Sample Emission Calculation

5-SoCal_Refineries (MidModerate_ECGeneral) 2035_H2-NG

10/14/2024

Emissions are calculated using the following equation(s):

BSL Overall Heat Rate (MMBtu/yr) = BSL NG Consumption (MMBtu/yr) x Equip. Throughput Fraction (MMBtu/100-MMBtu)

PRJ Overall Heat Rate (MMBtu/yr) = BSL NG Consumption) (MMBtu/yr) x Equip. Throughput Fraction) (MMBtu/100-MMBtu)

PRJ Overall H2 Heat Rate (MMBtu/yr) = PRJ H2 Demand) (MMBtu/yr) x Equip. Throughput Fraction) (MMBtu/100-MMBtu)

PRJ Overall NG Heat Rate (MMBtu/yr) = PRJ Overall Heat Rate) (MMBtu/yr) - PRJ Overall H2 Heat Rate) (MMBtu/yr)

BSL NG Vol (scf/yr) = BSL Overall Heat Rate (MMBtu/yr) x Conv (Btu-MMBtu) (Btu/MMBtu) ÷ HHV-scf NG (Btu/scf)

PRJ NG Vol (scf/yr) = PRJ Overall NG Heat Rate (MMBtu/yr) x Conv (Btu-MMBtu) (Btu/MMBtu) ÷ HHV-scf NG (Btu/scf)

PRJ H2 Vol (scf/yr) = PRJ Overall H2 Heat Rate (MMBtu/yr) x Conv (Btu-MMBtu) (Btu/MMBtu) ÷ HHV-scf H2 (Btu/scf)

Fd (H2 @ 68 F) (scf/MMBtu) = Specific Weight H2 (scf/lb) x Conv (Btu-MMBtu) (Btu/MMBtu) ÷ HHV-lb H2 (Btu/lb)

Parameter	Value	Units	Resource
			(%-vol NG * HHV-scf-NG + %-vol H2 * HHV-scf-H2)
Blending Check Factor	0.00	MMBtu/yr	Check factor for blending. This is the PRJ MMBtu of blended natural gas, given default (user input) blending assumptions. If this value exceeds overall PRJ natural gas demand, secondary blending assumptions must be made to satisfy energy balance. Based on the following assumptions: "Blend % H2" = Volume_{Blended-H2} /(Volume_{Blended-H2} + Volume_{Blended-NG}) Volume_{Blended-H2} = MMBtu_{Blended-H2} * 10^6 (Btu/MMBtu) /HHV_{Blended-H2} (Btu/scf) Volume_{Blended-NG} = MMBtu_{Blended-NG} * 10^6 (Btu/MMBtu) /HHV_{Blended-NG} (Btu/scf) The above equations can be used to solve for MMBtu_{Blended-NG} in terms of MMBtu_{Blended-H2}. This value can be compared to overall MMBtu of PRJ natural gas.

			(%-vol NG * HHV-scf-NG + %-vol H2 * HHV-scf-H2)
Blending Check Factor	2,864,368.23	MMBtu/yr	Check factor for blending. This is the PRJ MMBtu of blended natural gas, given default (user input) blending assumptions. If this value exceeds overall PRJ natural gas demand, secondary blending assumptions must be made to satisfy energy balance. Based on the following assumptions: "Blend % H2" = Volume_{Blended-H2} /(Volume_{Blended-H2} + Volume_{Blended-NG}) Volume_{Blended-H2} = MMBtu_{Blended-H2} * 10^6 (Btu/MMBtu) /HHV_{Blended-H2} (Btu/scf) Volume_{Blended-NG} = MMBtu_{Blended-NG} * 10^6 (Btu/MMBtu) /HHV_{Blended-NG} (Btu/scf) The above equations can be used to solve for MMBtu_{Blended-NG} in terms of MMBtu_{Blended-H2}. This value can be compared to overall MMBtu of PRJ natural gas.

Parameter	Value	Units	Resource
			(%-vol NG * HHV-scf-NG + %-vol H2 * HHV-scf-H2)
Blending Check Factor	26,628.03	MMBtu/yr	Check factor for blending. This is the PRJ MMBtu of blended natural gas, given default (user input) blending assumptions. If this value exceeds overall PRJ natural gas demand, secondary blending assumptions must be made to satisfy energy balance. Based on the following assumptions: "Blend % H2" = Volume_{Blended-H2} /(Volume_{Blended-H2} + Volume_{Blended-NG}) Volume_{Blended-H2} = MMBtu_{Blended-H2} * 10^6 (Btu/MMBtu) /HHV_{Blended-H2} (Btu/scf) Volume_{Blended-NG} = MMBtu_{Blended-NG} * 10^6 (Btu/MMBtu) /HHV_{Blended-NG} (Btu/scf) The above equations can be used to solve for MMBtu_{Blended-NG} in terms of MMBtu_{Blended-H2}. This value can be compared to overall MMBtu of PRJ natural gas.

