.3 million CY of over-excavation/recompaction, which would be balanced on site. Relative to the size and type of

⁸ An association is a vegetation classification unit defined by a diagnostic species, a characteristic range of species composition, general form or appearance, and distinctive habitat conditions (Jennings et al. 2006).

project, the required over-excavation/recompaction of more than 1.3 million CY would be considered substantial. Additionally, an average slope of almost 40% exceeds several of the slope thresholds defined by the scoring criteria (see Section 3.1). Therefore, because the average slope of the property is greater than 40% and/or substantial over-excavation/recompaction is required, the Avocado Site Alternative received a score of 0 points.

5.2.1.2.7 Traffic

The Avocado Site is approximately 3,800 feet west of the existing Ventura Compressor Station. The site has direct access from U.S. Route 101 to Taylor Ranch Road. The Avocado Site, whether the Natural Gas or the Hybrid Option, would require a new access road at least 24 feet in width and with a slope not exceeding 20%. Taylor Ranch Road is a narrow, unpaved road currently used for crop access that could be widened and improved with asphalt or other paving to meet the site's access requirements.

The surrounding area is primarily developed with agricultural uses and low-density residential development (the nearest residence is approximately 0.33 miles away) and the site is used for agriculture. Construction of the compressor station, including pad grading, access road, on-site utility installations, buildings, and compressors would require substantial amounts of grading and would take approximately 60 to 70 months, with heavy earthwork estimated to occur for more than 1 year.

While construction of the Avocado Site would continue for more than 1 year, heavy truck traffic would not occur on a constrained roadway, because direct access to Taylor Ranch Road (private road) is provided via a major highway (U.S. Route 101). However, because construction would impact Taylor Ranch Road, which might occasionally be used for access to the avocado groves, this alternative received a score of 7 points.

5.2.1.3 Off-Site Construction Considerations

5.2.1.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Natural Gas Option at the Avocado Site would require construction of approximately 982 linear feet of a pipeline system to connect to the existing main pipelines. It would also require grading, widening, and paving of approximately 12,315 linear feet of the existing road to accommodate plant traffic to the new site. The linear construction totals approximately 13,297 feet, which is in the moderate range. Therefore, this alternative received a score of 2 points.

5.2.1.3.2 Cultural Resources

A total of 74 cultural resources have been previously recorded within a 1-mile radius of the Avocado Site off-site components; however, no cultural resources have been identified within the off-site components of the Avocado Site. The closest resources to the off-site components of the Avocado Site are P-56-000481 and P-56-000849; a third prehistoric site, P-56-120026, is located 0.2 miles west of the Access Road. A site record summary of the cultural resources P-56-000481 and P-56-000849 is provided below.

- P-56-000481 is a prehistoric archaeological milling stone site located on the west terrace bank of the Ventura River within very close proximity of the off-site staging area and access road. Surface collection of artifacts included manos, metates, hammerstones, and flakes consisting of quartzite, jasper, and

chalcedony. The site was recorded in 1976 by M. Capelli and R. Browne, who noted the site appeared to date to the Oak Grove Period. The site record does not mention the occurrence of subsurface testing, so it is assumed the site boundary is based on surface observation and that the subsurface extent has yet to be determined.

- P-56-000849 is a prehistoric archaeological site comprising ground stone artifacts including hundreds of biface manos, metate fragments, and other tools. The site is located on top of an ancient terrace west of the Ventura River about 2.5 kilometers (1.6 miles) due north of the river mouth, within very close proximity of the off-site access road and according to the site record, near a buried gas line and cattle trough. The site was recorded in 1987 by Clay A Singer, who noted that subsurface testing had not occurred at the site but depth of archaeological deposits was suspected to be more than 50 centimeters (20 inches). The site record acknowledges that the site has been impacted by mechanical clearing operations and cattle grazing but no signs of large-scale disturbance or that of significant depth has occurred.

No resources listed on any federal, state, or local registry are located within the off-site components of the Avocado Site.

A total of 120 previously conducted studies have been undertaken within a 1-mile radius of the off-site components of the Avocado Site between 1973 and 2021. Investigations VN-519 (Singer 519) and VN-688 (Singer and Atwood 1987) conducted pedestrian surveys in portions of the off-site components and provide recommendations that the general area surrounding the Ventura River be avoided and left unaltered until further studies can be conducted, including archaeological and ethnographic analyses to determine the exact nature and scope of the potential resources. The authors also expressed that the general area should be considered culturally and/or scientifically significant.

According to the historic aerial photographs and topographic maps, the off-site components have been subject to ground disturbance. The off-site staging area has been subject to agricultural ground disturbance since at least 1967. The off-site access road component has been previously disturbed by road grading and construction at least as early as 1904. Some portions of the off-site pipeline component do not appear to have been previously disturbed, where other portions appear to be disturbed by agricultural use. With the exception of small portions, the off-site components are not within close proximity to a natural landmark capable of depositing sediment and therefore have a low potential for unknown archaeological material to be buried under natural sediment.

In summary, no known cultural resources are present within the off-site components of the Avocado Site. A majority of the off-site components of the Avocado Site have been subject to considerable ground disturbance for over 100 years, including road grading construction and agricultural use, with a small portion of the pipeline component appearing to have remained undisturbed. Generally, the off-site components of the Avocado Site are not located close to a natural landmark capable of depositing sediment and burying yet unidentified cultural resources, and no cultural resources have been identified within the off-site components of the Avocado Site.

However, three cultural resources have been identified within a 0.25-mile radius and two of them are very close to portions of the off-site component. These resources have not been subjected to subsurface testing but based on the site description, both cultural resources appear to be significant and may include buried deposits that potentially extend into the off-site components. If the adjacent resources do extend into the access road and staging area, the Avocado Site Alternative would have a potential to impact a significant resource; however, the adjacent resources' current site boundaries do not extend into the off-site components. Therefore, the off-site components

of the Avocado Site are in a location that is moderately sensitive for potentially significant cultural resources. Based on the above findings, the off-site components of the Avocado Site received a score of 6 points.

5.2.1.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in CO₂e) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the compressor station were calculated. The total GHG emissions from off-site construction of the Avocado Site Alternative are shown in Table 16.

Table 16. Off-Site GHG Construction Emissions: Avocado Site - Natural Gas

Activity	Total CO ₂ e Emissions (MT)
Power line	0
Pipeline – street	0
Pipeline – open space	15
Road construction	433
Total^a	448

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be close to the <500 MT CO₂e threshold. Therefore, this alternative received a score of 7 points.

5.2.1.3.4 Natural Resources

This alternative would require improvements to the access road and two new pipeline corridors. Grading of 12,600 linear feet of Taylor Ranch Road would be needed and is primarily within orchards, but there are portions that are in areas previously mapped as *Salvia mellifera*–*Salvia leucophylla* association (David Magney Environmental Consulting 2008), as shown in Figure NR-2B in Attachment 4. The proposed road improvements cross five linear wetland features (mapped as riverine) that could be impacted by road improvement. The proposed pipeline corridors and tie-ins are primarily within the adjacent orchards and would not cross any riverine features. The proposed staging area consists of developed lands and areas of potential coastal sage scrub based upon available imagery. No sensitive plant and animal species have been recorded on or adjacent to (within 500 feet of) the off-site components, as shown in Figure NR-1B in Attachment 4. The 27 sensitive plant and animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur in the off-site areas. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species and habitats in off-site areas, but there may be impacts to wetlands off site due to access road improvements; therefore, the alternative received a score of 0 points.

5.2.1.3.5 Noise

Predicted off-site construction noise exposure at the nearest non-industrial land use (as defined in Section 3.2.7), which is more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; therefore, the alternative received a score of 9 points.

5.2.1.3.6 Traffic

The Avocado Site Alternative would require grading, trenching, and natural gas pipeline installation in the agricultural fields adjacent to the site, but not beneath existing roadways. Additionally, other utility connections for electrical, potable water, sewer, and telecommunications would be conducted via trenching beneath Taylor Ranch Road. This alternative would require resurfacing and widening Taylor Ranch Road to 24 feet to meet SoCalGas and emergency responder access requirements. There would be no construction on public roadways, because Taylor Ranch Road is a private unpaved road used to provide access to the agricultural fields. While construction would impact Taylor Ranch Road, there would be no construction on public roadways that could cause new congestion or exacerbate existing traffic conditions. Therefore, this alternative received a score of 7 points.

5.2.1.3.7 Utilities/Service Systems

The Avocado Site Alternative – Natural Gas Option would require approximately 41,528 square feet of off-site ground disturbance for pipelines and utilities and approximately 7,500 square feet for the MLV connections, for a total of approximately 49,028 square feet of off-site ground disturbance. All off-site ground disturbance is summarized in Table 17 and would be conducted within and surrounded by non-urbanized and agricultural land; therefore, it would not impact urban roadways or otherwise impede commuter traffic.

Table 17. Off-Site Ground Disturbance: Avocado Site - Natural Gas

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (to the east)	3,019
Pipeline Corridor 2 (to the south)	1,563
Utility Lines	36,945
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	41,528
Mainline Valve Connections	
Mainline Valve Connection 1	3,750
Mainline Valve Connection 2	3,750
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connections</i>	7,500
Depressurization Line	
Depressurization Line	0
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	0
Electrical Pole Footings	
Electrical Pole Footings	0
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	0
Total Off-Site Ground Disturbance for All Construction Elements^a	49,028

Note:

^a Totals may not sum precisely due to rounding.

This alternative received a score of 4 points because of the minimal amount of off-site ground disturbance required.

5.2.2 Hybrid Option

5.2.2.1 Operational Considerations

5.2.2.1.1 Aesthetics and Visual Resources

Due to the need for approximately 30 new 50-foot-high electrical poles to accommodate the anticipated electrical demand and because a number of the poles would be visible from SR-33 (and could cross the scenic highway), the Hybrid Option would potentially result in greater visual impacts comparative to the Natural Gas Option. However, because both options would require over 650,000 CY of new disturbance on hillside and ridgeline terrain and would substantially alter the existing terrain, the Hybrid Option received a score of 0 points.

5.2.2.1.2 Air Quality

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, the Hybrid Option is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption. The Hybrid Option has fewer internal combustion engines and thus fewer direct emissions than the Natural Gas Option. The replacement of two of the internal combustion engines with two electric compressors of equivalent horsepower would essentially cut the expected direct emissions in half.

Operation of the Hybrid Option was calculated to result in 5.6 tons/year of NO_x emissions. As such, it would fall within the ≥ 4 tons/year but < 8 tons/year category, which is scored from 4 to 6. Because 5.6 tons/year is in the middle of the NO_x emissions range, the Hybrid Option received a score of 5 points.

5.2.2.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Avocado Site is in Census Tract 6111001206, which has a population of approximately 778. This tract has a total pollution burden score of 79%, which means that this census tract has more pollution burden than 79% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Avocado Site received a score of 2 points because a pollution burden of 79% is within the 71% to 80% scoring range.

5.2.2.1.4 Greenhouse Gases

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). The total direct GHG emissions would be 13,918 MT CO₂e/year and indirect GHG emissions would be 5,500 MT CO₂e/year from operational activities at the Avocado Site.

The shift from the Natural Gas Option to a Hybrid Option reduces the localized emissions of criteria pollutants and direct GHG emissions, but the increased power demand from the electric compressors would increase indirect GHG emissions depending on how the power that is used is generated. The estimated emissions for the hybrid technology were calculated to be 19,418 MT CO₂e/year, which would fall within the $\geq 10,000$ MT CO₂e/year but $< 25,000$ MT CO₂e/year category and therefore would score from 4 to 6. Because 19,418 MT CO₂e/year is in the middle of the emission range, the Hybrid Option received a score of 5 points.

5.2.2.1.5 Land Use Designation

In addition to the components previously discussed in Section 5.2.1.1.5, the hybrid alternative would require 30 new electrical poles and approximately 3,000 linear feet of overhead electrical line to accommodate the anticipated electrical demand. The electrical interconnect would have an underlying land use designation of Open Space (County of Ventura 2020) and zoning of AE-40 (County of Ventura 2008) and CA-40-sdf (County of Ventura 2012). Based on the above analysis and using the scoring criteria for a site that is within a Non-industrial/manufacturing zone and not adjacent to sensitive receptors, the Avocado Site Alternative – Hybrid Option received a score of 6 points. Within the 4 to 6 point range, the score was influenced by the following factors: (1) while the primary compressor station site is located partially within the active Ventura Oil Field, there are no active wells on site, which suggests the potential for oil/gas exploration but does not create complications related to active well operations, and (2) while the Avocado Site is zoned for agricultural use and is part of active agricultural parcels, aerial views of the site show no current crop production on the main compressor station site.

5.2.2.1.6 Noise

The nearest non-industrial land use to the Avocado Site is approximately 0.7 miles to the east. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (as defined in Section 3.2.7) of less than 35 dBA. Therefore, this alternative received a score of 9 points.

5.2.2.1.7 Wildfire

Due to the exposed nature of the electrical interconnect—30 poles and 3,000 linear feet of overhead electrical lines along Taylor Ranch Road—located in a Tier 3 HFTD, the electrical interconnect would represent an increased fire risk to the surrounding community due to potentially downed power lines (see maps in Attachment 7). Therefore, based on the ranking criteria for sites within high FHSZs, the Avocado Site Alternative – Hybrid Option received a score of 1 point, because the entirety of the electrical interconnect would travel through an HFTD.

5.2.2.2 On-Site Construction Considerations

5.2.2.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ were calculated from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station. The total NO_x and PM₁₀ emissions from on-site construction of the Avocado Site Alternative are shown in Table 18.

Table 18. On-Site Construction Emissions: Avocado Site - Hybrid

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading – flat	1,150	307
Grading – elevated	74,886	9,747
Compressor station	10,578	2,022
Substation	1,311	74
Total^a	87,925	12,150

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The Avocado Site is very hilly and would require grading and excavation to be suitable for use. The Avocado Site currently has no industrial development. The Hybrid Option would also require additional construction activity for a substation. The total NO_x emissions are greater than 80,000 pounds and PM₁₀ emissions are greater than 10,000 pounds; therefore, this alternative received a score of 0 points.

5.2.2.2.2 Cultural Resources

There are no differences in the results for on-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 6 points.

5.2.2.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station were calculated. The total GHG emissions from on-site construction of the Avocado Site Alternative are shown in Table 19.

Table 19. On-Site GHG Construction Emissions: Avocado Site - Hybrid

Activity	Total CO _{2e} Emissions (MT)
Grading – flat	139
Grading – elevated	11,870
Compressor station	1,560
Substation	294
Total^a	13,862

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The Hybrid Option would require the construction of a substation on the site, thus increasing the amount of on-site GHG emissions when compared to the Natural Gas Option. The GHG emissions for on-site construction are anticipated to fall within the >10,000 MT CO_{2e} to <20,000 MT CO_{2e} range. This would be due to an increase in the amount of off-road equipment usage that would be needed. Accordingly, this alternative received a score of 2 points.

5.2.2.2.4 Natural Resources

The Hybrid Option would not alter any conditions related to on-site natural resources and as such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands on site. Because of this lack of impact and considering the presence of natural vegetation within the site's limits, the alternative received a score of 8 points.

5.2.2.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; therefore, this alternative received a score of 9 points.

5.2.2.2.6 Slope, Topography, and Grading

The Hybrid Option would include an electrical interconnect, requiring approximately 60 CY of additional grading. This additional grading does not impact the ranking because the over-excavation required for the electrical alignment is a relatively negligible amount, compared to the overall amount. In addition, per the scoring criteria provided in Section 3.1, the slope, topography, and grading scenarios for the site, regardless of the electrical interconnect requirement, already qualify the site for a score of 0 points.

5.2.2.2.7 Traffic

There would be a negligible difference between construction of the Hybrid Option and the Natural Gas Option related heavy truck traffic for on-site construction activity. Therefore, this alternative received a score of 7 points.

5.2.2.3 Off-Site Construction Considerations

5.2.2.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Hybrid Option at the Avocado Site would require construction of approximately 982 linear feet of a pipeline system to connect to the existing main pipelines. It would also require grading, widening, and paving of approximately 12,315 linear feet of the existing road to accommodate compressor plant traffic to the new site. In addition, approximately 4,359 linear feet of electrical interconnect would be required to accommodate the increased demand from the electric compressors. The linear construction would total approximately 17,656 feet, which is in the substantial range. Therefore, this alternative received a score of 0 points.

5.2.2.3.2 Cultural Resources

There are no differences in the results for off-site construction considerations for the Hybrid Option and the Natural Gas Option; therefore, this alternative received a score of 6 points.

5.2.2.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the future compressor station were calculated. The total GHG emissions from off-site construction of the Avocado Site Alternative are shown in Table 20.

Table 20. Off-Site GHG Construction Emissions: Avocado Site - Hybrid

Activity	Total CO _{2e} Emissions (MT)
Power line	137
Pipeline – street	0
Pipeline – open space	15
Road construction	433
Total^a	585

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be just above the <500 MT CO_{2e} threshold. Therefore, this alternative received a score of 6 points.

5.2.2.3.4 Natural Resources

The Hybrid Option would require new off-site electric poles to connect the station to the existing SCE transmission line. The alternative requires 3,000 linear feet of overhead electrical line, with 30 poles, that is primarily through orchards but is also in areas previously mapped as *Salvia mellifera*-*Salvia leucophylla* association (David Magney Environmental Consulting 2008), as shown in Figure NR-2B in Attachment 4. The electrical line alignment also intersects four ephemeral wetland features (riverine); however, it is assumed that the poles can be sited outside the limits of these features. The proposed staging area consists of developed lands and areas of potential coastal sage scrub based upon available imagery. The same off-site staging area would be required for the Hybrid Option. No sensitive plant and animal species have been recorded on or adjacent to (within 500 feet of) the off-site components, as shown in Figure NR-1B in Attachment 4. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species and habitats in off-site areas, but there may be impacts to wetlands off site due to access road improvements. Therefore, this option also received a score of 0 points.

5.2.2.3.5 Noise

Predicted off-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; therefore, this alternative received a score of 9 points.

5.2.2.3.6 Traffic

Construction of the Hybrid Option would be the same as the Natural Gas Option, with the exception of the extension of electrical utilities. However, no roadway construction on existing roads for electrical utilities would be required. Therefore, this alternative received a score of 7 points.

5.2.2.3.7 Utilities/Service Systems

The Avocado Site would require approximately 41,528 square feet of off-site ground disturbance for pipelines and utilities, approximately 7,500 square feet for the MLV connections, and an additional 420 square feet of off-site ground disturbance required for electrical poles, for a total of 49,448 square feet of off-site ground disturbance. All off-site ground disturbance is summarized in Table 21 and would be conducted within and surrounded by non-urbanized and agricultural land; therefore, it would not impact urban roadways or otherwise impede commuter traffic.

Table 21. Off-Site Ground Disturbance: Avocado Site - Hybrid

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (to the east)	3,019
Pipeline Corridor 2 (to the south)	1,563
Utility Lines	36,945
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	41,528
Mainline Valve Connections	
Mainline Valve Connection 1	3,750
Mainline Valve Connection 2	3,750
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connections</i>	7,500
Depressurization Line	
Depressurization Line	0
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	0
Electrical Pole Footings	
Electrical Pole Footings	420
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	420
Total Off-Site Ground Disturbance for All Construction Elements^a	49,448

Note:

^a Totals may not sum precisely due to rounding.

The additional disturbance for the electrical poles would not substantively alter the amount of off-site ground disturbance required; therefore, this alternative received a score of 4 points.

5.3 Ventura Steel Site

The scoring rationale for each of the environmental topic areas for the Ventura Steel Site is described in this section.

5.3.1 Natural Gas Option

5.3.1.1 Operational Considerations

5.3.1.1.1 Aesthetics and Visual Resources

The Ventura Steel site is located within the local valley landscape to the east of SR-33 (and east of Ventura Avenue). While the site is visible from SR-33, the valley landscape has been visibly altered by previous development including oil wells, storage tanks, storage yards, and wooden and metallic siding structures supporting industrial and commercial businesses. Development of the site with the Natural Gas Option would not result in damage to a scenic resource (the site encompasses relatively flat and previously developed terrain) and would not obstruct or otherwise degrade an existing view to a valued scenic resource such as hillsides. Construction of off-site pipelines is likely to result in temporary contrasting lines and scars on hillsides that would be visible from SR-33; however, due to the temporal nature of the disturbance (which would revegetate over time) and the degraded character of the visible oil/gas uses in the vicinity, pipeline installation is not anticipated to create substantial effects to existing visual character. Development of this site would require a permanent access road (approximately 3,600 feet long by 12feet wide) that would result in linear visual disturbance on hillside visible from SR-33. However, as stated above, the presence of oil and gas infrastructure in the nearby SR-33 viewshed would reduce the severity of visual character effects. It should be noted that while adjacent to Ventura Boulevard, the site and segment of the roadway are north of the scenic corridor boundaries as identified by the City of Ventura (City of Ventura 2005b). Lastly, the Ventura Steel Site is not anticipated to be visible from Grant Park due to the presence of an intervening ridgeline that effectively blocks the site from view of Grant Park visitors.

Development of the Ventura Steel Site with the Natural Gas Option would minimally alter the existing visual character and the site is minimally to moderately visible from an identified scenic resource (i.e., SR-33, an eligible state scenic highway). However, contrasting lines and hillside scars created by the construction of off-site pipelines and a permanent access road lowers the overall score associated with development of the Ventura Steel Site, which received a score of 6 points.

5.3.1.1.2 Air Quality

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, the natural gas-powered compressor station is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption.

Operation of the natural-gas only compressors is calculated to result in 11 tons/year of NO_x emissions. As such, the Natural Gas Option would fall within the ≥ 8 tons/year but < 12 tons/year category, which is scored from 1 to 3. Because 11 tons/year is closer to the upper end of the NO_x emissions range, the Natural Gas Option received a score of 1 point.

5.3.1.1.3 CalEnviroScreen

As shown on the OEHHA CalEnviroScreen 4.0 Maps, the Ventura Steel Site is in Census Tract 6111001204, which has a population of approximately 3,036. This tract has a total pollution burden score of 69%, which took into consideration the exposure indicator and environmental effect scores in Table 22 (OEHHA 2022b). This score means that this census tract has more pollution burden than 69% of all census tracts within California.

Table 22. Pollution Burden for Census Tract 6111001204

Exposure Indicator	Score (Percentile)
Ozone	47
Fine Particulate Matter (PM _{2.5})	23
Diesel Particulate Matter	2
Pesticides	61
Toxic Releases	18
Traffic	23
Drinking Water Contaminants	65
Lead in Housing	81
Cleanups	64
Groundwater Threats	67
Hazardous Waste	77
Impaired Water	77
Solid Waste	59
Pollution Burden	69

Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Ventura Steel Site received a score of 3 points because a pollution burden of 69% is within the 61% to 70% scoring range.

5.3.1.1.4 Greenhouse Gases

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). Indirect GHG emissions for the operation of the natural-gas facilities were not quantified for the Natural Gas Option since anything attributable to indirect GHG emissions would be consistent across all the proposed alternative sites.

The estimated emissions for the Natural Gas Option were calculated to be 27,836 MT CO₂e/year, which would fall within the $\geq 25,000$ MT CO₂e/year but $< 50,000$ MT CO₂e/year category and therefore would score from 1 to 3.

Because 27,836 MT CO₂e/year is closer to the lower end of the emission range, the Natural Gas Option received a score of 3 points.

5.3.1.1.5 Land Use Designation

As shown on Figure 3, the approximately 10.00-acre Ventura Steel Site is located within the County of Ventura, approximately 0.31 miles north of the City of Ventura boundary, and within the City's sphere of influence (City of Ventura 2022, 2022), slightly west of SR-33. The Ventura Steel Site's on-site components are located across portions of several APNs, including APN 063021012 (8.77 acres), APN 063022014 (3.46 acres), APN 063022015 (1.49 acres), APN 063022016 (1.68 acres), and a slim portion of APN 063021009 (County of Ventura 2021). Under existing conditions, regional access to the site is provided by Ventura Avenue via SR-33 and U.S. Route 101.

Surrounding Land Uses

The General Plan Land Use and Zoning maps within Attachment 3 show the land use and zoning on and adjacent to the Ventura Steel Site (including off-site components). Land uses adjacent to the Ventura Steel Site include the County General Plan land use designations of Industrial to the north, west, and south, as well as Open Space directly adjacent and to the east. The adjacent land areas to the north, west, and south are zoned M-3 (General Industrial Zone with a 10,000-square-foot lot area minimum), per the County of Ventura non-coastal zoning ordinance (County of Ventura 2008; 2021). The parcel adjacent to the southeast corner of the site is zoned OS-160, requiring a minimum lot area of 160 acres, with an additional parcel located approximately 78 feet to the east zoned AE-40 which has a minimum lot size requirement of 40 acres (County of Ventura 2008). The Ventura Steel Site is not adjacent to any sensitive receptors. The nearest sensitive land use is a residentially zoned parcel (APN 0690151105) in the City of Ventura, approximately 0.33 miles to the south of the site boundary.

Project Component Land Uses

The Ventura Steel Site's operational components are located across portions of several APNS within the County. As shown in the General Plan Land Use and Zoning maps in Attachment 3, the current County of Ventura land use and zoning for the compressor station site are Industrial and M-3, which has a 10,000-square-foot lot area minimum. The Ventura Steel Site Alternative would require over 19,000 feet of additional pipeline. There are two main pipeline corridors proposed: one would be located primarily in the public right-of-way along Ventura Avenue connecting to an existing pipeline on the existing compressor station site (City of Ventura 2022, 2022). The other would be located east of the City's urban area skirting the City/County boundary line (see Attachment 3, Figure LU-1C, Land Use – Ventura Steel). This corridor would travel through County parcels with a land use designation of Open Space as well as a City parcel with a land use designation of Neighborhood Low (County of Ventura 2020; City of Ventura 2005a). Zoning for these parcels includes Residential Planned Development (RPD) (City), OS-160 (County), AE-40 (County), and M-3 (County). Because the compressor station site would be located on land areas designated for industrial and/or manufacturing uses, selection of this alternative would be consistent with existing land use and/or zoning. Additionally, the proposed staging area for the Ventura Steel Site Alternative would be spread across multiple parcels to the northeast of the compressor station site, all of which are similarly designated Industrial and zoned M-3; however, this component would be removed once the site becomes operational and is therefore not incorporated into the operational land use analysis.

Oil Wells

The Ventura Steel Site is located within the south-central portion of the active Ventura Oil Field (DOC 2022). According to the U.S. Department of Conservation (DOC 2022), there are at least 11 currently active wells located on the proposed compressor station site, in addition to a number of active wells operating in the near vicinity.

Evaluation and Score

This Ventura Steel Site is in an interface area between urban/suburban and open space/agricultural uses just north of the City line. It is proposed on land areas designated for industrial and/or manufacturing uses and not adjacent to any sensitive receptors. Industrial and/or manufacturing uses are located adjacent to the site to the north, west, and south, and the predominant land uses to the east of the site are open space and agricultural (County of Ventura 2020). Within the ranking criteria range of 7 to 9, “Industrial/manufacturing zone and not adjacent to sensitive receptors,” the Ventura Steel Site Natural Gas Option received a score of 9 points.

5.3.1.1.6 Noise

The nearest non-industrial land use to the Ventura Steel Site is a residentially zoned parcel in the City of Ventura approximately 0.33 miles to the south of the site boundary. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (as defined in Section 3.2.7) of less than 40 dBA. Therefore, this alternative received a score of 7 points.

5.3.1.1.7 Wildfire

All the operational components of the Ventura Steel Site are partially within an SRA or LRA very high FHSZ (CAL FIRE 2022). As shown on the FHSZ Maps in Attachment 7, the majority of the proposed compressor station site is within a very high FHSZ, and both off-site MLV stations and the majority of the eastern pipeline corridor are also within a very high FHSZ. The compressor station site is classified as a non-vegetated area within the Ventura Fuel Bed and is located immediately adjacent and to the west of a vegetated area within the Ventura Fuel Bed (Radeloff 2010; VCFPD 2021). While the eastern pipeline corridor would be undergrounded, access roads would still be required for maintenance and would be located in an unimproved, high fuel load area. As such, workers would be exposed to very high FHSZ conditions, particularly in the later summer and early fall. Therefore, based on the ranking score range for sites “within a very high fire hazard severity zone,” the Ventura Steel Natural Gas Option received a score of 0 points because (1) the main project component (the compressor station) is predominantly within a very high FHSZ and adjacent to a very high FHSZ and (2) the pipeline corridor to the east is predominantly within a very high FHSZ and vegetated fuel load area, which would present a fire hazard for workers, particularly during the fire season.

5.3.1.2 On-Site Construction Considerations

5.3.1.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ were calculated from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station. For the purposes of the earthwork required to inform the air quality analysis, it was

estimated that the site consisted of flat areas that required minimal grading. The total NO_x and PM₁₀ emissions from on-site construction of the Ventura Steel Site are shown in Table 23.

Table 23. On-Site Construction Emissions: Ventura Steel - Natural Gas

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading - flat	872	233
Grading - elevated	0	0
Compressor station	10,578	2,022
Substation	0	0
Total^a	11,450	2,255

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The Ventura Steel Site is flat, the amount of on-site diesel equipment would be minimal, and the duration of grading activities would be limited. The total emissions are in the <40,000 pounds and ≥8,000 pounds range for NO_x and the <6,000 pounds and ≥2,000 pounds range for PM₁₀; therefore, this alternative received a score of 6 points.

5.3.1.2.2 Cultural Resources

A total of 18 cultural resources have been previously recorded within a 1-mile radius of the Ventura Steel Site; however, no cultural resources have been identified on the Ventura Steel Site. One resource within a 0.25-mile radius of the Ventura Steel Site was identified and is summarized below:

- P-56-001109H is a historic site known as the Nordhoff Spur of the Ventura River and Ojai Valley Railroad, the first and only spur to enter the Ojai Valley. This linear site is approximately 275 feet west of the Ventura Steel Site. The track has been removed but the grade is still present, and portions of the railroad have been repurposed to accommodate cyclists and horses as part of the Ojai Trail. Because the railroad has been removed and the potential of intact archaeological deposits to exist is unlikely, this cultural resource is not considered significant.

No resources listed on any federal, state, or local registry are located within the Ventura Steel Site.

A total of 55 previously conducted studies have been undertaken within a 1-mile radius of the Ventura Steel Site between 1974 and 2014. Of these 55 reports, 11 reports (VN-214, VN-228, VN-1102, VN-1634, VN-1752, VN-1849, VN-1851, VN-2534, VN-2541, VN-2627, and VN-3117) address portions of the Ventura Steel Site. Most of the recommendations provided in the overlapping reports were meant to address concerns associated with the study area addressed in each report, portions of which are outside the Ventura Steel Site, and the recommendations do not appear to be intended to mitigate any specific cultural resources. It does not appear that the existing buildings located within the Ventura Steel Site have been previously evaluated, and it appears as if at least some of the buildings are older than 45 years.

According to the historic aerial photographs and topographic maps, the Ventura Steel Site has been subject to ground disturbance at least as early as 1952 and continuing through at least 2014, including construction of structures and likely grading and installation of utilities and pavement. The Ventura Steel Site is located

approximately 1,970 feet east of the Ventura River, 3 miles north of the Pacific Ocean, and 1.75 miles south of the Santa Ynez Mountains. The Ventura Steel Site is not within close proximity to a natural landmark capable of depositing sediment, such as a river or the base of a foothill, and therefore has a low potential for unknown archaeological material to be buried under natural sediment.

In summary, no known significant cultural resources exist within the Ventura Steel Site and only one known cultural resource is located within 0.25 miles; however, this resource is not considered significant. Some of the on-site buildings are older than 45 years; thus, the buildings could be historic due to their age. However, the buildings have not been evaluated and their significance is not known. Continual ground disturbance and lack of resources identified within close proximity to the site suggests that the potential for yet unknown and intact archaeological resources is low, and the on-site component of the Ventura Steel Site has an unknown sensitivity for built environment cultural resources. Thus, the project is in a location that is not sensitive for potentially significant cultural resources. Based on the above findings, the on-site component of the Ventura Steel Site received a score of 7 points.

5.3.1.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO₂e) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total GHG emissions from on-site construction of the Ventura Steel Site Alternative are shown in Table 24.

Table 24. On-Site GHG Construction Emissions: Ventura Steel - Natural Gas

Activity	Total CO ₂ e Emissions (MT)
Grading - flat	105
Grading - elevated	0
Compressor station	1,560
Substation	0
Total^a	1,666

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The GHG emissions for on-site construction are anticipated to be well below the <5,000 MT CO₂e threshold. Accordingly, this alternative received a score of 8 points.

5.3.1.2.4 Natural Resources

This alternative is within a developed area; however, there is some scattered ruderal vegetation present on site.⁹ The site is adjacent to developed areas on the north, south, and west, and the area to the east was previously mapped as developed, due to oil extraction facilities, but shrubs and ruderal vegetation are present in this area on

⁹ “Ruderal” refers to vegetation that is often composed of invasive species, whether exotic or native, that have expanded in extent and abundance due to human disturbances (Faber-Langendoen et al. 2014).

aerial imagery. Undisturbed open space habitat to the north of the oil extraction facilities has previously been mapped as *Salvia mellifera*-*Salvia leucophylla* association (David Magney Environmental Consulting 2008), as shown in Figure NR-2C in Attachment 4, which is not a sensitive community (CDFW 2021). No sensitive plant or animal species have been recorded on or adjacent to (within 500 feet of) the site, as shown in Figure NR-1C in Attachment 4. The 33 sensitive plant and animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur on the site. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands on site, and received a score of 9 points.

5.3.1.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; therefore, this alternative received a score of 9 points.

5.3.1.2.6 Slope, Topography, and Grading

The topography and slope maps in Attachment 6 show the slope for the Ventura Steel Site and surrounding area. The land area for this site is located in an interface zone between urban/suburban and agricultural/open space uses near the northeastern boundary of the City of Ventura. The average slope range calculations for the site are provided in Table 25.

Table 25. Average Slope Calculations

Class Range	% Slope Range	Acres	% Slope	Avg Avg	% Slope	Min Avg	% Slope	Max Avg
Ventura Steel Site – 10.00 Acres								
Site Classes: 0%–30%	0%–10%	8.97	5%	0.45	0%	0	10%	0.9
	>10%–20%	0.98	15%	0.15	10%	0.1	20%	0.2
	>20%–30%	0.05	25%	0.01	20%	0.01	30%	0.02
Site Averages				6%		1%		11%

The site has been previously graded and developed, resulting in an average on-site slope of approximately 6%. The surrounding area is similarly improved to the north, west, and southeast, with slopes of less than 20%. Based on conceptual engineering analysis, grading for the on-site components would entail approximately 4,500 CY of over-excavation/recompaction. In addition, the access road would require approximately 1,600 CY of over-excavation/recompaction, however, this would take place off site. For the purposes of this analysis, a total of 6,100 CY, together with a slope of less than 10%, would be considered “negligible.” Additionally, an average slope of approximately 6% would suggest a high-ranking score is appropriate, as it would not exceed the 20% slope threshold defined in the scoring criteria (see Section 3.1). As such, within the score range of 7 to 9, where the “average slope of the property is less than 20%” and “negligible/no over-excavation/recompaction is required,” the Ventura Steel Site received a score of 8 points.

5.3.1.2.7 Traffic

The Ventura Steel Site Alternative is an industrial site located approximately 8,000 feet north of the Existing Site. The Ventura Steel Site has direct access from U.S. Route 101 to SR-33 to the Shell Road interchange and North Ventura Avenue. The County of Ventura General Plan (Ventura County 2020) classifies Shell Road as a minor road and North Ventura Avenue as a collector. North Ventura Avenue is also identified in the General Plan as a major County Road. Although Shell Road is classified as a minor road, trucks would travel to and from the interchange for approximately 1,800 feet or less along this road. Therefore, with direct access to the site provided via highways and a major County roadway, the project is not considered to travel through a road-constrained area. Furthermore, access to the site is provided by multiple driveways off North Ventura Avenue and East Shell Road that currently meet SoCalGas and emergency responder access requirements.

Construction of the compressor station, including pad grading, access road, on-site utility installations, buildings, and compressors, would take approximately 36 to 48 months, with major earthwork and heavy truck traffic occurring for less than 1 year due to the flat/graded nature of the property. Given the location of the site and sufficient existing access, heavy trucks would not travel through residential areas or roadway-constrained areas. Therefore, this alternative received a score of 9 points.

5.3.1.3 Off-Site Construction Considerations

5.3.1.3.1 Air Quality

Scoring for air quality impact from off-site construction was based on the distance of linear construction of the proposed pipeline, power line, and access road construction. The Natural Gas Option at the Ventura Steel Site would require extensive construction of approximately 26,786 linear feet of pipeline systems to connect to existing main pipelines and approximately 3,600 linear feet of access road construction. The linear construction totals approximately 30,386 linear feet, which is above the substantial range. Therefore, this alternative received a score of 0 points.

5.3.1.3.2 Cultural Resources

A total of 19 cultural resources have been previously recorded within a 1-mile radius of the off-site components of the Ventura Steel Site; however, no cultural resources have been identified within the off-site components. There is only one resource within a 0.25-mile radius of the off-site component of the Ventura Steel Site, which is P-56-001109H (Nordhoff Spur of the Ventura River and Ojai Valley Railroad). This resource has been described previously and is not considered a culturally significant resource. No resources listed on any federal, state, or local registry are located within the off-site components of the Ventura Steel Site.

A total of 56 previously conducted studies have been undertaken within a 1-mile radius of the off-site components of the Ventura Steel Site between 1974 and 2021. Of these 55 studies, 4 (VN-01851, VN-02534, VN-02541, and VN-003177) address portions of the off-site components of the Ventura Steel Site, and not all off-site components have been subject to a cultural resources study. Recommendations provided in the reports that are relevant to the off-site components are comprehensive in nature and appear to be developed as preemptive measures.

According to the historic aerial photographs and topographic maps, the off-site components of the Ventura Steel Site have been subject to ground disturbance at least as early as 1947, including structure and road construction, grading, and installation of utilities and pavement. The off-site staging area component has been subject to ground disturbance since at least 1947, including grading, construction, and subsequent demolition of cisterns occupied by an orchard, and as result has been subjected to ground disturbance for more than half a century. Portions of the off-site pipeline components have been previously disturbed by road grading and construction, as well as occupation of an oil facility, and other portions do not appear to have been previously disturbed. The off-site components are not close to a natural landmark capable of depositing sediment, such as a river or the base of a foothill; therefore, it has a low potential for unknown archaeological material to be buried under natural sediment.

In summary, no known cultural resources exist within the off-site components of the Ventura Steel Site. The off-site components of the Ventura Steel Site have been subject to multiple cultural resources studies, yet no cultural resources have been identified within the off-site component boundary. Continual ground disturbance and lack of resources identified within close proximity suggests that the potential for yet unknown and intact cultural resources to exist is low. Therefore, the off-site components of the Ventura Steel Site are in a location that is not sensitive for potentially significant cultural resources. Based on the above findings, the off-site components of the Ventura Steel Site received a score of 8 points.

5.3.1.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in CO₂e) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the compressor station were calculated. The total GHG emissions from off-site construction of the Ventura Steel Site Alternative are shown in Table 26.

Table 26. Off-Site GHG Construction Emissions: Ventura Steel - Natural Gas

Activity	Total CO ₂ e Emissions (MT)
Power line	0
Pipeline – street	599
Pipeline – open space	144
Road construction	126
Total^a	870

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be in the ≥500 MT CO₂e but <1,000 MT CO₂e range. Therefore, this alternative received a score of 4 points.

5.3.1.3.4 Natural Resources

No electrical interconnect is proposed for this alternative, but three pipeline corridors are proposed. One of the proposed pipeline corridors is within Ventura Avenue to the west of the site and is within the developed roadway and highly disturbed areas. The other two proposed pipeline corridors and associated tie-ins are within the oil

extraction facilities to the east and into areas previously mapped as non-native grasslands (at the series level but mapped as *Danthonia californica* association [David Magney Environmental Consulting 2008], or California oat grass, which is a species that has not been recorded in Ventura County) and *Salvia mellifera*–*Salvia leucophylla* association, as shown in Figure NR-2C in Attachment 4. These pipeline corridors cross one linear wetland feature (mapped as freshwater forest/shrub wetland), which may be impacted during construction. A proposed access road would be constructed for portions of the eastern proposed pipeline corridors. The proposed staging area is adjacent to the northwest of the site within developed areas. No sensitive plant or animal species have been recorded on or adjacent to (within 500 feet of) the proposed pipeline corridors, access roads, or staging area, as shown in Figure NR-1C in Attachment 4. Coastal whiptail (*Aspidoscelis tigris stejnegeri*) and American badger (*Taxidea taxus*), both CDFW Species of Special Concern, have potential to occur in the eastern proposed pipeline corridors and associated access road; however, only avoidance and minimization measures would be needed to prevent impacts to the species. The remaining 31 sensitive plant or animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur within the off-site areas. As such, this alternative is not expected to directly or indirectly impact sensitive habitats or sensitive plant or animal species, but it may directly impact wetlands in off-site areas; it received a score of 0 points.

5.3.1.3.5 Noise

Due to pipeline installation along Ventura Avenue, predicted off-site construction noise exposure at the nearest non-industrial land use, which would be between 0 and 50 feet from the construction activity for this alternative, received a score of 0 points.

5.3.1.3.6 Traffic

The Ventura Steel Site Alternative would require natural gas pipelines to be constructed beneath Ventura Avenue, requiring grading, trenching, and pipeline installation and potentially acquisition of additional pipeline right-of-way. Construction of the Ventura Steel Site Alternative would require road closures on Ventura Avenue. Roadway construction would be phased to ensure that disruption for lane closures would still allow for adequate roadway functions and emergency access. To maintain traffic flow, one lane would be closed for 6 months and then the alternate lane would be closed for 6 months, with traffic control measures in place for the duration of the work. Pipeline Corridor 1 would require 9,398 linear feet of pipelines located within Ventura Avenue. Because construction would require lane closures greater than 5,000 linear feet, this alternative received a score of 0 points.

5.3.1.3.7 Utilities/Service Systems

The Ventura Steel Site Alternative would require approximately 78,561 square feet of off-site ground disturbance for pipelines, approximately 282 square feet of depressurization line, and approximately 7,500 square feet for the MLV connections, for a total of approximately 86,343 square feet of off-site ground disturbance. One pipeline route would be within open space/hillside areas and surrounded by non-urbanized land and would not impact urban roadways or otherwise impede commuter traffic. The other pipeline route would be constructed beneath the alignment of North Ventura Avenue, which is a primary thoroughfare for commuter traffic in the area. Pipeline construction would require staged construction, with one pipeline trenched, constructed, and completed beneath one portion of the road, followed by the second pipeline's trenching, construction, and completion. This staged construction within North Ventura Avenue would be required to minimize the extent of required lane closures,

ensure adequate northbound–southbound traffic flow during roadway construction, and allow for adequate space between pipelines and avoidance of existing utility lines. All off-site ground disturbance is summarized in Table 27.

Table 27. Off-Site Ground Disturbance: Ventura Steel - Natural Gas

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (North Ventura Avenue)	39,685
Pipeline Corridor 2 (Hills)	38,876
Utility Lines	0
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	78,561
Mainline Valve Connection	
Mainline Valve Connection 1	3,750
Mainline Valve Connection 2	3,750
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connection</i>	7,500
Depressurization Line	
Depressurization Line	282
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	282
Electrical Pole Footings	
Electrical Pole Footings	0
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	0
Total Off-Site Ground Disturbance for All Construction Elements^a	86,343

Note:

^a Totals may not sum precisely due to rounding.

This alternative received a score of 1 point because of the moderate amount of off-site ground disturbance required.

5.3.2 Hybrid Option

5.3.2.1 Operational Considerations

5.3.2.1.1 Aesthetics and Visual Resources

Compared to the Natural Gas Option, which would not include new electrical poles, the Ventura Steel Site – Hybrid Option would require approximately 37 electrical poles to extend to an existing electrical line to the San Nicholas Circuit. The installation of poles would slightly expand the viewshed of project components and would result in some additional view degradation, although the surrounding area currently includes multiple utility poles/lines that traverse the area and Ventura Avenue. Therefore, compared to the Natural Gas Option, the Hybrid Option would result in slightly increased potential impacts to aesthetics and visual resources and received a score of 5 points.

5.3.2.1.2 Air Quality

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, the Hybrid Option is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption. The Hybrid Option has fewer internal combustion engines and thus fewer direct emissions than the Natural Gas Option. The replacement of two of the internal combustion engines with two electric compressors of equivalent horsepower would essentially cut the expected direct emissions in half.

Operation of the Hybrid Option was calculated to result in 5.6 tons/year of NO_x emissions. As such, the Natural Gas Option would fall within the ≥4 tons/year but <8 tons/year category, which would score from 4 to 6. Because 5.6 tons/year is in the middle of the NO_x emissions range, the Hybrid Option received a score of 5 points.

5.3.2.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Ventura Steel Site is in Census Tract 6111001204, which has a population of approximately 3,036. This tract has a total pollution burden score of 69%, which means that this census tract has more pollution burden than 69% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Ventura Steel Site received a score of 3 points because a pollution burden of 69% is within the 61% to 70% scoring range.

5.3.2.1.4 Greenhouse Gases

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). The total annual direct GHG emissions would be 13,918 MT CO₂e/year and indirect GHG emissions would be 5,500 MT CO₂e/year from operational activities at the Ventura Steel Site.

The shift from natural gas to a Hybrid Option reduces the localized emissions of criteria pollutants and direct GHG emissions, but the increased power demand from the electric compressors would increase indirect GHG emissions depending on how the power that is used is generated. The estimated emissions for the Hybrid Option were calculated to be 19,418 MT CO₂e/year, which would fall within the ≥10,000 MT CO₂e/year but <25,000 MT CO₂e/year category and therefore would score from 4 to 6. Because 19,418 MT CO₂e/year is in the middle of the emission range, the Hybrid Option received a score of 5 points.

5.3.2.1.5 Land Use Designation

The Hybrid Option would not require the installation of extensive off-site electrical infrastructure. Within the ranking criteria range of 7 to 9, “Industrial/manufacturing zone and not adjacent to sensitive receptors,” the Ventura Steel Site Alternative – Hybrid Option received a score of 9 points.

5.3.2.1.6 Noise

The nearest non-industrial land use to the Ventura Steel Site is a residentially zoned parcel in the City of Ventura approximately 0.33 miles to the south of the site boundary. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use of less than 40 dBA. Therefore, this alternative received a score of 8 points.

5.3.2.1.7 Wildfire

The main project component (the compressor station) is predominantly within a very high FHSZ and is adjacent to a very high FHSZ. In addition, the location of off-site components in a very high FHSZ would present a hazard to workers. As such, the Ventura Steel Hybrid Option received a score of 0.

5.3.2.2 On-Site Construction Considerations

5.3.2.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ were calculated from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station. The total NO_x and PM₁₀ exhaust emissions from on-site construction of the Ventura Steel Site are shown in Table 28.

Table 28. On-Site Construction Emissions: Ventura Steel - Hybrid

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading - flat	872	233
Grading - elevated	0	0
Compressor station	10,578	2,022
Substation	1,311	74
Total^a	12,761	2,329

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The property is flat, with a minimal amount of new disturbance area requiring grading. The Hybrid Option would require the construction of a substation, slightly increasing the amount of NO_x and PM₁₀ emissions when compared to the Natural Gas Option. The total emissions are in the <40,000 pounds and ≥8,000 pounds range for NO_x and <6,000 pounds and ≥2,000 pounds range for PM₁₀; therefore, this alternative received a score of 6 points.

5.3.2.2.2 Cultural Resources

There are no differences in the results for on-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 7 points.

5.3.2.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO₂e) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the future compressor station were calculated. The total GHG emissions from on-site construction of the Ventura Steel Site Alternative are shown in Table 29.

Table 29. On-Site GHG Construction Emissions: Ventura Steel - Hybrid

Activity	Total CO ₂ e Emissions (MT)
Grading - flat	105
Grading - elevated	0
Compressor station	1,560
Substation	294
Total^a	1,959

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The Hybrid Option would require the construction of a substation on the site, thus increasing the amount of on-site GHG emissions when compared to the Natural Gas Option. The expected GHG emissions for on-site construction would be well below the <5,000 MT CO₂e threshold. Accordingly, this alternative received a score of 8 points.

5.3.2.2.4 Natural Resources

The Hybrid Option would not alter any conditions related to on-site natural resources and as such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands on site, and received a score of 9.

5.3.2.2.5 Noise

Predicted on-site construction noise exposure at the nearest non-industrial land use, which would be more than 1,000 feet from the construction activity for this alternative, received a score of 9 points.

5.3.2.2.6 Slope, Topography, and Grading

The Hybrid Option would include an electrical interconnect, requiring approximately 74 CY of additional over-excavation/recompaction to install the required electrical poles. The electrical interconnect does not impact the ranking because the additional earthwork required (74 CY) is a relatively negligible amount and the total cubic yardage for the project site would remain under 10,000 (County of Ventura 2022). As such, within the score range of 7 to 9, where the “average slope of the property is less than 20%” and “negligible/no over-excavation/recompaction is required” (see Section 3.1, Scoring Criteria), the Ventura Steel Site received a score of 8 under both compressor station technology scenarios.

5.3.2.2.7 Traffic

There would be a negligible difference between construction of the Hybrid Option and the Natural Gas Option related to heavy truck traffic for on-site construction activity. Therefore, this alternative received a score of 9 points.

5.3.2.3 Off-Site Construction Considerations

5.3.2.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Hybrid Option at the Ventura Steel Site would require the extensive construction of approximately 26,786 linear feet of pipeline systems to connect to existing main pipelines and approximately 3,600 linear feet of access road construction. In addition, approximately 122 linear feet of electrical interconnect would be required to accommodate the increased demand from the electric compressors. The linear construction totals approximately 30,508 linear feet, which is far above the substantial range. Therefore, this alternative received a score of 0 points.

5.3.2.3.2 Cultural Resources

There are no differences in results for off-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 8 points.

5.3.2.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO₂e) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the compressor station were calculated. The total GHG emissions from off-site construction of the Ventura Steel Site Alternative are shown in Table 30.

Table 30. Off-Site GHG Construction Emissions: Ventura Steel - Hybrid

Activity	Total CO ₂ e Emissions (MT)
Power line	4
Pipeline – street	599
Pipeline – open space	144
Road construction	126
Total^a	873

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be in the ≥500 MT CO₂e but <1,000 MT CO₂e range. Therefore, this alternative received a score of 4 points.

5.3.2.3.4 Natural Resources

The Hybrid Option would require new off-site electric poles needed to connect the station to the existing SCE transmission line. The proposed electrical interconnect would require two new electrical poles, but it is assumed that these poles would be within developed or disturbed areas. The same three pipeline corridors (two of which

could impact wetlands) and off-site staging area would be required for the Hybrid Option and the Natural Gas Option. As such, this alternative is not expected to directly or indirectly impact sensitive habitats or sensitive plant or animal species, but it may directly or indirectly impact wetlands in off-site areas; therefore, it received a score of 0 points.

5.3.2.3.5 Noise

Predicted off-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7) would be greater than 90 dBA and between 0 and 50 feet from the construction activity for this alternative; therefore, this alternative received a score of 0 points.

5.3.2.3.6 Traffic

Off-site construction of the Hybrid Option would be the same as the Natural Gas Option, with the exception of the extension of electrical utilities. This alternative would require natural gas pipelines to be constructed beneath Ventura Avenue, requiring grading, trenching, and pipeline installation and potentially acquisition of additional pipeline right-of-way and road closures on Ventura Avenue. Roadway construction would be phased to ensure that disruption for lane closures would still allow for adequate roadway functions and emergency access. To maintain traffic flow, one lane would be closed for 6 months and then the alternate lane would be closed for 6 months, with traffic control measures in place for the duration of the work. However, no roadway construction on existing roads for electrical utilities would be required. Therefore, this alternative received a score of 0 points.

5.3.2.3.7 Utilities/Service Systems

The Ventura Steel Site Alternative – Hybrid Option would require approximately 78,561 square feet of off-site ground disturbance for pipelines and utilities, approximately 282 square feet of depressurization line, approximately 7,500 square feet for the MLV connections, and an additional 28 square feet of footings for the required electrical poles, for a total of approximately 86,371 square feet of off-site ground disturbance. As with the Natural Gas Option, for the Hybrid Option one pipeline route would be within open space/hillside areas and surrounded by non-urbanized land and would not impact urban roadways or otherwise impede commuter traffic. The other pipeline route would be constructed beneath the alignment of North Ventura Avenue, which is a primary thoroughfare for commuter traffic in the area. Pipeline construction would require staged construction, with one pipeline trenched, constructed, and completed beneath one portion of the road, followed by the second pipeline’s trenching, construction, and completion. This staged construction within North Ventura Avenue would be required to minimize the extent of required lane closures, ensure adequate northbound–southbound traffic flow during roadway construction, and allow for adequate space between pipelines and avoidance of existing utility lines. All off-site ground disturbance is summarized in Table 31.

Table 31. Off-Site Ground Disturbance: Ventura Steel - Hybrid

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (North Ventura Ave)	39,685
Pipeline Corridor 2 (Hills)	38,876
Utility Lines	0

Table 31. Off-Site Ground Disturbance: Ventura Steel - Hybrid

Construction Element	Square Feet
Pipelines and Utilities	
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	78,561
Mainline Valve Connection	
Mainline Valve Connection 1	3,750
Mainline Valve Connection 2	3,750
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connection</i>	7,500
Depressurization Line	
Depressurization Line	282
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	282
Electrical Pole Footings	
Electrical Pole Footings	28
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	28
Total Off-Site Ground Disturbance for All Construction Elements^a	86,371

Note:

^a Totals may not sum precisely due to rounding.

The additional disturbance for the electrical poles would not substantively alter the amount of off-site ground disturbance required; therefore, this alternative received a score of 1 point.

5.4 Devil’s Canyon Road Site

The scoring rationale for each of the environmental topic areas for the Devil’s Canyon Road Site is described in this section.

5.4.1 Natural Gas Option

5.4.1.1 Operational Considerations

5.4.1.1.1 Aesthetics and Visual Resources

The Devil’s Canyon Road Site is relatively flat and has been visually altered by previous oil/gas related development. The implementation of the Natural Gas Option would not alter an identified scenic resource, such as hillside or ridgeline terrain, because the site is located on previously developed land that included industry-related structures. Further, the site presents minimal visibility from SR-33 because existing roadside-adjacent trees and vegetation regularly blocks the site from view of passing motorists. Thus, the site is not highly visible from most publicly accessible vantage points in the surrounding area including roads, scenic corridors, parks, and the Ojai–Ventura Bike Path. Given the lack of public visibility, this alternative received a score of 8 points.

5.4.1.1.2 Air Quality

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, the natural gas-powered compressor station is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption.

Operation of the natural gas compressors is calculated to result in 11 tons/year of NO_x emissions. As such, the Natural Gas Option would fall within the ≥8 tons/year but <12 tons/year category, which would score from 1 to 3. Because 11 tons/year is closer to the upper end of the NO_x emissions range, the Natural Gas Option received a score of 1 point.

5.4.1.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Devil's Canyon Road Site is in Census Tract 6111001206, which has a population of approximately 778. As described in Section 5.2.1.1.3, CalEnviroScreen, this tract has a total pollution burden score of 79%, which means that this census tract has more pollution burden than 79% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Devil's Canyon Road Site received a score of 2 points because a pollution burden of 79% is within the 71% to 80% scoring range.

5.4.1.1.4 Greenhouse Gases

This option would include the installation of four new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). Indirect GHG emissions for the operation of the natural-gas facilities were not quantified for the Natural Gas Option because anything attributable to indirect GHG emissions would be consistent across all the proposed alternative sites.