Parameter	Value	Units	Resource
			(%-vol NG * HHV-scf-NG + %-vol H2 * HHV-scf-H2)
Blending Check Factor	2,864,368.23	MMBtu/yr	Check factor for blending. This is the PRJ MMBtu of blended natural gas, given default (user input) blending assumptions. If this value exceeds overall PRJ natural gas demand, secondary blending assumptions must be made to satisfy energy balance. Based on the following assumptions: "Blend % H2" = Volume_{Blended-H2} /(Volume_{Blended-H2} + Volume_{Blended-NG}) Volume_{Blended-H2} = MMBtu_{Blended-H2} * 10^6 (Btu/MMBtu) /HHV_{Blended-H2} (Btu/scf) Volume_{Blended-NG} = MMBtu_{Blended-NG} * 10^6 (Btu/MMBtu) /HHV_{Blended-NG} (Btu/scf) The above equations can be used to solve for MMBtu_{Blended-NG} in terms of MMBtu_{Blended-H2}. This value can be compared to overall MMBtu of PRJ natural gas.

Take the case of a theoretical packaged boiler running at around 600 PSIG and at 750°F that can deal with 100,000 lbs per hour. Efficiency will be lower with hydrogen (less than 80%) at high heating value (HHV) compared to natural gas (84%). But this can be misleading. At a low heating value (LHV), hydrogen efficiency risen to almost 95% whereas natural gas at LHV is only 93%. The important thing is to know whether you are dealing with HHV or LHV numbers. Confusion could lead to misunderstandings and miscalculations.

Boilers running on hydrogen: What you need to know (power-eng.com)
https://www.power-eng.com/hydrogen/boilers-running-on-hydrogen-what-you-need-to-know/

Unit	Efficiency	Source
Large Gas-	96%	US DOE
Large Gas-	83%	US DOE
Hydrogen	37.6	Gupalo et al.
Hydrogen-	50.2	Gupalo et al.
HHV Hydro	75%	Gerardo Lara
LHV Hydro	95%	Gerardo Lara
Average	73%	

*Article states "Efficiency will be lower with hydrogen (less than 80%) at high heating value".
Used 75% in the absence of an exact value.

3		Additional information on combustion ratio process used to develop calculations in Tab 3. External_Comb_Calcs_H2. This relates to the raw data in Tabs 6. External_Comb_Heat_Rating and 7. PNNL_SMR_Facilities.
4		
5		**Development of the Combustion Ratio:**
6		To calculate N2O emissions from the external combustion unit within the steam reforming process, a heat rating per unit of hydrogen produced was required. To estimate an appropriate heat rating for the steam reforming process, air permits for existing steam methane reforming plants were reviewed. Only standalone SMR production facilities, external combustion units with a given heat rating rather than a “not-to-exceed", and facilities with no more than 2 external combustion units were reviewed.
7		The external combustion unit heat rating was compared against the plant hydrogen production capacity to develop a ratio of (MMBtu/hr) / (MMscf/day H2 production) ratio. For facilities where the plant H2 production capacity was not stated in the air permit, the facility H2 production capacity was gathered from the Pacific Northwest National Laboratory (PNNL) Hydrogen Analysis Resource Center North American Merchant Hydrogen Plant Production Capacity list (shown on tab "PNNL_SMR_Facilities"). Of the facilities considered, the highest (MMBtu/hr) / (MMscf/day H2 production) ratio was 3.71 MMBtu/hr per MMscf/day H2 production, and the average was 2.97 MMBtu/hr per MMscf/day H2 production.
8		Three calculation cases were established: the Maximum Ratio Case using the average plus standard deviation for the ratio value, the Average Ratio Case using the average ratio, and the Minimum Ratio Case using the average ratio minus the standard deviation for the ratio value.

$$N2O\ ppm \div Conv\ (Conc - ppm) \div Molar\ Volume\ \left(\frac{dscf}{lb{-}mol}\right) * Fd\ H_2\ \left(\frac{scf}{MMbtu}\right) * \left(\frac{20.9}{20.9 - O_2\%}\right) = N_2O\ Emission\ Factor\ \left(\frac{lb}{MMBtu}\right)$$

$$2\ ppm * \left(\frac{1\ scf}{1{,}000{,}000\ scf{-}ppm}\right) * \left(\frac{1\ lb{-}mol}{385\ dscf}\right) * 44.01\frac{g}{mol} * 5975.05\frac{scf}{MMbtu} * 1.17\frac{scf}{scf} = 0.0016\frac{lb}{MMbtu}$$

Tab Contents

This tab calculates estimated N2O emissions from the combustion of hydrogen per the MMBtu of fuel required to produce the hydrogen demand projected by the Demand Study. The top of the tab includes conversion factors and emissions factors utilized within the calculations. The rows below outline the calculation process, and an equation is included at the top of each set of calculations. Please see the "4. Combustion Ratio" tab for a more detailed description of the ratios presented in rows 19 through 21.

2	**Tab Contents**				
3	This workbook contains select tabs (including this one) from a proprietary Stantec calculation tool. This data is copied from "ALP1_GHG_S&T_1_DataPrep_SoCalGas", "1. Data_Prep_S&T" tab. The input data in this tab was processed through the function in "3.1 EQ S&T" to produce the results in "4. Calculations".				
4	In this workbook, the terms "Low", "Mid", and "High" correspond to the "Conservative", "Moderate", and "Ambitious" market scenarios.