The estimated emissions for the all-Natural Gas Option were calculated to be 27,836 MT CO₂e/year, which would fall within the ≥25,000 MT CO₂e/year but <50,000 MT CO₂e/year category and therefore would score from 1 to 3. Because 27,836 MT CO₂e/year is closer to the lower end of the emission range, the Natural Gas Option received a score of 3 points.

5.4.1.1.5 Land Use Designation

Regional Site Location

As shown on Figure 4, the proposed Devil's Canyon Road Site is in southwest Ventura County, located slightly east of SR-33 and the City of Ventura, approximately 6,000 feet northwest of the Existing Site. The Devil's Canyon Road Site and all on-site project components are located within a single approximately 336-acre parcel (APN 060031016), with off-site components—including two existing transmission pipelines and two MLV stations (one at the terminus of each proposed pipeline)—located on portions of adjacent APN 060031015, APN 060031017, APN 060031018, and APN 060030004. Regional access to the site is currently provided from SR-33 via U.S. Route 101.

Site access from the highway is provided by an existing access road and bridge approximately 28 feet in width that crosses the Ventura River, also located within APN 060031016.

Surrounding Land Uses

The surrounding land uses of the Devil's Canyon Road Site are predominantly open space and agricultural, with minimum lot sizes ranging from 40 to 160 acres. These include the County General Plan (2020) land use designation of Open Space in all directions, as well as County zoning of AE-40 to the southwest; OS-160 to the north, south, west, and east; and an HCWC overlay zone to the east running along the Ventura River riparian corridor west of SR-33 (County of Ventura 2021). The nearest industrial land use (County—Industrial) and zoning (County—General Industrial Zone [M-3] with a 10,000-square-foot lot area minimum) is located approximately 1,300 feet to the east on the east side of SR-33 (APN 068001001) (County of Ventura 2021). The Devil's Canyon Road Site is not adjacent to any sensitive receptors. The nearest sensitive land use is a residentially zoned parcel (APN 0690141135) in the City of Ventura, approximately 0.54 miles east of the site boundary on the east side of SR-33.

Project Component Land Uses

As shown on the General Plan Land Use and Zoning maps in Attachment 3, the approximately 15-acre Devil's Canyon Road Site, MLV station, and the required access road are all located on privately held lands within Ventura County. The site selected for the compressor station is currently developed with oil extraction uses. The Devil's Canyon Road Site and all on-site project components are located on a portion of much larger single parcel (APN 060031016, approximately 336 acres) that has an underlying County General Plan land use designation of Open Space (County of Ventura 2020; 2021) and County zoning of OS-160, requiring a minimum parcel size of 160 acres (County of Ventura 2008). Although largely extending off site, the Devil's Canyon Road Site's two required ancillary pipelines and MLV station would also be within land areas designated as Open Space and zoned OS-160 (County of Ventura 2008, 2020, 2021). According to the currently available aerial views, the proposed site for the off-site MLV station appears to be developed with an active avocado orchard. As previously discussed in Section 5.2.1.1.5, the open space designation is applied to parcels or areas of land that are essentially unimproved and devoted to an open-space use. The OS-160 designation allows for generally passive uses, including preservation of natural resources, managed production of resources, outdoor recreation, and areas requiring special management due to hazardous or special conditions (e.g., earthquake fault zones, unstable soil areas, flood plains, high fire severity areas), among others (County of Ventura 2008, Section 8104-1.1). Oil and gas exploration and production is permitted with a conditional use permit (County of Ventura 2008, Section 8105-4).

The selection of the Devil's Canyon Road Site is not consistent with existing land use and zoning for the on-site location to facilitate the types of operational uses required by the project. In addition, the underlying land use of the compressor station site is included in the County of Ventura Measure C, SOAR Initiative—2050 (County of Ventura 2016).

Oil Wells

The Devil's Canyon Road Site is located within the south-central portion of the active Ventura Oil Field (DOC 2022). According to the U.S. Department of Conservation (DOC 2022), there are at least five currently active wells located on the proposed compressor station site, in addition to a number of active wells operating in the near vicinity.

Evaluation and Score

All the Devil's Canyon Road – Natural Gas Option's operational components are located within parcels with County zoning that does not support industrial and/or manufacturing uses. Additionally, the primary compressor station site is within an area governed by the SOAR initiative. No portion of the site is adjacent to any sensitive receptors. The nearest industrially zoned land use parcel is approximately 0.25 miles to the east of the compressor station boundary (APN 068001001), while the nearest sensitive land use is a residentially zoned parcel (APN 0690141135) in the City of Ventura, approximately 0.54 miles from the Devil's Canyon Road Site (County of Ventura 2021). The proposed staging area is located within a parcel zoned for industrial uses; however, this feature would not be required during project operation and is therefore not incorporated into this land use analysis. Additionally, the primary compressor station site is within an area governed by the SOAR initiative. Based on the above analysis and using the scoring criteria for a site that is within a "Non-Industrial/manufacturing zone and not adjacent to sensitive receptors," the Devil's Canyon Road – Natural Gas Option received a score of 6 points.

5.4.1.1.6 Noise

The nearest non-industrial land use to the Devil's Canyon Road Site is a residentially zoned parcel in the City of Ventura approximately 0.54 miles to the east of the site boundary on the east side of SR-33. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (as defined in Section 3.2.7) of less than 40 dBA. Therefore, this alternative received a score of 8 points.

5.4.1.1.7 Wildfire

All operational components of the Devil's Canyon Road Site are fully or partially within FHSZ and within the Casitas Fuel Bed (VCFPD 2021; CAL FIRE 2022). As shown on the FHSZ Maps in Attachment 7, a little over half of the compressor station site is within a very high FHSZ, while the rest, along with the required MLV, are within a high FHSZ. The access road passes through a high, moderate, and very high FHSZ. Given the ranking criteria for sites within high FHSZs, the Devil's Canyon Road – Natural Gas Option received a score of 2 points because the portion of the site located in a very high FHSZ and the presence of vegetative fuel sources in the surrounding areas (Radeloff 2010; VCFPD 2021).

5.4.1.2 On-Site Construction Considerations

5.4.1.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. For the purposes of the earthwork required to inform the air quality analysis, it was estimated that the site consisted of flat areas that required minimal grading. The total PM₁₀ exhaust emissions from on-site construction of the Devil's Canyon Road Site are shown in Table 32.

Table 32. On-Site Construction Emissions: Devil’s Canyon Road - Natural Gas

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading – flat	872	233
Grading – elevated	0	0
Compressor station	10,578	2,022
Substation	0	0
Total^a	11,450	2,255

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The Devil’s Canyon Road Site is generally flat, the amount of on-site diesel equipment would be minimal, and the duration of grading activities would be limited. NO_x emissions would be in the <40,000 pounds and ≥8,000 pounds range and PM₁₀ emissions would be in the <6,000 pounds and ≥2,000 pounds range; therefore, this alternative received a score of 6 points.

5.4.1.2.2 Cultural Resources

A total of 12 cultural resources have been previously recorded within a 1-mile radius of the Devil’s Canyon Road Site; however, no cultural resources have been identified within the Devil’s Canyon Road Site. There are no cultural resources within a 0.25-mile radius of the Devil’s Canyon Road Site, nor are there any resources listed on any federal, state, or local registry within the on-site component of the Devil’s Canyon Road Site.

A total of 58 previously conducted studies have been undertaken within a 1-mile radius of the Devil’s Canyon Road Site between 1974 and 2021. Of these 58 studies, 1 addresses approximately 5% of the Devil’s Canyon Road Site and recommends the general area surrounding the Ventura River be avoided and left unaltered until further studies can be conducted, including archaeological and ethnographic analyses to determine the exact nature and scope of the potential resources. The author also expressed that the general area should be considered culturally and/or scientifically significant.

According to the historical aerial photographs and topographic maps reviewed, the Devil’s Canyon Road Site has been disturbed as early as 1947, including road and building construction and grading associated with industrial development. The Devil’s Canyon Road Site is located approximately 492 feet east of the Ventura River, 2.3 miles north of the Pacific Ocean and at the southern base of the Santa Ynez Mountains. The Devil’s Canyon Road Site is within close proximity to the base of the Santa Ynez Mountains, which are capable of depositing sediment; therefore, the site has potential for unknown archaeological material to be buried under natural alluvial sediment.

In summary, no known cultural resources are present within the Devil’s Canyon Road Site. The Devil’s Canyon Road Site has been minimally addressed by one cultural resources study; however, the surrounding area has been subjected to multiple cultural resources studies and no significant cultural resources have been identified within a 0.25-mile radius. The considerable and continual ground disturbance extending over 70 years and the lack of resources identified within close proximity suggests that the potential for yet unknown and intact cultural resources is low. Therefore, the Devil’s Canyon Road Site is in a location that is not sensitive for potentially significant cultural

resources. Based on the above findings, the on-site component of the Devil’s Canyon Road Site received a score of 7 points.

5.4.1.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total GHG emissions from on-site construction of the Devil’s Canyon Road Alternative are shown in Table 33.

Table 33. On-Site GHG Construction Emissions: Devil’s Canyon Road - Natural Gas

Activity	Total CO _{2e} Emissions (MT)
Grading - flat	105
Grading - elevated	0
Compressor station	1,560
Substation	0
Total^a	1,666

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The expected GHG emissions for on-site construction are well below the <5,000 MT CO_{2e} threshold. Accordingly, this alternative received a score of 8 points.

5.4.1.2.4 Natural Resources

This alternative is primarily within a developed area (oil extraction facilities), with the very southeast corner previously mapped as *Salix lasiolepis* association (David Magney Environmental Consulting 2008), which is typically associated with riparian habitat (i.e., the Ventura River). The site has developed areas (oil extraction facilities) to the north and west, and riparian habitats to the south and east. No sensitive plant or animal species have been recorded on site; however, the site is adjacent to the Ventura River (to the east of the site), it has designated critical habitat for southwestern willow flycatcher and southern steelhead, and it has records for the federal and state listed least Bell’s vireo (*Vireo bellii pusillus*); in addition, two CDFW Species of Special Concern, western pond turtle (*Emys marmorata*) and two-striped gartersnake (*Thamnophis hammondi*), have nearby records. Avoidance and minimization measures could be used if needed to prevent direct impacts to these 5 species and their associated riparian habitat; the remaining 29 sensitive plant or animal species and habitats with previously recorded occurrences within 3 miles have low potential to occur or are not expected to occur on site. As such, this alternative may indirectly impact sensitive habitats or sensitive animal species and received a score of 4 points.

5.4.1.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; thus, the alternative received a score of 9 points.

5.4.1.2.6 Slope, Topography, and Grading

The topography and slope maps in Attachment 6 show the slope for the Devil’s Canyon Road Site and surrounding area. The site has been previously graded and developed and currently supports an oil extraction facility with multiple active wells. The average slope range calculations for the site are provided in Table 34.

Table 34. Average Slope Calculations

Class Range	% Slope Range	Acres	% Slope	Avg Avg	% Slope	Min Avg	% Slope	Max Avg
Devil’s Canyon Road Site – 12.88 Acres								
Site Classes: 0%–30%	0%–10%	11.98	5%	0.6	0%	0	10%	1.2
	>10%–20%	0.71	15%	0.11	10%	0.07	20%	0.14
	>20%–30%	0.19	25%	0.05	20%	0.04	30%	0.06
<i>Site Averages</i>				6%		1%		11%

The on-site slope ranges from a low of 0% to a high of over 30%, with a site average of approximately 6%. Based on conceptual engineering analysis, grading for this site would entail approximately 4,500 CY of over-excavation/recompaction. For the purposes of this analysis, a total of 4,500 CY, together with a slope of less than 10%, would be considered “negligible.” As such, within the score range of 7 to 9, where the “average slope of the property is less than 20%” and “negligible/no over-excavation/recompaction is required” (see Section 3.1, Scoring Criteria), the Devil’s Canyon Road Site received a score of 8 points.

5.4.1.2.7 Traffic

The Devil’s Canyon Road Site would be located at an existing oil extraction site located approximately 6,000 feet to the north of the existing Ventura Compressor Station, on the west side of SR-33. The site is located in an industrial and agricultural area. The site has direct access from U.S. Route 101 to SR-33 to the Shell Road/Mill Canyon Road interchange to Shell Road and Devils Canyon Road. Shell Road (west of SR-33) and Devils Canyon Road are both unpaved roads with negligible vehicular traffic and are primarily used for private access to the oil/gas field. Therefore, with direct access to the site provided via major highways, the project is not considered to be in a road-constrained area. Furthermore, access to the site is provided by multiple driveways off Shell Road that meet SoCalGas and emergency responder access requirements. It is assumed that the existing access serving the site is sufficient.

Construction of the compressor station, including pad grading, access road, on-site utility installations, buildings, and compressors, would take approximately 24 to 30 months, with major earthwork occurring for less than 1 year due to the flat/graded nature of the property. Given the location of the site and sufficient existing access, heavy trucks would not travel through residential areas or roadway-constrained areas. Therefore, this alternative received a score of 9 points.

5.4.1.3 Off-Site Construction Considerations

5.4.1.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Natural Gas Option at the Devil's Canyon Road Site would require construction of approximately 5,135 linear feet of new pipeline systems, as well as approximately 1,892 linear feet of access road work. The linear construction totals approximately 7,027 linear feet, which is in the middle of the minimal range. Therefore, this alternative received a score of 5 points.

5.4.1.3.2 Cultural Resources

A total of 12 cultural resources have been previously recorded within a 1-mile radius of the off-site components of the Devil's Canyon Road Site; however, no cultural resources have been identified within the off-site components. The only resource within a 0.25-mile radius of the off-site component of the Devil's Canyon Road Site is the P-56-001109H (Nordhoff Spur of the Ventura River and Ojai Valley Railroad), which was determined not to be a significant resource and was previously described in Section 5.3.1.2.2. No resources listed on any federal, state, or local registry are located within the off-site components of the Devil's Canyon Road Site.

A total of 58 previously conducted studies have been undertaken within a 1-mile radius of the off-site components of the Devil's Canyon Road Site between 1974 and 2021. Two of these studies address approximately 5% of the off-site components of the Devil's Canyon Road Site. Only VN-00519 (Singer 1987) surveyed portions of the pipeline system and MLV station and recommends the general area surrounding the Ventura River be avoided and left unaltered until further studies can be conducted including archaeological and ethnographic analyses to determine the exact nature and scope of the potential resources. The author also expressed that the general area should be considered culturally and/or scientifically significant.

According to the historical aerial photographs and topographic maps reviewed, the off-site components of the Devil's Canyon Road Site have been disturbed at least as early as 1904 with industrial development as well as road grading and construction. The off-site staging area component has been disturbed as early as 1947 with industrial cisterns and evidence of grading. The off-site access road component along Mill Canyon Road and Devil's Canyon Road has been developed as a roadway at least as early as 1904. The off-site roadway and pipeline components appear to have also been developed as a roadway at least as early as 1904.

A segment of the off-site pipeline component intersects the Ventura River, which is capable of depositing sediment, and therefore has potential for unknown archaeological material to be buried under natural sediment. The Ventura River would have served as a freshwater resource in prehistoric and historic periods. Some of the off-site components appear to be too close to the river to be a hospitable location for habitation due to the propensity for flooding. Other components are farther from the river, increasing the potential for the area to be hospitable to habitation. However, depending on the depth and timing of depositional sediment as well as the depth of previous disturbance, unknown cultural resources, if present, may have been destroyed, displaced, and/or buried deeper than the proposed depth of disturbance. Conversely, some off-site components of the Devil's Canyon Road Site are located within a potentially sensitive area because of the close proximity to a freshwater source.

In summary, no known cultural resources exist within the off-site components of the Devil’s Canyon Road Site. The off-site component of the Devil’s Canyon Road Site has been minimally addressed by previous cultural resources studies. However, the surrounding area has been subjected to multiple cultural resource studies with only one non-significant cultural resource identified within a 0.25-mile radius. Considering the continual ground disturbance extending over 100 years and the lack of resources identified within close proximity to the off-site components, the potential for yet unknown and intact cultural resources is low. Therefore, the off-site component of the Devil’s Canyon Road Site is in a location that is not sensitive for potentially significant cultural resources. Based on the above findings, the off-site component of the Devil’s Canyon Road Site received a score of 7 points.

5.4.1.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in CO₂e) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the compressor station were calculated. The total GHG emissions from off-site construction of the Devil’s Canyon Road Alternative are shown in Table 35.

Table 35. Off-Site GHG Construction Emissions: Devil’s Canyon Road - Natural Gas

Activity	Total CO ₂ e Emissions (MT)
Power line	0
Pipeline – street	181
Pipeline – open space	0
Road construction	67
Total^a	248

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be in the <500 MT CO₂e range. Therefore, this alternative received a score of 7.

5.4.1.3.4 Natural Resources

No electrical interconnect is proposed for this alternative. The proposed staging area is within a developed area but adjacent to a wetland feature (freshwater forested/shrub wetland). The proposed tie-in is within an orchard and the proposed pipeline corridor is also within developed areas (oil extraction facilities) and areas previously mapped as *Salvia mellifera*-*Salvia leucophylla* association (David Magney Environmental Consulting 2008), as shown in Figure NR-2D in Attachment 4. The pipeline corridor crosses one linear wetland feature (mapped as riverine). The access road improvements are not expected to occur on the bridge or within the support structures and footings within the Ventura River. The pipeline corridor and access road improvements are within 500 feet of designated critical habitat for southwestern willow flycatcher and southern steelhead and records for the federally and state-listed least Bell’s vireo and two CDFW Species of Special Concern (western pond turtle and two-striped gartersnake), as shown in Figure NR-1D in Attachment 4. The remaining 29 sensitive plant or animal species and habitats with previously recorded occurrences within 3 miles have low potential to occur or are not expected to occur in off-site areas. Avoidance and minimization measures could be used if needed to prevent direct impacts to the five species listed

above and to their riparian habitat; however, a wetland feature is crossed by the pipeline corridor. As such, this alternative may indirectly impact sensitive animal species and directly and indirectly impact wetlands in adjacent off-site areas; therefore, it received a score of 0 points.

5.4.1.3.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; thus, the alternative received a score of 9 points.

5.4.1.3.6 Traffic

The Devil's Canyon Road Site would require the construction of pipelines through the oil/gas hillside area, requiring grading, trenching, and pipeline installation and potentially acquisition of additional pipeline right-of-way. The project would require construction of 5,280 linear feet of new pipeline within or near Devil's Canyon Road. It is assumed that there would be moderate construction on Devil's Canyon Road, with the potential for lane closures along several segments (representing at least 2,500 linear feet). However, Devil's Canyon Road is a private unpaved road and is primarily used for private access to the oil/gas field.

Construction would have some impact on Devil's Canyon Road; however, there would be no construction on public roadways that could cause new congestion or exacerbate existing traffic conditions. Therefore, this alternative received a score of 7 points.

5.4.1.3.7 Utilities/Service Systems

The Devil's Canyon Road Site – Natural Gas Option would require approximately 47,927 square feet of off-site ground disturbance for pipelines and approximately 7,500 square feet for the MLV connection, for a total of approximately 55,427 square feet of off-site ground disturbance. All off-site ground disturbance is summarized in Table 36 and would be conducted within and surrounded by non-urbanized and industrial land.

Table 36. Off-Site Ground Disturbance: Devil's Canyon Road - Natural Gas

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (Devil's Canyon Road)	23,963
Pipeline Corridor 2 (Also Devil's Canyon Road)	23,963
Utility Lines	0
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	<i>47,927</i>
Mainline Valve Connection	
Mainline Valve Connection	7,500
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connection</i>	<i>7,500</i>
Depressurization Line	
Depressurization Line	0

Table 36. Off-Site Ground Disturbance: Devil’s Canyon Road - Natural Gas

Construction Element	Square Feet
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	0
Electrical Pole Footings	
Electrical Pole Footings	0
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	0
Total Off-Site Ground Disturbance for All Construction Elements^a	55,427

Note:

^a Totals may not sum precisely due to rounding.

Therefore, this alternative received a score of 3 points because of the moderate amount of off-site ground disturbance required.

5.4.2 Hybrid Option

5.4.2.1 Operational Considerations

5.4.2.1.1 Aesthetics and Visual Resources

Implementation of the Hybrid Option at the Devil’s Canyon Road Site would require the installation of approximately 40 electrical poles to connect to an existing SCE subtransmission line. Although electrical poles are likely to be visible from public roads due to their height and the number of poles needed, electrical poles are commonplace throughout the area and are unlikely to require substantial alteration of an identified scenic resource or result in substantial alteration of existing character that encompasses previous on-site development and oil well sites in the hillsides to the west. As with the Natural Gas Option, development of the site with a compressor building and other associated infrastructure/features would generally be obscured from public view due to the presence of existing vegetation that blocks the site from most public roads, accessible vistas, and trails. Therefore, due to new electrical pole installation, this alternative received a score of 7 points.

5.4.2.1.2 Air Quality

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, the Hybrid Option is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption. The Hybrid Option has fewer internal combustion engines and thus fewer direct emissions than the Natural Gas Option. The replacement of two of the internal combustion engines with two electric compressors of equivalent horsepower would essentially cut the expected direct emissions in half.

Operation of the Hybrid Option was calculated to result in 5.6 tons/year of NO_x emissions. As such, the Hybrid Option would fall within the ≥4 tons/year but <8 tons/year category, which would score from 4 to 6. Because 5.6 tons/year is in the middle of the NO_x emissions range, the Hybrid Option received a score of 5 points.

5.4.2.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the Devil's Canyon Road Site is in Census Tract 6111001206, which has a population of approximately 778. As described in Section 5.2.1.1.3, this tract has a total pollution burden score of 79%, which means that this census tract has more pollution burden than 79% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the Devil's Canyon Road Site received a score of 2 points because a pollution burden of 79% is within the 80% to 71% scoring range.

5.4.2.1.4 Greenhouse Gases

This option would include the installation of two new 1,900 HP natural gas compressors and two new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). The total direct GHG emissions would be 13,918 MT CO₂e/year and indirect GHG emissions would be 5,500 MT CO₂e/year from operational activities at the Devil's Canyon Road Site.

The shift from natural gas to a Hybrid Option reduces the localized emissions of criteria pollutants and direct GHG emissions, but the increased power demand from the electric compressors would increase indirect GHG emissions depending on how the power that is used is generated. The estimated emissions for the hybrid technology were calculated to be 19,418 MT CO₂e/year, which would fall within the $\geq 10,000$ MT CO₂e/year but $< 25,000$ MT CO₂e/year category and therefore would score from 4 to 6. Because 19,418 MT CO₂e/year is in the middle of the emission range, the Hybrid Option received a score of 5 points.

5.4.2.1.5 Land Use Designation

The Devil's Canyon Road – Hybrid Option would require the installation of approximately 40 electrical poles and associated overhead electrical conduit to connect to an existing subtransmission line; however, the location and underlying land use(s) of the electrical interconnect are not primary considerations for the land use criteria as described in Section 3.1 and as such, do not significantly influence the score for this site. All the Devil's Canyon Road – Hybrid Option's operational components are located within parcels with County zoning that does not support industrial and/or manufacturing uses. Additionally, the primary compressor station site is within an area governed by the SOAR initiative. No portion of the site is adjacent to any sensitive receptors. The nearest industrially zoned land use parcel is approximately 0.25 miles to the east of the compressor station boundary (APN 068001001), while the nearest sensitive land use is a residentially zoned parcel (APN 0690141135) in the City of Ventura, approximately 0.54 miles from the site (County of Ventura 2021). Using the scoring criteria for a site which is within a "Non-Industrial/manufacturing zone and not adjacent to sensitive receptors," the Devil's Canyon Road – Hybrid Option received a score of 6 points.

5.4.2.1.6 Noise

Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (defined per Section 3.2.7) of less than 35 dBA. Therefore, this alternative received a score of 9 points.

5.4.2.1.7 Wildfire

The Hybrid Option alternative would require installation of 40 poles and associated overhead electrical lines to provide adequate power to the compressor stations. Due to the exposed nature of the electrical interconnect—traveling through a Tier 3 HFTD—the electrical interconnect could represent an increased fire risk to the surrounding community due to potentially downed power lines (CPUC 2021a; 2021b) (see maps in Attachment 7). As such, the Hybrid Option received a score of 1 point. This score is due to the location of the electrical interconnect within a Tier 3 HFTD and the number of required poles/exposed length of conduit within a Tier 3 HFTD (CPUC 2021a; 2021b; Radeloff 2010; VCFPD 2021).

5.4.2.2 On-Site Construction Considerations

5.4.2.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total NO_x and PM₁₀ emissions from on-site construction of the Devil’s Canyon Road Site are shown in Table 37.

Table 37. On-Site Construction Emissions: Devil’s Canyon Road - Hybrid

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading - flat	872	233
Grading - elevated	0	0
Compressor station	10,578	2,022
Substation	1,311	74.3
Total^a	12,761	2,329

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The amount of on-site diesel equipment would be minimal, and the duration of grading activities would be limited. The Hybrid Option would also require additional construction activity for a substation. NO_x emissions would be in the <40,000 pounds and ≥8,000 pounds range and PM₁₀ emissions would be in the <6,000 pounds and ≥2,000 pounds range. Therefore, this alternative received a score of 6 points.

5.4.2.2.2 Cultural Resources

There are no differences in results for on-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 7 points.

5.4.2.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO₂e) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total GHG emissions from on-site construction of the Devil’s Canyon Road Alternative are shown in Table 38.

Table 38. On-Site GHG Construction Emissions: Devil’s Canyon Road - Hybrid

Activity	Total CO ₂ e Emissions (MT)
Grading – flat	105
Grading – elevated	0
Compressor station	1,560
Substation	294
Total^a	1,959

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The GHG emissions for on-site construction are anticipated to be well below the <5,000 MT CO₂e threshold. Accordingly, this alternative received a score of 8 points.

5.4.2.2.4 Natural Resources

The Hybrid Option may directly or indirectly impact wetlands that support sensitive wildlife species and habitat. As such, this alternative may indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands adjacent to the site, and received a score of 4 points.

5.4.2.2.5 Noise

The nearest non-industrial land use to the Devil’s Canyon Road Site is a residentially zoned parcel in the City of Ventura approximately 0.54 miles to the east of the site boundary on the east side of SR-33. Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; thus, the alternative received a score of 9 points.

5.4.2.2.6 Slope, Topography, and Grading

The Hybrid Option would include an electrical interconnect, requiring approximately 80 CY of over-excavation/recompaction in addition to the 4,500 CY required for the on-site components. The additional 80 CY does not impact the ranking because the over-excavation is a relatively negligible amount and the total cubic yardage for the project site would remain under 10,000 (County of Ventura 2022). As such, within the score range of 7 to 9, where the “average slope of the property is less than 20%” and “negligible/no over-excavation/recompaction is required” (see Section 3.1, Scoring Criteria), the Devil’s Canyon Road Site received a score of 8 points.

5.4.2.2.7 Traffic

There would be a negligible difference between construction of the Hybrid Option and the Natural Gas Option related to heavy truck traffic for on-site construction activity. Therefore, this alternative also received a score of 9 points.

5.4.2.3 Off-Site Construction Considerations

5.4.2.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Hybrid Option at the Devil’s Canyon Road Site would require construction of approximately 5,135 linear feet of new pipeline systems, as well as approximately 1,892 linear feet of access road work. In addition, approximately 4,507 linear feet of electrical interconnect would be required to accommodate the increased demand from the electric compressors. The linear construction totals approximately 11,534 linear feet, which is in the moderate range. Therefore, this alternative received a score of 3 points.

5.4.2.3.2 Cultural Resources

There are no differences in results for off-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 7 points.

5.4.2.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the future compressor station were calculated. The total GHG emissions from off-site construction of the Devil’s Canyon Road Alternative are shown in Table 39.

Table 39. Off-Site GHG Construction Emissions: Devil’s Canyon Road - Hybrid

Activity	Total CO _{2e} Emissions (MT)
Power line	141
Pipeline – street	181
Pipeline – open space	0
Road construction	67
Total^a	389

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be in the <500 MT CO_{2e} range. Therefore, this alternative received a score of 7 points.

5.4.2.3.4 Natural Resources

The proposed electrical interconnect for this alternative is within developed areas with areas of shrubs and crosses one wetland feature (freshwater forested/shrub wetland) and one sensitive habitat (southern coast live oak riparian forest); however, individual pole siting could avoid or minimize impacts to wetlands and sensitive habitats. The proposed tie-in is within an orchard and the proposed pipeline corridor is within developed areas (oil extraction facilities) and areas previously mapped as *Salvia mellifera*-*Salvia leucophylla* association (David Magney Environmental Consulting 2008), as shown in Figure NR-2D in Attachment 4. The same staging area would be required for the Hybrid Option. The proposed pipeline corridor would cross one wetland feature. As such, this alternative may indirectly impact sensitive animal species in adjacent habitats and directly impact sensitive habitats or wetlands in off-site areas; therefore, it received a score of 0 points.

5.4.2.3.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (as defined in Section 3.2.7), which would be more than 1,000 feet from the construction activity, would be less than 64 dBA for this alternative; thus, the alternative received a score of 9 points.

5.4.2.3.6 Traffic

Construction of the Hybrid Option would be the same as the Natural Gas Option, with the exception of the extension of electrical utilities. However, no roadway construction on existing roads for electrical utilities would be required. Therefore, this alternative received a score of 7 points.

5.4.2.3.7 Utilities/Service Systems

The Devil’s Canyon Road – Hybrid Option would require approximately 47,927 square feet of off-site ground disturbance for pipelines, approximately 7,500 square feet for the MLV connection, and 636 square feet of footings required for electrical poles, for a total of 55,978 square feet of ground disturbance. All off-site ground disturbance is summarized in Table 40 and would be conducted within and surrounded by non-urbanized and industrial land.

Table 40. Off-Site Ground Disturbance: Devil’s Canyon Road - Hybrid

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (Devil’s Canyon Road)	23,963
Pipeline Corridor 2 (Also Devil’s Canyon Road)	23,963
Utility Lines	0
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	<i>47,927</i>
Mainline Valve Connection	
Mainline Valve Connection	7,500
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connection</i>	<i>7,500</i>

Table 40. Off-Site Ground Disturbance: Devil’s Canyon Road - Hybrid

Construction Element	Square Feet
Depressurization Line	
Depressurization Line	0
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	0
Electrical Pole Footings	
Electrical Pole Footings	560
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	560
Total Off-Site Ground Disturbance for All Construction Elements^a	55,987

Note:

^a Totals may not sum precisely due to rounding.

The additional disturbance for the electrical poles would not substantively alter the amount of off-site ground disturbance required; therefore, this alternative received a score of 3 points.

5.5 County Line Site

The scoring rationale for each of the environmental topic areas for the County Line Site Alternative is described below.

5.5.1 Natural Gas Option

5.5.1.1 Operational Considerations

5.5.1.1.1 Aesthetics and Visual Resources

The County Line Site is within the viewshed of SR-150 (an eligible state scenic highway) over an approximately 0.7-mile-long segment extending north from approximately Rincon Hill Road. Over this segment, the site is occasionally blocked from view by nearby native vegetation and agricultural crops; however, site development is likely to remain visible above adjacent vegetation due to the inclusion of hillsides on the County Line Site. Depending on the location of grading limits, development of the site could result in substantial alteration to the established visual character of a scenic roadway and to the open space character of the surrounding areas including the currently undeveloped site. Both the visual character of scenic roadways and the open space character of lands outside of existing communities are identified as scenic resources in the Ventura County General Plan (County of Ventura 2020). Due to the potential visibility of site development, potentially available views from a scenic roadway/eligible state scenic highway, and the existing undeveloped and open space character of the site, development of the Natural Gas Option received a score of 0 points.

5.5.1.1.2 Air Quality

This option would include the installation of five new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG

Analysis in Attachment 1, the natural gas-powered compressor station is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption.

Operation of the natural gas compressors is calculated to result in 14 tons/year of emissions. As such, the Natural Gas Option would fall within the >12 tons/year category. Therefore, the Natural Gas Option received a score of 0 points.

5.5.1.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the County Line Site is in Census Tract 6111001206, which has a population of approximately 778. As described in Section 5.2.1.1.3, this tract has a total pollution burden score of 79%, which means that this census tract has more pollution burden than 79% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the County Line Site received a score of 2 points because a pollution burden of 79% is within the 71% to 80% scoring range.

5.5.1.1.4 Greenhouse Gases

This option would include the installation of five new 1,900 HP natural gas compressors equipped with state-of-the-art emission control technology that would be installed in a new compressor building. As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). Indirect GHG emissions for the operation of the natural-gas facilities were not quantified for the Natural Gas Option since anything attributable to indirect GHG emissions would be consistent across all the proposed alternative sites.

The estimated emissions for the all-Natural Gas Option were calculated to be 34,795 MT CO₂e/year, which would fall within the $\geq 25,000$ MT CO₂e/year but <50,000 MT CO₂e/year category and therefore would score from 1 to 3. Because 34,795 MT CO₂e/year is in the middle of the emission range, the Natural Gas Option received a score of 2 points.

5.5.1.1.5 Land Use Designation

Regional Site Location

As shown on Figure 5, the County Line Site is in southwest Ventura County, located just west of the Ventura County–Santa Barbara County line, and approximately 22.18 miles east west and slightly north of the Existing Site. The County Line Site lies across a small portion of two larger APNs within Ventura County: APN 008016048 to the northeast and APN 008016047 to the southwest. Regional access to the site and the adjacent staging area—located directly to the northeast of the compressor station site—is via U.S. Route 101 to SR-10/Rincon Road.

Surrounding Land Uses

As shown on the General Plan Land Use and Zoning maps within Attachment 3, the surrounding land uses of the County Line Site are predominantly open space and agricultural, with minimum lot sizes ranging from 40 to 160 acres (County of Ventura 2021). These include County General Plan (2020) land use designations of Open Space in all directions, as well as zoning of AE-40 to the northeast and southeast, OS-160 to the northeast, and

CA-40 to the northwest and southwest (County of Ventura 2021). Land uses northwest of SR-150/Rincon Road and the Santa Barbara County line are also predominantly open space and agriculture, including the County of Santa Barbara Comprehensive Plan (2016) land use designation of Agriculture II, and a minimum parcel size of 100 acres (A-II-100) (County of Santa Barbara 2016; 2021). While the County Line Site compressor station site is not directly adjacent to any sensitive receptors, according to the currently available aerial views, there appears to be a residential development (e.g., sensitive land use area) located approximately 0.24 miles to the northeast.

Project Component Land Uses

The approximately 12.33 acres County Line Site compressor station site is located within Ventura County. The proposed locations for much of the required pipelines and off-site MLV station, and the County Line tie-in for depressurization would be on currently developed land, including approximately 0.93 miles of existing dirt roadway and several operational agricultural lots. All the operational components are within parcels with County General Plan (2020) land use designations of Open Space and County zoning of either CA-40 (Coastal Agricultural; minimum lot size of 40 acres) (County of Ventura 2008) or AE-40 (Agricultural Exclusive; minimum lot size of 40 acres) (County of Ventura 2012). While the County Line Site is located on part of an active agricultural parcel, the available aerial views of the site appear to show no current crop production.

The selection of the County Line Alternative would require changes to for a compressor station would not be is not consistent with the existing land use and zoning for the on-site location to facilitate the types of operational uses required by the project. In addition, Additionally, the primary compressor station site is within an area governed by the SOAR initiative.

Oil Wells

The County Line Site is adjacent to a small, abandoned oil field (e.g., Rincon Creek) (DOC 2019). There are no active wells present on or adjacent to the site (DOC 2022).

Evaluation and Score

While the County Line Site Natural Gas Option's compressor station site is not directly adjacent to any sensitive receptors (i.e., within 500 feet), all the site's operational components are located within parcels with County zoning that does not support the types of industrial and/or manufacturing uses required by the project. Additionally, the primary compressor station site is within an area governed by the SOAR initiative. While the County Line Site is part of an active agricultural parcel, the currently available aerial views of the site show no current crop production. The nearest industrially designated land use to the County Line Site is 0.83 miles to the southeast (APN 060010030). The nearest sensitive land use to the compressor station site is approximately 0.24 miles away. Using the scoring criteria for a site that is within a Non-Industrial/manufacturing zone and is not adjacent to sensitive receptors, the County Line – Natural Gas Option received a score of 6 points.

5.5.1.1.6 Noise

The nearest non-industrial land use to the County Line Site is a residential area located approximately 0.24 miles to the northeast of the site. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-

industrial land use (defined per Section 3.2.7) of less than 55 dBA. Therefore, this alternative received a score of 4 points.

5.5.1.1.7 Wildfire

As shown on the SRA and LRA FHSZ Maps in Attachment 7, approximately two-thirds of the County Line Site is located within a very high FHSZ (CAL FIRE 2022). The other third of the site is located within a moderate FHSZ (CAL FIRE 2022). All operational project components are located within a vegetated area of a known fuel bed (i.e., Casitas Fuel Bed) (Radeloff 2010; VCFPD 2021). Because this site is located on the westernmost edge of a very high FHSZ and because the surrounding area to the north, south, and west are identified as being moderate FHSZs, this site received a score of 3 points under the scoring criteria. The score of 3 is provided with an understanding that the site is not within a high FHSZ; however, portions of the site are within both very high and moderate FHSZs, and the site is bordered by moderate FHSZs to the north, west, and south (CAL FIRE 2022).

5.5.1.2 On-Site Construction Considerations

5.5.1.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. For the purposes of the earthwork required to inform the air quality analysis, it was estimated that the site consisted of hillside/elevated land and flat areas that required grading. The total NO_x and PM₁₀ emissions from on-site construction of the County Line Site are shown in Table 41.

Table 41. On-Site Construction Emissions: County Line - Natural Gas

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Exhaust Emissions (lb)
Grading - flat	8,218	2,193
Grading - elevated	41,021	5,339
Compressor station	10,578	2,022
Substation		0
Total^a	59,817	9,555

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The County Line Site is very hilly and would require substantial grading to be suitable for use. The County Line Site currently has no industrial development. NO_x emissions would be in the <80,000 pounds and ≥40,000 pounds range and PM₁₀ emissions would be in the <10,000 pounds and ≥6,000 pounds range; therefore, this alternative received a score of 2 points.

5.5.1.2.2 Cultural Resources

A total of 5 cultural resources have been previously recorded within a 1-mile radius of the County Line Site; however, no cultural resources have been identified within the site and there are no resources within a 0.5-mile radius of the

County Line Site. Additionally, no resources listed on any federal, state, or local registry are located within the on-site component of the County Line Site.

A total of 28 previously conducted studies have been undertaken within a 1-mile radius of the County Line Site between 1962 and 2014. Of these 28 studies, none addresses the County Line Site.

According to the historic aerial photographs and topographic maps, the County Line Site has been subject to ground disturbance at least as early as 1947 because it was occupied by an orchard from at least 1947 until 2002. The County Line Site is located approximately 787 feet east of Rincon Creek, 8,825 feet north of the Pacific Ocean, and 1.3 miles south of the Santa Ynez Mountains. The County Line Site is not close to a natural landmark capable of depositing sediment, such as a river or the base of a foothill; therefore, it has a low potential for unknown archaeological material to be buried under natural sediment.

In summary, no known cultural resources exist within the County Line Site or within close proximity. Although the on-site component of the County Line Site has not been subjected to a cultural resource study, the continual ground disturbance and lack of resources identified within close proximity suggests that the potential for yet unknown and intact cultural resources is low. Therefore, the on-site component of the County Line Site in a location that is not sensitive for potentially significant cultural resources. Based on the above findings, the on-site component of the County Line Site received a score of 8 points.

5.5.1.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total GHG emissions from on-site construction of the County Line Alternative are shown in Table 42.

Table 42. On-Site GHG Construction Emissions: County Line - Natural Gas

Activity	Total CO _{2e} Emissions (MT)
Grading - flat	992
Grading - elevated	6,502
Compressor station	1,560
Substation	0
Total^a	9,055

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The GHG emissions for on-site construction are anticipated to fall slightly under the <10,000 MT CO_{2e} threshold. Accordingly, this alternative received a score of 4 points.

5.5.1.2.4 Natural Resources

Based on aerial imagery, this alternative is located on a former orchard, leaving disturbed habitat and some shrub growth in the eastern portion of the site that may include species of the historically mapped lower montane mixed chaparral. A linear wetland feature (mapped as freshwater emergent wetland) is located along the southern

boundary. No sensitive plant or animal species have been recorded on or adjacent to the site. The 15 sensitive plant and animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur on the site. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species or sensitive habitats on site but may directly or indirectly impact on-site and adjacent wetlands; therefore, it received a score of 6 points.

5.5.1.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (defined per Section 3.2.7), the apparent occupied farmhouse east of Rincon Road, which would be between 250 and 500 feet from the construction activity, would be less than 75 dBA for this alternative; therefore, this alternative received a score of 7 points.

5.5.1.2.6 Slope, Topography, and Grading

The topography and slope maps in Attachment 6 show the slope for the County Line Site and surrounding area. The site itself currently supports agricultural uses and does not appear to have been subject to previous substantial grading or other intensive use-type improvements. The on-site slope ranges from a low of 0% to a high of over 60%, with a site average of approximately 26%. The average slope range calculations for the site are provided in Table 43.

Table 43. Average Slope Calculations

Class Range	% Slope Range	Acres	% Slope	Avg Avg	% Slope	Min Avg	% Slope	Max Avg
County Line Site – 12.33 Acres								
Site Classes: 0%–70%	0%–10%	1.48	5%	0.07	0%	0	10%	0.15
	>10%–20%	2.95	15%	0.44	10%	0.3	20%	0.6
	>20%–30%	3.39	25%	0.85	20%	0.68	30%	1.02
	>30%–40%	2.35	35%	0.82	30%	0.71	40%	0.94
	>40%–50%	1.8	45%	0.81	40%	0.72	50%	0.9
	>50%–60%	0.3	55%	0.17	50%	0.15	60%	0.18
	>60%–70%	0.07	65%	0.05	60%	0.04	70%	0.05
<i>Site Averages</i>				26%		21%		31%

Based on conceptual engineering analysis, grading for this site would entail approximately 600,000 CY of over-excavation/recompaction. The grading requirements for the County Line Site are substantially greater than the other sites (with the exception of the Avocado Site at 1.3 million CY), due in large part to the fact that this site is in a relatively unimproved area and is surrounded to the south and east by slopes in exceedance of 30%. The average slope within the area that would be developed is also approximately 26%. As such, the County Line Site received a score of 3 points, with the understanding that grading would be substantial, and the slope would be less impactful on the constructability than the established ranking criteria would suggest.

5.5.1.2.7 Traffic

The County Line Alternative would be located on a vacant parcel of land at the county line between Santa Barbara and Ventura Counties. The area is primarily developed with agricultural uses and low-density residential

development. The site has direct access from U.S. Route 101 to SR-150 to Avocado Hill Road, an existing dirt access road. Access to the site via a minimum 24-foot-wide driveway would be needed to meet SoCalGas and emergency responder access requirements. The width of the existing access road varies, and some portions would need to be widened and graded to achieve an acceptable grade suitable for fire truck access. Construction of the compressor station, including pad grading, access road, on-site utility installations, buildings, and compressors, would take approximately 60 to 70 months, with major earthwork occurring for approximately 1 year due to the amount of grading required.

While construction of the County Line Site would occur for approximately 1 year, heavy truck traffic would not travel on a constrained roadway. However, heavy truck travel would occur near low-density residential uses along SR-150 and would also impact Avocado Hill Road (a private road). Therefore, this alternative received a score of 2 points.

5.5.1.3 Off-Site Construction Considerations

5.5.1.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Natural Gas Option at the County Line Site would require construction of approximately 5,650 linear feet of a pipeline system to connect to an existing main pipeline and approximately 2,499 linear feet of access road improvements. The linear construction totals approximately 8,149 linear feet, which is in the minimal range. Therefore, this alternative received a score of 5 points.

5.5.1.3.2 Cultural Resources

A total of 5 cultural resources have been previously recorded within a 1-mile radius of the County Line Site search; however, no cultural resources have been identified within the off-site components of the County Line Site. There is one resource within a 0.5-mile radius of the off-site component of the County Line Site, a historic building (P-56-152756) approximately 500 feet northwest of the off-site component pipeline system. No resources listed on any federal, state, or local registry are located within the off-site components of the County Line Site.

A total of 28 previously conducted studies have been undertaken within a 1-mile radius of the off-site components of the County Line Site between 1962 and 2014. Of these 28 studies, 3 address the off-site components of the County Line Site. Approximately 5% of the off-site components of the County Line Site, including portions of the access road widening, electrical interconnect, pipeline system, depressurization line, and staging area, have been previously surveyed and are documented by studies conducted in 1981, 1983, and 2012 (VN-00636, VN-00426, and VN-03064). Only one of the reports (VN-00426) provides recommendations including an inadvertent discovery clause and archaeological monitoring recommendation.

According to the historic aerial photographs and topographic maps, the off-site components of the County Line Site have been subject to ground disturbance at least as early as 1947. The staging area portion of the off-site component of the County Line Site was occupied by an orchard from at least 1947 until 2009 and historic aerials show evidence of grading disturbance beginning in 2018. The potential access road and pipeline remain partially undisturbed at least as early as 1904 to present where other portions have been disturbed by road grading and construction.

Portions of the off-site components of the County Line Site are within close proximity to Rincon Creek, which is capable of depositing sediment. Therefore, some components have potential for unknown archaeological material to be buried under natural sediment. Although Rincon Creek would have served as a freshwater resource in prehistoric and historic periods, the off-site components appear to be too close to be a hospitable location for habitation due to the propensity for flooding. Depending on the depth and timing of depositional sediment as well as the depth of disturbance incurred as a result of road construction and agricultural activities, unknown cultural resources, if present, may have been destroyed, displaced, and /or buried deeper than the proposed depth of disturbance. These conditions are in part the reason previous cultural resources studies have recommended an inadvertent discovery clause and archaeological monitoring.

In summary, no known cultural resources exist within or in close proximity to the off-site component of the County Line Site. One built resource is located approximately 500 feet northwest of the off-site pipeline component. The continual ground disturbance and lack of resources identified within close proximity suggest that the potential for yet unknown and intact cultural resources is low. However, consideration should be given to the proximity of Rincon Creek to the staging area and other off-site components outside the floodplain of the creek in that the creek would have served as a freshwater resource in prehistoric and historic periods, presenting a hospitable location for habitation. Thus, the off-site component of the County Line Site is in a location that is moderately sensitive for potentially significant cultural resources and the off-site components of the County Line Site received a score of 6 points.

5.5.1.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in CO₂e) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the future compressor station were calculated. The total GHG emissions from off-site construction of the County Line Alternative are shown in Table 44.

Table 44. Off-Site GHG Construction Emissions: County Line - Natural Gas

Activity	Total CO ₂ e Emissions (MT)
Power line	0
Pipeline – street	0
Pipeline – open space	84
Road construction	87
Total^a	171

Notes: GHG = greenhouse gas; CO₂e = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be well below the <500 MT CO₂e threshold. Therefore, this alternative received a score of 9 points.

5.5.1.3.4 Natural Resources

No electrical interconnect is proposed for this alternative. The proposed pipeline corridors, associated tie-ins, and access road improvements are within orchards, and one linear wetland feature (mapped as freshwater

forested/shrub wetland) is crossed. However, based upon aerial imagery, this feature appears to have been removed by the creation of the orchard. The 15 sensitive plant and animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur on the site. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands in off-site areas, and received a score of 8 points due to the low potential for the wetland feature.

5.5.1.3.5 Noise

Predicted off-site construction activity noise exposure level, associated with potential pipeline and access road locations east of Rincon Road and apparently in the vicinity of the Rincon Del Mar Ranch property, at the nearest non-industrial land use (defined per Section 3.2.7), which would be between 0 and 50 feet from the construction activity, would be approximately 90 dBA for this alternative; therefore, this alternative received a score of 0 points.

5.5.1.3.6 Traffic

The County Line Alternative would require the construction of a pipeline system through the oil/gas hillside area, requiring grading, trenching and pipeline installation and potentially acquisition of additional pipeline right-of-way. The project would construct 5,280 linear feet of new pipeline, with some segments of the pipeline occurring along Avocado Hill Road. It is anticipated that minimal roadway construction would be needed and there would be less than 2,500 feet of lane closures. Avocado Hill Road is a private dirt road with low traffic volumes that is primarily used to access the agricultural fields, and there would be no construction on public roadways. Therefore, this alternative would receive a score of 7 points.

5.5.1.3.7 Utilities/Service Systems

The County Line Site – Natural Gas Option would require approximately 27,470 square feet of off-site ground disturbance for pipelines and utilities, approximately 7,500 square feet for the MLV connection, and approximately 3,197 square feet of depressurization line for a total of approximately 38,167 square feet of off-site ground disturbance. All off-site ground disturbance summarized in Table 45 would be conducted within and surrounded by non-urbanized and industrial land and would not impact urban roadways or otherwise impede commuter traffic.

Table 45. Off-Site Ground Disturbance: County Line - Natural Gas

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (to the Northeast)	19,973
Utility Lines	7,497
<i>Subtotal Off-Site Ground Disturbance – Pipelines and Utilities</i>	<i>27,470</i>
Mainline Valve Connections	
Mainline Valve Connection 1	3,750
Mainline Valve Connection 2	3,750
<i>Subtotal Off-Site Ground Disturbance – Mainline Valve Connections</i>	<i>7,500</i>

Table 45. Off-Site Ground Disturbance: County Line - Natural Gas

Construction Element	Square Feet
Depressurization Line	
Depressurization Line	3,197
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	<i>3,197</i>
Electrical Pole Footings	
Electrical Pole Footings	0
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	<i>0</i>
Total Off-Site Ground Disturbance for All Construction Elements^a	38,167

Note:

^a Totals may not sum precisely due to rounding.

This alternative received a score of 4 points because of the minimal amount of off-site ground disturbance required.

5.5.2 Hybrid Option

5.5.2.1 Operational Considerations

5.5.2.1.1 Aesthetics and Visual Resources

With the exception of approximately 15 new electrical poles, there would be no difference between construction of the Hybrid Option and the Natural Gas Option. New poles are likely to be visible from SR-150, which, based on the presence of existing poles along the roadway, would not result in substantial view obstruction or alteration of existing visual character. As with the Natural Gas Option, construction and operation of the Hybrid Option is likely to be visible from SR-150 and required construction activities including vegetation removal and grading would alter the general open space and agricultural character of the surrounding landscape. Therefore, this alternative received a score of 0 points.

5.5.2.1.2 Air Quality

This option would include the installation of two new 1,900 HP natural gas compressors and three new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, the Hybrid Option is assumed to operate 24 hours a day, 7 days a week, which is a conservative assumption. The Hybrid Option has fewer internal combustion engines and thus fewer direct emissions than the Natural Gas Option. The Hybrid Option would replace three of the internal combustion engines with three electric compressors of equivalent horsepower. Even though an additional electric compressor is required for the County Line Site, the NO_x emissions would remain the same for the Hybrid Option when compared to the other sites, since two natural gas compressors would be required for all Hybrid Options.

Operation of the Hybrid Option was calculated to result in 5.6 tons/year of NO_x emissions. As such, the Hybrid Option would fall within the ≥ 4 tons/year but < 8 tons/year category, which would score from 4 to 6. Because 5.6 tons/year is in the middle of the NO_x emissions range, the Hybrid Option received a score of 5 points.

5.5.2.1.3 CalEnviroScreen

OEHHA CalEnviroScreen 4.0 Maps indicate that the County Line Site is in Census Tract 6111001206, which has a population of approximately 778. As described in Section 5.2.1.1.3, this tract has a total pollution burden score of 79%, which means that this census tract has more pollution burden than 79% of all census tracts within California (OEHHA 2022b). Therefore, based on the ranking score range of 1 to 3 for sites with a 61% to 90% pollution burden, the County Line Site received a score of 2 points because a pollution burden of 79% is within the 71% to 80% scoring range.

5.5.2.1.4 Greenhouse Gases

This option would include the installation of two new 1,900 HP natural gas compressors and three new 1,900 HP electric compressors installed in a new compressor building. The Hybrid Option would also require 5 megawatts in electric service capacity. As detailed in the AQ/GHG Analysis in Attachment 1, the Hybrid Option is assumed to operate 24 hours per day, 7 days per week, which is a conservative assumption. = As detailed in the AQ/GHG Analysis in Attachment 1, GHG impacts are rated according to the metric tons of CO₂ equivalent that are directly produced from equipment and indirectly produced as a result of activities related to operations but not immediately on site (e.g., as a result of electricity generated elsewhere that is used on site). The total direct GHG emissions would be 13,918 MT CO₂e/year and indirect GHG emissions would be 8,250 MT CO₂e/year from operational activities at for the County Line Site.

The shift from natural gas to a Hybrid Option reduces the localized emissions of criteria pollutants and direct GHG emissions, but the increased power demand from the electric compressors would increase indirect GHG emissions depending on how the power that is used is generated. The estimated emissions for the hybrid technology were calculated to be 22,168 MT CO₂e/year, which would fall within the $\geq 10,000$ MT CO₂e/year but $< 25,000$ MT CO₂e/year category and therefore would score from 4 to 6. Because 22,168 MT CO₂e/year is near the top of the emission range, the Hybrid Option received a score of 4 points.

5.5.2.1.5 Land Use Designation

The County Line Site Hybrid Option would require 15 new electrical poles as well as overhead electrical line to accommodate the anticipated electrical demand. The electrical interconnect would have an underlying land use designation of Open Space (County of Ventura 2020) and zoning of AE-40 (County of Ventura 2008) and CA-40-sdf (County of Ventura 2012). However, the location and underlying land use(s) of the electrical interconnect are not primary considerations for the land use criteria as described in Section 3.1 and as such, do not significantly influence the score for this site.

While the Hybrid Option's compressor station site is not directly adjacent to any sensitive receptors, all the site's operational components are located within parcels with County zoning that does not support the types of industrial uses required by the project. Additionally, the primary compressor station site is within an area governed by the SOAR initiative. While no current crop production is occurring within the footprint of the compressor station, the site

has historically been used as an orchard. The nearest industrially designated land use to the County Line Site is 0.83 miles to the southeast (APN 060010030). Using the scoring criteria for a site that is within a Non-Industrial/manufacturing zone and is not adjacent to sensitive receptors, the County Line – Hybrid Option received a score of 6 points.

5.5.2.1.6 Noise

The nearest non-industrial land use to the County Line Site is a residential area located approximately 0.24 miles to the northeast of the site. Based on the assessment provided in Attachment 5, the prediction model enabled an estimate of aggregate operational facility noise at the property boundaries or at the nearest boundary of non-industrial land use (defined per Section 3.2.7) of less than 50 dBA. Therefore, this alternative received a score of 6 points.

5.5.2.1.7 Wildfire

In addition to the presence of a very high FHSZ, due to the exposed nature of the electrical interconnect, consisting of 15 poles and associated overhead electrical lines running through a Tier 2 HFTD, the electrical interconnect could represent an increased fire risk to the surrounding community due to potentially downed power lines (see maps in Attachment 7). Due to this increased risk, the County Line – Hybrid Option received a score of 2 points.

5.5.2.2 On-Site Construction Considerations

5.5.2.2.1 Air Quality

As detailed in the AQ/GHG Analysis in Attachment 1, on-site construction emissions of NO_x and PM₁₀ from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total PM₁₀ exhaust emissions from on-site construction of the County Line Site are shown in Table 46.

Table 46. On-Site Construction Emissions: County Line - Hybrid

Activity	Total NO _x Emissions (lb)	Total PM ₁₀ Emissions (lb)
Grading - flat	8,218	2,193
Grading - elevated	41,021	5,339
Compressor station	10,578	2,022
Substation	1,311	74.3
Total^a	61,128	9,629

Notes: NO_x = oxides of nitrogen; lb = pounds; PM₁₀ = coarse particulate matter.

^a Totals may not sum precisely due to rounding.

The County Line Site is hilly and would require grading and excavation to be suitable for use. The County Line Site currently has no industrial development. The Hybrid Option would also require additional construction activity for a substation. NO_x emissions would be in the <80,000 pounds and ≥40,000 pounds range and PM₁₀ emissions would be in the <10,000 pounds and ≥6,000 pounds range. Therefore, this alternative received a score of 2 points.

5.5.2.2.2 Cultural Resources

There are no differences in the results for on-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 8 points.

5.5.2.2.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from on-site activities such as site preparation, grading, and construction within the footprint of the compressor station were calculated. The total GHG emissions from on-site construction of the County Line Alternative are shown in Table 47.

Table 47. On-Site GHG Construction Emissions: County Line - Hybrid

Activity	Total CO _{2e} Emissions (MT)
Grading - flat	992
Grading - elevated	6,502
Compressor station	1,560
Substation	294
Total^a	9,348

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

The expected GHG emissions for on-site construction would fall just below the <10,000 MT CO_{2e} threshold. Accordingly, this alternative received a score of 4 points.

5.5.2.2.4 Natural Resources

The Hybrid Option would not alter any conditions related to on-site natural resources. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species or sensitive habitats on site but it may directly or indirectly impact on-site and adjacent wetlands; therefore, it received a score of 6 points.

5.5.2.2.5 Noise

Predicted on-site construction activity noise exposure level at the nearest non-industrial land use (defined per Section 3.2.7), the apparent occupied farmhouse east of Rincon Road, which would be between 250 and 500 feet from the construction activity, would be less than 75 dBA for this alternative; therefore, the alternative received a score of 7 points.

5.5.2.2.6 Slope, Topography, and Grading

In addition to the analysis above, the Hybrid Option would include an electrical interconnect, requiring approximately 30 CY of additional grading. This additional grading does not impact the ranking due to the fact the electrical interconnect over-excavation is a relatively negligible amount, and the grading for the rest of the site is substantial (600,000 CY). As such, the County Line Site received a score of 3 points under the Hybrid Option.

5.5.2.2.7 Traffic

There would be a negligible difference between construction of the Hybrid Option and the Natural Gas Option related to heavy truck traffic for on-site construction activity. Therefore, this alternative received a score of 2 points.

5.5.2.3 Off-Site Construction Considerations

5.5.2.3.1 Air Quality

Scoring for air quality impacts from off-site construction was based on the total distance of linear construction of the proposed pipeline system, power line, and access road construction. The Hybrid Option at the County Line Site would require construction of approximately 5,650 linear feet of a pipeline system to connect to an existing main pipeline and approximately 2,499 linear feet of access road improvements. In addition, approximately 1,405 linear feet of electrical interconnect is required to accommodate the increased power requirements for the electric compressors. The linear construction totals approximately 9,554 feet, which is at the top of the minimal range. Therefore, this alternative received a score of 4 points.

5.5.2.3.2 Cultural Resources

There are no differences in the results for off-site construction considerations for the Hybrid Option and the Natural Gas Option. Therefore, this alternative received a score of 6 points.

5.5.2.3.3 Greenhouse Gases

As detailed in the AQ/GHG Analysis in Attachment 1, the GHG emissions (expressed in MT CO_{2e}) resulting from off-site activities such as construction of power lines, pipelines, and roads outside the footprint of the compressor station were calculated. The total GHG emissions from off-site construction of the County Line Alternative are shown in Table 48.

Table 48. Off-Site GHG Construction Emissions: County Line - Hybrid

Activity	Total CO _{2e} Emissions (MT)
Power line	45
Pipeline – street	0
Pipeline – open space	84
Road construction	87
Total^a	216

Notes: GHG = greenhouse gas; CO_{2e} = carbon dioxide equivalent; MT = metric tons.

^a Totals may not sum precisely due to rounding.

GHG emissions from off-site construction would be well below the <500 MT CO_{2e} threshold. Therefore, this alternative received a score of 9 points.

5.5.2.3.4 Natural Resources

The proposed electrical interconnect is within orchards. The proposed pipeline corridors, associated tie-ins, and access road improvements are within orchards, and one linear wetland feature (mapped as freshwater forested/shrub wetland) is crossed. However, based upon aerial imagery, this feature appears to have been removed by the creation of the orchard. The 15 sensitive plant and animal species and habitats with previously recorded occurrences within 3 miles have a low potential to occur or are not expected to occur on the site. As such, this alternative is not expected to directly or indirectly impact sensitive plant or animal species, sensitive habitats, or wetlands in off-site areas, and received a score of 8 points due to the low potential for the wetland feature.

5.5.2.3.5 Noise

Predicted off-site construction activity noise exposure level, associated with potential pipeline and access road locations east of Rincon Road and apparently in the vicinity of the Rincon Del Mar Ranch property, at the nearest non-industrial land use (defined per Section 3.2.7), which would be between 0 and 50 feet from the construction activity, would be approximately 90 dBA for this alternative; therefore, the alternative received a score of 0 points.

5.5.2.3.6 Traffic

Construction of the Hybrid Option would be the same as the Natural Gas Option, with the exception of the extension of electrical utilities. However, no roadway construction on existing roads for electrical utilities would be required. Therefore, this alternative also receives a score of 7 points.

5.5.2.3.7 Utilities/Service Systems

The County Line - Hybrid Option would require approximately 27,470 square feet of off-site ground disturbance for pipelines and utilities, approximately 7,500 square feet for the MLV connection, approximately 3,197 square feet of depressurization line, and 200 square feet of footings for the electrical poles for a total of approximately 38,377 square feet of off-site ground disturbance. All off-site ground disturbance summarized in Table 49 would be conducted within and surrounded by non-urbanized and industrial land.

Table 49. Off-Site Ground Disturbance: County Line - Hybrid

Construction Element	Square Feet
Pipelines and Utilities	
Pipeline Corridor 1 (to the Northeast)	19,973
Utility Lines	7,497
<i>Subtotal Off-Site Ground Disturbance - Pipelines and Utilities</i>	<i>27,470</i>
Mainline Valve Connections	
Mainline Valve Connection 1	3,750
Mainline Valve Connection 2	3,750
<i>Subtotal Off-Site Ground Disturbance - Mainline Valve Connections</i>	<i>7,500</i>

Table 49. Off-Site Ground Disturbance: County Line - Hybrid

Construction Element	Square Feet
Pipelines and Utilities	
Depressurization Line	
Depressurization Line	3,197
<i>Subtotal Off-Site Ground Disturbance – Depressurization Line</i>	<i>3,197</i>
Electrical Pole Footings	
Electrical Pole Footings	210
<i>Subtotal Off-Site Ground Disturbance – Electrical Pole Footings</i>	<i>210</i>
Total Off-Site Ground Disturbance for All Construction Elements^a	38,377

Note:

^a Totals may not sum precisely due to rounding.

The additional disturbance for the electrical poles would not substantively alter the amount of off-site ground disturbance required and this alternative received a score of 4 points.

5.6 Ranking of Alternatives

Upon completion of the rubric scoring, the final tallies for each of the alternative sites and technology options were compared. The final scoring range for the alternatives is shown in Table 50.

Table 50. Alternative Ranking Based on the Environmental Scoring Rubric

Alternative Sites	Technology Options	Operational Considerations Ranking (×10)	On-Site Construction Considerations Ranking	Off-Site Construction for Utilities Considerations	Total Score
Option 4: Devil’s Canyon Road Site	B. Hybrid	350	51	35	437
Option 1: Existing Site	B. Hybrid	320	48	61	429
Option 3: Ventura Steel Site	B. Hybrid	350	56	13	419
Option 4: Devil’s Canyon Road Site	A. Natural Gas	300	51	37	389
Option 1: Existing Site (Planned Project)	A. Natural Gas	260	48	61	369
Option 3: Ventura Steel Site	A. Natural Gas	290	56	13	359
Option 2: Avocado Site	B. Hybrid	280	32	32	344

Table 50. Alternative Ranking Based on the Environmental Scoring Rubric

Alternative Sites	Technology Options	Operational Considerations Ranking ($\times 10$)	On-Site Construction Considerations Ranking	Off-Site Construction for Utilities Considerations	Total Score
Option 5: County Line Site	B. Hybrid	250	32	38	320
Option 2: Avocado Site	A. Natural Gas	230	32	35	297
Option 5: County Line Site	A. Natural Gas	170	32	39	241

As previously discussed in Chapter 4, Environmental Scoring and Ranking, the scores in the “Operational Considerations” category were multiplied by a factor of 10. The scores were weighted because operational considerations would have long-term implications for the environment over the life of the modernization project and thus should be considered as more consequential, whereas short-term construction activities are temporary. The factor of 10 was determined to be appropriate by considering the duration of construction impacts in the context of the life of the project. The duration of site construction activities would vary according to site-specific considerations described in Section 2, Alternative Options, and the average length of construction activity for all 10 development scenarios would be 3.8 years. The anticipated useful lifespan of the modernization project is estimated to be 40 years. As such, increasing the numeric scoring for the “Operational Considerations” category by a factor of 10 was determined to adequately capture the environmental consequences of short-term construction vs. long-term operational impacts.

As shown in Table 50, the alternative with the greatest point total is the Devil’s Canyon Road – Hybrid Option, with a score of 437. This is followed in ranking by the Existing Site – Hybrid Option and the Ventura Steel – Hybrid Option. These three sites and technologies scored within 18 points of each other. Overall, the Hybrid Option at each site scored higher than the Natural Gas Option at that same site.

Air Quality and Greenhouse Gas Emissions Analysis

March 16, 2022

Dudek
38 North Marengo Avenue
Pasadena, CA 91101

Subject: Ventura Compressor Station Alternatives Analysis Methodology Writeup

Dear Dudek:

Due to changes to the operating environment of Southern California Gas Company's (SoCalGas's) natural gas transmission system, SoCalGas has proposed to modernize the Ventura Compressor Station (VCS), by replacing three existing natural gas compressors with four new natural gas compressors within a new compressor building and other associated improvements (planned project).

In response to letters from the California Public Utilities Commission (CPUC), SoCalGas is evaluating four alternative site locations in addition to the existing VCS site for the project. For each of the four alternative site locations, two equipment configurations were reviewed, one with all four or five compressor engines fueled with only natural gas (NG), as well as a hybrid option of two or three NG compressors and two electric driven compressors (EDCs). Yorke Engineering, LLC (Yorke) was retained by Dudek to assist in the preparation of an environmental evaluation for SoCalGas as part of this study of potential alternative site locations and equipment configurations. Yorke's analysis evaluated air quality and greenhouse gas (GHG) impacts from construction (on-site and off-site) as well as operational impacts of each equipment configuration.

SITE DESCRIPTIONS

Five sites were evaluated including the proposed project located at the existing VCS site, and four alternative site locations. These are briefly described below.

Option 1: VCS Existing Site

The existing VCS location is flat and will require a minimal amount of grading. No new pipelines or electrical interconnection will be required, and no road improvements will be necessary. The Hybrid option will require a new substation.

Option 2: Avocado Site

The Avocado site is a hillside location on private land. It will require a large amount of elevated grading as well as some flat grading. Development of this site will require widening, regrading, and paving of an existing access road. New pipelines through open space land use areas will be required to connect to existing main lines. The Hybrid option (2B) will require a new electrical interconnect and a substation.

Option 3: Ventura Steel

The Ventura Steel option is located on an industrial site within the County of Ventura. This site is flat and will require some flat grading. New pipelines will be required to tie in to three existing main lines. A pipeline system will pass under a major roadway (Ventura Avenue), impacting non-industrial land use areas for most of its length and requiring closure of one side of the road at a

time. The other new pipelines will largely impact open space land use areas. The Ventura Steel site has also been estimated to require 3,600 additional linear feet of roads to access the new pipeline route. The Hybrid option (3B) will require aboveground electrical utility extensions and a substation.

Option 4: Devil's Canyon Road

The Devil's Canyon Road option is located on a previously developed, largely flat site, and will require some flat grading. An existing access road will require some upgrades to accommodate the project. New pipelines are required to connect to existing main lines. Pipeline work will also include road reconstruction along the pipeline path to stabilize the pipeline location. The Hybrid option (4B) will require a new electrical interconnect and a substation.

Option 5: County Line

The County Line site is located within a vacant parcel of land designated and zoned for agricultural use, within the County of Ventura on the border of Santa Barbara County. The site is hilly and will require a large amount of elevated grading as well as some flat grading. New pipelines and a depressurization line will be required to connect to existing main lines. Access road improvements will also be required. To overcome a greater pressure differential due to the location being farther north in the SoCalGas distribution system than the other four sites, an additional NG compressor is required at this location, i.e., five NG compressors rather than four for the NG-Only options and two NG compressors along with three EDCs rather than two of each for the Hybrid options at the other four sites. The Hybrid option (5B) will require a new electrical interconnect and a substation.

For each alternative site, expected areas and distances were identified based on the construction assumptions provided, estimates based on previous project data, and analysis of the GIS data. These values were used to scale the emission factors and estimate the emissions associated with each activity at each site.

CONSTRUCTION EMISSIONS

For each alternative site Yorke generated activity-based emission factors to evaluate construction of project components given various site conditions. The activities used are construction actions that the alternatives hold in common for a project to construct a natural gas compressor station such as has been proposed at the existing VCS. To standardize across variations, common phases of a construction project were grouped into activity categories.

Activity Categories

Rankings of sites within the rubric are based on construction activities expected at each site:

- Grading – Flat: grading on a relatively flat surface, without any major elevation changes needed;
- Grading – Elevated: grading where large amounts of earthworks may be involved, including excavation of hillsides, and typically involves more equipment than Grading – Flat;
- Powerline: linear construction for new or upgraded electrical transmission lines; includes trenching and power pole erection as well as pulling and reconductoring of lines;

- Pipeline – Street: linear construction for new gas pipeline under existing roadway to connect into existing main lines, and includes equipment used for trenching, backfilling, and paving;
- Pipeline – Open Space: linear construction for new gas pipeline in undeveloped land to connect into existing main lines, and includes trenching and backfill;
- Compressor Station: construction of the footprint of the new facility and structures housing the new compressor station equipment; and
- Substation: construction of a new substation at the compressor facility.

Representative Data

Representative construction equipment and schedule data from other recent, similar pipeline and compressor station modernization projects were extracted for input into the California Emissions Estimator Model[®] (CalEEMod) to estimate construction emissions. Equipment inventories were developed based on representative project phases and consolidated to correlate to the activity categories above.

Emission Factors

To generate emission factors for the various construction activities, the CalEEMod version 2020.4.0 was used. CalEEMod is the official statewide land use computer model designed to provide a uniform platform for estimating potential criteria pollutant and GHG emissions associated with construction and operation of projects. The model quantifies direct emissions from construction and vehicle use, as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. The mobile source emission factors used in the model, published by the California Air Resources Board (CARB), include the Pavley standards and Low Carbon Fuel Standards. The emissions model also identifies project design features, regulatory measures, and selectable mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from the selected measures. CalEEMod was developed by the California Air Pollution Control Officers Association (CAPCOA) in collaboration with California air districts. Default land use data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) were provided by the various California air districts such as the Ventura County Air Pollution Control District (VCAPCD) to account for local requirements and conditions.

Each representative equipment inventory was entered into CalEEMod, along with an average duration in days and a unit measurement appropriate to the construction activity involved. For example, per acre was used for grading, and per mile was used for pipeline construction. The CalEEMod simulations were run to determine the amount of pollutants and GHGs that would be emitted for construction during each activity. For air quality, the focus of the on-site construction analysis is on oxides of nitrogen (NO_x) and respirable particulate matter (PM₁₀) because construction activities generally cause substantial emissions of these pollutants and Ventura County is non-attainment for the California Ambient Air Quality Standards for ozone (and NO_x is an ozone precursor) and PM₁₀. The GHG emissions were obtained from CalEEMod in the form of metric tons (MT) of carbon dioxide equivalents (CO₂e) for the total construction activity. After the selected scenarios were run, the emissions were normalized to produce the emission factors that can be applied to scale for each location based on the types and amount of that activity

required. Emission factors were identified as associated with either an on-site or an off-site construction activity.

On-Site Construction Activity-Based Emission Factors

On-site construction emissions include site preparation, grading, and construction within the footprint of the future compressor station. Activity-based emission factors used for this evaluation are Grading – Flat, Grading – Elevated, Compressor Station, and Substation (where applicable). Emission factors for these activities are shown in Table 1. These factors represent the maximum emissions per unit of measure to provide a conservative estimate.

Table 1: On-Site Construction Activity-Based Emission Factors

Construction Activity	NO _x (pound [lb]/acre)	PM ₁₀ (lb/acre)	CO ₂ e (MT/acre)
Grading – Flat	1,855	495	224
Grading – Elevated	5,186	675	822
Compressor Station	2,678	512	395
Substation	2,081	118	466

Off-Site Construction Activity-Based Emissions Factors

Off-site construction emissions include those from equipment used for pipeline, powerline, and road work. Activity-based emission factors used for this evaluation are Pipeline-Street, Pipeline-Open Space, and Powerline. Since linear component construction is spread over miles, the air quality ranking is based on total length of the components and only GHG emissions were calculated for off-site construction. GHG emission factors for these activities are shown in Table 2. These factors represent the maximum emissions per unit of measure to provide a conservative estimate.

Table 2: Off-Site Construction Activity-Based Emission Factors

Construction Activity	CO ₂ e (MT/mile)
Powerline	166
Pipeline – Street	186
Pipeline – Open Space	78

Construction Air Quality and GHG Results

For each site alternatives analysis, the site options have been assigned a number and a letter (A or B) for use in the rubric to correspond to the two equipment configuration options, Option A designated the NG-Only option and Option B designated the Hybrid option. Results of the emissions analysis for on-site and off-site construction activities are presented for each alternative by equipment configuration option.

On-Site Construction Emissions

Estimated acreages for the Compressor Station and Substation activities are based on the acreages from the example projects used for developing equipment inventories for input into CalEEMod. Acreages for grading are based on the “new disturbance” areas from the construction assumptions, as well as analysis of the GIS data to determine the amount of

flat versus elevated grading. Elevated area is assumed as any area that has a greater than 20 percent slope. The scaling values for the NG-Only options are shown in Table 3 and the Hybrid options in Table 4.

Table 3: On-Site Construction Scaling Values (Acres) – NG-Only Option

Activity	Units	Option 1A: Existing Site – NG	Option 2A: Avocado Site – NG	Option 3A: Ventura Steel – NG	Option 4A: Devil’s Canyon Road - NG	Option 5A: County Line – NG
Grading – Flat	Acres	0.47	0.62	0.47	0.47	4.43
Grading – Elevated	Acres	0	14.44	0	0	7.91
Compressor Station	Acres	3.95	3.95	3.95	3.95	3.95
Substation	Acres	0	0	0	0	0

Table 4: On-Site Construction Scaling Values (Acres) – Hybrid Option

Activity	Units	Option 1B: Existing Site – Hybrid	Option 2B: Avocado Site – Hybrid	Option 3B: Ventura Steel – Hybrid	Option 4B: Devil’s Canyon Road – Hybrid	Option 5B: County Line – Hybrid
Grading – Flat	Acres	0.47	0.62	0.47	0.47	4.43
Grading – Elevated	Acres	0	14.44	0	0	7.91
Compressor Station	Acres	3.95	3.95	3.95	3.95	3.95
Substation	Acres	0.63	0.63	0.63	0.63	0.63

Estimated emissions from on-site construction are calculated by multiplying the emission factor by the corresponding area for that activity. The results are shown in Table 5 for the NG-Only options and in Table 6 for the Hybrid options.

Table 5: On-Site Construction Emissions – NG-Only Options

Pollutant	Units	Option 1A: Existing Site – NG	Option 2A: Avocado Site – NG	Option 3A: Ventura Steel – NG	Option 4A: Devil’s Canyon Road – NG	Option 5A: County Line – NG
NO _x	Pounds	11,450	86,614	11,450	11,450	59,817
PM ₁₀	Pounds	2,255	12,076	2,255	2,255	9,555
CO _{2e}	MT	1,666	13,569	1,666	1,666	9,055

Table 6: On-Site Construction Emissions – Hybrid Options

Pollutant	Units	Option 1B: Existing Site – Hybrid	Option 2B: Avocado Site – Hybrid	Option 3B: Ventura Steel – Hybrid	Option 4B: Devil's Canyon Road – Hybrid	Option 5B: County Line – Hybrid
NO _x	Pounds	12,761	87,925	12,761	12,761	61,128
PM ₁₀	Pounds	2,329	12,151	2,329	2,329	9,629
CO ₂ e	MT	1,959	13,862	1,959	1,959	9,348

Ranking for On-Site Construction

In the ranking rubric, air quality for the on-site construction activities is rated according to the amount of off-road construction equipment on site and duration of activity.

- For NO_x emissions, the ranking levels are: 0, greater than 80,000 pounds (40 tons); 1 to 3, less than 80,000 pounds and greater than 40,000 pounds; 4 to 6, less than 40,000 pounds and greater than 8,000 pounds; 7 to 9, less than 8,000 pounds (4 tons).
- For PM₁₀ emissions, the ranking levels are: 0, greater than 10,000 pounds; 1 to 3, less than 10,000 and greater than 6,000 pounds; 4 to 6, less than 6,000 and greater than 2,000 pounds; 7 to 9, less than 2,000 pounds.

The GHG impact is rated according to the metric tons of CO₂e that are directly produced from construction equipment on-site and indirectly produced, i.e., resulting from activities related to construction but not immediately on site.

- The ranking ranges for construction are: 0, greater than or equal to 20,000 MT CO₂e; 1 to 3, greater than or equal to 10,000 MT CO₂e but less than 20,000 MT CO₂e; 4 to 6, greater than or equal to 5,000 MT CO₂e but less than 10,000 MT CO₂e; 7 to 9, less than 5,000 MT CO₂e.

Option 1A: Existing NG-Only

The existing site is flat, with a minimal amount of new disturbance area requiring grading. As a result, the NO_x and PM₁₀ emissions are in the low end of the 4 to 6 ranking range. The expected GHG emissions are under 2,000 MT.

Ranking:

- Air quality (NO_x/PM₁₀): 6
- GHG: 8

Option 1B: Existing Hybrid

The existing site is flat, with a minimal amount of new disturbance area requiring grading. A new on-site substation is not needed for the Hybrid option. As a result, both NO_x and PM₁₀ emissions are also within the 4 to 6 ranking range for air quality. The expected GHG emissions are under 2,000 MT, within the lowest range of less than 5,000 MT.

Ranking:

- Air quality (NO_x/PM₁₀): 6
- GHG: 8

Option 2A: Avocado NG-Only

The Avocado site is very hilly (over 14 acres with a slope greater than 20%) and will require a large amount of grading and excavation; the existing site has no industrial development. As a result, both the NO_x and PM₁₀ emissions are in the highest range for air quality. The increased amount of off-road equipment usage increases the GHG emissions above 10,000 MT, into the lower ranking range.

Ranking:

- Air quality (NO_x/PM₁₀): 0
- GHG: 2

Option 2B: Avocado Hybrid

The Avocado site is very hilly (over 14 acres with a slope greater than 20%) and will require a large amount of grading and excavation; the existing site has no industrial development. The Hybrid option will also require additional on-site construction activity for a substation. As a result, both the NO_x and PM₁₀ emissions are somewhat higher than Option 2A so are also in the highest range for air quality. The increased amount of off-road equipment usage increases the GHG emissions above 10,000 MT, into the 4 to 6 range.

Ranking:

- Air quality (NO_x/PM₁₀): 0
- GHG: 2

Option 3A: Ventura Steel NG-Only

The Ventura Steel site is flat, with a minimal amount of new disturbance area requiring grading. As a result, the NO_x and PM₁₀ emissions are in the low end of the 4 to 6 ranking range. The expected GHG emissions are under 2,000 MT, within the range of less than 5,000 MT.

Ranking:

- Air quality (NO_x/PM₁₀): 6
- GHG: 8

Option 3B: Ventura Steel Hybrid

The Ventura Steel site is flat, with a minimal amount of new disturbance area requiring grading. The hybrid site also requires construction of a substation, increasing the NO_x and PM₁₀ emissions by less than 10% from Option 3A. As a result, both NO_x and PM₁₀ emissions are within the 4 to 6 ranking range for air quality. The expected GHG emissions are under 2,000 MT, within the range of less than 5,000 MT.

Ranking:

- Air quality (NO_x/PM₁₀): 6
- GHG: 8

Option 4A: Devil's Canyon NG-Only

The Devil's Canyon site has minimal elevated areas, with a minimal amount of new disturbance area requiring grading. As a result, the NO_x and PM₁₀ emissions are in the low end of the ranking range. The expected GHG emissions are under 2,000 MT, within the range of less than 5,000 MT.

Ranking:

- Air quality (NO_x/PM₁₀): 6
- GHG: 8

Option 4B: Devil's Canyon Hybrid

The Devil's Canyon site has minimal elevated areas, with a minimal amount of new disturbance area requiring grading. The hybrid site also requires construction of a substation, increasing the NO_x and PM₁₀ emissions by less than 10% over Option 4A. As a result, both NO_x and PM₁₀ emissions are within the 4 to 6 ranking range for air quality. The expected GHG emissions are under 2,000 MT, within the range of less than 5,000 MT.

Ranking:

- Air quality (NO_x/ PM₁₀): 6
- GHG: 8

Option 5A: County Line NG-Only

The County Line site is hilly (over 7.5 acres with a slope greater than 20%) and will require a large amount of grading and excavation; the existing site has no industrial development. As a result, the NO_x and PM₁₀ emissions are in the 1 to 3 ranking range for air quality. The increased amount of off-road equipment usage increases the GHG emissions over the relatively flat options (1, 3, and 4), but the emissions are slightly under 10,000 MT, in the 4 to 6 range.

Ranking:

- Air quality (NO_x/PM₁₀): 2
- GHG: 4

Option 5B: County Line Hybrid

The County Line site is hilly (over 7.5 acres with a slope greater than 20%) and will require a large amount of grading and excavation; the existing site has no industrial development. The Hybrid option will also require additional construction activity for a substation. As a result, the NO_x and PM₁₀ emissions are in the 1 to 3 ranking range for air quality. The increased amount of off-road equipment usage increases the GHG emissions over Option 5A, but the emissions are also slightly under 10,000 MT.

Ranking:

- Air quality (NO_x/PM₁₀): 2
- GHG: 4

Off-Site Construction Emissions

Estimated distances for linear, off-site construction are provided in Table 7. These values are based on the construction assumptions provided, as well as analysis of the GIS data and land use data.

Table 7: Length of New Linear Construction Associated with Each Site and Configuration Option

Site	New Linear Components	Length (feet)	
		NG-Only (Option A)	Hybrid (Option B)
1. Existing	None	0	0
2. Avocado	Access Road	12,315	12,315
	Electrical Interconnect	0	4,359
	Pipeline System	982	982
	Total (feet)	13,297	17,656
	Total (miles)	2.52	3.34
3. Ventura Steel	Access Road	3,600	3,600
	Electrical Interconnect	0	122
	Pipeline System	26,786*	26,786*
	Total (feet)	30,386*	30,508*
	Total (miles)	5.75	5.78
4. Devil's Canyon	Access Road	1,892	1,892
	Electrical Interconnect	0	4,507
	Pipeline System	5,135	5,135
	Total (feet)	7,027	11,534
	Total (miles)	1.33	2.18
5. County Line	Access Road	2,499	2,499
	Electrical Interconnect	0	1,405
	Pipeline System	5,650	5,650
	Total (feet)	8,149	9,554
	Total (miles)	1.54	1.81

* Distance totals reflect that the pipeline length for Ventura Steel is doubled for the 1.61 miles along Ventura Avenue because trenching on both sides of the street is required.

The scaling values for the NG options are shown in Table 7 and for the Hybrid options in Table 8.

Table 8: Off-Site Construction Scaling Values – NG-Only Options

Activity	Units	Option 1A: Existing Site – NG	Option 2A: Avocado Site – NG	Option 3A: Ventura Steel – NG	Option 4A: Devil’s Canyon Road – NG	Option 5A: County Line – NG
Powerline	Miles	0	0	0	0	0
Pipeline – Street	Miles	0	0	3.22	0.97	0
Pipeline – Open Space	Miles	0	0.19	1.85	0	1.07
Road Construction	Miles	0	2.33	0.68	0.36	0.47

Table 9: Off-Site Construction Scaling Values – Hybrid Options

Activity	Units	Option 1B: Existing Site – Hybrid	Option 2B: Avocado Site – Hybrid	Option 3B: Ventura Steel – Hybrid	Option 4B: Devil’s Canyon Road – Hybrid	Option 5B: County Line – Hybrid
Powerline	Miles	0	0.83	0.02	0.85	0.27
Pipeline – Street	Miles	0	0	3.22	0.97	0
Pipeline – Open Space	Miles	0	0.19	1.85	0	1.07
Road Construction	Miles	0	2.33	0.68	0.36	0.47

Estimated GHG emissions from linear, off-site construction are calculated by multiplying the emission factor by the corresponding length for each component, with the GHG emissions adjusted to reflect the complexity of the activity. Pipeline-Street emission factors are used to estimate emissions from road construction. The results are shown in Table 10 for the NG-Only options and in Table 11 for the Hybrid options.

Table 10: Off-Site Construction Emissions – NG-Only Options

Pollutant	Units	Option 1A: Existing Site – NG	Option 2A: Avocado Site – NG	Option 3A: Ventura Steel – NG	Option 4A: Devil’s Canyon Road – NG	Option 5A: County Line – NG
CO ₂ e	MT	0	448	870	248	171

Table 11: Off-Site Construction Emissions – Hybrid Options

Pollutant	Units	Option 1B: Existing Site – Hybrid	Option 2B: Avocado Site – Hybrid	Option 3B: Ventura Steel – Hybrid	Option 4B: Devil’s Canyon Road – Hybrid	Option 5B: County Line – Hybrid
CO ₂ e	MT	0	585	874	389	216

Ranking for Off-Site Construction

In the ranking rubric, scoring for air quality impact from off-site construction is based on the total length of the linear construction associated with each site. Ranking levels were set to best differentiate the potential impacts for each site.

- Based on linear feet of off-site components, the ranking levels are: 0, greater than 15,000 feet; 1 to 3, greater than 10,000 and less than 15,000 feet; 4 to 6, greater than 500 feet and less than 5,000 feet; and 7 to 9, less than 500 feet.

The GHG impact is rated according to the metric tons of CO₂e that are directly produced from the types of construction equipment expected for the linear components and indirectly produced, i.e., resulting from activities related to construction but directly from the equipment used.

- The ranking ranges for off-site construction are: 0, greater than or equal to 2,000 MT CO₂e; 1 to 3, greater than or equal to 1,000 MT CO₂e but less than 2,000 MT CO₂e; 4 to 6, greater than or equal to 500 MT CO₂e but less than 1,000 MT CO₂e; 7 to 9, less than 500 MT CO₂e.

Option 1A: Existing NG-Only

The existing site for the NG-only option will not require any new off-site linear construction, so it is given the highest score of 9. Since it will require no off-site linear construction, the GHG contribution is zero, and it is given the highest score of 9.

Ranking:

- Air quality: 9
- GHG: 9

Option 1B: Existing Hybrid

The existing site for the Hybrid option will not require any new off-site linear construction, so it is given the highest score of 9. Since it will require no off-site linear construction, the GHG contribution is zero, and it is given the highest score of 9.

Ranking:

- Air quality: 9
- GHG: 9

Option 2A: Avocado NG-Only

The Avocado site will require construction of two pipelines to connect to the existing main lines. It will also require grading, widening, and paving of an existing road to accommodate plant traffic to the new site. All this linear construction is adjacent to open space land and is estimated to be a total of 13,297 feet, which is in the 1 to 3 ranking range.

GHG emissions from off-site construction are close to the less than 500 MT threshold so it is given a score of 7.

Ranking:

- Air quality: 2
- GHG: 7

Option 2B: Avocado Hybrid

The Avocado site for the Hybrid option will require construction of two pipelines to connect to the existing main lines. It will also require grading, widening, and paving of an existing road to accommodate plant traffic to the new site. In addition, it will require an electrical interconnect to accommodate the increased demand from the EDCs. All linear construction is adjacent to open space land and totals an estimated 17,656 feet, which is in the highest range.

GHG emissions from off-site construction are in the range just above 500 MT, so it is given a score of 6.

Ranking:

- Air quality: 0
- GHG: 6

Option 3A: Ventura Steel NG-Only

For the NG-Only option, the Ventura Steel site will require extensive pipeline work to connect to existing main lines. Two pipelines will be located under Ventura Avenue to connect to the main pipelines at the existing Ventura Compressor Station location. The 1.61-mile length of the two pipelines along Ventura Avenue have been doubled since trenching along both sides of this street will be required. Additional pipelines will be constructed southeastward adjacent to open space and residential areas. New access roads will be needed to reach the pipeline routes. In all, an estimated 30,386 feet of linear components will be constructed, placing this option far above the highest level value.

GHG emissions from off-site construction are in the range between 500 and 1,000 MT.

Ranking:

- Air quality: 0
- GHG: 4

Option 3B: Ventura Steel Hybrid

For the Hybrid option, the Ventura Steel site will require extensive pipeline work to connect to existing main lines. Two pipelines will be located under Ventura Avenue to connect to the main pipelines at the existing Ventura Compressor Station location. The 1.61-mile length of the two pipelines along Ventura Avenue have been doubled since trenching along both sides of this street will be required. Additional pipelines will be constructed southeastward adjacent to open space and residential areas. New access roads will be needed to reach the pipeline routes. The Hybrid option will also require a new powerline due to increased power demand. In all, an estimated 30,508 feet of linear components will be constructed, placing this option far above the highest level value.

GHG emissions from off-site construction are slightly higher for the Hybrid option than the NG-Only option, but still within the 4 to 6 range.

Ranking:

- Air quality: 0
- GHG: 4

Option 4A: Devil's Canyon NG-Only

For the NG-Only option, Devil's Canyon will require a new pipeline beneath an upgraded roadway, as well as additional access road work to the northeast. All linear construction is through open space and is estimated to be a total of 7,027 feet, which is in the middle of the ranking range.

GHG emissions from off-site construction are in the range below 500 MT.

Ranking:

- Air quality: 5
- GHG: 8

Option 4B: Devil's Canyon Hybrid

For the Hybrid option, Devil's Canyon will require a new pipeline beneath an upgraded roadway, as well as additional access road work to the northeast. The Hybrid option will require almost a mile of new electrical interconnect and a substation. All this linear construction is through open space, and totals an estimated 11,534 feet, which raises this site's Hybrid option to the 4 to 6 ranking range.

GHG emissions from off-site construction are in the lowest range but slightly higher than the NG-Only option.

Ranking:

- Air quality: 3
- GHG: 7

Option 5A: County Line NG-Only

For the NG-Only option, County Line will require a new pipeline to connect to an existing main line, as well as a depressurization line. Access road improvements are also required. All this linear construction is through open space, and totals an estimated 8,149 feet, which is in the middle of the ranking range.

GHG emissions from off-site construction are well below the less than 500 MT threshold.

Ranking:

- Air quality: 5
- GHG: 9

Option 5B: County Line Hybrid

For the Hybrid option, County Line will require a new pipeline to connect to an existing main line, as well as a depressurization line. Access road improvements are also required. In addition, 1,405 feet of electrical interconnect and a new substation is required to accommodate the increased power requirements for the EDCs. All this linear construction is through open space, and totals an estimated 9,554 feet, which is near the top of the ranking range.

GHG emissions from off-site construction are well below the less than 500 MT threshold.

Ranking:

- Air quality: 4
- GHG: 9

OPERATIONAL EMISSIONS

As proposed, the operational emissions will be the same as proposed for the existing VCS site with four engine-driven NG compressors for four of the sites and only vary for the County Line site (Options 5A and 5B), which requires an additional compressor over the others due to its location. There will also be variation in emissions associated with the compressor drivers in the NG-only option as compared to the Hybrid option since the Hybrid option has fewer NG compressors and thus fewer direct emissions than the NG-Only option.

The Hybrid option replaces two of the NG compressors with two EDCs of equivalent horsepower (and also includes an additional NG compressor replacement with an EDC in the case of Option 5), essentially cutting the expected direct emissions in half. However, the Hybrid option will require electricity to operate the EDCs, and indirect GHG may be emitted associated with additional electrical generation, whereas the NG-only option has negligible indirect GHG emissions.

Representative Data

For operational emissions, calculations for the new proposed engine-driven NG compressors were taken from the Authority to Construct (ATC) application that was submitted to the VCAPCD for the VCS Modernization Project at the existing site, which is based on potential to emit (PTE). Specifically, each of the four (or five) engine compressors were assumed to operate up to 24 hours

per day, 7 days per week and associated PTE emissions were calculated. For the Hybrid option, it was assumed that each of the two (or three) natural gas engine compressors and each of the two EDCs would operate up to 24 hours per day, 7 days per week, for the direct criteria and GHG emissions calculations, and for the indirect GHG emission calculations. Operational emissions for the Hybrid option were based on contributions from the reduced number of NG compressors, plus additional GHG emissions associated with the indirect electricity needed to operate the EDCs. Operational emissions for both equipment configurations were assumed to be roughly the same for Options 1-4, so was not a differentiator of those sites for this analysis; Option 5 requires an additional NG compressor for a total of five units, resulting in higher emissions. PM₁₀ from this equipment are expected to be low during operation since either NG or electricity will be used for fuel, and only NO_x emissions are ranked.

Emission Factors and Calculations

As noted above, operational emissions for the proposed Waukesha 1,900 brake horsepower engines that drive the NG compressors were based on the ATC application submitted to the VCAPCD for modernization of the existing VCS site. These emissions calculations relied on the engine manufacturer’s data as well as standard natural gas fired combustion for the proposed engines and accounted for VCAPCD best available control technology (BACT) requirements.

Operational NO_x emissions for the Hybrid option are based on two NG-fired engines. It is assumed that the Hybrid option will operate all compressors (both natural gas and electric) 24 hours a day, seven days a week.

For this analysis, the Western Electricity Coordinating Council (WECC) California and Mexico subregion (CAMX) emission factor was used to estimate indirect GHG emissions for electricity use for the EDCs. This factor is an average of the regional power mix, accounting for renewable energy generation as well as fossil-fueled generation to determine an average emission factor for pounds of CO_{2e} per megawatt-hour produced. It is assumed that the Hybrid option will operate all compressors (both natural gas and electric) 24 hours a day, seven days a week (8,760 hours/year).

Results

The shift from the NG-Only option to a Hybrid option reduces the localized emissions of criteria pollutants and direct GHG emissions, but increased power demand from the electric compressors will increase indirect GHG emissions depending on how the power that is used is generated.

Estimated operational NO_x emissions are presented in Table 12. The ranking ranges for operational NO_x emissions are: 0, greater than or equal to 12 tons/yr (0); 1 to 3, greater than or equal to 8 tons/yr but less than 12 tons/yr (1-3); 4 to 6, greater than or equal to 4 tons/yr but less 8 tons/yr (4-6); and 7 to 9, less than 4 tons/yr (7-9).

Table 12: Operational NO_x Emissions

	Options 1A-4A NG-Only	Options 1B-4B Hybrid	Option 5A NG-Only	Option 5B Hybrid
NO _x (tons/yr/engine)	2.8	2.8	2.8	2.8
Number of engines	4	2	5	2
Total NO _x (tons/yr)	11	5.6	14	5.6

The GHG impact is rated according to the MT/year of CO₂e that are directly produced from equipment and indirectly produced, indirectly produced, e.g., as a result of electricity generated elsewhere that is used on site. The results of the GHG calculations are presented in Table 13. The ranking ranges for GHG emissions are: 0, greater than or equal to 50,000 MT/yr CO₂e; 1 to 3, greater than or equal to 25,000 MT/yr CO₂e but less than 50,000 MT/yr CO₂e; 4 to 6, greater than or equal to 10,000 MT/yr CO₂e but less than 25,000 MT/yr CO₂e; and 7 to 9, less than 10,000 MT/yr CO₂e.

Table 13: Operational Greenhouse Gas Emissions

	Options 1A-4A NG-Only	Options 1B-4B Hybrid	Option 5A NG-Only	Option 5B Hybrid
Direct GHG (MT CO ₂ e/yr/engine)	6,959	6,959	6,959	6,959
Indirect GHG (MT CO ₂ e/yr/EDC)	2,750	2,750	2,750	2,750
Number of engines	4	2	5	2
Number of EDCs	0	2	0	3
Total MT CO ₂ e/yr	27,836	19,418	34,795	22,168

Ranking for Operations Emissions

Option 1A-4A: NG-Only

Options 1 through 4 have the same ranking for Option A.

- Air Quality: 1
- GHG: 3

For air quality, the estimated emissions of NO_x for the NG-Only option fall in the 8 to 12 tons/yr category. Since 11 tons/yr is closer to the upper end of the emission range, Option A was scored a 1.

For GHG, the estimated emissions for the NG-Only option fall in the 25,000 to 50,000 MT/yr category. Since 27,836 MT/yr is closer to the lower end of the range, Option A was scored a 3.

Option 1B-4B: Hybrid

Options 1 through 4 have the same ranking for Option B.

- Air Quality: 5
- GHG: 5

For air quality, the estimated emissions of NO_x for the Hybrid option fall in the 4 to 8 tons/yr category. The estimated emissions of 5.5 tons/yr are in the middle of the range, so Option B was scored a 5.

For GHG, the estimated emissions for the Hybrid option fall in the 10,000 to 25,000 MT/yr category. Since 19,418 MT/yr is closer to the middle of this emissions range, Option B was scored a 5.

Option 5A: NG-Only

- Air Quality: 0
- GHG: 2

For air quality, the estimated emissions of NO_x for the NG-Only option at County Line are in the greater than 12 tons/yr category due to the additional engine.

For GHG, the estimated emissions for the NG-Only option still fall in the 25,000 to 50,000 MT/yr category even with an additional engine, but closer to the middle of the range, so it is scored a 2.

Option 5B: Hybrid

- Air Quality: 5
- GHG: 5

For air quality, the estimated emissions of NO_x for the Hybrid option fall in the 4 to 8 tons/yr category. The estimated emissions of 5.5 tons/yr are in the middle of the range, so Option 5B was scored a 5.

For GHG, the estimated emissions for the Hybrid option fall in the 10,000 to 25,000 MT/yr category, but closer to the high end of the range with the additional EDC, so Option B was scored a 4.

SUMMARY AND CONCLUSION

Using objective activity-based emission factors and expected operational data, along with construction mobile source emissions estimates using CalEEMod and basic assumptions, Yorke quantitatively evaluated the various alternative site locations and equipment configurations for the air quality and GHG impact areas. These rankings are summarized in Table 14. Based on Yorke's calculations and rankings for air quality and GHG emissions for compressor station operation, on-site construction, and off-site construction support, the highest scoring option was Option 1B, the existing VCS site with the Hybrid option, which resulted in a combined score of 42. The next highest score was for the originally proposed all natural-gas option at the existing VCS site (Option 1A), with a score of 36. The highest-ranking alternative site option was Devil's Canyon Road with Hybrid option (4B), with a score of 34.

Should you have any questions or concerns, please contact Yorke Engineering at (949) 248-8490.

Sincerely,

Yorke Engineering, LLC

DATA RELATED TO METHODOLOGY COMPONENT - ARCHIVAL RESEARCH, HISTORIC MAPS AND AERIAL PHOTOGRAPHS

VENTURA COMPRESSOR SITE

Historical Aerials Review

Year	Description
Site Location	
1947	The 1947 aerial shows the proposed Site Location cleared of vegetation with a series of long rectangular structures along the north and west edges. There are four smaller square structures along the eastern edge.
1967	The 1967 aerial only depicts the northern-most rectangular structures previously mentioned, the remainder of the area appears to be paved and is void of structures and vegetation.
1978	The 1978 aerial is of poor quality and there are no discernable changes since the 1967 aerial was taken.
1980	The 1980 aerial shows the southern half of the proposed Site location in use as a parking lot, as well as two additional structures near the northern boundary.
1994	The 1994 aerial only depicts two structures near the northern boundary, the remainder of the proposed Site Location is void of structures.
2005 -2018	No significant changes to the proposed Site Location.
Staging Area	
1947	The 1947 aerial shows the northern half of the proposed Staging Area as partially developed with circular structures. The southern half of the proposed Staging Area appears to be undeveloped and void of vegetation.
1967	The 1967 aerial shows the surface area of the southern half of the proposed Staging Area as disturbed. There is possibly a small square structure within the southeast corner of the proposed Staging Area.
1978	The 1978 aerial is of poor quality however the southern half of the proposed Staging Area appears partially developed.
1980	The 1980 aerial shows the circular structures as no longer present. There are four structures present within the proposed Staging Area, three small square structures along the northeast corner and one along the southeastern edge.
1984	The 1984 aerial shows the surface area of the proposed Staging area as covered, possibly paved. None of the structures present within the previous aerials are present. There are rows going east to west across the proposed Staging Area, however, due to the quality of the image, it cannot be discerned what the rows are.
1994	The 1994 aerial shows the proposed Staging Area in use as a storage yard.
2005-2018	No significant changes to the proposed Staging Area.

Topographic Maps Review

Year	Description
Site Location	
1904	The topographic map depicts the proposed Site Location as undeveloped and void of structures.
1910-1946	No significant changes to the proposed Site Location.
1952	The topographic map depicts a series of seven structures along the eastern edge and three larger rectangular structures along the northern edge of the proposed Site Location. The area is labeled as "Chrisman."
1955	No significant changes to the proposed Site Location.
1961	The topographic map only shows a series of three structures along the eastern edge, and an orchard present in the southern half of the proposed Site Location.
1964	No significant changes to the proposed Site Location.
1966	The topographic map resembles the maps from 1952 through 1955, with no discernable changes.
1968-1972	No significant changes to the proposed Site Location.
2012	The topographic map only depicts structures of community or social significance (i.e.: schools and churches). No structures are within the proposed Site Location.
2015-2018	No significant changes to the proposed Site Location.
Staging Area	
1904	Proposed Staging Area is depicted as undeveloped, with a rail line to the west.
1910-1946	No significant changes to the proposed Staging Area.
1952	The topographic map depicts a cluster of six circular structures in the northern portion of the proposed Staging Area and the southern half as undeveloped.
1955	No significant changes to the proposed Staging Area.
1961 & 1964	The topographic map shows the proposed Staging Area as an orchard with a rail line to the west.
1966	The 1966 topographic map resembles the 1955 map, and depicts no significant changes to the proposed Staging Area.
1968 & 1972	No significant changes to the proposed Staging Area.
2012-2018	The topographic map only depicts structures of community or social significance (i.e.: schools and churches). No structures are depicted within the proposed Staging Area.

AVOCADO SITE

Historical Aerials Review

Year	Description
Site Location	
1947	The 1947 aerial shows the proposed Site Location as covered in vegetation.
1967-1978	Due to the quality of the aerial photographs, there are no discernable changes to the proposed Site Location
1980-2018	No significant changes to the proposed Site Location
Staging Area	
1947	The 1947 aerial shows the proposed Staging Area as undeveloped. There are tree lines along the southern and western borders. There is a road south of the proposed Staging Area.
1967	The 1967 aerial shows the road south of the proposed Staging Area as expanded and connecting to the Highway. The proposed Staging Area is undeveloped. The southern end of the proposed Staging Area was been cleared of most small and large vegetation.
1978	The 1978 aerial is of poor quality and there are no discernable changes since the 1967 aerial was taken.
1980	The 1980 aerial shows the tree lines as having been removed and only a single tree within the southwest corner remains. The southern end of the proposed Staging Area is cleared of all vegetation.
1984	The proposed Staging Area is being used as an agricultural field. There once again is a tree line along the western and southern borders of the proposed Staging Area.
1994	The 1949 aerial shows additional trees within the southwest corner of the proposed Staging Area. There are no other significant changes.
2005	By 2005 the trees within the southwest corner of the proposed Staging Area have been removed and the proposed Staging Area's surface appears to be graded.
2009 & 2010	The proposed Staging Area is being used for Agricultural purposes.
2012	The proposed Staging Area is being used for Agricultural purposes and the trees along the western and southern borders have been removed.
2014 & 2016	There are no significant changes to the proposed Staging Area
2018	The proposed Staging Area is being used for agricultural purposes and is covered in agricultural covers.
Potential Access Road (Taylor Ranch Road)	
1947-2018	There have been no significant changes to the Potential Access Road, Taylor Ranch Road.
Potential Pipeline	
1947-2005	The Potential Pipeline is undeveloped.
2009-2018	The area on the Potential Pipeline outside of the proposed Site location is being used for agricultural purposes

Topographic Maps Review

Year	Description
Site location	
1904-2018	No significant changes to the proposed Site Location
Staging Area	
1904-1946	The proposed Staging Area is depicted as undeveloped
1952 & 1955	The proposed Staging Area is depicted as undeveloped. The road south of the proposed Staging Area is labeled as Highway 101 and as 3 lanes. There is also a road west of the proposed Staging Area.
1961 & 1964	The proposed Staging Area is depicted as undeveloped. The road west of the proposed Staging Area is not depicted on the map
1966-1972	The 1966 to 1972 topographic maps depict the same information as the 1952 and 1955 maps
2012-2018	There are no changes to the proposed Staging Area depicted.
Potential Access Road (Taylor Ranch Road)	
1904-1946	The Potential Access Road is depicted as east of its current location and runs north to south until it turns west into Canada del Diablo
1952, 1955, 1966-1972	The Potential Access Road is depicted as it currently is, but with a fork branching off into the proposed Staging Area
1964 & 1964	The Potential Access Road is depicted as east of its current location and runs north to south until it turns west into Canada del Diablo
2012 & 2018	The Potential Access Road is depicted as it is currently.
2015	The Potential Access Road is not depicted on the topographic map
Potential Pipeline	
1904-2018	The Potential Pipeline area is depicted as undeveloped

VENTURA STEEL SITE

Historical Aerials Review

Year	Description
Site Location	
1947	The 1947 aerial shows East Shell Road and Hartman Turnoff as present. There appears to be some activity within the proposed Project Location; however due to the quality of the image, it is not discernable on whether there are structures present or if the proposed Project Location is being used for storage.
1967	The 1967 aerial depicts the proposed Site Location as having one permanent structure in the southwest corner and approximately three-quarters of the proposed Project Location appears to be in use as a storage yard. Approximately one-quarter section of the eastern portion of the proposed Project Location is partially covered with small vegetation
1978-1994	No significant changes to the proposed Site Location, with the exception of the small vegetation within the approximate one-quarter section of the eastern portion of the proposed Project Location has been removed.
2005-2018	No significant changes to the proposed Site Location.
Staging Area	
1947	The 1947 aerial depicts the proposed Staging Area as void of structures and appears to have been graded.
1967	The 1967 aerial shows a series of 12 cisterns in the northeastern corner of the proposed Staging Area, as well as additional ancillary structures along the southern edge. It appears to be paved.
1978	The 1978 aerial is of poor quality and there are no discernable changes since the 1967 aerial was taken.
1980	The 1980 aerial shows only nine of the cisterns, as well as an increase in structures along the southern edge of the proposed Staging Area.
1994	The 1994 aerial does not show any cisterns, it appears the proposed Staging Area is in use as a storage yard.
2005-2018	No significant changes to the proposed Staging Area.
Potential Pipeline	
1947	The 1947 aerial depicts the western half of the proposed Potential Pipeline following North Ventura Avenue from West McFarlane Drive to Shell Road, all of which are present. The eastern half is undeveloped.
1967	The 1967 aerial depicts no significant changes to the western half of the proposed Potential Pipeline. The eastern half appears to intersect an oil facility along Shell Road East.
1978	No significant changes to the proposed Potential Pipeline.
1980	The 1980 aerial no longer depicts the oil facility along Shell Road East along the eastern half of the proposed Potential Pipeline.
1994-2018	No significant changes to the proposed Potential Pipeline.

Topographic Maps Review

Year	Description
Site Location and Staging Area	
1904-1946	The proposed Site Location and proposed Staging Area are undeveloped.
1952 & 1955	The proposed Site Location is partially developed with seven circular structures. The proposed Staging Area is developed with twelve circular structures and two rectangular structures.
1961 & 1964	The 1961 and 1964 topographic maps show five circular structures scattered between Shell Road and Hartman Turnoff, as well as circular structures south of Shell Road.
1966	The 1966 topographic map depicts the same information as the 1952 and 1955 maps.
1968 & 1972	There are no significant changes to the proposed Site Location since the 1966 topographic map was created. There are an additional three square structures within the proposed Staging Area.
2012-2018	Shell Road, Hartman Turnoff, and Ventura Avenue are depicted. There is no other development depicted within the proposed Site Location and proposed Staging Area.
Potential Pipeline	
1904-1946	Ventura Avenue has been present since at least 1904. West McFarlan Drive was not present. The Potential Pipeline route east of the City of Ventura was depicted as undeveloped.
1952-1972	West McFarlan Drive is present. The Potential Pipeline route east of the City of Ventura and south of Cañada San Joaquin is undeveloped. There are scattered oil wells east of the City of Ventura and north of Cañada San Joaquin. It is difficult to discern if any of the oil wells overlap the proposed Pipeline route.
2012-2018	The Potential Pipeline Route east of the City of Ventura is primarily undeveloped, with the exception of School Canyon Road and Fire Road.

DEVILS CANYON ROAD SITE

Historical Aerials

Year	Description
Site Location	
1947-2018	The proposed Site Location has been developed for industrial purposes with Devil's Canyon Road intersecting the proposed Site location. By 1978 the amount of structures within the proposed Site Location has decreased, but the area remained developed
Staging Area	
1947	The surface area of the proposed Staging Area appears disturbed. There are six small circular tanks within the northwest section of the proposed Staging Area and a road running north to southwest west of the tanks. The road connects to Ventura Avenue.
1967	Five more small circular tanks have been added directly east of the existing tanks.
1978-1980	With the exception of the removal of small vegetation, there are no significant changes to the proposed Staging Area.
1994	The tanks have been removed and the road intersecting the proposed Staging Area is no longer visible.
2005-2018	There are no significant changes to the proposed Staging Area from how it appears currently
Potential Access Road (Mill Canyon Road and Devil's Canyon Road)	
1947-2018	There are no significant changes to the Potential Access Road
Potential Pipeline	
1947-2018	There are no significant changes to the Potential Pipeline route that runs along Devil's Canyon Road, north of where Devil's Canyon Road connects to Conoco Oil Road.
1947	The section of the Potential Pipeline route that runs south where Devil's Canyon Road connects to Conoco Oil Road appears to be in a wash area from the Ventura River.
1967	There is a road going south from where Devil's Canyon Road connects to Conoco Oil Road, however it does not follow the contours of the current road. The area on either side of the road is undeveloped and mostly covered in small vegetation.
1978 & 1980	The vegetation east of the road appears to be mostly cleared.
1994-2018	There are no significant changes to the Potential Pipeline route from how it appears currently.

Topographic Maps

Year	Description
Site Location	
1904-1946	Devil's Canyon Road is present however it is not depicted as straight as the current road. The proposed Site Location east and west of Devil's Canyon Road is undeveloped.
1952 & 1955	There are seven circular structures depicted within the proposed Site Location, west of Devil's Canyon Road.
1961 & 1964	There are six circular structures depicted within the proposed Site Location, west of Devil's Canyon Road.
1966-1972	There are seven circular structures depicted within the proposed Site Location, west of Devil's Canyon Road.
2012-2018	No development is depicted within the proposed Site Location
Staging Area	
1904-1946	Ventura Avenue, a rail line, and the Ventura River are depicted as running parallel to one another. The rail line is between the Ventura River and Ventura. There is no other development depicted within the area surrounding the proposed Staging Area.
1952 & 1955	The rail line is depicted where the current Ventura River Trail is located. There is a road along the western edge of the proposed Staging Area and there are six circular structures within the proposed Staging Area.
1961 & 1964	Ventura Avenue, a rail line, and the Ventura River are depicted however the proposed Staging Area is not decipherable.
1966-1972	The proposed Staging Area appears as it did in the 1952 and 1955 topographic maps
2012-2018	No development is depicted within the proposed Staging Area.
Potential Access Road (Mill Canyon Road and Devil's Canyon Road)	
1904-1946	There are roads where Mill Canyon Road and Devil's Canyon Road are located, however they are not depicted as straight as the current roads.
1952-2018	There are no significant changes to the Potential Access Road
Potential Pipeline	
1904-1946	There is a road depicted where Devil's Canyon Road is currently, however it runs parallel to the Ventura River and appears to connect with Taylor Ranch Road. The Road connects with a road running east to west through Canada del Diablo. The area between Devil's Canyon Road and the Ventura River is undeveloped.
1952-1972	Devil's Canyon Road and where it connects to Conoco Oil Road appears as it does currently. The area south of where Devil's Canyon Road connects to Conoco Oil Road is undeveloped and a tributary of the Ventura River runs parallel to Conoco Oil Road
2012 & 2018	The road running south of where Devil's Canyon Road connects to Conoco Oil Road is depicted and is intersected by a tributary of the Ventura River.
2015	The road running south of where Devil's Canyon Road connects to Conoco Oil Road is not depicted.

COUNTY LINE SITE

Historical Aerials Review

Year	Description
Site location and Staging Area	
1947-1994	The proposed Site Location and the proposed Staging Area are being used as an orchard.
2002	Most of the trees within the proposed Site Location have been removed, the proposed Staging Area remains as an orchard
2005	There is now a road trending northeast to southwest intersecting the proposed Site Location and proposed Staging Area. The road connects to Avocado Hill Road.
2009	The remaining trees within the proposed Site Location and most of the trees within the proposed Staging Area have been removed. The road intersecting the proposed Site Location now connects to the road boarding the western end of the proposed Staging Area and proposed Site Location
2010-2014	No significant changes to the proposed Site Location or proposed Staging Area
2016	The remaining orchard trees within the proposed Staging area have been removed
2018	The proposed Staging Area appears to be graded. There are no other significant changes.
Potential Access Road	
1947-2018	There are no significant changes to the Potential Access Road
Potential Pipeline	
1947-2018	The northern section of the Potential Pipeline follows Rincon Creek. Since 1947 Rincon Creek has had no significant changes and has been surrounded by a tree line and orchards. In 2005 there was a decrease in trees along the edge of Rincon Creek.
1947-2018	There are no significant changes to the southern section of the Potential Pipeline that does not intersect the proposed Site Location and proposed Staging Area.

Topographic Maps Review

Year	Description
Site Location and Staging Area	
1904-1946	The topographic maps depict Rincon Creek running adjacent and overlapping Rincon Road and the road connecting Rincon Road to Avocado Hill Road. The proposed Site Location and proposed Staging Area are depicted as undeveloped.
1953-2000	The topographic maps depict the proposed Site Location and proposed Staging Area as an orchard.
2012-2018	The topographic maps show the proposed Site Location and proposed Staging Area as covered in vegetation. Avocado Hill Road is not depicted on the 2015 topographic map.
Potential Access Road	
1904-2018	There are no significant changes to the Potential Access Road shown within the topographic maps
Potential Pipeline	
1904-1946	The topographic maps depict Rincon Creek running adjacent and overlapping Rincon Road and the road connecting Rincon Road to Avocado Hill Road. The remaining areas of the Potential Pipeline are undeveloped.
1953-2002	The Potential Pipeline sections that are not within existing roads are covered by orchards
2012-2015	The Potential Pipeline sections that are not within existing roads are covered by vegetation

DATA RELATED TO METHODOLOGY COMPONENT – NATURAL LANDSCAPE SETTING

VENTURA COMPRESSOR SITE ENVIRONMENTAL SETTING

The potential proposed Project site is located on the western edge of the City of Ventura, within Ventura County, California. The 8.42-acre parcel is currently developed and in use as the Ventura Compressor Station. It is generally flat with an average elevation of 65' amsl. The proposed potential Project site is located approximately 350 meters east of the Ventura River, which flows generally north to south from Matilija Creek of the Santa Ynez Mountains into the Pacific Ocean. It is situated approximately 2.6 miles north of the Pacific Ocean and approximately 3.8 miles south of the Santa Ynez Mountains. Soils are comprised of Anacapa sandy loam found at 2 to 9 percent slopes. The series profile is as follows: 0 to 35 inches of sandy loam, and 35 to 60 inches of stratified coarse sandy loam to loam.

AVOCADO SITE ENVIRONMENTAL SETTING

The 15.06-acre parcel is currently undeveloped and located near the base of the southern Santa Ynez Mountains within Ventura County, California. The proposed potential Project site is generally northeastern sloping with an elevation ranging from 720' to 380' amsl. It is situated approximately 2.5 miles south of the Santa Ynez Mountains and approximately 600m west of the Ventura River, which flows generally north to south from Matilija Creek of the Santa Ynez Mountains into the Pacific Ocean. The potential site is located approximately 1.5 miles north of the Pacific Ocean, and the proposed potential staging area is located less than 200 meters north of the Pacific Ocean. Soils within the potential site are comprised of a mixture of the following:

- Huerhuero very fine sandy loam, 9 to 15 percent slopes, eroded: Profile consisting of 0 to 15 inches of very fine sandy loam, 15 to 29 inches of clay, and 29 to 57 inches of stratified sandy loam to clay loam
- Malibu loam, 15 to 30 percent slopes, eroded: Profile consisting of 0 to 14 inches of loam, 14 to 23 inches of clay, and 23 to 33 inches of un-weathered bedrock
- San Benito clay loam, 30 to 50 percent slopes, eroded: Profile consisting of 0 to 25 inches of clay loam, 25 to 60 inches of clay loam, and 60 to 79 inches of bedrock
- San Benito clay loam, 50 to 75 percent slopes: Profile consisting of 0 to 25 inches of clay loam, 25 to 45 inches of clay loam, and 45 to 79 inches of bedrock

VENTURA STEEL SITE ENVIRONMENTAL SETTING

The 10-acre parcel is located just north of the City of Ventura within Ventura County, California. The proposed potential Project site is generally flat with an average elevation of 170' amsl. It is located approximately 600 meters east of the Ventura River, which flows generally north to south from Matilija Creek of the Santa Ynez Mountains into the Pacific Ocean. The potential site is situated approximately 3 miles north of the Pacific Ocean and approximately 1.75 miles south of the Santa Ynez Mountains. Soils are comprised of Sorrento loam found at 2 to 9 percent slopes. The series profile is as follows: 0 to 12 inches of loam, 12 to 62 inches of silty clay loam, and 62 to 72 inches of sandy loam.

DEVILS CANYON ROAD SITE ENVIRONMENTAL SETTING

The 12.88-acre parcel is located near the base of the southern Santa Ynez Mountains within Ventura County, California. The proposed potential Project site is currently developed as an energy facility. The site is generally flat with an average elevation of approximately 120' amsl. It is located less than 150 meters east of the Ventura River, which flows generally north to south from Matilija Creek of the Santa Ynez Mountains into the Pacific Ocean. The potential site is situated approximately 2.3 miles north of the Pacific Ocean and approximately 1.2 miles southeast of the Santa Ynez Mountains. Soils are comprised of Sorrento loam found at 2 to 9 percent slopes. The series profile is as follows: 0 to 12 inches of loam, 12 to 62 inches of silty clay loam, and 62 to 72 inches of sandy loam.

COUNTY LINE SITE ENVIRONMENTAL SETTING

The 12.33-acre parcel is currently undeveloped and located near the western boundary of Ventura County, California. The proposed potential Project site is generally westward sloping with an elevation ranging from 140' to 288' amsl. It is situated approximately 820 meters north of the Pacific Ocean and approximately 1.3 miles south of the Santa Inez Mountain Range. Soils are comprised of a mixture of the following:

- Malibu loam, 15 to 30 percent slopes, eroded: Profile consisting of 0 to 14 inches of loam, 14 to 23 inches of clay, and 23 to 33 inches of un-weathered bedrock
- Malibu loam, 30 to 50 percent slopes: Profile consisting of 0 to 14 inches of loam, 14 to 23 inches of clay, and 23 to 33 inches of unweathered bedrock
- Mocho loam, 2 to 9 percent slopes: Profile consisting of 0 to 60 inches of loam
- Sorrento loam, 2 to 9 percent slopes: Profile consisting of 0 to 12 inches of loam, 12 to 62 inches of silty clay loam, and 62 to 72 inches of sandy loam

Appendix B

Feasibility Study Scoring Rubric

Ventura Compressor Station Feasibility Study

Goal

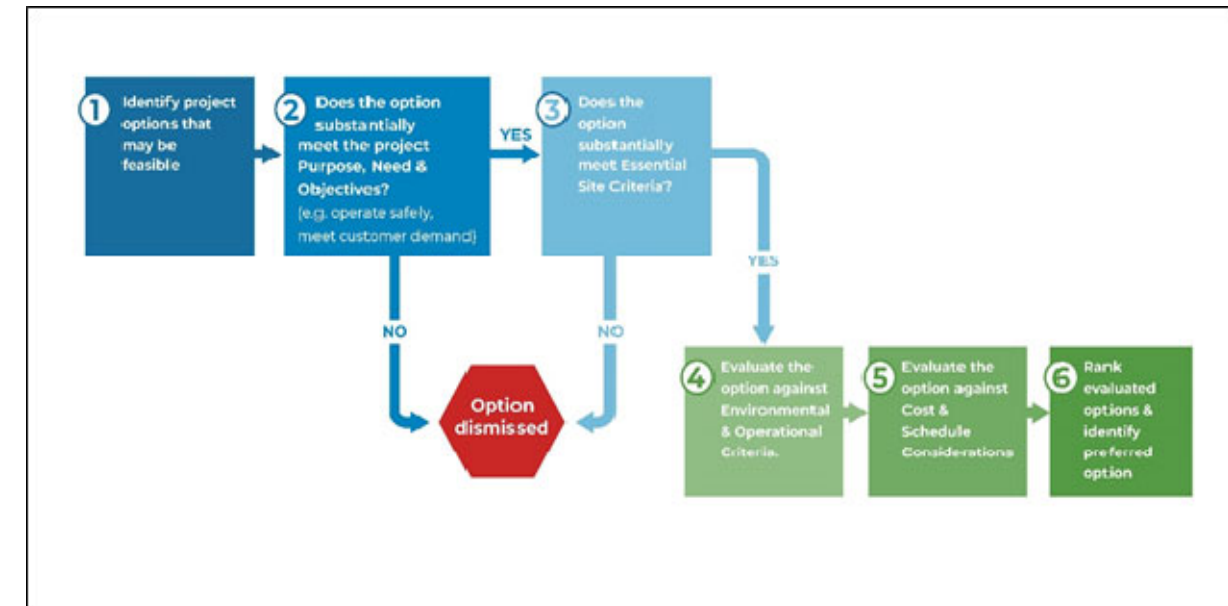

SoCalGas will evaluate a range of alternatives to a proposed project that would feasibly attain most of the basic project objective but would lessen any of the significant effects of the project.

Process

SoCalGas will evaluate whether the existing infrastructure can be modified to meet the project objects. If not, then SoCalGas will evaluate what new infrastructure is required and where it would be located to meet project objectives

Methodology

Potential Alternatives	Step 1	Identify project alternatives that may be feasible.
Initial Screening for Purpose, Need and Objectives	Step 2	Evaluate each project in accordance with whether the alternative would substantially meet the purpose, need and objectives. If the alternative does not meet purpose, need and objective, dismiss from further consideration.
Essential Site Criteria Analysis	Step 3	Perform Essential Site Criteria Analysis of alternatives consistent with established evaluation criteria. If project does not meet essential site parameters, dismiss from further consideration.
Site and Environmental Considerations	Step 4	Perform Operational, Emissions and Environmental Considerations Analysis of alternatives consistent with established evaluation criteria and assign point total to each category.
Cost and Schedule Considerations	Step 5	Perform Other Considerations Analysis of alternatives consistent with established evaluation criteria and assign point total to each category.
Rank & Identify Preferred Alternative	Step 6	Rank alternatives based on resulting point totals, with highest score being best to identify the preferred alternative.

Ventura Compressor Station Feasibility Study

STEP 1: IDENTIFY ALTERNATIVES

Alternative	Technology	Site Identified by	Land Use/Zoning	Location
No Project - Keep existing in operation	All Natural Gas	SoCalGas	Industry/ M-2	Maintain existing site configuration and operational profile keeping the 30-year old gas engine driven machines in service.
Compressor Station Removal	Nothing	Community	Industry/M-2	Request is to remove the station in its entirety.
All Electric at Any of the Sites	All Electric	SoCalGas/CPUC too?	Various	Replace existing compression with new electric compressors. Same benefits and/or issues will be experienced at any site.
Hybrid - 3 Electric and 1 Gas Engine at any site	Hybrid - 3 Elec / 1 Gas Engine	SoCalGas	Various	Replace existing compression with 3 new electric compressors and 1 gas engine. Same benefits and/or issues will be experienced at any site.
Petrochem	Natural gas	SoCalGas	Industrial/M3-10,000 sf	Industrial site located approximately 13,500 feet northwest of the existing compressor station on the west side of State Route 33 within the County of Ventura.
Petrochem - Hybrid	Hybrid - gas/electric	SoCalGas	Industrial/M3-10,000 sf	
Move Compression to Goleta Storage Field	Nat Gas/Elec or Hybrid	SoCalGas	UT – Public Utility/PU – Public Utilities	Remove the existing horsepower from Ventura and replace with new equipment at the Goleta Storage Field approximately 40 miles up the coast.
Alternative 1A: Planned Project	Natural gas	SoCalGas	Industry/ M-2	Current site - Approximately 8-acre parcel located on land designated by the Ventura General Plan as “Industry” and zoned “M-2 General Industrial,” on the west side of City of Ventura.
Alternative 1B: Current Site, Hybrid	Hybrid - gas/electric	CPUC	Industry/M-2	
Alternative 2A: Avocado Site	Natural gas	Community	Open Space/AE-40 ac	Approximately 15-acre agricultural site located approximately 3,000 feet west of the compressor station, on privately held land currently developed with an avocado orchard within the County of Ventura.
Alternative 2B: Avocado Site - Hybrid	Hybrid - gas/electric	Community	Open Space/AE-40 ac	
Alternative 3A: Ventura Steel	Natural gas	SoCalGas	Industrial/M3-10,000 sf	Approximately 15-acre industrial site located approximately 8,000 feet north of the compressor station within the County of Ventura
Alternative 3B: Ventura Steel - Hybrid	Hybrid - gas/electric	SoCalGas	Industrial/M3-10,000 sf	
Alternative 4A: Devil's Cyn Rd	Natural gas	Community	Open Space/OS-160 ac/HCWC*	Approximately 15-acre oil extraction site located approximately 6,000 feet to the north of the compressor station on west side of State Route (SR) 33 within the County of Ventura.
Alternative 4B: Devil's Cyn Rd - Hybrid	Hybrid - gas/electric	Community	Open Space/OS-160 ac/HCWC*	
Alternative 5A: County Line	Natural gas	SoCalGas	Open Space/AE-40 ac	Approximately 15-acre vacant parcel of land designated and zoned for agriculture located within County of Ventura at the county line between Santa Barbara/Ventura Counties approximately 12 miles northwest of the existing compressor station.
Alternative 5B: County Line - Hybrid	Hybrid - gas/electric	SoCalGas	Open Space/AE-40 ac	

STEP 2: PURPOSE, NEED AND OBJECTIVES

Evaluation Criteria	Rationale for Criteria	Alternative 1: Ventura-Existing Site North Olive Street		Alternative 2: Avocado Site-Ventura		Alternative 3: Ventura Steel		Alternative 4: Devil's Cyn Rd		Alternative 5: County Line		All Electric at any proposed site	Hybrid Electric/ 1 Gas Engine at any site	No Project - Keep Existing in Service	Remove Existing Facility	Petrochem		Goleta Storage Field
		Natural Gas (1A)	Hybrid (1B)	Natural Gas (2A)	Hybrid (2B)	Natural Gas (3A)	Hybrid (3B)	Natural Gas (4A)	Hybrid (4B)	Natural Gas (5A)	Hybrid (5B)					Natural Gas (A)	Hybrid (B)	Any Driver
Safety Consideration	Project must be able to operate safely	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	No Go	Go	Go	Go
System Operational Requirements	Project must meet basic system operational requirements (Meet minimum and maximum flow requirements throughout the range of pipeline operating pressures)	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	No Go	No Go	Go	Go	Go
System Operational Requirements	Ability to meet core customer demand w/o Goleta W/D	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	No Go	No Go	Go	Go	No Go
System Operational Requirements	Adequate capacity to inject at La Goleta Storage Field	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	No Go	No Go	Go	Go	Go
System Operational Requirements	Enhance reliability by modernizing aging infrastructure	Go	Go	Go	Go	Go	Go	Go	Go	Go	Go	No Go	No Go	No Go	No Go	Go	Go	No Go

STEP 4: ENVIRONMENTAL - OPERATIONAL CRITERIA

Environmental scored by Dudek, Yorke Operational scored by Operations/PMT

Topic Areas	Ranking				Option 1: Ventura- Existing Site North Olive Street		Option 2: Avocado Site- Ventura		Option 3: Ventura Steel		Option 4: Devil's Cyn Rd		Option 5: County Line	
	0	"1-2-3"	"4-5-6"	"7-8-9"	Natural Gas (1A)	Hybrid (1B)	Natural Gas (2A)	Hybrid (2B)	Natural Gas (3A)	Hybrid (3B)	Natural Gas (4A)	Hybrid (4B)	Natural Gas (5A)	Hybrid (5B)
Environmental Considerations: Operational (10X multiplier applied to Operational only)					26	32	23	28	29	35	30	35	17	25
Air - Criteria Pollutant to Emit = 24/7/365 (Potential)	NOx emission ≥ 12 tons per year	NOx emissions ≥ 8 tons per year but < 12 tons per year	NOx emission ≥4 tons per year but <8 tons per year	NOx emissions <4 tons per year	1	5	1	5	1	5	1	5	0	5
GHGs (Direct and Indirect) to Emit = 24/7/365 (Potential)	GHG emissions ≥50,000 MT/yr CO2e	GHG emissions ≥25,000 MT/yr CO2e but <50,000 MT/yr CO2e	GHG emissions ≥10,000 MT/yr CO2e but <25,000 MT/yr CO2e	GHG emissions <10,000 MT/yr CO2e	3	5	3	5	3	5	3	5	2	4
Land Use Designation	Non-industrial/manufacturing zone and adjacent to sensitive receptor	Industrial/manufacturing zone located adjacent to sensitive receptor	Non-industrial/manufacturing zone not adjacent to sensitive receptor	Industrial/manufacturing zone not adjacent to sensitive receptor	1	1	6	6	9	9	6	6	6	6

Cultural Resources (Records Search)	Significant Cultural Resource(s), are present and the project has the potential to impact the significance of that resource.	Significant Cultural Resource(s), are present and project impacts will be less than significant with minimization measures incorporated in the project; or, the project is in a location that is highly sensitive for potentially significant cultural resources.	Significant Cultural Resources are present, but project does not have the potential to impact the significance of that resource; or, the project is in a location that is moderately sensitive for potentially significant cultural resources.	No significant cultural resources are present based on records search results and the project is in a location that is not sensitive for potentially significant cultural resources.	8	8	6	6	8	8	6	7	7	6
Grand Total Environmental Score					369	429	297	344	359	419	388	437	242	320

Additional Operational Considerations					39.0	34.5	23.3	18.8	35.0	30.5	28.8	24.5	31.0	26.5
Geotechnical Engineering Constraints	Substantial geotechnical constraints associated with high risk of liquefaction, faulting/seismicity and landslide	Moderate geotechnical constraints associated with high risk of liquefaction, faulting/seismicity and landslide	Minimal geotechnical constraints	No known geotechnical constraints	6	6	4	4	6	6	5	5	6	6
Emergency Access (max 20% slope and minimum 20-foot wide)	Emergency access exceeds 20% grade even with engineered design (including retaining walls)	Construct new access road to meet requirements	Modify existing access road to meet requirements	No access road construction is necessary	9	9	4	4	9	9	7	7	5	5
Complexity of Auxiliary and Control Systems (with hybrids, Station Control panel would need to talk to two unique types of unit control panels, instead of one panel and one set of commands and control philosophy)	Hybrid option that relies on SCE power for running 50% of compressors	Hybrid option that does not rely on SCE power for running 50% of compressors	Non-hybrid with back-up power from SCE (2-line feed) to run 50% of compressors	Non-hybrid option with on-site back-up power generation to run 50% of compressors	9	5	9	5	9	5	9	5	9	5
Back-up power requirements. Lowest for gas engines; highest for all electric	No operation possible without SCE power in service.	Black start capability and ability to provide less than 50% of horsepower without SCE power in service	Black start capability and ability to provide less than 100% down to 50% of horsepower without SCE power in service	Black start capability and ability to provide 100% of horsepower without SCE power in service	6	6	6	6	6	6	6	6	6	6
Proximity to lower pressure Distribution System - needed to depressurize without blowing gas to atmosphere.	Zero access to Distribution without substantial effort	Distribution access greater than 1/2 mile	Distribution access outside the facility but less than 1/2 mile away.	Distribution lines are within the facility	9	9	1	1	5	5	2	2	5	5
Option Grand Totals					408	464	320	363	394	450	417	462	273	347

*Non-industrial land uses include, but are not limited to, residential, commercial, agricultural, and parks.

- NOTES:
1. Environmental considerations were included in response to CPUC request.
 2. Developed for purpose of Ventura site considerations; not transferrable to other projects.
 3. Proposed project back-up generation provides power to black start and operate two gas engines to meet core demand and not inject at Goleta.

Students at Ventura Unified School District

The student body at the schools served by Ventura Unified School District is 36.2% White, 1.1% Black, 3.4% Asian or Asian/Pacific Islander, 54.9% Hispanic/Latino, 0.2% American Indian or Alaska Native, and 0.1% Native Hawaiian or other Pacific Islander. In addition, 4% of students are two or more races, and 0% have not specified their race or ethnicity.

Also, 49% of students are female, and 51% of students are male. At schools in Ventura Unified School District, 37.1% of students are eligible to participate in the federal free and reduced price meal program and 19.7% of students are English language learners.

School information is provided by the government.

Enrollment by Gender:

Female **49%**

Male **51%**

Enrollment by Diversity:

54.9% Hispanic/Latino

36.2% White

4.0% Two or more races

3.4% Asian or Asian Pacific Islander

1.1% Black or African American

0.2% American Indian or Alaska Native

0.1% Native Hawaiian or Other Pacific Islander

Students on free or reduced price lunch: **37.1%**

Students learning English (average): **19.7%**

Teachers at Ventura Unified School District

Within Ventura Unified School District, 98.1% of teachers are licensed, and 95.2% have three or more years of experience. The student-to-teacher ratio is higher than the state average, at 25:1. The district has 16 full-time counselors on staff.

Student-teacher ratio: **25:1**

State average: 22:1

Percentage of teachers who are certified (average): **98.1%**

Teachers with 3 or more years experience (average): **95.2%**

Number of full-time school counselors: **16**

Test Scores at Ventura Unified School District

In Ventura Unified School District, 53% of elementary students tested at or above the proficient level for reading, and 46% tested at or above that level for math. Also, 53% of middle school students tested at or above the proficient level for reading, and 40% tested at or above that level for math. And 72% of high school students tested at or above the proficient level for reading, and 46% tested at or above that level for math.

Coronavirus Information

For 24/7 Access to Mental Health services and/or if you are experiencing a Mental Health Crisis please call Ventura County Behavioral Health Access & Crisis Team at 1-866-998-2243.

For 24/7 Access to Substance Use services, please call Ventura County Behavioral Health Substance Use Treatment Services Toll-free Access Line at 1-844-385-9200.

Ventura County Medical Center (VCMC) is a fully-integrated, comprehensive system of hospital, clinic and specialty services. The system provides access to high quality, compassionate health care to residents throughout Ventura County.

While VCMC provides access to health care to all residents of our county, special emphasis is placed on providing access to care for the underserved and those facing barriers to access. Referred to as the “safety net” population, these individuals comprise over three quarters of the care provided by VCMC.

VCMC is noted for its renowned Family Medicine Residency Program, and is distinguished as the only Ventura County academic teaching hospital with a residency affiliated with UCLA School of Medicine.

VCMC is the designated Level II Trauma Center for the west county and is known for its extraordinary trauma team, which includes skilled and talented surgeons covering neurosurgery, orthopedic and general surgery cases.

Additionally, our award-winning neonatal intensive care unit and pediatric unit are unique to a county this size; VCMC boasts the only pediatric hospitalist in the county as well as having the county’s first and only Pediatric Intensive Care Unit (PICU).

VENTURA COUNTY MEDICAL CENTER

Ventura County Medical Center (VCMC) is a fully-integrated, comprehensive system of hospital, clinic and specialty services. The system provides access to high quality, compassionate health care to residents throughout Ventura County.

Fire Operations

The Operations Division is comprised of six fire stations and strives to maintain an average response time of five minutes to emergencies within the City. Emergency calls may consist of brush fires, structure fires, automobile accidents, and life-threatening medical emergencies. Firefighters are often required to carry various types of equipment in addition to approximately 50lbs of personal protective gear.

The standard emergency response unit for the Ventura City Fire Department is the Paramedic Engine Company. Each company consists of a Captain, Engineer, and Firefighter-Paramedic.

- **Captain:** supervises and directs all emergency operations
- **Engineer:** responsible for the safe operation of the apparatus and all equipment on board
- **Firefighter-Paramedic:** completed firefighting tasks as directed by the Captain and provides advanced life support measures

Fire Stations

Our six fire stations are located across the City of Ventura. Find photos and locations on this webpage.

Hazardous Materials Unit

The Hazardous Materials Unit is part of the Ventura County Regional Hazmat Plan. Team members assigned to Station 6 receive extensive Hazmat training and are certified as Technicians or Specialists.

Fire Stations

The City of Ventura has six fire stations, each with an engine company and a minimum of three firefighter-paramedics on duty at any given time. Additionally, our agency is the first in Ventura County to require a paramedic on every engine! We strive to reach every emergency within five minutes of dispatch.

The Ventura City Fire Headquarters, including the Fire Prevention Division, is located at [1425 Dowell Drive, Ventura, CA 93003](#). Headquarters can be reached at [805-339-4300](tel:805-339-4300).

Hazardous Materials Unit

Our Hazardous Materials (HazMat) Unit is part of the Ventura County Regional HazMat Plan and provides 24/7 emergency response services to incidents occurring in our city/county for the safety of our residents and our local environment. We accomplish this by assessing threats, mitigating accidental releases, monitoring clean-up operations, and working with law enforcement agencies and continued training at the local and regional levels.

Our responses also include: radiological, biological, chemical threats, agricultural emergencies, and the decontamination of victims and fire personnel.

Fire Station 6, located at 10797 Darling Road, houses our HazMat Unit and firefighters assigned to Station 6 receive extensive HazMat training. We have 27 firefighters throughout our department who can be called upon to fill this role, each are certified as either HazMat Technicians or HazMat Specialists.

Fire Strategic Plan

On March 21, 2022, the City Council received the Ventura Fire Department's five-year Strategic Plan created to address increased call volume and workload, possible operational changes, and staffing recommendations. The next phase of this effort is centered around community education and outreach. We're eager to connect with Ventura residents and engage in community conversations.

Strategic Plan Goals:

1. Keep the residents and property in our city safe
2. Respond to all emergencies with improved response times
3. Maintain highly trained and diverse staff at all levels
4. Fund modern and well-maintained stations and appropriate apparatus throughout the city
5. Educate and enhance the department's relationship with the community

Fire Station Community Meetings:

As part of the Fire Department five-year Strategic Plan, community members were invited to join the Ventura Fire Department for a series of fire station open house events happening June 15 – August 3, 2022.

Participants had the opportunity to engage directly with City leadership, meet local firefighters, tour fire stations, hear about current conditions, and contribute to conversations about becoming a 21st century fire department.

"Each day of my career, my professional goal as been the same: be a public servant with character, integrity, and accountability. As the leader of one of the primary public safety department of our city, my priorities are the current daily activities, the long-term future, and the optimal operation and serv. outcomes of the fire department."

- Fire Hello 🙋. How can we help you?

Select Language ▼

A community meeting was held at each of the six Ventura fire stations on select Wednesdays from 6:00 – 8:00 p.m. on the following dates:

- **June 15, Fire Station 3**, located at [5838 Telegraph Road, 93003](#)
- **June 22, Fire Station 1**, located at [717 N. Ventura Avenue, 93001](#)
- **June 29, Fire Station 2**, located at [41 S. Seaward Avenue, 93003](#)
- **July 20, Fire Station 4**, located at [8303 Telephone Road, 93004](#)
- **July 27, Fire Station 5**, located at [4225 E. Main Street, 93003](#)
- **August 3, Fire Station 6**, located at [10797 Darling Road, 93004](#)

Live Spanish interpretation was also be offered at Fire Stations 1 and 2.

Meeting Recordings

For residents unable to attend, the below videos were captured at the community meeting on August 3, 2022 at Fire Station 6.

Strategic Plan & Annual Report

The Crime Fighting Strategies of the Ventura Police Department are outlined in our [2020-2023 Strategic Plan](#), [en Español aquí](#)

Strategic Plan Measures

Stats and Comparisons Reflect information from January through June 2022.

Each goal is accompanied by performance measures to indicate our successes. Additionally, we identify strategies to guide our actions and provide a path to success. These citywide performance measures include some of the key indicators used by the police department to assess the level of crime in our community as well as the result of the efforts of our crime fighting resources.

RESPONSE TIMES

Updated: 07/15/22

Why This is Important?

Providing for the protection of life and property is a core function of the police department. The timely arrival of a police officer to a reported crime in-progress or other serious emergency is vital to prevent injury or death, apprehend suspected criminals, identify witnesses and evidence, and enhance the ability to solve the given crime.

What Is Being Done?

The Ventura Police Department prioritizes all calls for service. Emergency and in-progress crimes are given the highest priority. Response times to these calls are reviewed on a monthly basis and compared to our goal of responding to emergency and in-progress crimes in less than 5 minutes. We also have the goal of arriving on scene for Priority 2 and Priority 3 calls within 10 & 20 minutes respectively.

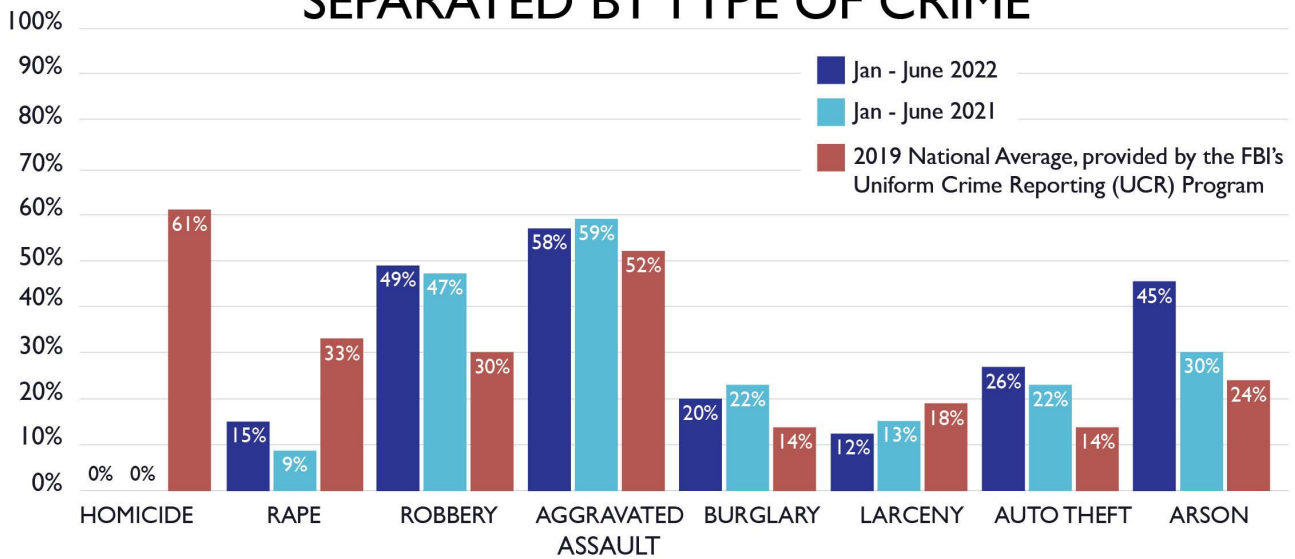

CLEARANCE RATES FOR PART I CRIMES

Updated: 07/15/22

2

CLEARANCE RATES FOR PART I CRIMES SEPARATED BY TYPE OF CRIME

Updated: 07/15/22

3

Why Is this Important?

In the FBI's Uniform Crime Reporting (UCR) program, crimes are considered to be "cleared" when an arrest is made, when the suspect is charged with an offense, or the case is turned over to the court for prosecution. National crime clearance rate comparisons of similarly sized cities provide a baseline to assess the effectiveness of policing within communities. This is important information because solving crimes can be an indicator of police effectiveness as well as police-community collaboration.

What Is Being Done:

Solving crime is the product of effective community policing efforts and provides a significant deterrent for criminal activity. Depending on the seriousness and complexity of the crime, it may be assigned for further investigation by detectives. Solvable cases result in arrests and are considered “cleared.” Unsolved investigations are tracked and open cases are reviewed to see if additional information has resulted in new leads.

RACE OF SWORN OFFICERS COMPARED TO THE COMMUNITY THEY SERVE

Chief	Asst. Chief	Commanders	Sergeants	Corporals	Officers	Academy Recruits	Vacancies	TOTAL
1	1	6	15	17	91	2	5	138

Updated: 07/15/22

EDUCATION OF SWORN OFFICERS

High School

Associates

Bachelors

Masters

Updated: 07/15/22

LENGTH OF SERVICE FOR SWORN OFFICERS

6

Updated: 07/15/22

MALE/FEMALE DEMOGRAPHICS OF SWORN OFFICERS

7

Updated: 07/15/22

Why This Is Important?

The work of sworn police officers is vital to the safety of our community. As in any kind of business providing a service, the delivery of that service is directly related to the availability of highly trained and available personnel to provide the service.

What Is Being Done?

To ensure sworn demographics align with those of our community, we are developing a police explorer program with representation from all city districts, expanding our recruitment efforts, and evaluating our hiring/selection

process.

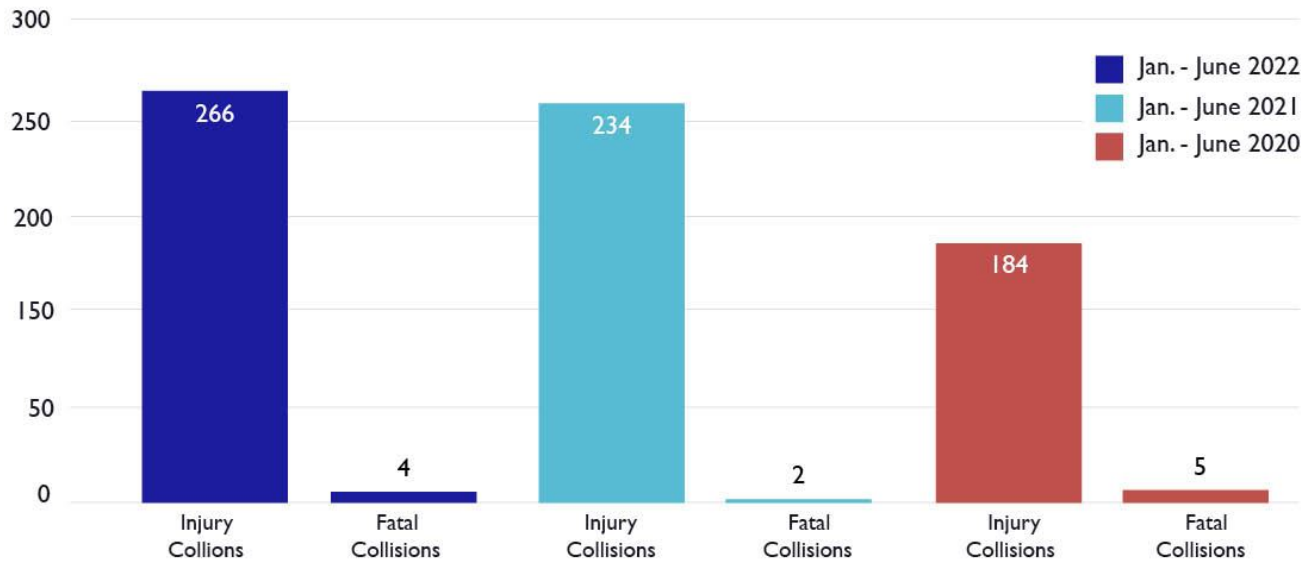

Why This is Important:

The impacts of vagrancy can have a significant impact on the quality of life in a community. Measuring police calls for service to behaviors related to vagrancy helps to define the scope and depth of the problem as well as a indicator of the success of the citywide strategies implemented to address the issue.

What Is Being Done:

To decrease community complaints related to vagrancy, we're working the City Attorney's Office to update the Chronic Offender Ordinance, enhancing our coordination with County Behavioral Health, and are designating specific "enhanced patrol" officers to focus on vagrancy related calls.

FATAL AND INJURY TRAFFIC COLLISIONS

Updated: 07/15/22

9

PROPERTY CRIMES THAT IMPACT NEIGHBORHOODS

Updated: 07/15/22

10

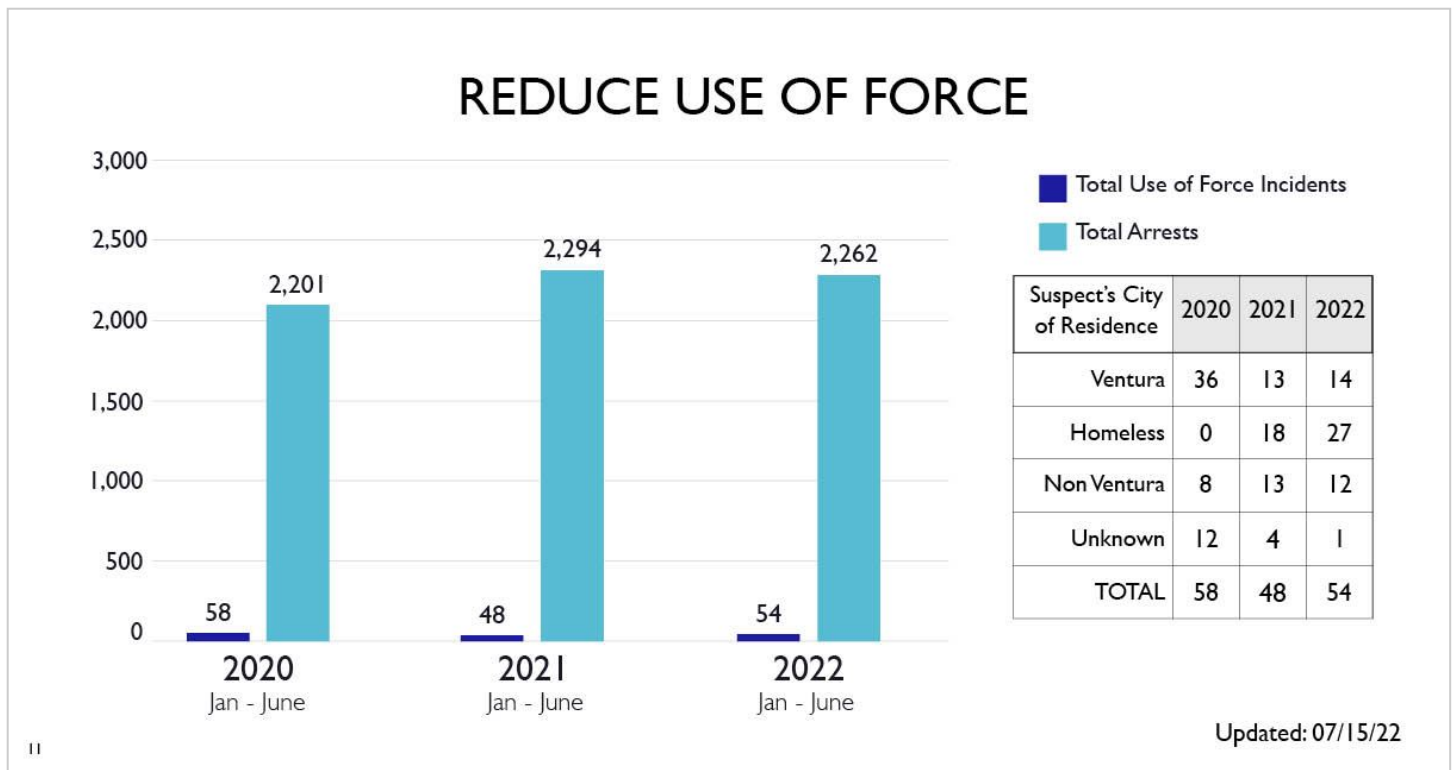

Why This is Important:

Maintaining safe neighborhoods helps make our community a better and safer place. This measure aims to reduce identified crimes that impact neighborhoods compared to the annual average from the last 3 years.

What is Being Done:

A few strategies we're implementing to increase collaborative efforts and decrease crimes that impact neighborhoods include: creating an in-person Neighborhood Watch Program, participating in the California Office

of Traffic Safety (OTS) grant operations, and are focusing investigative resources on addressing narcotic/property crimes in neighborhoods and public spaces.

Why is Use of Force:

The application of physical techniques or tactics, chemical agents, or weapons to another person. It is not a use of force when a person allows themselves to be searched, escorted, handcuffed, or restrained.

Why This is Important:

Efficiency and accountability are important in building public trust and we are committed to increasing transparency with our community.

What is Being Done:

To increase transparency and attain a 100% "within department policy" for all use of force incidents, we are providing bi-annual statistics for use of force, public complaints, and department training, improving the way we track complaints, and are conducting use of force skills training and testing twice a year.

About The VPD

The mission of the Ventura Police Department is **to protect, serve, and problem solve with our community.** We are great people, providing exceptional service, and we value excellence, integrity, professionalism, respect, and transparency.

We are a family of over 250 sworn, professional staff, and volunteers that work tirelessly towards this mission each day. We accomplish this by investing in our team and building strong community partnerships through community events, neighborhood meetings, and day to day activities. We stay committed to you by maintaining trust through transparency and showcasing our commitment to excellence.

The Ventura Police Department is comprised of two divisions: Field Operations and Administration Operations.

- The majority of our staffing is dedicated to patrol operations. Many of our special assignment teams, such as the Patrol Task Force dedicated to homeless outreach, our K9 Unit, and Traffic Unit, as well as the calming voices of Dispatch, work within the Field Operations Division.
- Our Administration Operations includes all Investigations units, Crime Analysis, School Resource Officers, Records, and Professional Standards and Training.

Each of the members in these divisions proudly serve our city and strive to perform their best every day, treating each resident equally with respect, empathy and dignity. Please take a moment to learn more about our [community engagement opportunities](#), [Community Crime Map](#), [District Commanders](#), and the goals established in our [2020-2023 Strategic Plan](#).

We thank you for putting your trust in us to protect your families, property, and businesses and look forward to our next positive interaction.

Learn more about us:

Our Units

The Ventura Police Department is comprised of about 137 police officers and 48 professional staff who serve the city in different roles. Learn more about the K9 Unit, dispatchers, records, volunteers, community outreach, investigations, and more.

Strategic Plan

The Ventura Police three-year Strategic Plan serves as a guiding document for where the department hopes to go, programs we hope to implement, and goals we hope to accomplish in the foreseeable future. The annual report is made available as a document to help measure success, showcase accomplishments, and educate community members.

Join Our Team

Have an amazing career at the Ventura Police Department! We are always looking for courageous men and women who have a passion to protect, serve, and problem solve with our community to join our team as police officers, public safety dispatchers, cadets, and professional staff. We have great people, providing

Employee Development

We have high expectations of our officers and provide more training than is required by California's Commission on Peace Officer Standards and Training. We pride ourselves on continually learning and improving upon our skills to provide the highest of quality of service to our Ventura.

Firearms Training

The Ventura Police Shooting Range can be used by police personnel seven days a week from 9am-7pm, but is not used every day. The range hours are set to allow for necessary training while trying to reduce the noise impact on the surrounding neighborhoods.

District Commanders

As part of our effort to strengthen community partnerships, increase collaboration and accountability, and streamline problem solving efforts, a Ventura Police Commander has been assigned to each of the Neighborhood Community Councils and to the Downtown Ventura Partners.

Public Postings

exceptional service and we value excellence, integrity, professionalism, respect, and transparency.

Command Staff

The Ventura Police Department has one chief, one assistant chief, and six commanders leading the agency. Learn more about them, their backgrounds, and their contact information.

+ Civic Use of Facilities/Rentals

New VUSD Online Portal for Facilities - Outdoor Facilities are available at this time

[FACILITRON \(https://www.facilitron.com/vusd93001\)](https://www.facilitron.com/vusd93001)

<https://www.facilitron.com/vusd93001> (<https://www.facilitron.com/vusd93001>)

Public use of Ventura Unified School District INDOOR facilities has been suspended until further notice due to COVID-19.

The District will continue to monitor the situation and will confirm when they are open to receiving new requests again for other spaces.

Please reference the availability calendar on [Facilitron \(https://www.facilitron.com/vusd93001\)](https://www.facilitron.com/vusd93001) for any district facility for updates.

+ Developer Fees - School Assessment Fees

In order to complete the assessment fees, please visit the Education Service Center in person. If you need an estimate of the school assessment fees, please contact accountsreceivable@ventrausd.org.

+ Parcel Tax Committee

On November 6, 2012, the Ventura Unified School District received approval from City of Ventura voters to implement an annual \$59 per parcel tax levy to support educational programs for a period of four years. On November 8, 2016 and again on November 3, 2020, voters extended the parcel tax another four years. The District established a Parcel Tax Oversight Committee (PTOC) since inception of the parcel tax pursuant to its desire to assure the community that parcel tax dollars are expended in a manner consistent with the ballot language.

The PTOC is charged with providing oversight and accountability on the expenditures funded by the parcel tax to ensure that the said funds are spent for the purposes approved by the voters. The PTOC will meet at least semi-annually to monitor the expenditures of these funds by the District and will report to the Board of Education and the community, on an annual basis on how these funds have been spent. An annual audit will be a part of the PTOC's report to the Board.

MEASURE E

Although it appears that our schools are in good shape based on achievements by our students, our school facilities need to be improved. The Ventura Unified School District covers an area of approximately 165 square miles in western Ventura County and includes the City of Ventura and surrounding areas. With an enrollment of over 15,000 students, the District has 28 schools with education from pre-kindergarten through 12th grade and Adult School. A [LONG RANGE FACILITIES MASTER PLAN 2020-2030](https://drive.google.com/file/d/1O3-AS7D3YUg_T3WNEEtW6dCknZgHM8lY/view) (https://drive.google.com/file/d/1O3-AS7D3YUg_T3WNEEtW6dCknZgHM8lY/view) was adopted by the Board of Education on April 28, 2020 and was used to initially used to determine a priority projects list. That list will be revisited before a final plan is put into place for repairs/upgrades/etc. and stakeholder engagement will occur.

Faced with aging classrooms and a need to bring school facilities up to current standards, the District placed Measure E on the November 2022 ballot that would upgrade, modernize and renovate the outdated schools. We want to thank our voters for passing measure E. We will place more information here about our Measure E oversight committee and future projects as we have it.

The following information is provided to assist the community in understanding the facts behind Measure E and how its passage will affect the District and its residents.

MEASURE E OVERSIGHT COMMITTEE

The Ventura Unified School District has established a citizens' oversight committee to oversee expenditures of Measure E bond funds, which was the bond measure approved by District voters on November 8, 2022. The District is presently accepting applications from interested citizens to serve on the committee. The committee will consist of seven to eleven members who meet, review and report on expenditures of bond funds to ensure money is used only for voter-approved purposes. Interested persons may download the [Measure E Oversight Committee Application](https://fs.resource-manager/view/4accd076-c67e-4697-acb1-56b07236bf3b) ([/fs/resource-manager/view/4accd076-c67e-4697-acb1-56b07236bf3b](https://fs.resource-manager/view/4accd076-c67e-4697-acb1-56b07236bf3b)) or obtain a paper copy from the Superintendent's office, located at 255 Stanley Avenue, Ventura, California. **Applications are due by Tuesday, February 14, 2023 by 4pm.**

[Measure E Oversight Committee Application](https://fs.resource-manager/view/4accd076-c67e-4697-acb1-56b07236bf3b) ([/fs/resource-manager/view/4accd076-c67e-4697-acb1-56b07236bf3b](https://fs.resource-manager/view/4accd076-c67e-4697-acb1-56b07236bf3b))

Return application by Tues. Feb. 14 at 4 pm either by email to Vanessa.Cordero@venturausd.org (<mailto:Vanessa.Cordero@venturausd.org>) or in-person or US Postal

Mail to:

Ventura Unified School District

Ventura, CA 93001

+ What is Measure E?

[Skip To Main Content](#)

Measure E is a \$434.5 million general obligation (G.O.) bond program. When combined with State-matching funds, developer fees, and other funding sources, the measure is intended to address the needs of our students through modernization and renovation projects at schools throughout the District.

+ Why did the District place Measure E on the ballot?

Many of our schools are outdated and major upgrades and renovations need to be made. Although our schools have been well maintained over the years, the last major renovations to elementary and middle schools occurred in the 1990s. Many outdated classrooms and facilities now require significant upgrades to meet 21st-century standards. Currently, the average age of our schools in the District is 63 years. EP Foster Elementary, is our oldest, and Ventura High School is over 84 years old. These aging schools need major classroom and infrastructure improvements to maintain the quality of education provided to local children.

+ How did the District come up with the project list for Measure E?

Over the last several months with input from staff, teachers, parents, community leaders, and facilities experts, the District has prepared a School Facilities Needs Analysis. The Needs Analysis identifies the major repairs and upgrades that need to be made. This information can be found in the [LONG RANGE FACILITIES MASTER PLAN 2020-2030](https://drive.google.com/file/d/1O3-AS7D3YUg_T3WNEEtW6dCknZgHM8lY/view) (https://drive.google.com/file/d/1O3-AS7D3YUg_T3WNEEtW6dCknZgHM8lY/view) - adopted by the Board of Education on April 28, 2020.

Specific projects identified include:

- Repairing and replacing leaky roofs
- Constructing science labs and career technical educational facilities
- Making health, safety, and security improvements
- Renovating or replacing deteriorating plumbing and sewer systems
- Upgrading inadequate electrical systems

+ Has VUSD passed a school improvement measure before?

Yes. The District passed a measure in June 1997, over 20 years ago with 75% voter approval. Funds were used to upgrade and modernize some of the oldest classrooms and facilities in the District as well as build a new school and additional classrooms.

+ Why can't the District meet its facilities needs with its current budget?

Today, the scope of improvements needed at the Ventura Unified School District is far more than the current funding sources available. The per-pupil funding which the District receives from the state is intended to be used for the day-to-day business of educating children and not for major upgrades, renovations, and modernization projects.

How common are school improvement measures? Have neighboring districts also passed

[Skip To Main Content](#)

▾ these measures?

Every unified school district in Ventura County has passed a school improvement measure, and some districts in the county have passed five. VUSD has passed one.

VUSD has the fewest amount of bond dollars per student in the County (see chart). Furthermore, the District has nearly the lowest bond tax rate at \$23.40 per \$100,000 of assessed value. By comparison, Oak Park Unified has a tax rate of \$146.60 and three bonds passed for classroom improvements.

 bond dollars passed per student

+ What is a G.O. bond?

G.O. bonds fund projects such as the renovation of classrooms and school facilities, as well as construction of new schools and classrooms. Similar to a home loan, G.O. bonds are typically repaid over 30 years. The loan repayment comes from a tax on all taxable property - residential, commercial, agricultural and industrial - located within the District's boundaries.

+ What will the passage of Measure E mean for our students and the community?

Measure E will provide our students with a better learning environment by making renovations and upgrades to existing classrooms and school facilities; many of which are also used by and available to the community such as the libraries, gymnasiums, and playing fields.

+ What will Measure E cost?

The tax rate per property owner is estimated to not exceed \$60 per \$100,000 of assessed valuation per year, or about \$5.00 a month. (Do not confuse assessed valuation with market value. Assessed valuations are the value placed on property by the County and are lower than market values). Check your property tax statement for your current assessed valuation.

+ How can I be sure that Measure E funds will be spent on improving our local schools?

By law, all bond funds have to be spent locally and cannot be taken by the state. In addition, a local independent citizens' oversight committee will be established to ensure that bond funds are properly spent. Also by law, there must be annual audits of expenditures and no bond money can be used for teacher or administrative salaries.

SCHOOLS OF CHOICE

CHOOSING YOUR CHILD'S SCHOOL

When it comes to delivering an education that prepares students for a future in the world today, a one-size-fits-all approach no longer suffices. Students must be able to think critically, approach problem-solving with agility and creativity, be open to exploration, and adapt to new ideas and pathways they will invariably encounter throughout their lives.

At Ventura Unified School District, we cultivate a wealth of diverse academic programs so every student in our community has the chance to explore and engage with a learning environment that not only challenges them academically, but also promotes their growth as people, scholars, and citizens of the world, in an open and positive environment.

Our passion is to help the children in our schools find their passion—academically and personally—believing that each and every student has a brilliant future ahead of them. It is with this commitment, we offer the following options for choosing your child's school:

ENROLLING IN YOUR RESIDENTIAL BOUNDARY NEIGHBORHOOD SCHOOL

This is an excellent option as all our schools are staffed with exemplary teachers and amazing support staff. Pay a visit to your neighborhood school and you will see rigorous and relevant academics that challenge each student. To discover which neighborhood school is in your boundary, visit [MySchoolLocator](http://locator.decisioninsite.com/?StudyID=196118#) (<http://locator.decisioninsite.com/?StudyID=196118#>).

SCHOOLS OF CHOICE (SOC)

THE SOC 2022-23 APPLICATION WINDOW HAS CLOSED. FOR SOC 2024-2025, PLEASE RETURN TO THIS PAGE FOR INFORMATION REGARDING THE ONLINE APPLICATION DATES.

Schools of Choice (SOC) is the process Ventura Unified School District (VUSD) uses to give parents who reside within the VUSD boundary a choice to select a school within VUSD that they feel will most benefit their child. Schools and programs are identified based on space availability for additional students. [SOC online applications](https://schoolsofchoice.venturausd.org/) (<https://schoolsofchoice.venturausd.org/>) are selected for approval via a random and unbiased lottery. Online applications are not selected on a first come-first served basis. **The online application window for the 2023-24 school year is November 4 - December 2, 2022 at 4 pm.** Should you miss applying during these dates, and if you live within the VUSD boundary area, you may submit an [intradistrict transfer](http://www.venturausd.org/enrollment/transferring) (<http://www.venturausd.org/enrollment/transferring>) to a school other than your home boundary school.

TRANSFERRING OPTIONS

SUBMITTING AN INTRADISTRICT TRANSFER

([HTTP://WWW.VENTURAUUSD.ORG/ENROLLMENT/TRANSFERRING](http://www.venturausd.org/enrollment/transferring))

This is an option for families residing within the VUSD boundary and requesting their child attend a school other than their boundary/neighborhood school.

SUBMITTING AN INTERDISTRICT TRANSFER

([HTTP://WWW.VENTURAUUSD.ORG/ENROLLMENT/TRANSFERRING](http://www.venturausd.org/enrollment/transferring))

This is an option for families requesting their child *attend school in a different school district*, incoming or exiting VUSD.
